Rouffeau, in his ingenious and fpirited "Lettre fur la Mutique Francoife," has confined his remarks chiefly to the vices of the French language ; but to all, except the natives of France, a lefs cloquent and forcible writer might eafily have proved it unfit for every kind of vocal mufic, Supericr to a "Vaudeville," or "Chanfon à table :" for the words of thefe compofitions being their principal merit, the hearer is the lefs inclined to judge feverely of the mufic, or the finger, provided he lofes none of the wit or ingenuity of the poem. And, indecd, it is at the ferious Frencls opera, and by the performance of flow nufic, and airs tendres, that thofe accuftomed to good linging are molt offended. However, in the parallel which Rouffeau has drawn between the languages of France and Italy, aftcr defcribing all the inconveniences arifing to a finger from the compound, mute, nafal, and dead fyllables, of the French language; he afferts, that the pancity of fonorous vowels, and abundance of confonants and articulations, force the lyric poet to exclude many words, and allow the mufical compofer to give only elementary, or fhort and fingle founds, to the others. There is nolanguage in which all the words of its vocabulary are equally fit for mufic, or lyric poetry; acco:ding to Salvini, out of forty thoufand words in the Italian language, only fix or feven thoufand can be adopted by the writers of ferious mufical dramas. Indeed, fome of thefe rejected words, by their want of dignity, as well as foftnefs, may be unfit for lyric compofitions. Hence, the melody neceffarily becomes infipid and monotonous, and its movement flow and tirefome; for if the time of fuch mufic be at all accelcrated, its velocity refembles that of an angular body rumbling on a pavement. He goes on with his frictures, and fuppofes, that " fuch a language as he hath been deicribing, has a bad profody, unmarked, without exactitude and precifion; that the lung and fhort fyllables have no fenfible and determinate proportion betwecn them in duration, or numbers, by which the rhythm can be rendered agreeable, exact, and regular; that it has both long and fhort fyllables of an uncertain duration, with others that are neither long nor fhurt; and that the difference between them is wholly incommenfurable.
"'Thefe vices and inconveniences," he ax'ds, " have fuch an effect upon the time or meafure of mufic, when applied to fuch words, as to render it wholly unmarked, irregular, and disjointed.

His character of the Italian language, and defeription of its beauties, and advantage over all others, for vocal purpofes, are fo appofite to the prefent enquiries, that we flail faithfully tranilite the whole paflige.
" If it flould be afked what language is the moft grammatical, I hould anfiwer, that of the people who reafon the belt; and if it thould be afked what people are likely to have the belt mulic, I fhould fay, thofe that have the beft language for it. Now if there is in Europe one language more favourable to mufic than another, it is certainly the Italian: for this language is foft, fonorous, melodious, and more accentuated than any other; four qualities peculiarly important to wocal mulic. It is foff from its articulations being uncempouniled; from the infrequency of clafling confonants; ani from cyery word in the language being terminated by a vowel. It is fonorous from moft of its yowels being open; its diphthongs uncompounded; from having no nafal vowels; and from its articulations being few and eafy, which render the found of each neat and full. It is melodious from its own native fweetnefs, which renders it wocal even in declamation and common fpeech, without the affit-
ance of mufical notes. But what renders the Italian hane gnage more peculianly mellifluous, as well as more exprefive of fentiment, than any other, is the great compafs and variety of its tones, and the choice it allows in painting the palfions. 'To prove this, let any one who imagines it to be only the language of love and tendernefs, take the trouble of comparing the two following Itanzas of Taflo."

> "Teneri fdegn ie eplacide è tranquille
> Repulfe e cari vezzi e liete pace,
> Sorrifi, parolette, e dolce fille
> Di pianto e fofpir, tronchi e molli bacci
> Fufe tai cofe tutte, e pofcia unille,
> Et al foce tempro di lente faci;
> E ne formo quel fi mirabil cinto
> Di ch' ella avena il bel fianco fuccinto."
> Canto IV. Stanza xxxiii.
"Chiama gl" abitator de l'ombre eterne Il ratuco fuon de la tartarea tromba; Treman le fpaziofe atre caverne, E l'aer cieco a quel romor rimbomba; Ne fi ftridendo mai de la luperne Regione del cielo il folgor piomla, Ne fi fcoffa giammai trema la terra Quando i vapori in fen gravida ferra." Canto XVI. Stanza xxv。
It will be found, perhaps, equally difficult to express in any other language the fweetuefs of the one or the vigour of the other of thefe flanzas. But the roughnefs of the laft Atanza does not confitt in hard and uncouth words; they are all fonorous, and, though rough to the ear, eafy of utterance.

Thefe ftanzas, however, which Roufleau, and, after him, almoft all mufical writers have inftanced as of remarkably eafy utterance, thould have been confined to reading and declamation; for better lyrical or vocal verfes may be found in Metaftafio, and, indeed, in almoft all Italian lyric poets, fince it has been found that the vowel $a$ is the beft for divifions, and all the other vowels have been long in difufe for fuch purpofes, by the beft latian compofers for the flage. In the flanza cited as a model of foftnefs, in vocal verfes, there are but two words, to which, in a lively air, divifions would be given: Cari, pace. But even thefe, in which the vowel $a$ occurs in the finf fyllable, would have no long divifions affigned them, if there was a final.fyldable terminated by that letter, as in the third perfon lingular of the future tenfe of verbs, vectrà, uuciderà, farà, darà, parterà̀, cantarà, fuggirà; in the elifion of the infinitive mood, trionfar, Tipofar, frordar, Iufingar, saufragar; and in the fubltan tives, fedeltà, pietà, felicità, libertà, crudeltà, and Mar.
In fetting Metaltafio's early operas, till about the middle of the prefent century, we find the beft compofers giving divifions to the vowels o and $e ;$ as in morirò, dovrà, fugiro, $r e$, te, fì, freme, ffeme, vender, woler, è, mercè, \&cc. but never to $i$ or $u$.
Rouffeau declined difcufing the accents of the Italian tongue; but if, as has been imagihed, the Gréek accents were ufed as a notation of the tone or tune of vcice in reading or fpeaking; the acute accent raifing the voice, the grave deprefing it, and the circumflex keeping it at a middie pitch or tone, the Italian would afford a more varied and pleafing melody than any of the otber European dialects.

All tuneable founds, fays Dr. Holder, of which the human voice is one, are produced by a regular and equal vibration of the fonorous body and undulation of the air, proportioned

## LANGUAGE.

to the acutencfs or gravity of the tone. And, according to Dr. Wallis, this gravity, or acutenefs of tones in fpeech, depends on the opennefs of the aperture in the laryax, which is the feat of the voice; and roughefs and fmoothuefs of rocal tones, he refers to the llate of this organ.

But as thefe learned philoiogers have only diffected our alphabet, and analyfed the pronmaciation of our language, as far as concerns its articulation in fpeech, we fhall examine it with refpect to lyric poetry and linging, to which our remarks will be ltrietly confincd.
If it be confijered that of the five vowels in European alphabets, only $\mathrm{two}, a$ and $c$, are favourable to the clear emiffion of rocal found; that of the ninetwen confonants eight are abfolutely mute, as $b$, hard $\epsilon$ and $g, b, k, p, q, t$; feven femi-mute, that is, allowing only a murmuring noife, but no mufical found, as $f, m, n, \int, v, s, z$; that the foft $g$ and confonant $j$ are likewife of this kind; and that $r$, though accounted a liquid, only admits of a fararing, canine kind of a noife; $l$, indeed, is a true liquid, allowing a continuation of found after it is forned; and $e y$ and $y$ may be accounted femi-vowels; yet fo numerons are the impedinents to a neat, clean articulation, as well as fweetnefs and purity of mufical tones, that fome care fhould at leatt be ufed by the lyric poet in the felecion of words, as well as great precaution by the compofer, who gives them a melody.

If our alphabet be critically examined, in order to difcover the effect which each letter has upon the voice in finging ; it will be found that peculiar letters, as well as combinations of letters, have peculiar wices and tendencies to impede or corrugt mufical founds, both in their formation and paflage : that $f$ admits only of a whilper; for though regarded as a femi-vowel on account of its allowing us to breathe after it has been pronsunced, wi:hout altering the form of the mouth; yet, as Dr. Holder has well obferved, "it is one thing to breatbe, and another to vocalife that breath." $\tilde{n}, n$, and $n g$, likewife allow us to breathe ; but as it is only nafal breath, the found we are able to emit is finuffing and impure. $S$, and its fubftitute, foft $c$, are bilfing; $v$ and $z$ afford only a jarriag buz, by the vibration of the teeth and underlip, like that' of a wafp or bee; the cannot be uttered without a $h / p$; and the Saxo-Norman fyllables ble, cle, fle, gle, kle, ple, the, are all unmufical, and of difficult utterance.

The vowel $a$, according to our manner of founding it in the words all, ball, call, \&c. affords the pureft and moft open paffage to the voice through the mouth; and long divifions and vocal effufions fhould be appropriated as much as poffible to this vowel, which is ftill more convenient to the finger when combined with no other letter, which alters the form of the organ. O, a lows a free paffage to found; yet, as it feparates the lips and teeth lefs than the letter a, it is in lefs favour with fingers: however, the Englifh words blow, fow, glow, flow, woo, Sc. are well calculated for mufical divifions. $E, i$, and $u$, partake of the na ure of confonants, by putting the organs of fpeech in motion when they are firft founded ; and in dwelling upon thefe vowels no woce di petto, no woice can be produced from the chef, as they confine it to a fmall part of the mouth, or render it nafal. Indeed, the $u$, by almolt clofing the lips, allows but a very narrow and inconvenient paflage to the voice; the i and the $e$ are more favourable to a faliet, a voce da tefta, or feigned voice, than to a true portamento, or conduct of the roice.

Tofi, in his " Opinioni de' cantori antichi e moderni, - fieno offervazioni fopra il canto figurato," or florid fong, fourfcore years ago, recommended the exercifing of the voice upon the three open vowels, which, with the Italians,
are $a, e$, , equivalent to our atu, $a, 0$. The Italian i, founded like our double $c$, and $u$ an our double o, are never honoured with divigions or long founds by the belt compofers or finging matters of Italy.
As opeñ vowels are the moli cefirable to fingers; fo diftinet, determinate, and uncompounded confonants, a"e the befl crutches for the voice to lean on; for a neat, clear, and articulate pronunciation of confonants is as necelfary to the intelligence of what is finging, as open wowels are to its being well fung. The letters $\beta, t, k$, for inflance, are fuch clear and diftinct articulations, that the voice, after any one of them, is delivered with a gentle kind of explolion, which confiderably augments its force.

The $\boldsymbol{i}$, in Englifh, as it is founded in the word fimile, and which is fo peculiar to Enghfla mouths, feems a diphthong. compounded of e feminine, and $y^{\prime \prime}$, or the Greek diphthorg ts, or rather the German ei, as founded in eifenac, eichner, \& C. and not a fimple, or original vowel. Indeed, moft of the diphthongs in our language require aetion in the organ, and fpring in the mufcles, as ay, oy, $\mathrm{Cu}, \mathrm{ou}$, in the words bay, boy, Europe, our.
As accent and emphafis have great influence in varying the found of oral language, they are rot indifferent to vocal melody: the Italian tongl:e, though it is caly to pronounce, and foft and mellifluous to the ear, from the opennefs and frequency of its-vowels; yet the articulations of its confonants are more firm, vigorous, and poignant, than in any other language; and as every chalcet has peculiar inflections of woice which form a kind of tune in its utterance, the Italian feems to have a greater compals and variety; of intervals in this colloquial tune, or contitcna, than any other with which we are acquainted.
Diomedes calls accent the foul of fpeech, anirra vocis. And every word of more than one fyllable in profe, mutt have one emphatic or accented fyllable among the reft. However, in verfe, this. rule cannot be oblerved without abfurdity.
"Of min's firft difobedience, and the früit Of that forbidden tree," \&c.
"Awake my Säint John, leave all meaner things To low ambītion, and the pride of kings."
In each of thefe two lalt verfes, were they fet in recitative, which is the beft mufical criterion of accenting any language, there can only be two emphatic, accented fyl. lables: as in Handel's opening of "Alexander's Feaft;"
"'Twas at the royal feält, for Perfia wōn."
A fyllab'e in Englifh, as well as Latin, which has two confonants after a vowel, is long, except one of theie confonants be mute, and the other a liquid, as in rĕgrèt, rĕplēte. Indeed, the accented fyllable in our words which have double confonants, is thort: fo that accent and long do not always imply the fame thing. In the cafe of double rhymes this rule fhould be oblerved: as pleafure, meafure, manncr, Banner; which thould all have fhort notes. Here accent and quantity certaiuly differ. By applying Italian melody to Englif words, we feem to lofe in fenfe what we gain in found. The univerfality of double rhymes in Italian poetry mult have an influence upon vocal melody, which our fingle rhymes but aukwardly imitate.
Dacier, in a note to his tranflation of Plutarch's Life of Lycurgus, fass, that "the progrefs of mufic, in all times, has ever been proportioned to the genius and language of the people." The ancient Romans, though great in arms, agriculture, and literature, were not fuccefsful cultivators

## LANGUAGE.

of the fine arts; and nothing was achiered in then, throughout their empire, but by Grecian artilts. For this we may, however, account, by the flaves only being allowed to cultivate the polite arts, among the Romans; whereas, in Grecee, on the contrary, they were wholly prol:Bited their uf

No vilionary innovation, or fantaltical change, is here intended, in a language fo excellent as our own for every purpofe of reafon, fcience, philofophy, and we may furely add, poctry; all we would recommend, is care to our lyric poets in the felcetion and arrangement of fyllables, as well as unity of fubject (fee Italian Tour. p. 4 \&, and our articles Soxe, Swamerky, and Uxity of ATclody), and attentive ubfervance to the compofers who fet them to mufic, not to dwell on harfh, mute, nafal, or guttural words, whish either prechude or vitiate all mulical fotund.

Song and fing, unfortunately, the two moll common words in our lyric poetry, begin by a biff, and end with a found entirely nafal ; and if we exanine the fyllatles which terminate each line in Dryden's Ode on St. Cecilia's Day', the belt of our lyric poems, and perhaps the mott noble production, to read, of modern languages, we fhall find that the dead letter $d$ predominates; terminating in the courfe of the poem no lefs than two or three and thirty lines; in more than half of which, this hard and dumb letter is preceded by $n$, which, though it does not wholly filence the voice, yet allows it no paffage, but through the nofe. However, this junction is not fo imjurious to vocalifed found, as $n g$ in the words fung, youns, berinning, suinning, deflroying, enjoying; or $f$ and $z$ in ears, bears, Spheres, comes, drums, prize, /Rics. \&cc, which terminate each mulical phrafe or period with a hifs. The impervious confonant $t$, in futu, fiate, fizt, \&c. preceded by a vowel, is lefs difficult to pronounce, and lefs offenfive to hear, than the libilation in bradf, oppref, sc.

Admirable and fubline as this ode is in the perufal, fome of the lines are extremely difficulv to fing, without injuring either the poct or mufician; the firtl, by a languid and inarticulate utterance, or the latter by a pronunciation-too rough and violent. The recitatives may, with propriety, admit of ftrong accentuation, as coly fuch a portion of found is wanting as will render the words more audible, and nearer finging, than mere fpeech : but as recitative is the medium between declamation and mulical air, fome attention feems neceffary in felecting the words, and polifhing the verfes, even for this narrative melody; in fhunning harfh alliterations, fuch as in the lines, thrice be flew the flainthe fweet enthufiafl from ber facred flore, \&c. where there is a coniltant and unavoidable hiffing upon all the accents; and in placing fuch words at the paufe, or hiatus, in the middle as well as at the end of each line or verfe, where the punctuation requires a repofe, or long bote, as will neither wholly filence the voice, nor impede its expanfion. If fuch precautions fhould be thought neceflary for words of quick aitterance in recitative, flill more folicitous fhould the lyric poet be in the choice and arrangement when he writes an air, where every fyllable is lengthened and vocalifed, and where the vowel in each is all that the compofer can tune, or the finger fiveeten and refine.

It is very natural for poets to wifh that the language, in fetting it to mufic, fhould be more refpected than it has generally been, particularly in our church compofitions, by old malters, which the lite Mr. Mafon, in his "Anthem Book for York Cathedral," has very juftly cerifured ; but he commends Tucker, who was gentleman of Charlcs IId's chapel, for his very accurate attention to accent and lenptli of fyllables; and fums up the excellencies and defeets of
our ecclefiaftical compofers brought up in the King's chapel, after the Refloration, by fpeaking with exact difcrimination of "the plealing melodies of Wife; pathetic airs of Clarke ; majeflic movements of Blow; and fublime Itrains of Purcell."
But Purcell, the pride of every Englifuman who loves mulic, was, in general, not only accurate, but happy and touching in the expreffion of words. Many of his melodies are, however, now become wholly obfolete and unconth, from the temporary graces, with which he overloaded them, for the fake of ignorant fingers; and, indeed, he wrote for no other. Bat thefe being the furbelows and flounces of a particular period, are very fhort-lived, and foon difgrace that melody which they were intended to embellif.
Languages are in general divided into orlginal or motbertongues; as the Hebrew and Arabic, in the Ealt; the Tcutomice and Sclavonic, in the welt.
Lavguages, Secondary, or derivative, which are thofeformed out of a mixture of feveral others, as Latin, French, \&c.
Kircher will have the Coptic a mother-tongue independint of all others. See Coptic.
Du Jon maintains the Gothic a primitive language, and the mother of all the Teutonic tongues; that is, of all thofe fooken in the north. See Gotinc.
Some add the Bafque, or Bifcayan, and Bas Briton, to the number of mother-tongues, imagining them to have been thofe of the ancient Celtr, or Gauls.
Langusges, Lcarned, or Dead, are thofe which only fublitt in books, and which mult be learned by the rules of grammar ; as the Greek, Hebrew, Syriac, and Chaldee.

Raimond Lutly folicited the eftablifhment of the ftudy of the learned languages a long time, in the thirtcenth and fourteenth centuries. At length, in the year 1312, pope Clement, and the council of Vienne, appointed, that in the court of Rome, and in the univerfities of Paris, Oxford, Bologna, and Salamanca, there fhould be inftituted profeffors of each, who fhould have falarjes from the refpective courts. The monks, however, vigoroully oppofed the fireading of thefe ftudies; and with fo much fuccefs, that Erafmus tells us, in his time, "Grace noffe fufpectum, Hebraice prope hereticum."
Languages, Living, are thofe fill fpoken in fome coun* try or other; and which may be learned by converfation. The molt popular among thefe are the French, Italian, Spanifh, and Englih.
The Spaniards feem to place the noblenefs and gravity of their language in the number of fyllables, and the fwelling of words; and fpeale lefs to be underfood, than to be admired. Their terms are fonorous; their expreffions haughty; pomp and oftentation run through all they fay; their language cannot paint a thought to the life; it always magnifies it; frequently diftorts it ; and does nothing, if it does not exceed nature.

The Italian tongue does not fwell up things to that degree, but it adorns and embelifhes them more; yet thefe ornaments and embelliflhments are not real beauties. The Italian expreffions, thus rich and brilliant, are like thofe faces covered with patch and paint, which make a fine fhow; but the finery is all deceit.

The French language (as fome of their authors exprefs themfelves) is fimple, without lownefs; bold, without indecency: elegant and florid, without affectation; harmonious, without fwelling ; majeftic, without pride; delicate, without foftnefs; and itrong, without roughnefs. Though; as to the points of ftrength and majelly, the French mmit

## I. $A \cdot N$

## I. $\wedge \mathbb{N}$

give way to the Englifh; which in thefe, as well as in copioufnefs, exceeds moft of the living languages; as far as it is inferior to fome of them in fmoothnefs and delicacy.

Of all the modern languages, the French is generally allowed to be the molt clear, and fit for philofophecal and critical fubjeets; the chalteft and molt refersed in its diction; the mof judicious and fevere in its ormanemts.

The language of France, for vocal purpofes, may be compared with that of Italy. That the Italan tanguage is favourable to the pure emifion of found, and confequently to finging, and the French the contrary, none but a native of France will difpute. Yet M. Framery, a man of tate and knowledge of mufic, and who fometimes feems to feel and acknowledge the defects of French muicic and its language for vocal purpofes, fays in the Encyclopédic Methodique, p. 235: "de celébres compofiteurs, Meffis. Duni, Gluck, Piccini, Sacchini, ont dit, ont ecrit, qu'ils aimosent mieus eompofer fur la langue Françife que fur la langue Italienne!". credat Judaus. M. Framery never furprifed us more, or convinced us lefs. Thefe compofers may have faid fomething flattering to the lrench, in public about their language, while at Paris; but in private, Gluck and Sacchini, to our knowledge, fpoke of French as a mufical language with no great refpect. The Italians have often pretended, in Scotland, to prefer Scots tun:s, and in Ireland, Irifh, to Italian mufic. Geminiani and Tenducci did this in both countries ; but in England, and among their own countrymen, they turned to ridicule both thefe national mufics, more than they deferved; for though, when fung by fine fingers, they lofe their chief merit of originality and fimplicity, when fung by the natives, they are extremely pleafing, and often truly touching.

Of all orhers, the Englifh is faid to be the moft honeft, open, and undefigning language. With all its fublimity, it is gay and pleafant on occafion; but its gaiety is ftill moderated and reftrained by good fenfe; it hates excefive ornaments; and, for the greater fimplicity, would almoit choofe, as fome fay of the French, to go naked; it never drefies more than decorum and neceflity require.
The Englifh language is derived from fo many and fuch different fources, that, on this account, it is deficient in regularity and analogy. Yet we have this advantage to compenfate the defect, that what we want in elegance, we gain in copioufnefs, in which laft refpect few languages will be found fuperior to our own. See Exgeisio.
Ennius and Cecrops are celcbrated for their knowled e of many languages. Mithridates, king of Pontus, it is faid, underttood twenty-two tongues, which was the number of different people over whom he commanded; and thofe langruares he knew fo well, that he was able to harangue each of his people in their own tongue. It was a faying of Charles V. "That fo many languages as a man underftands, fo many times he is a man." Sultan Soliman's irnterpreter fpoke perfectly well feventeen different languages. But among the moderns, none has been more remarkable in this way than Poflellus; who, belides a perfect knowledge of all the dead languages, was fo well acquainted with the living, that it is faid he could have made the tour of the globe, without the ufe of an interpreter. See our asticle Jones, Sir William.

Bibliander has written of the analogy and proportion of languages and letters, De Ratione Communi Linguarum, in 1518 . Gefner, of the Difference of Languages, in 1572. Lazius publifhed an Introduction to the Learning of the politer Languages, in a common Method, in $154^{\mathrm{S}}$. Mepiffier, a fcheme of forty different languages, and different dialects, fpecimens of exch whereof he gives in the Lord's
prayer, in 1503. Dc Recol-s, in his Addition to the World of Daviti, has publifhed the Pater-nolter in all the languages fpoken among Chriltians ; and Mr. Chamberlayne propofed to do the fime in a hundred languages, a feecimen of whicte has been publifted. Albericus Gentilis wrote of the mixture of languages, in 1633 . Atul father lecienier's Difcourfe on Etymologics, is a work of the fame kind. In $161_{13}$, Durer publified a treafure of the hitlory of all the languages in the universe. Guichart has a treatife of the ctymolegical harmony of languages, pu'd lifhed in 1619 . Drarewood has given us ctrious enquiries into the diverfities of lanmuares and religions, publifhed in $1635^{\circ}$

Language, Ibilyoflical. See Cmaractrire, Unimerga'.
Languagie is alfo ufed, in the order of Malta, for nathon. The knights of Malta are divided into eight languages: three whereof are for Prance; viz. the languages of Provence, of Auvergne, and of France; two for Spain, thofe of Caftile and Arragon; the other three are the languages of Italy, England, and Germany.

Each of thefe languages has its chief, who prefides in affemblies of the language to which he betongs. See Malta.

Language, Frome. See Frank.
Lavguage Helicmilic. Sce Helitemistic.
Laxguage, Laze. See Law Lambaze.
LaNGUED, Laxgue, in Heralury, is applied to fuct animals whofe tongues appear out of their mouths: being of a colour different from that of the body of the animal.

LANGUEDOC, Occitania, in Gcography, a portion of Gallia Braccata, a maritime province (as it was denominated before the revolution,) bounded on the N. by Guienne, Auvergné, and Lyonnois, on the E. by the Rhone, on the S. by Foix, Roufillon, and the Mediterranean, and on the W. by the Garonne. It lies between $42^{\circ} 40^{\prime}$, and $45^{\circ} 20^{\prime} \mathrm{N}$. lat., and between $1^{\circ} 20^{\prime}$, and $4^{\circ}+5^{\circ}$ E. long. In $43^{\circ} 30^{\prime}$, the parallel of Touloufe nearly, it extends 53 leagues from W. to E. ; but towards either extremity, it does not excced 33. Its breadth, for the greatelt part, is 33 to 38 leagues, except towards the middle, where it fcarcely amounts to 40 miles. The coaft from Agde eaftward is confiderably augmented, the fea baving retired, as appears by comparing the fituation of the maritme places in ancient and modern times. The furface of this province confilts of mountains and vallies, hills and plains. In the mountains, called the Cevennes and its branches, which are partly covered with forefts, there are lead and iron mines. The lower tracts are fertile, and well watered, yielding grain, wise, and fruit; but one half of the province is of an ungrateful and unproductive foil. The principal rivers are the Rhone, Garoune, Loire, Gardon, Villre, Erault, Orbe, Aude, Arriege, Allier, Tarn, and Lot. In this province many canals have been formed for commercial purpofes.

Languedoc has been fometimes divided into Upper, Lower, and the Cevennes; the Upper, including nine diocefes, the Lower, containing in bihoprics, and the Cevennes, comprehending three. Geographers have divided this province into Upper and Lower; containing three archbifhoprics, 23 bihoprics, 61 abbies, 637 priories, 353 religious houfes, 60 commanderies, 200 towns and villages, 2 univerffies, 6 academies, 1000 ecclefiaftics, 342,758 fanilies, and $1,560,000$ iuhabitants. The ecclefiattical divifion has been differently arranged fince the revolution. The capital of Upper Languedoc was Touloufe, and of Lower Languedoc, Montpellier. It is now divided iuto feven departments, viz. the Ardêche, Lozere, Gard, Herault, Tarn, Upper Garonne, and Aude.
LANGUENBRUCK, a town of Switzerland, in the canton of Soleure; 54 miles N.E. of Soleure.

LANGUEPOUR, a town of Hindooftan, in Bahar; 43 miles S.S.W, of Bahar.
LaNGUET, John Baftist Josebit, in Biography, fon of Denis Languet, attorney-general to the parliament of Dijon, in which city he was born in the ycar 1575. He received the clementary parts of his education in his native place, and then went to purfue his fudies at Paris, where he refided at the Seminary at St. Sulpice. In the year 1698 , he was admitted a licentiate of the faculty of the Sorbonne, and was ordained, foon after, a prieft at Vienne, in Dauphiné. He returned to Paris, took the degree of doctor in 1703 , and attached hinfelf to the community of St. Sulpice, "here, by the exertions of his benevolent labours, he rendered himfelf to ufeful that he was chofen curate to M. de la Chetardic. The duties of this appoinment he difcharged ten years, and fold his eftate, that he might have it in his power to relicve the neceffitics of the poor. In the year 1714 , he fuccecced to the living of St. Sulpice, and finding the church much too firall for the number of his parifhioners, he conceived the delign of building a place tbat fhould excel every other church in the world in magnifcence, and architectural decorations. This great work he accomplifhed by means of donations, which poured in from all quarters the moment his intentions were made known. It was confecrated, in the year 1745 , with fo much fplendour, that Frederic I[., king of Prufin, was induced, from an account which he read of the proceedings on that occafion, to fend a polite complimentary letter to M. Languct. He eftablifhed likewife "La Maifon de l'Infant Jefue," interded for the accommodation of 30 or 40 poor ladies of noble defcent. Here they were boarded and educated in a manner fuitable to them, but at the fame time were taught to be ufeful. They were empluyed, by turns, in attending to donictlic concerns, and in other offices that would render them ferviceab'e to their relations in the country. Another objuct of this eftablifhment, was to afford an afylum to more than eight hundred poor women and girls deflitute of the means of fupport, belonging either to the city or country. They were provided with daily food, and were made to earn their fupport, chiefly by Epinning cotton and linen. Without entering into the minutix of the regulations of the place, it is fufficient to fay, that this ellablifhment has proved a moft happy retreat for numerous infortunate femalcs, who had been abandoned, by infamous betrayers, to difeafe and wretchedrefs. Here, by good example and excellent moral inftruction, they have been recalled to virtue, and habituated to induftry, and many of them have proved ufeful and honourable members of the fociety. For their encouragement when they quited the houfe, they were paid in money the amount of what they had earned by their labour. Though the land attached to the houfe confitted of only fourteen French acres, yet it fed a fufficient number of cows to give milk for upwards of two thouland children in the parih: it alfo contained conveniences for pigs and all kinds of poultry, which were fold for the benefit of the inititution; a bakeboufe, furnifhing more than a hundred thoufand pounds of bread monthly, which was diltributed among the poor of the parifh; fpiming-rooms, an excellent and well cultivated garden, a noble difpenfary, $\& c \mathrm{c}$. The management and regularity with which every department in this houfe was condueted, either for the inftruetion, employment, or fupport of fuch a number of perfons, were fo adsirable, and gave fo high an idea of the great directing hand, that Cardinal Fleury propofed that Languet fhould be appointed fuperintendant of all the horpitals in the kingdom; to whom he anfwered with a frile, "I have alway's faid, my lord, that the bounty of your eminence led me to the
hofpital." M. Languet's benevolent exertions were not confined to the objects already mentioned, but extended to the poor and wretched of every defcription. No perfon was ever more active and fucceffful than himfelf in obtaining large alms and confiderable legacies, which he diftributed with admirable prudence and difcretion. It is faid, on good authority, that he difburfed about a million of livres in charity every year. Noble families reduced to poverty, were among the prime objects of his benevolent attention. At the time of the great dearth in 1725 , in order that he might relieve the poor, he fold his houfhold furniture, his pictures, and curious and rare pieces of workmanfhip, and, in fhort, fcarcely left himfelf the bare neceffarics of life. He was among the firlt to be prefent at fires, or any other fcene of public calamity, where his prudence, felf-poffeffion, and univerfally refpected character, rendered his advice and exertions effentially ferviceable. He had a wonderful talent in difcovering the different difpofitions of mankind, and he knew how to employ every perfon according to his capacity. This excellent man declined the offers made of feveral bifhoprics ; his great ambition was to do good, and he had ample meeans for this as a parifh prieff. He died in the year 1750 at the age of feventy-five. His piety and application to works of benevolence did not prevent him from being a lively and cheerful companion. He polleffed a fine genius, and was highly delighted with cheerful and amufing fociety. His younger brother, named John Jofeph, born at Dijon in 1667 , rofe to confiderable eminence in the church, and was 40 years archbifiop of Sens. He died in 1753. He took a very diftinguifhed part as a controverfialiit, in defence of the bull "Unigenitus," and difplayed much learning and acutenefs in his polemical pieces, which were tranfated into Latin, and printed in 1753, in two volumes folio. He was author of "A Tranflation of the Book of Pfalms," and of difcourfes publifhed in the collections of the French academy. Moreri.

Lixauet, Hubert, was born at Viteaux, in Burgundy, in 1518: after a preliminary courfe of inftruction in his own country, he went to Italy for the fludy of the civil law, and took a doctor's degree at Pavia. Having met with a book of the reformer Melancthon's, he felt a great defire of feeing the author, and, in 1549, procured an interview with him at Wittenberg, which terminated in his converfion to the Proteltant faith. After this he fpent feveral years in travelling over different countries in the north of Europe; in his tour he became acquainted with Guftavus, king of Sweden, who gave him a commiflion to invite perfons feilful in the arts and fciences from France to his dominions. In 1559, he accompanied Adolphus of Naflau, prince of Orange, into Italy; after this he was nominated by the elector of Saxony to be his envoy to the court of France. He was deputed by that prince to the affembly of the ftates of Ang fourg in 1568 , and was employed by him in other important negociations. He was again fent to France in 15\%0, when he pronounced a bold and eloquent harangue in the name of the Protaftant princes of Germany before Charles IX. He refided at Paris during the bloody malfacre of St. Bartholomew, and expofed his oxn life to danger by his efforts in faving his hoft, Andrew Wechel, the famous printer, and his friend, Dupleffis Mornai. After accomplining various other miffions 10 the fatisfaction of his employers, he died at Antwerp in September, 158 I , at the age of 63 , greatly regretted by all who knew him. 'The prince of Orange, in whofe fervice he had been employed, walked as chief mourner at his funeral. He was a man of pure virtue in corrupt and difficult times: "He was," fays one of his biographers, "fuch at many would wifh to appeat;

permit one to pals wool without paying cuflom, he having paid it before in Wales.

LANISCHLE, in Geograpby, a town of Iftria; 16 miles S.E of Capo d'Ifria.

LANISTA, in Antiquity, is fometimes ufed to fignify an executioner, but more frequently for a mafler gladiator, who taught the ufe of arms, and had always people under them, ready to exhibit flows of that kind. For which purpofe they either purchafed gladiators, or educated children, that had been expofed in that art.

Laxista was alfo ufed to denote one who taught gamè cocks to fight.
LANIUS, in Ornithology, a genus of the rapacions tribe, having the bill rather Itraight, with a tooth, or notch, on each mandible near the end; the bafe naked; and the tongue jagged at the tip. To this character, uffigued by Gmelin after Linuæus, may be added, that the nottrils are generally round, and covered with ftiff briftes. Dr. Latham obferves ftill further, that the birds of this genus are not furnifhed with a cere at the bafe of the bill, and that the middle toe is connected to the next as far as the firt joint. Laftly, according to Scopoli, the fegments of the acins are feven in number.

Linnæus, in the various editions of his Syftema Nature and other works, has referred this genus of birds to feveral dif. tinct families, having fometimes placed it with the chatterers, fometimes with the titmice, and then again, from its habits of rapacits, with the accipitres, in which laft-mentioned order it ftands in the Gmelinian edition of that author's publication. Before the time of Linnæus, our countryman, Ray, had claffed this tribe among the flort-winged hawks: Buffon allo had arranged it after the falcons; but Brifion, on the contrary, includes them with the thrufhes and the chatterers, two analugous genera, which obvioufly belong to the order pafferes. Kramer introduces it unde- the pafferine order ; Scopoli under the pies; and Pennant, in his "Genera of Birds," with the accipitres; from which, however, the latter writer removes it to the order picx, in a fublequent edition. Gmelin retains it ftill in the accipitrine order. In Latham's "Synopfis," and alfo in his "Index Ornithologicus," the example of Scopoli is followed; the flrikes are difpofed at the head of the order pič, and this arrangement has obtained the fanction of the French ornithologitis. We are far from wifhing to intrude a folitary fuggeition again!t eltablifhed opinions, and thofe too of acknowledged merit; yet, on a point in which fo much difference has prevailed, a fuggeltion may be allowed. The flrikes then appear to us, at leaft in a general view, lefs intimately conneted with the pies than the falcon tribe, though confeffedly allied to both; and in defining the precife line between, it is not impoffible that a future era will concur in the accuracy of Gmelin, who incorporates them with the accipitres; or, in reverting itill farther back to the example of Ray, our enlightened countryman, place them as the laft of the falcon tribe.

The birds of this genus are difperfed throughout moft parts of the globe: they are generally of a noify, reflefs, quarrelfome; and ferocious dilpefition; prey on all the fmaller kinds of birds as well as infects. The manner in which they de?roy ther prey is almoft, if not entirely, peculiar to themfelves, and evinces a degree of addrefs and cruelty that has not inaptly obtained them the name of butcherbirds. After youncing upon their deltined victim, which they ufually feize upon in a defencelefs fate, while young, and in the neft, they bear it away to fome thorny buif, and by the dint of dextrity force it upon one of the ftoutelt
and flarpelt fines ; after which they proceed to tear the yet living creature into pieces, feparating its mangled remains by the affittance of their bill and talons, and difperfing on different fines of the bufh fuch remmants of the flefh, after being for the prefent fatisficd, as are referved for futuremeals. In this maner, the fhrike tribe alfo treat the larger kinds of infects, as well as birds.

## Species.

Foretcatus. Tail forked; frontal creft erect ; body greenifh-black. Linn. Drongo, Buff. Gobe-nouché buppé; de Malabar, ibid. Fork-tailedjbrike.

Length ten inches; fize of a black-bird; tail long, and much furcated; crelt Cometimes wanting. Inhabits the Cape of Good Hope, Madagafcar, and China.

Czrulescens. "Tail forked; body blueifh-black; belly white. Linn. La pie-griefche a queue fourcbue de Bengale: Brift. Le fingah, Buff. Fork-dailed Indian butcher-bird, Edwards.

Inhahits Bengal, where it is called fingah: the Engtifh. fettlers call it alfo the king of the crows, from the holtiledifpofition they conftantly evince againft thofe birds. Its. length is feven inches and a half; the tail much forked, theouter feather fpotted with dirty white.

Malabaricus. Body blueih-black; quill and tail-feathers black ; outer tail-feathers long, and without webs, except on the outer fide near the tip. Lath. Ind. Orn. Gobemouche de Malabar, Son. Drongo de Malabar, Buff. Malabar /brike.
Length feventeen inches and a half. This fpecies inhabits; Malabar.
Castaneus. Tail cuneated; body above chefnut, beneath white; crown, nape, and hind-head cinereous. Latho. Lanius caftaneus, Gmel. Chefrut-backed /brike.

Country unknown. The bill, wings, and legs black; front black. Length ten inches.

Luctonensis. Tail cuneated; body reddifh-grey; tailfeathers banded with brown at the ends; a black fpot on the head, behind the eye. Lanius lucionenfis, Linn. La piegriefche de Luzon, Briff. Luzonian Jbrike.

Length reven inches and a half; bill and body above grey-brown ; beneath, and on the fides, reddifh, with whitelines; tail rufous-grey; the tip of each feather, except the two middle ones, rufous white; legs and claws brown. According to Briffon, the inhabitants of the illand of Luçonia, which it inhabits, call this bird cabegote.

Coristatus. Tail cuneated; head crefted; body reddifh, beneath waved with tawny and brown. Gmel. Bcngalenfis rufus, Briff. Crefled red, or rouffet-coloured butcherbird, Edwards Crefted red fbrike.

Canadensis. Tail cuneated; head crefted; body reddifh, beneath whitifh. Gmel. Lanius Canadenfis, Brifo. Pic-griecho bupé de Canuda, Buff. Crefled Jrike:

Length fix inches and a balf; the bill and claws black ;: creit reddifh; cheeks dufky, with white fpots; throat and brealt yellowifh-red; belly cinereous; wing-coverts black, edged with white; tail black, with white dots. This fpecies inhabits Canada.
Ludovicisnus. Tail cuneated and cinereous; body above cinercous, beneath whitifh. Gmel. Pie griefcbe de la Louifane, Buff. Louifiane Jarike.
Inhabits Louifiane. Length eight inches; under the eyes. a black band ; fix middle tail-feathers black, the reft white at the bafe and tip.
Nengeta. Tail cuncated, white at the tip; body cinereous, beneath whitifh. Limn. Cotinga cinerea, Briff.

Guirarts

Guiraru nheengeta, Ray. Guirarou, Buff. Grey pye of Brafl, Edw. Grey Jrike.

Inhabits northern Europe, Brafil, Surinam, and other parts of South America, frequenting marfhy places. Length nine inches. In this fpecies the wings and tail are blackifh; wing-coverts black, with the tips dull white; primary quill-feathers black, outer tail-feathers at the tip white.
Curvinostris. Tail cuncated; body white; back black; firft five quill-fuathers with a white fpot. Gmel. Collurio Madagafarion/is, Briff. Eecorcbeur de Madagafar, Buff. Vanga ou becarde a ventre blanc. Buff. Hook-billed Jurike.

Both mandibles reflected at the tips; hind-head greenifhblack; greater tail-coverts obliquely fpoited with white; rail-feathers in the middle, within cincreous, withoat black, tip whiee: legs lead colour, claws blackifh. A native of Madagafcar, where the inhabitants diftinguifi it by the name of vanga. It feeds on fruits, and is faid to whifle well.
Collaris. Tail cuneated; body black, beneath white; firt quill-feathers white at the bafe. Gmel. Pie oriefibe du Cap de Bonne Epherance, Buff. Collared florike.

Native of the Cape of Good Hope. Length twelve inches.

Excubitor. Tail cuneated, white at the fides; back hoary; wings black, with a white fpot. Linn. Lanius cinereus, Brift. Lanius cinereus major, Gefn. Cafrica palombina, Olin. Great cinereous Jbrike, Arct. Zool. Donov. Brit. Birds, \&c.
This fpecies inhabits many parts of North America and Europe, and is the largelt of its tribe found in Britain, where, however, it is extremely rare. The length is ten inches. The male differs very little from the female, except that the parts beneath in the former are entirely white, while thofe in the female are marked with fine femicircular brownifh lines. The female makes her nelt of heath and mofs, lined with wool and other foft fubftances. The fpecies chiefly inhabits woods: it feeds on infects and fmall birds, the latter of which it feizes by the throat, then fixes them on a fharp thorn, and tears them to pieces. When confined in a cage, it will often, if poffible, contrive to affix its food againft the wires, that in like manner it may pull it afunder with its claws and bill. In countries where thefe birds are abundant, the hufbandmen treat them with regard, being efpecially ufeful in the deftruction of rats, mice, and other vermin. There are fome diftinct varieties of this bird: in one the body is white, the legs yellowifh, and the bill and claws blackifh; and another in which the leffer wing-coverts and thoulders are reddifh.

Collurio. Tail fomewhat cuneated; back grey; four middle tail-feathers unicolour; bill lead colour. Linn. Fn. Suec. Lanius minor rufus, E̛c. Ray. Merula congener alia, Ray. Ecorcbeur, Buff. Lefler butcher bird, fiuber, Eic. Will. Red-backed /brike, Donov. Brit. Birds, \&c.

Length feven inches and a half; the head and lower parts of the back light grey; upper part of the back, with the wing-coverts, ferruginous; the tail black, with all the feathers, except the two middle ones, more or lefs white at the bafe; the outer web of the outer feather white; breaft, belly, and fides bloffom-colour; legs black. In the female, the head is dull ferruginous, mixed with grey ; breaft, belly, and fides dirty white, with femicircular dufky lines; tail deep brown, the outer feather only white on the outer web. This fpecies is not very uncommon in Britain, where it is confidered as a bird of paflage. It lays fix white eggs, marked with a rufous brown circle towards the large end.

The neft is generally placed in a hedge or low buth, near which, it is afferted, no fmall birds have the temerity to build, as it not only feeds on iafects, but alfo on the young of other birds, which it feizes in the neft by the neek, and kills by piercing the fkull with its bill, the brain and eyes being the parts it firft devours. It is remarkably fund of grafshoppers and beetles, which it cats by morfels; and when fatisfied, translixes the remains on a thorn, to be caten at another opportunity. This, like the grey frike, has no note peculiar to itfelf: it is mercly an adept in the imitative art, as its note is varied to that of any other birds it wifhes to decoy within its power. Writers defcribe two or three varieties of this fpecies, the moft probable of which is the variegated thrike, l'Ecorcheur varie of Briffon. This is grey on the upper part of the body, and rufous-white beneath, the whole marked with tranfverfe brown flimations; the fcapulars rufous-white, bounded by a parallel black ftripe; the tail black, the three outer feathers rufous-white at the bafe and tips, the outer one wholly rufous-white on the outer edge. It is the leffer variegated butcher bird of Willughby, and is admitted as a varicty by Gmelin and Latham. Gmelin is, however, miftaken in placing the following bird as another variety of the fpecies collurio.

Retrus. Crown and nape rufous, furrounded with fufcous; front, fcapulars, fpot on the wing, and whole furface beneath whitifh. Donov. Br. Birds. Lanius rufur, Brif: Lanius rufus (y Collurio), Gmel. Lanius rufus, Lath. Lanius rutilus, Ind. Orn. Lavius pomeranes, Mufo Carlfc. Lanius minor cinerafeens, Ray. Lantius minor rutilus, Klein. Ampelis dorifo grifeo, \&c. Linn. Fn. Suiec. Pie-griefche rouffe, Buff. Bufferola, Zinnan. Wood-chat, Albin, \&c.
Extremely rare in Britain. Its fize is equal to that of the common or red-backed firike, and its manners, fo far as we are acquainted with the fecies, are nearly the fame, except that it never frequents woods, kecping conftantly on the elevations or among the low bufhes in the open plains; it inhabits Africa and Southern Europe chiefly. There is an apparent error among writers in confidering the bird called by Buffon la pie-griefche rouffe á tete noire du Senegal, as a variety of Lanius rufus. Levaillant defcribes Buffon's bird under the name of Tchagra, from the peculiar found of its note, which refembles the repeated repetition of the words tcha-tcha-tcha-gra, and affures us it is no other than a varjety of the following fpecies.
Senegalus. Grey, beneath whitifl; crown, band through the eyes, and tail-feathers black; the laft, except the two middle feathers, white at the tips. Lanius Sengalus, Linn. Lanius Senegalenfis cinereus, Brifl. Scnegal farikie.

Lenyth nine inches. Very common in Senegal.
Anticuanus. Tail long and cuneated; body above yellowifh rufous, beneath white, head, bill, wings, legs, and tail above black. Gmel. Pie-griefche d'Antigue, Sonnerat. Antiguan farike, Lath.

Inhabits the Philippines and Panay ifles.
Nıger. Black; tail fomewhat cuneated. Gmel. Blatk farike.

Native of Jamaica. Length feven inches.
Leverianus. Tail long, cuneated, black at the tip; bill, head, neck, middle of the breait, and legs black, the relt white. Gmel. Lanius picatus, Lath. Alagpie Jrike.

Inhabits South America; length ten inches; greater wing-coverts and fecondary quill-feathers white at the edge; two middle tail-feathers as long again as the reft, the whole black with white tips.
Rupus. Rufous, beneath white; head greenilh-black. OO 2

Linn.

Linn. Lamius Madazafarienfis rufus, Briff. Schet-bé, Duff. Rufous Jorike.

Length eight inches, the bill, legs, and claws leadcolour.

Leucocepinaus. Greenih-black; head, neck, and body beneath white. Ginel. Sc. Lanius MIadagnfarienfis wajor viridis, Brif. Tiba-chert-hé, Buff. Whbite-headed frike.

Size of the laft, and inhabits the fame country.
Atricapillus. Tail cuneated, and with the neck, crown, floulders, and wings black; body above moufecolour, beneath blueih-alh. Merrem.

Native of Surinam. 'The length five inches; wings fhort; wing-coverts and fecondary quill-feathers edred with white; tail-feathers, except the two middle ones, tipped with white.

Pomeranes.` Body above black, beneath white, hind head and back of the nock dark rufty, furrounded with black; two fpots on each fide the wings and rump white. Sparmann.

Inhabits Pomerania; bill, legs, and wings black.
Tyrannes. Body cinereous, beneath white; crown black, with a longitudival tawny treak. Gmel. Mufcicapa tyrannus, Brif. Tyran, Buff. Tyrant Jorike.

Native of America. Length eight inches. Builds in hollow trees, is fierce and audacious, and will even attack the eagle, faltening upon its back, and continuixg to fcream and peck with its beak till it forces the eagle to retreat. There are feveral varieties of this bird.

Major. Grey; each fide the head reddifh; tail longer than the body, and pointed. La grande pie-grieche, Sonnini.

Size of the black-bird, the plumage greyih-ath; bill citron-yellow; legs brownifh, claws black.

Africanus. Body above black, beneath white, and a band of the fame on the wings. La pie-grieche filencieuff, Sonnini.

Size of the common red butcher-bird of Europe, the bill horn-colour; iris and legs brown, and claws black. The female is rather fmaller than the male, and the colours more obfcure. The neft, which is conftracted with much art, is placed among trees, and commonly contains from three to four eggs of a pale green colour. The young in plumage refemble the female. Inhabits Africa.

Schach. Body yellowih; front and wings black. Linn. Lanius a-faack, Otbeck: Cbinefe Jorike.

Native of China, in fize refembling the fecies tyrannus. Head and neck on the upper part grey; neck beneath dull reddifh-white; back and belly reddifh.

Pitangua. Body black, beneath yellow; crown with a tawny ftreak; band over the eyes white. Gmel. J.anius pitangua, Linn. Pitangua guaca, Ray. Tyramus Brafilienfis, Briff. Bentizeo, ou Cuiriri, Buff. Braftian Jbrike.

Length nine incles; bill thick, throat white; wings beneath yellow. Native of South America.

Barbirus. Black, beneath red; crown and thighs tawny. Gmel. Lanius Seneralen/is ruber, Briff. Gonolak, Buff. Pie-grivebe du Sencgal, ibid. Barbary forike.

Length nine inches; the bill, wings, tail, feet, and claws black, head, neck, vent, and lower wing-coverts yellow. Inhabits Barbary.

Sulphuratus. Fufcous, beneath yellow, head blackinh, furrounded by a whitih band. Gmel. 'Lanius Cayanenfis luteus, Briff. Pie-gritfche jaune de Cayemne, Buff. Becarde a zentre jaune, ibid. Tcllow-bellied /brike.

Native of Cayenne, the length nine inches; chin and throat white; legs grey; bill and claws blackinh; wings and tail brown, edged with rufous.

Cayanus. Cincrous ; head, tail, and primary quill-fet. thers black. Linn. Lanius Cayanenfis cincreus, Brilf. Piegrifche grife de Cayenne, Buff. Cayenne ßprike.
Size of a black-bird, the length eight inches and a half, bill at the bafe red, at the tip black; legs cinereous, claws black. Bufton defcribes a fuppofed variety, about the fame fize, that differs in having a longitudinal black ftreak down each feather. This is from Cayenne, as is likewife another variety of fmaller fize, with the front yellowif.

Madagascarensis. Cinereous, beneath whitifh; lores black; tail-feathers reddifh. Gmel. Lanius Madagafearienfis major, Briff. Cali-calic et Bruja, Buff. Madagafar plovike.

Length fcarcely five inches, and inhabits Madagafcar. In the male, the chin and throat is black; in the female, white mixed with rufous.
Auravrius. Tawny yellow; chin, throat, and brealt reddifh ; head, above the eyes, and nape black; wings and tail brown. Lath. Ind. Orn. Orange /Jsikic.
Native of Cayenne. Length feven inches.
Nootкa. T'ail rounded; body above black, beneath white ; crown black ; collar white. Gmel. Nookk /brike, Lath.

Length feven inches; bill and legs black; above the eyes a white line reaching to the nape, and a black one beneath the nape; leffer wing-coverts black, greater white; tailfeathers black, the four outer white at the tips." Native of New Zealand.

Emeria. Grey, beneath white, temples and rump red. Gmel. Lanius Bengalenfis fufcus, Briff. Mufcicapa emeria, Linn. Rouge queue, Buff, Bengal red fart, Albin. Beno gal flrike.

Length five inches and a half; the bill greyih-brown ; crown and hind head black; abdomen and upper tail-coverts red ; each fide the neck four black curved fpots. Native of Bengal.

Jocosus. Tail rounded; body grey; lower eye.lid purple; vent fanguineous red. Linn. Amocn. Acad. Merula Jimenfis crifata minor, Briff. Jocofe forike.

Size of a lark; length feren inches and a half, and inha* bits China, where it is called Kowkai-kon.

Bicolor. Blue, beneath white, frontlet black. Linn. Mant. I, oxia MIadagafcarina, Sylt. Nat. Pie-griefche blue de Madagafar. Blue farike.

Length fix inches and a half; the bill, head, margin of the quill-feathers, two middle tail-feathers, and outer margin of the four next blue, the feathers furrounding the bill, the quill-feathers, except at the bafe, outer tail-feathers, legs, and claws black; female beneath dirty white; tail flightly cuneated. Native of Madagarcar.
Levcoruxxcos. Body above blackifh, beneath whitifh ; bill, breaft, belly, and rump white. Gmel. Lazius Manillenfis, Briff. Pie-griefcbe de Madayafar, Buff. Longraien, ibid. I'bite-bellied firike.

Inhabits Manilla; length feven inches; wings, tail, legs, and claws black ; tail equal.

Ferrucinels. Body above black-brown; throat and brealt dirty-white; belly ferruginous. Gmel. Fcrruginous forike, Lath.
A native of the Cape of Good Hope; fize the fame as the cinereous fhrike; the bill lead colour; tail dunky brown; legs black.
Taducesis. Body above olive ; chin and breaft cinereous; belly yellewith-brown; tail and legs brown. Gmel. Tabuan forike.

Length eight inches; the bill brown; crown greenifh; wings black on the outer edge. Firft defcribed by Dr. La-
tham, from a fpecimen in the Leverian Mufeum, It inhabits the Friendly illes.
Pactricus. Black; head and neck approaching to grenill ; belly and tail more dukk. Gmel. Pacijo forike, Lath.
Defcribed from an example of the fpecies in the Dankfian collection, found in one of the iflands of the south feas. The bill is dufly ; feathers of the head and neck very narrow; tail three inches long, dunky and even at the end ; toes divided to the bafe, the middle one very long.
Septentrionalis. Bill black; legs lead colour ; body above brown; chin aud brealt cinereou3; belly and vent brownifh. Gmel. Nortbern forike, Lath.
Length eight inches; four middle tail-feathers brown, the reft within white at the tip, and each two inches long; legs flort ; claws flout and brown. Native of North America.
Pheatus. Head black and crelted; body cinereous; throat anci breaft black; wing-coverts barred with white; tail black at the tip. Lath. Ind. Orn. Black capped purike.

Native of Cayenne. Length fix inches. Female without creft; throat and breaft cinereous.

Viribis. Head, wings, and body above dufky green, beneath white; tail black. Gmel. Tcha-chert, Buff. Green Brike.

Size of the laft ; the wings long; two middle tail-feathers dufly-green, the reft black at the outer edge; legs and claws black.

Varius.' Body above cinereous brown; chin and breaft yellow-buff; belly, rump, and vent dirty brownifh-white; intericapulars white; tail and wings brown. Gmel. White Jouldered /brike, Lath.

Deicribed by Pennant as a native of Brafil ; the legs and bill are black ; front and cheeks with paler fpots.

Leucocephalos. White; body above greenifh-black; head, neck, and under parts of the body white. Lath. \&cc. Tcha-chert-bé, Buff, White-beaded Jorike.

Length eight inches. This fecies inhabits Madagafcar.
Dominicanus. Black; belly and rump white. Gmel. Pie-griefche Dominicaine, Sonnerat.

Inhabits the Philippine iflands; exceeds the fparrow in fize; flies fwift, is bold and troublefome to crows. Is by fome prefumed to be a variety of the preceding fpecies.

Panayensis. Bill and legs black; head, throat, breaft, and belly red; crown, wings, and tail brown. Gmel. Panay farike.

Seven inches in length, and inhabits the ifland Panay.
Albus. White ; bill, tail, legs, and greater part of the wings, black. Gmel. IWbite forike.

Inhabits fame place as the former.

- Nevius. Body above black; beneath cinereous; an oblong fpot of white on the wing-coverts. Gmel. Spotted Brike.

Native of Cayenne; the bill ard legs black; tail-feathers white at the tip.

Obscurus. Body above dufky-black, beneath white; over each eye a white line. Gmel. $D_{u j} / y /$ Brike, Lath.

Suppofed to inhabit America; in fize correfponds with L. nævius; the bill is horn-colour ; wings and tail more dufky than the body, and the legs brown.

Fuscus. Above brown, beneath white; lores, tips of the fecondary quill-feathers, and edges of the primary, yellowifh. Gmel. Brown /brike, Lath.

## Bill at the tip, and legs black.

Ruber. Red; wings and tail with ocellar fpots, black at the tips. Gmel. Red lanius, or butcher-bird of Surinam, Bancr. Red Jerik.

Native of Surinam.
Amemeasus. Black; fpot on the firt quill-feathere, checks, and chin white; breatt and belly cincreous. Gmel.

Inhabits North America.
Minor. Cinereous; chin white; breaft and belly rofy ; front, line over the eyes, and tail black. Gmel. Pic.griefche d'Italie, Buff.

Native of Italy, Spain, and Ruffia, and refembles the grey frike.

Melanocephalus. Bill, head, and chin black; body olive above, beneath paler; tail with a broad black band, at the tip yellow. -Gmel. Black-beaded Jorike, Lath.

Length fix inches, the legs dufky; and inhabits the South Sca iflands.
Brachyurus. Head above rufty grey; cye-brows white; a black band from between the eyes to the ears; body above cinereous, grey, beneath yellowifh-white; tail rounded. Pallas. Short-tailed Srike.

Size of the red-backed fhrike; wings blackih ; tail-feathers ten, brown-grey, and, except the middle ones, white at the tip. Native of Hungary.

Boulboul. Black; breaft and belly tinged with cinereous; wings brown, with two white bands. Lath. Ind. Orn. Boulboul Jbrike.

Size of the field-fare; bill and legs yellow. Inhabits India.

Picemicurus. Body above reddifh-grey, beneath yellow-ifh-white, tail long, rounded, and with the rump brighe red; orbits crofled by a black band. Pallas.

Inhabits rocky places on the river Onon; fize of the laft.

Doliatus. Tail rounded; body clofely varied with black and white lines. Linn. Pied fruike.

Native of Cayenne; the length fix inches and a half; bill dufky, claws and legs brown; feather on the hind head long, and when erected form a creit ; wings and tail with tranfverfe white fpots.

Faustus. Grey, beneath ferruginous; a white line between the eyes; tail rounded. Linn. Amœen. Acad.

Size of the field-fare; bill and legs pale; wings rounded; quill-feathers brownifh, grey at the edges, tail brown, and all marked with light brown decuffating lines.

LANKA, in Geography, a pofition of fome importance, referring both to the fcience and hiltory of the Hindoos. It is the generally received opinion, that Lanka is Ceylon; but in a note of the Ayin Acbaree (vol. iii. p. 36, Calcutta ed.) it is afferted, that Lanka is not Ceylon, but a place determined by the interfection of the equator and the meridian of Delhi, anfwering to the fouthern extremity of the Maldevy iflands. "Indeed," the note continues, "there are many reafons for concluding Lanka to have been part of the Taprobane of the ancients, and that Taprobane, or more properly Tapobon, which in Sanfcrit means the wildernefs of prayer, was a very large ifland, including the whole, or the greater part, of the Maldevy iflands, which have fince been deftroyed by inundations. This agrees very well with Ptolemy's defcription, and his ifland of monkies feems to relate to thofe of the Ramayana." See Ramayana and Taprobana.
On this note it is obferved, in the Hindoo Pantheon, p. 328 , whence this article is chiefly taken, that therein is an avowed obfcurity, and an exifting error fomewhere; for that many arguments, if not proofs, may be adduced in fupport of the identity of Lanka and Ceylon, and perhaps Taprobane. Lanka was the theatre of Rama's exploits againft its tyrannical king Ravana, whofe name is indifferently pronounced Ravan, Raban, Rabon, \&c. nor can there be

## LAN

much doubt of the inand that we now call Cerion having formed a part, at any ratc, of that theatre, which might in former times have been of greater extent than that ifliand is at prefent.

It is daid, that in Sanfcrit books Ceylon is called T'apa Rawan; 'l'apa or Tay, in that language, meaning an inand, and it may be indifferently pronounced 'Taporaban, or indeed, in common difcourfe, 'Taproban, or 'Taprobane. Much Atrefs is not perhaps to be laid on cosjectural etymology, but it may be obferved, that many names of places and things on Ceylon, and in its neighbourhood, correfpond with the nomenclature of the Ramayan. In the fifth volume of the Afiatic Refearches is ant intercfling account by the Hon. Mr. Duncan, of that extraordinary traveller Purana-Puri, who notices on Ceylon a lake called the "tank of Ravan or Raban (the $b$ and $v$ being pronounced indifferently in various parts of India), from whom this tapu, or ifland, may probably have received its ancient appellation of Taprobane (i.e. the ine of Raban) : here alfo is a place called Sita Koond, or the pool of Sita, where Rama is related to have left his wife Sita, on the occafion of the war with the ravifher Ravan." (See Sita.) In the poetical hyperbole of the Hindoos, the tears fhed by Sita, in her lamentation for her lord's abfence and her own captivity, are faid to form this koonda, or pool, lill called by her name.

Between Ceylon and the continent is 3 feries of rocks, fome of which appear above water, admitting a paffage only in fine weather to veffels of fmall burden. This in our maps is called Adam's bridge, the Romifh miffonaries having placed the garden of Eden in Ceylon, and fancied this bridge his only mode of exit. In Hindoo writings this is called Rama's bridge, and in the Hindoo Pantheon a plate is given of the building of it by Rama's monkey-general Hanuman, and his Simian affociates. The confipicuous part acted by thofe animals, in the wars of the Ramayan, reminds us ftrongly of Ptolemy's ifland of monkies, and offers another niark of identity. On the continent of India, Ceylon is to this day popularly believed to be inhabited principally by monkies, lions, and monters; one of its names, Singala dwipa, whence Seilan diva, Selendeb, Ceylon, \&c. means the country of lions. See Cexlon.

In Hamilton's account of the Eaft Indies (vol. i. p. If2.) a map of the peninfula has one of the Maldevy iflands marked Hunnamandow, evidently the fame with Hanuman devy, as it would be more correctly pronounced, meaning the ifland of Hanuman; and this name occurving confpicuoufly on thofe iflands gives room for imagining a connection between them and the hiftory of Rama, Ravana, Lanka, \&c. that would be farther developed if we had more knowledge of the iflands in queftion; a knowledge that might be abundantly obtained by a permitted admiffion to the records at the India Houfe. Hamilton calls the fouthern extremity of the peninfula Ram's point; this, in our more modern maps, is named Cape Comorin, and it has derived this name, which is cited by Ptolemy, from a celebrated temple of the goddefs Ifa, or Devi, in her character of Kumari, or the Virgin. Thefe are names of Parijati, which fee. Rami is another of her names, and the temple, which is generally imagined to be in honour of Rama, the avatara or incarnation of Vifhnu, may perhaps originally have been dedicated to Rami, whatever rites may now obtain there: a point that we are uninformed on; and fhall offer no more thereon in this place than the remark that the rites of the virgin goddefs Kumari, (whofe magnificent temple under the name of Ramifwara, or Ramiferam, at the fouthern extremity of the promontory of India, is fill a much venerated fhrine, and of great refort by pilgrims, ) have a ftriking analogy with thofe' of the Taurican

Diana, a virgin goddefs alfo, whofe temple fimilarly occupied the fouthern promontory of the Taurican Cherfonefus. See Ramiand Ramisivara.

Thic firlt meridian of the Hindoo aftronomers paffed through Uja ini (Ogein, which fee) and Lanka; the latter cannot therefore 'o Ceylon if confined to its prefent extent, for Oojein lies in aboct 76, and the wefternmont part of Ceylon in $80^{\circ}$ caft of Greemich. This difficulty feems reconcileable only by allowing what is afferted in India, that Ceytion was formerly of greater extent than at prefent, and it is faid, that appearances between that ifland and the Maldevys, or Maldivas, as well as between it and the continent, juftify the belief of their having once joined. See Af. Ref. vol. ini. p. 44 , alfo Ceylon and Maldives in this work.

LANKAYT, a fmall ifland near the W. coaft of Celebes. S. lat. $+57^{\prime}$. E. long. $119^{\circ} 12^{\prime}$.

LANKE', a lake of Thibet, about 45 miles in circumference; 40 miles N. of Darmadijira.

LANMEUR, a town of France, in the department of Finitterre, and chief place of a canton, in the ditrict of Morlaix ; 6 miles N.E. of Morlaix. The place contains 2389 , and the canton 13,170 inhabitants, on a territory of $182 \frac{1}{2}$ kiliometres, in 8 communes.
LANNARIUS, in Ornithology, the name of a bird of the long-winged hawk kind; the Falco lannarius of Linnæus, called in Englifh the lanner, and the male lannareto See Falco lanarius.

LANNAS, in Geography, a town of Sweden, in the province of Angermannland; 35 miles N.W. of Hernofand.

LANNIERS, or Laniards, in a Slip, are fmall ropes reeved into the dead-men's-eyes of all the fhrouds and chains. Their ufe is to flacken or fet taught the flrouds. The ftays alfo of all malts are fet taught by lanniers. That rope, which fattens the ftopper of the halliards to them, is called alfo a lannier: and the term is generally applied to any flhort piece of cord or line, faftened to feveral machines in a fhip, and ferving to fecure them in a particular place, or to manage them more conveniently; fuch are the laniards of the gun-ports, the laniard of the buoy, of the cat-hook, \&c.
LANNION, in Geografby, a town of France, and chief place of a diftrict, in the department of the Northern Coafts. The place contains 3132 , and the canton 14,988 inhabitants, on a territory of 105 kiliometres, in 9 conmunes. N. lat. $48^{\circ} 44^{\prime}$. W. long. $3^{\circ} 22^{\prime}$.
LANNOY, a town of France, in the department of the North, and chief place of a canton, in the diftrict of Lille ; 6 miles E.N.E. of Lille. The place contains 923, and the canton 13,033 inhabitants, on a territory of $97 \frac{1}{2}$ kiliometres, in 16 communes.
LANNSTROFF, a town of France, in the department of the Mofelle, and chief place of a canton, in the diftrict of Thionville. The place contains 338 , and the canton 13,615 inhabitants, on a territory of $307 \frac{1}{2}$ kiliometres, in 44 communes.

LANO, a lake of the ifland Mindanao, from 15 to 20 miles broad, and about 60 miles round. See Mindanao.
LANOUAILLE, a town of France, in the department of the Dordogne, and chief place of a canton, in the diftrict of Nontron. The place contains $45^{8}$, and the canton 9581 inhabitants, on a territury of 235 kiliometres, in 10 communes.
LANPENCKEN, a town of Pruffia, in the palatinate of Culm; 14 miles N. of Strafburg.

LANSARD, a town of Perfia, in the province of Mazanideran,
zanderan, on the coaf of the Cafpian fea; romiles W . of Fehrabad.

LANSINBURG, New City, a town of America, in the townflip of Troy, county of Reuflalar, Now York, pleafantly fituated on the E. bank of Hudfon's river, oppofite to one of the mouths of the Mobawk; containing about 250 houfes, a brick church for the juint ufe of the Dutchand Pefbyterians, a court-houfe, grol, and an academy, incorporated in 1796. 'The library of this town was incorporated in $1775 ; 9$ miles N. of Albany. N. lat. $42^{\prime \prime}$ 46. W. long $73{ }^{\circ} 34^{\prime}$.

LANS-LE-BOURG, a town of France, in the department of Mont Blanc, and chief place of a canton, in the dif. trict of St. Jean-de-Maurienne. The place contains 874, and the canton 4675 inhabitants, on a territory of $742 \frac{1}{2}$ kiliometres, in 7 communes.

LANSMANS, a town of Norway; 116 miles $N$. of Bergen.
LANSPESSADE, in Military Afairs. See Avspessade.

LANSQUENET is the name of a game at cards.
LANTA, in Geography, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the diftrict of Villefranche; 9 miles E. of Touloufe. The place contains 1455 , and the canton 5669 inhabitants, on a territory of $115 \frac{1}{2}$ Isilismetres, in 16 communes.

LANTAB-LEPTEN, a fmall ifland on the coaft of China, near the harbour of Macao.
LANTANA, in Botany, luppofed to be derived from Lentus, flexible, was in that fenfe originally applied to the Pliant Mealy Tree, Viburnum Lantana. It is now ufed generically for a fet of plants, rather agreeing with that in general afpect, than in this peculiar quality--Linn. Gen. 316. Sclreb. 413 Willd. Sp. Pl. v. 3.315. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 1. v. 2. 350 . Juff. rog. Lamarck Illuttr. t. 540. Gærtn. t. 5 5. (Camara; Plum. Gen. 31. t. 2.)-Clafs and order, Didynamia Angiofpermia. Nat. Ord. Perfonata, Linn. Vilices, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, very fhort, cohering, tubular, with four flight teeth. Cor. of one petal, nearly regular; tube cylindrical, flenfder, longer than the calyx, fomewhat oblique; limb flat, unequally and bluntly four-cleft. Stam. Filaments four, extremely minute, fituated in the middle of the tube, flender, two of them a little above the relt; anthers roundifh. Pift. Germen fuperior, roundifh; ftyle thread-fhaped, fhort ; ftigma bent backward like a hook, pointed downswards, and attached obliquely, as it were, to the top of the ftyle. Peric. Drupa roundifh, of one celi. Secd. Nut roundifh, fomewhat pyramidal, of three cells, the lowermof of which is barren; kernels folitary, oblong.

Obf. Linnzus obferves that the effential character confits in the figure of the Atigma. His L. Africana is now feparated from the relt; and called Spielmannia. In the genuine Lantans there is a many-leaved involucrum, according to Linnæus, (rather to be termed a number of bracteas,) and the common receptacle of the fructification is oblong, bearing many crowded feffile flowers, moftly very unequal.

Eff. Ch. Calyx obfcurely four-toothed. Limb of the corolla unequally four-cleft, flat, with an open mouth. Stigma bent back like ahook. Drupa with a fmooth nut of two cells.

The fpecies in Willdenow are 15, but profeffor Martyn reckons up 19. Some uncertainty attends a few, even of thofe defined by Linnrus, at lealt he fufpected his trifolia might not be diftinct from annua, but in this he feems to lave been miftaken. Medicus, indeed, who took fome pains
with this genm, anpears to lave diefuiberl antra for trif la, which Reichard eorr cted. 'The L. falovifolian of Limaima is properly referred in !'ort. Kew, to Buddiala.

Good examples of the genas are,
L. aculeata. Prickly-flalked Lantana,-Lim. Sp. PI. 874. Curt. Mag. t. 96.-Leaves ovate, fomewhat hisart. maped, downy underneath. Stem prickiy. Hencteas hanceolate, with a broad bafe.-Native of the Wett Indies, where it is vulgulariy called Wild Suge. It is one of the mott commonly cultiatied in our thoves, being really propacated by cuttings, and flowerny alm alt all the year. The Jenz is fhrubby, more or lefs rough, with projecting prickl.o. Leaves Italked, ferrated, pointed, rou-him, atrout two inches long. Flowers bright yellow at firlt, then orange, nuticrous, in flattencd heads, on limple, folitary, axillary ttalks.
L. Camara. Various-coloured Lantana.-Linn. Sp. Pl. 874. (Camara melifix-folio, flore variabili; Dill. Elth. 65 . t. j6. f. 65.)-Leaves ovate, rough on both fides. Stem unarmed. Bracteas ovate, fmall, downy.-Native of South America; an old inhabitant of our floves. The fozeers arc changeable in colour, being, at firt opening, yellow, then orange, finally fcarlet; which becomes duil or brownih as they fade, not purple, as in fome other fuccies.-Several of this genus are defcribed under the Brafilian name of Camara, in Pifo and Marcgrave. The word is now adopted by the Portuguefe, as it feems, in a medical fenfi, fuggeted by the colour of the flowers, for the dyfentery.
L. annua. Annual Lantana,-Linn. Sp. Pl. 874. Curt. Mag. t. 1022.-Leaves ovate, downy beneath. Stem unarmed, hairy. Spikes oblong. Bracteas ovate, pointed.Native of the Weft India iflands, as well as of the Spanifh Main; rarely preferved long in our ftoves, to which it has from time to time been introduced, becaufe the feeds do not ripen well here, and the plant, though flrubby in habit, is properly aunual. The leages are broad, almon heart-fhaped. Flowers in oblong, ftalked, axillary fpikes, very beautiful. When cultivated in an airy light \{ove, being bright reddifhpurple, or pink, with a white ring and yellow eye.
L. trifolia of Linnaus differs from the laft very widely in appearance, and has the liaves growing three or four together, ovate, much more finely crenate; the heads of flowers rounder; brateas larger, and mare obtufe.-Plumier's Icones, t. 70, quoted for this, is not at all like the Linnæan fpecimen, but appears to be merely a three-leaved variety of the annua.
L. nivea. Venten. Malmaif. t. S, appears to us a whiteflowered variety of L. aculeata; at lealt we can difcover no fpecific diftinction, unlefs the flower-ftalks, growing in pairs at each leaf, fhould prove to be fuch. This is a native of the Weft Indies, and was fent to the garden of Malmaifon by Meffrs. Lee and Kennedy. The leaves are of a full bright green; flowers fnow-white, copious about the ends of the branches.

Jacquin has a few new or doubtful fpecies in his Hortus. Schoenbrunenfis; amongft others
L. luvandulacea, t. 361 . Willd. n. 1 I.. White fmall. flowered Lantana-Leaves elliptic-lanceolate, ferrated, downy beneath. Stem roundifh. Heads of flowers cylin. drical, fhorter than the leaves. Bracteas nearly orbicular. -Willdenow, who firft defcribed this, and Jacquin, had it in their gardens, without knowing whence it came. We have a native fpecimen, gathered by Dombey, in moift fituations at Lima. It is $\beta$ brubby, with round, flender, roughih branches. Leaves oppofite, ftalked, an inch long or more, rugofe; rough above ; downy, with numerous, branching, prominent ribs and veins beneath; the margin fharply ferrated. Flower-falks axillary, various in length, but always.

## L A N

much morter than the leaves. Spikes oblong, with broad, roundifh, pointed bradcas; the flowors white, unequally five-lobed, turning reddifh-brown in decay. The dried leaves are aromatic, with fomewhat of the flavour of fage. -This fecies is properly placed nest to L. odorata.

Lastiks, in Gardening, comprehends plants of the flububy, exotic, green-houfe, and fove kinds, of which the fpecies cultivated are the various-flowered lantana, L. milta; the various-coloured lantana, L. camara; the round-leaved lantana; L. involucrata; baum-leaved lantana, L. meliffefolia; the prickly lantana, L. aculeata; the golden-flowered lantana, L. aurea.

Method of Culture-Thefe plants are capable of being raifed by feeds and cuttings of the young branches.

With regard to the feeds, they fhould be fown in pots of light mould in the carly fpring, plunging them in a bark hot-bed. When the plants have attained fome inches growth, they fhould be removed into feparate pots of a fmall fize, and be replunged in the bark-bed, due fhade and air being given. The plants fhould afterwards, when they have acquired frength, be removed into an airy glafs-cafe, or dry Atove, where they may have a large thare of air in warm weather, but be protected from the cold. This is neceflary for the young plants, which flould not the firlt year be expofed to the open air, but afterwards they may be placed abroad in the warmelt part of the fummer, and in winter be placed upon ftands in the dry flove, where they will continue long in flower, and many of the forts ripen their fceds. In winter they fhould be fearingly watered, as much moilture rots their roots.

And the cuttings fhould be planted in pots in the fpring and fummer months, as in May and July, and be plunged in a moderate hot-bed, due fhade being given. They foon take root, and fhould afterwards be removed into feparate pots filleci with light carth, and managed in the fame manner as thofe raifed from feed.

Thefe plants afford ornament and variety among collections of fove and green-houfe plants.

LANTARGUR, in Geograpby, a town of Lamjungh ; $4^{2}$ miles N. of Gorkah. N. lat. $295^{\prime} \cdot$ E. long. $S_{4}{ }^{\prime}$ I $S^{\prime}$.

Lantchang. See Lanjan.
LANTER-LOO, or Loo, is the name of a common -game at cards.

LANTERN, or LANThors, a cover for a luminary, made of fome traniparent matter; ferving to tranfinit the light, and, at the fame time, to fkreen it from the wind and rain.

The word is derived from the French lanterne; and that from the Latin laterna, of lateo, I am bidden; co quod butcen balet interius claufam, becaufe the light is hidden within, fay Ifidore and Lambin. But according to Pezron, latirna comes from the Celtic latern, and according to Salmafius lantern comes from lato, of firo, becaufe it bears a Iamp or a light.

Epictetus's lantern is faid to have been fold for three thoufand drachmas; that of Diogencs was hield in great veneration among the ancients; and that of Judas is ftill preferved in the treafury of St. Denys, as a very carious piece of antiquity.

Lanterns are made of glafs, horn, paper, \&c. Formerly they were made of the horn of a wild bull, called urus; which, when cut into thin laminx, Pliny tells us, was very tranfparent. Thofe of horn were firit introduced into England by king Alfred, about the year 887 , in order to preferve his candle time-meafurers from the wind. See Lens. And Hift. Com. vol. i. p. 45 .

Lasterx, Dark, is a lantern with only one opening or

## LA N

light, which, too, may be clofed up when the light is to be entirely hid: and may be prefented to the perfon one would fee without being perceived one's felf.

The ancients had their dark lanterns, but they differed from our's: they were covered with four fkins, one on each fide, or light, three of which were black, and only the fourth traniparent. Cafaubon, who gives us the defcription, took it from a manufrript of Julius Frontinus. There were principally ufed in their armies, when they were to march privately off from their enemies in the night-time.

Lanterns are ufed at fieges in the night-time, upon the batteries; but thefe mult be blind or dark lanterns. There is always great provifion of them in all ftore-houfes.

Lanterns for fhips are made of tin and glafs, to light thofe parts of a fhip where naked candles would be dangerous, fuch as for lighting the magazine and ftore rooms. Thofe ufed at the ftern are called poop-lanterns, and thofe aloft toplanterns.

Lanteras, Fcaft of, in China, is a celebrated fealt held on the fifteenth day of the firft month; and is fo called from the great number of lanterns hung out of the houfes and in the flreets; infomuch that it rather appears a fit of madnefs than of feafting. On this day are expofed lanterns of all prices, fome of which are faid to coft two thoufand crowns. Some of their grandees retrench fomewhat every day out of their table, out of their drefs, equipage, \&c. to appear the more magnificent in lanterns. They are adorned wish gilding, fculpture, painting, japanning, \&c. and as to their lize, it is extravagant; fome are from twentyfive to thirty feet diameter; they reprefent halls and chambers, and two or three fuch machines together would make handfome houfes; fo that in China they are able to eat, lodge, receive vifits, have balls, and act plays, in a lantern.

To illumine them, they fhould have bonfires; but as that would be inconvenient, they content themfelves with lighting up in them a great number of torches or lamps, which at a diftance have a beautiful effect. In thefe they exhibit various kinds of fhows to divert the people.

Befides thefe enormous lanterns, there is a multitude of other fmaller : thefe ufually confit of fix faces or lights, each about four feet high and one and a half broad, framed in wood finely gilt and adorned; over thefe they ftretch a fine tranfparent filk, curioufly painted with flowers, trees, and fometimes human figures : the painting is very extraordinary, and the colours extremely bright; and when their torches are lighted, they appear highly beautiful and furprizing.

Lantern, or Lanthorn, in Arcbitecture, a turret raifed above the roof with windows rourd the fides, in order to light the apartment below. Lanterns are much more convenient than fkylights; as the furface of the glafs ftands vertical, they are not fo liable to be broken, nor fo fubject to the rattling noife of heavy rains and hail.

LhNTERN is alfo ufed for a fquare cage of timber, with glafs in it, placed over the ridge of a corridor, or a gallery between two rows of fhops to illuminate them.

Lantern, Magic, in Optics, the name of a machine, which, in the dark, reprefents various images and fpectres on a wall, or other white furface, fo odd and furprizing, that thofe who are not in the fecret think them the effect of magic. See Magic.

Linters-Fijb, in Ichthyology, the Englifh name of a fifh of the foal-kind, but fmaller and fmoother to the touch, called in Latin amog lof Jus .

Lantern-Fly, in Natural Hifory, the name of a very fingular kind of infect produced in the Weft Indies, and
carrying a ftrong light with it in the night. The Arueture of the trunk in this infect is of the fame kind with that of the cicada; and it wants the power of making the noife for which the cicada is fo famous; it belongs, according to M. Reaumur's diltinctions, to that fpecies of infect called the procizale, or procicida.

The glow-worm and the luminous beetles, with all the other luminous infects we are acquainted with in this part of the world, diffufe their light from a part which is near the extremity of the body, and under the belly, but the lanternAy gives it from its head. It differs alfo greatly in the degree of light; for this, in all the infects we are acquainted with, is wery feeble; whereas in this fly it is fo ftrong, that Mrs. Merian, who is the firt that well defcribed it, fays fhe could read a fmall print in a dark night by the light that one of them gave. The head of this creature, ftrictly fpeaking, is very flort, not exceeding the length of one of the rings of the body, if it be meafured from its joining with the corcelet to its joining with the lantern, but if that part be acecounted a portion of the head, then the head is equal in length to the whole body. This lantern is wider than it is deep, or thick, and has near its origin a large protuberance, which gives it a bunched or humped look. There are feveral tubercles and lines on it, of a reddifl colour. The ground colour is an olive brown, and underneath it has one large rib running all the way along it, from end to end, and dividing it into two, and by the fides of that there are fome others. Thefe are all reddifh, and thofe neareft the edges have fmall rows of fpines running along them. Over each of the eyes there is a round granulated prominence, which feems to have been a collection of fmaller eyes: and if fo, the animal is fupplied with the organs of vifion in a different manner from all other known creatures. But there requires an examination of the creature on the fpot, and while alive, in order to find out this. The upper pair of wings are not perfectly tranfparent, they are dotted with white in fome places, and are variegated near their origin with feveral blackifh fpots. The under pair are more tranfparent than the upper; they are much fhorter, and are broader than the others: thefe have each a large and beautiful reund fpot near the extremity, refembling that on the wing of the peacockbutterfly. The colours of the circles of thefe eyes are brown and olive ; the laft colour very bright and clear, the other very dufky and oblcure. The fpots are fo large, that they appear very beautiful. Reaumur's Hilt. Inf. vol. ix. p. 247 .

LANTERNISTS, a name aflumed by the academicians of Thouloufe.

LANTHONY, in Geography, a hamlet in the parih of Cwmyoy, and hundred of Abergavenny, county of Monmouth, England, is noted for the fine and picturefque ruins of its abbey-church. Thefe are feated in a narrow, deep valley, called "The Vale of Euras." The furrounding hills, called Hatteral, are lofty and grand, and from their fteep acclivities are almoft impaffable for travellers. In a fequeftered dale among thefe hills or mountains, Hugh Lacy founded a priory of canons-regular of the order of St . Auguftine, about the year 1108 . A very particular hiftory and defcription of this abbey, and the furrounding country, with feveral prints, are to be found in Coxe's "Hiftorical Tour in Monmouthhire," 4to. 1801.
LANTIGNANO, a town of Etruria ; 13 miles S. of Pifa.
I.ANTO, a fmall ifland in the Baltic, between the ifland of Aland and the coaft of Finland, N. lat. $10^{\circ} 25^{\prime \prime}$. E. long. $20^{\circ} 36^{\prime}$.

Vol. XX.

LANTOOR, or BANDA, the chief ifland amang thole called loanda illands in the Ealt Indian fea. See Basiba.

LAN-T'SAN, a river of Alia, which rifes in the N. part of the Chinefe province of Yun-nan, on the borders of Thiibet, traverfes the province from N . to S ., changing its name to Koll-long ; enters the kingdom of Laos, affuming the name of Mecon, and afterwards difeharges itfelf into the Ealt Indian fea.

LANUGinOUS. See Lanigerous.
LANUGO, in Botany, down; that foft, hairy woolly covering, which grows on leaves, ftalks, or fruits, of divers plants.

Such is that found on the leaves of the rofe-campion, and on the fruit of the peach-tree.
LANVOLLON, in Geography, a town of France, in the department of the North Coalts, and chief place of a canton, in the diftrict of St. Brieuc ; II miles N.IV. of St. Brieuc. The place contains 1123 , and the canton 15,296 inhabitants, on a territory of $147 \frac{1}{2}$ kiliometres, in 12 communes.

LANUVIUM, in Ancient Geography, a town of Latium, in Italy, S.E. of Rome, and S.E. of Alba, fituated on the brow of a mountain near the Appian way. Milo, who killed Clodius, was born in this town. Here was a temple of Juno, worfhipped under the three names of Sofpita, Moneta, and Regina.

LANYARDS, or Laniards, on Ship-board. Sce Lanniers.

LANZA, in Geography, a town of Spain, in Navarre; 5 miles N. of Pamplona.

LANZETTI, in Biography, an eminent performer on the violoncello, during the early part of the laft century. He was in England about the year 1740; but returned to Bologna, the place of his nativity, where he ended his days.
LANZO, in Geography, a town of France, in the department of the Po, on the Stura; II miles N.W. of Turin.

LANZONI, Josepir, in Biography, a phyfician, was born at Ferrara on the 26th of OCtober 1663. From his early childhood he exhibited a ftrong inclination for litera~ ture, which his parents indulged, by obtaining for him the beft mafters. He diftinguifhed himfelf particularly in the fchools of philofophy and of medicine, and graduated in both thefe fciences in the year 1683. In the following year, at the age of 21, he was appointed ordinary profeffor, and difplayed talents which did honour to the univerfity of Ferrara, during the long period in which he filled that office. He died in February $\mathbf{1}_{73}$, at the age of 66.
Lanzoni acquired a high reputation by the fuccefs of his practice, and obtained the confidence and efteem of many illuttrious perfonages. His attachment to ftudy increafed with his years; and every moment, in which he was not em. ployed in the duties of his profeflion, was devoted to literature, philofophy, or antiquarian refearch. His character as a phyfician and philofopher, indeed, ranked fo high, that if any queftion upon thefe fubjects was agitated in Italy, the decifion was commonly referred to him. He was diftin. guifhed likewife by his genius in Latin and Italian poetry ; and he was the reftorer and fecretary of the academy of Ferrara, and a member of many of the learned focieties of his time. He left a confiderable number of works, both publifhed and in manufcript, in the execution of which he has been reproached with careleffnefs and incorreanefs. It will be fufficient to ftate, that a collection of his works, as well of thofe publifhed by himfelf as of his manufcripts, wa3
printed at Laufanne, in 1738 , in 3 volso 4 to., with an account of his life, under the title of "Jofephit Lanzoni, Philofophix et Medicine Doctoris, in Patria Univerfitate Lectoris primarii, \&cc. Opera omnia Medico-phylica et Philologica." Eloy. Diet. Hift.

LAO, in Geography, a town of the inland of Cuba; 25 miles W. of Havanna.
LAOCOON, in the Hifory of the Aris, is a celebrated monument of Greek fculpture, executed in marble by Polydorus, Athenodorus, and Agefander, the three fanous artifts of Rhodes. This remain of antiquity was found at Rome, in the ruins of the palace of Titus, in the beginning of the fixteenth century, under the pontificate of Julius II., and fince depofited in the Farnefe palace. Laocoon, the prieft of Apollo and Neptune, is here reprefented with his two fons, with two hideous ferpents clinging round his body, gnawing it, and injecting their poifon. Virgil has given us the following defcription of the fact :

> "Serpens amplexus uterque
> Implicat \& miferos norfu depafcitur artus: Corripiunt, firifque lizant ingentibus, \& jam Bic medium amplexit, bis collo fquamea circum Terga dati, fuperant capite, \& cervicibus altis."

This ftatue exhibits the moft aftonifhing dignity and tranquillity of mind, in the midat of the mok excruciating torments. Pliny fays of it, that it is "opus omnibus, picture \& Ratuarix artis, preferendum " Lib. xxxvi. c. 5 .

LAODICEA, in Ancient Geography, a town of Alia, in Caria, called "Laodicea ad Lycum," not that it was near this river, which paffed to the weft of it, and received, to the north of Laodicea, the river Caprus, which traverfed the town, arid the Afopus, which was eaft of it. A litle to the fouth of Laodicea was Hierapolis. This town was more anciently called Diofpolis, and afterwards Rhaas. It was reeeftablifhed by Antiochus, who gave it the name of his wife; and it became one of the molt confiderable and rich zowns of Afia Minor.
Laonicea Cabiofa, a town of Afia, in Syria, fituated eaftward near mountains, weft of Emefa and the river Orontes. It was favoured by the emperor Severus, on account of its attachment to the interelts of the empire. By way of diftinction, it was called "Laodicea ad Libanum."

Laonicea ad Mare, Latikea, a maritime town of Syria, fituated on an eminence, near the fea-coaft. Strabo fays, that its environs furnifhed abundance of wine. In its prefent ruins may be feen columns of porphyry and granite, an aqueduct, and a triumphal arch, fupported by columns of the Corinthian order. About a fladium welt of this town are the ruins of a fine port, artificially conftructed in the form of an amphitheatre, and capable of containing a confiderable fleet.

Latodicea Combufla, a town of Afia, in Lycaonia, ealt of Philomelium; fuppofed to have derived its name from traces of ancient volcanos.
Laodicea, a town of Afia, on the confines of Media and Perfia Propria.-Alfo, a town of Mefopotamia, according to Pliny; being one of the fix towns built by Seleucus under this name.-Aifo, a town of the Pcloponnefus, in the Megrapolitide, according to Polybius and Thucydides; the fame with the Ladoncte of Paufanias.

LAO-KUN-TIM, in Geggraphy, a town of Clinefe Tartary ; 50 miles S.W. of Ning-yuen-tcheou.

LAON, a town of France, and chief place of a diftrict, in the department of the Aifne; and before the revolution, the eapital of a fmall country called Laonnois, and the fee
of a bifhop, who was a duke, and the fecond peer of France, The place contains 6691 , and the canton 14.958 inhabitants, on a territory of 215 kiliometres, in 27 communes. N. lat. $49^{\prime} 34^{\prime}$. E. long. $3^{\prime} 42^{\prime}$.

LAOS, in Ancient Geography, a town of Italy, in Lucania, weft of Brutium, and near it. It was fituated on a fmall gulf, diftant 400 ftadia from the town of Hyole. It was founded by a colony of Sybarites.

Laos, in Geography, a country of Afia, bounded on the north by the Chincle province of Yun-nan, on the eaft by I'onquin, on the fouth by Cambodia, and on the welt by Siam and Ava. Kxempfer reprefents it as a powerful ftate, furrounded by forefts and deferts, and of difficult accefs by water, becaufe the river is full of rocks and cataracts. The foil is reprefented as fertile in rice, and the merchants of Cambodia were furnifhed from hence with the beft benjoin and lacca. Exquifite mulk is alfo obtained from Laos, with fome gold and rubies; and the rivers fupply the frefh water mya, which yields pearls. The religion and manners of the people refemble thofe of Siam; but in perfonal appearance they are like the fouthern Chinefe. In Kæmpfer's time, the chief towns were Landjan, or Lantchang, and Tfiamaja, whence the people take the name of Landjanefe, to which, in modern maps, is added Sandepora. Duhalde has given fome account of this country, the capital of which is denominated Mohang.Lang by the Chinefe. (See Mo-ilang-Lavg.) Laos, in his time, was tributary to Ava; but its chief trade was with the Chinefe. It is faid to have mines of gold, filver, and copper; near the capital is one mine of rubies; and its emeralds are of large fize. The articles exported are tin and fulphur, (perlaps cinnabar or realgar,) cotton, tea, and fapan or Drafil wood. The chief river is denominated Meinam Kong, which paffes through Cambodia; and its different branches bear different appellations. This grand ftream, in Mr. Dalrymple's map of exterior India, is called the Kion-Long, or MaykaungMr. Arrowfmith derives it from the Tibetian Alps, where it is called the Satchou, and by D'Anville the Lantiankiang. Of this country Turpin, cited by Pinkerton, (Geog. vol. ii.) has given the moft recent account. The name Laos, he fays, deriotes 1000 elephants, with which animals the country abounds. The climate is fo temperate, and the air fo pure, that men are faid to retain their health and vigour, in fome inftances, to the age of 100 years The flat part of the country refembles Siam, but the foil on the eaft bank of the river is more fertile than that on the welt. The rice is preferred to that of other oriental countries. The ivory is beautiful, but the horn of the rhinoceros is particularly efteemed from a fuperflitious notion, that the poffeflor, who keeps it, infures his felicity. The fields, abounding with flowers, afford food for numerous: fwarms of bees, which fupply excellent wax and honey. In the mountains are found rich mines of tin, iron, and lead; but gold and filver are explored in the fands of the rivers. Mufk, fays this author, is not a product of the country. Before the irruption of the Tartars, the Chinefe carried on a confiderable commerce with Laos; exchanging their velvets, filks, cottons, and porcelain, for ivory, opium, and medicinal plants. In the province of Laos, whence the kingdom derives its name, is a deep mine, which furnifhes rubies ard beautiful emeralds, one of which, in the royak treafury, is faid to be as large as a common orange. The inhabitants of this kingdom are celebrated for their honelty and fidelity; and fo anxious are they to maintain their reputation in this refpect, that if a traveller be robbed, the neareft town or village is obliged to indemnify him. At the
fame
fame time, they are indolent and luxurious, and addicted to the itudy and practice of magic. The army of Laos is eltimated by 'T'urpin at 500,000 combatants; but he adds a circumftance which fomewhat affects his credrbility, that a numerous army might be raifed of men who have lived a century. The people of this country are not very diftinguifhed for their fobriety and temperance, as they eat daily tour repaits of rice, fifh, and the flefh of the buffalo; the buffalo and venifon being common in their markets. Marriages are eafly contracted, and no lefs cafily diffolved; and the rich entertain many concubines. A funeral refembles a feftival; and a fum of money is depofited in the tomb, which is circulated, after a certain period, by the priets. The commerce of this country was chiefly carried on in former times with Siam; but after the irruption of the Birmas, it paffed to Pegu; at a later period, the trade of Laos has been transferred to Cambodia. The inhabitants of Laos boalt that the Siamefe borrowed the art of writing on palmtree leaves from them. The tongue and characters are the fame; but it is faid, that the Laofian cannot pronounce the letters $L$ and $R$.

The ancient worfhip of thefe people is faid to have been directed to one God, the creator of all, who was only to be pleafed by the exercife of virtue, and not by facrifices, ceremonies, and the obfervance of certain days. But the purity of their faith has been corrupted by their intercourfe with the Chinefe. They helieve in regular renovations of the univerfe; and that our earth has attained the age of 28,00p years. Polygamy is one of the promifed joys of paradife, and the women are affured, that if they lead a virtuous life, they thall be changed into men. The priefts take comfort, under the privations of celibacy, from a perfuafion which they indulge, that in another world they fhall be able, by the privilege of their order, to create females at their pleafure. Some of their ceremonies, like thofe of Thibet, feem to have been derived from the Neftorian Chriftians. To the rich they fell difpenfations and pardons; while the poor alone are condemned to perpetual mifery.

The king of Laos is faid to be an abfolute, independent prince, and to acknowledge no fuperior, either in temporal or fpiritual concerns. In him is vefted the whole property of lands, and he difpofes at pleafure the effects of his fubjects; nor can any family in the kingdom inherit or poffefs any thing left them by will.
L.AOUR, a town of Hindooftan, in Bengal ; 40 miles N.W. of Silhet. N. lat. $25^{\circ} 7^{\prime}$. E. long. $9 \mathrm{I}^{\prime} 20^{\prime}$.

LAPA, one of the Sooloo iflands. N. lat. $5^{2} 25^{\prime}$. E. long. $120^{\circ} 42^{\prime}$ - Alfo, a town of Circaffia, on the Cuban. N. lat. $44^{\circ} 50^{\prime}$. E. long. $58^{\circ} 34^{\prime}$.

LAPACTICS, from $\lambda x \pi \alpha \zeta_{\omega}$, I evacuate, a term ufed by the old writers in medicine to exprefs fuch things as purged by ftool, or at leaft gently loofened the belly. It was fometimes applied to the cathartic medicines, and fometimes to thofe foods which were of this tendency.

LA PALISSE, in Geography. See La Palisse.
LAPAROCELE, (from lapara, the flanks, and $x, \lambda n$, a tumour, ) a term, in Surgery, denoting a fwelling, or hernia, at the fide of the belly.

LAPARY, in Geography, a town of Hindooftan, in Allahabad; 7 miles $N$. of Jiobpour.

LAPA'TA, a chain of mountains in Africa, called the "Backbone of the World," extending from N. to S. about 600 miles. S. lat. $12^{\circ} 30^{\prime}$ to $20^{\circ}$. E. long. $27^{\circ}$ to $33^{\circ}$.

LAPATHIOS, in Ancient Geograply, a town of the ifland of Crete, on the northern coalt.

LAPATHUM, in Botany, $2 . s$ _ntoy of the Greeks, from $\lambda 2 \pi x S^{3}$, or $2 x \pi x i x$, to evacuate, alluding to its medical
qualitics; a general name for various plants, moftly of the Dock kiud, belonging to the Rumex, Rheum, Chenopodiun, or Spinachian of Sammus.

LAPATHUS, Lapito, in Ancicne Geograploy, a town on the $N$. coalt of the ifland of Cyprus, at the bottom of a fimall gulf, formed to the N. WV. by the promontory called Cron mon. It was founded by the Licedxmonians as a place of arms, and a port.

La PAZ, in Gcography. See La Paz.
1.AP-DOG, called alio melitaus, or fotor, and by Dr. Caius, in his Syftem of Britifh Dogs, the fpaniel gentle or comforter, is a fpecies of the mott generous kiud of dogs. Sce 1)og.

Mr. Pennant obferves, that the Maltefe little dogs were as much efteemed by the finc ladies of paft times as thole of Bologna are among the moderns. Old Hollinghed is ridiculoully fevere on the fair of his days for their excelive paffion for thefe little anmals; which is fefficient to prove it was in his time, viz. in the rejgn of queen Elizabeth, a novelty.

LAPEYROUSIA, in Botany, received its name from the Abbe Pourret of Narbonne, in honour of M. Picot Lapeyroufe, author of a fplendid botanical book on the genus Saxifraga, and who has paid great attention to the natural hitory of the Pyrenées. Thunberg bas applied the fame name to a Cape plant, Ofmites calycina, Limn. Suppl. 380 , which he feparates in his Prodromus, p. 163 , from Of. mites, faying the receptacle is naked, and the corolla difcoid. In this Willdenow follows him, Sp. Pl. v. 3. 2260. On examining the original Limmean fpecimen, marked as communicated by Thunberg himfelf, we find ourfelves obliged to declare that peither of thefe characters holds good. The lanceolate fcales of the receptacle are numeroufly apparent between the florets of the difk, and the ligulate florets of the radius are no lefs vifible within the calyx; though indeed the large membranous inner fcales of the latter equal them in length. The habit of the fhrub, too, is fufficiently like other fpecies of Ofmifes. Such being the thate of the cafe, and the right of priority moreover in favour of Pourret, we adopt his Lapeyroufia in preference.-Ker (Gawler) in Curt. Mag. v. 16. 595, and vo 3. 1246. Ann. of Bot. vo $\mathbf{I}_{0}$ 237. Dryandr. in Ait. Hort. Kew. ed. 2. v. 1. $110 .-\mathrm{Clafe}$ and order, Triandria Monogynia. Nat. Ord. Enfati, Linn. Irides, Juff.

Gen. Ch. Cal. Spatha inferior, fhorter than the corolla, of two, rarely but one, folded valves. Cor of one petal, fuperior, falver-fhaped, nearly or quite equal ; tube long, flender, triangular, its throat a little enlarged; limb in fik deep fegments, fhorter than the tube, either quite equal and regular, or lightly irregular, in the former cafe horizontal, in the latter inclining. Stam. Filaments three, inferted into the mouth of the tube, rather fhorter than the limb, various in direction; authers oblong, incumbent. Pijf. Germen inferior, roundifh; ftyle capillary, as long as the Itamens; figmas three, linear, deeply divided, fpreading and recurved, downy. Peric. Capfule membranous, three-lobed, or with three compreffed dilated angles, of three cells and three valyes, with very fhort partitions. Secds numerous, in two rows, nearly globofe, or nightly angular from preffure.

Eff. Ch. Spatha of one or two folded valves. Corolla fal-ver-fhaped; limb in fix deep fegments, fhorter than the tube. Stigmas three, deeply divided. Capfule membranous, triangular, with many globular feeds.

The moft correct enumeration of the fpecies of this genus, previoufly, by other writers, confounded with Ixia, Gladiolus, or Galazia, is given by Mr. Ker, in Curt. Mag. v. 31. above quoted as follows.

## L A P

1. L. corymbofa, Level-topped Lapeyroufia. Curt. Mag. t. 595. (Ixia corymbofa; Linn. Sp. Pl. 5r. Willd. Sp. Pl. v. I. 199. Jacq. Ic. Rar.t. 288. I. crifpifolia; Andr. Repof. t. 35.)-Flowers regular, corymbofe; tube fcarcely longer than the limb. Stamens widely fpreading. Stem two edged, fomewhat branched.-Native of the Cape of Good Hope, from whence it was introduced by Mr. Maffon, in 1791. It flowers in the green-houfe in May and $J$ June, and requires to be kept dry when out of bloffom. The bulb is conical, with a broad bafe. Stent about a foot ligh, zig-zag, fomewhat branched, leafy, corymbofe. Leaves verrical, clafping the ftem with their broad fheathing bafe. Flowers numcrous, not an inch wide, blue, generally with a white ftarry central mark, bordered with darker blue, not very unlike another beautiful Cape plant, Roclla ciliata, however different in botanical affinity. Sometimes they vary to white.

Mr. Ker is now convinced that Ixia fofigiata, Lamarck. Dist. v. $3.33 \%$, is not fpecifically diltinct from the above.
2. L. fakicha. Falcate Lapeyroufia. - (Gladiotus falcatus; Thuib. Gladiol, n. 4. t. 1. f. 3.) -Flowers nightly irregular, racernofe; tube twice as long as the limb. Stem comprefed. Leaves nearly radical, falcate, obovato-lanceolate. From the fame country; difcovered by Thunberg. The $f_{l} m$ is but five or fix inches high. Leaves one or two. Flowers five or fix, blue. Sputha of two valves.
3. L. faficulata. Fafciculate Lapeyroufia.- (Ixia heterophylla, Vahl. Enum. vo 2, 57. Galaxia plicata; Jacq. Ic. Rar, t. 292.)-Radical leaves fword-haped, erect ; Hloral ones crowded, recurved, undulated, obtufe, longer than the cluftered flowers. Corolla regular; tube above twice as long as the limb. Spatha of one valve.-Native of the Cape of Good Hope. The fem is very fhort. The flowers are cluftered at its fummit, white, with narrow equal fegments, and remarkable for beiag encompaffed with crowded floral leaves, which are longer than themfelves, recurved, undulated and obtufe. The foliage is glaucous. Radical leaves few, long, erect, fword-fhaped and acute.

Vahl and Ker appear to have adopted this fpecies from Jacquin, and they both cite his t. 291, and inftead of 292, apparently after Willdenow in Sp. Pl. v. I. 199; quoted by Ker 159: Thus erroneous references accumulate, for want of turning to the original authorities.
4. L. Fiffolia. Split-leaved Lapeyronfia.- (Gladiolus Efififolius; Jacq. Ic. Rar. t. 268. Vahl. Enum. v. 2. 107.) -Leaves dceply fiplit, and clafping the ftem at their bafe; with a thort fword-fhaped point; floral ones rounded. Spike Icafy. Corolla fomewhat irregular, drooping; tube thrice as long as the limb. - Received from the Cape of Good Hope by Meflrs. Lee and Kennedy, with whom it flowered in Sept. 1809. Mr. Maffon, however, is recorded as having fent 'the fame to Kew in 1791. The leafy $\int$ pike is peculiar, as well as the long deep fiffure of the flem-leaves. The flowers are purplifh, fragrant, varying in the fize and colours of their limb.
5. L. anccps. Sword-leaved Laneyroufia.-(Gladiolus anceps ; Linn. Suppl. 94. Jacq. Ic. Rar. t. 269.)- Leaves f:vord-faped, decurrent, toothed at the outer edge. Stem corymbofe, fpreading. Ccrolla irregular ; tube thrice as long as the limb.-Native of the Cape. . This appears to be the original fpecies on which Pourret founded the genus, in the Memoirs of the Society of Thouloufe, vol. 3. It differs from the laft in its branching corymbofe flem, winged with the narrow, decurrent, toothed bafes of the perfectly fword-ihaped and vertical leques. The flowers vary with different fhades of blue, and have a very long tube. The floral leaves are either large, with toothed or crifped edges,
as Jacquin reprefents them ; or fmall and nearly fmooth or cven.
6. L. filenoides. Campion-flowered Lapeyroufia,-(Gladiolus filenoides ; Jacq. Ic. Rar. t. 270. Vahl. Enum. v. 2. 106. Willd, n. 33.)-Leaves linear-fword-flaped, entire; floral ones as long as the reft. Corolla irregular ; tube five tiines as long as the limb, erect.-Native of the Cape, and, as it feems, known only to Jacquin, who has named it very happily from the afpect of the flower, which is red, with a fpot of yellow at the bafe of three of the fegments, all on one fide. The fcm is about a fpan high, branched from the bottom, and clothed with linear, glaucous, graffy leaver, from feveral of the uppermolt of which the flowers proceed, and their white tube is about as long as the correfponding leaf, ftraight and rather tumid in its upper part.

Two other fpecies are indicated as doubtful by Mr. Ker, Gladiolus brateutus and G. Fabricii of Thunberg and Vahl, which are fufpected to be pollibly not diftinct from L. fiflefolia, or from anceps.
LAPFIORD, in Gcograpby, a town of Sweden, in a bay of the gulf of Bothnia ; eight miles S. of Chriftianiladt.

LAPHAO, a town on the N. coaft of the ifland of Timor, inhabited by Portuguefe or their defcendants, fituated at the bottom of a bay, and containing a church and about 60 houfes; the inhabitants are of a copper colour, with black hair; they carry on fome trade with Batavia; and this port is vifited by fome Chinefe junks and veffels from Goa, but the port is fafe only from March till Auguft; at other times the hurricanes render it infecure.

LAPHIATI, in Zoology, the name by which the people of Lemnos call a fpecies of ferpent, fuppofed by Bellonius to be the fame with the elaps, or elaphis, of the ancients.

LAPHYSTIUS, in Ancient Gcography, a mountain of Beootia, 20 ftadia from Coronna. It had a certain diftrict confecrated to Jupiter Laphyftius, in which there was a marble ftatue of this deity. Hercules Charops kad alfo a temple at a little diltance from it. Paufanius, l. ix. Bceotic. c. 34 .

LAPIDARY, Lapidarius, an artificer, who cuts precious ftones. See Gems.

The art of cutting precious ftones is very ancient; but, like other arts, itsoriginal was very imperfect. The French have fucceeded in it the belt; and the lapidaries of Paris; who have been a corporation fince the year 1200 , have carried it, efpecially in cutting of diamonds called brilliants, to a very great perfection, but not fuperior to that of the Englifh.

There are various machines ufed in the cutting of precious ftones, according to the quality of the matter to be cut : the diamond, which is extremely hard, is cut and formed on a wheel of foft fteel, turned by a kind of mill, with diamond duft tempered in oil of olives; and this fefes to polilh them as we!l as to cut them.

Oriental rubies, fapphires, and topazes, are cut and formed on a copper wheel, with oil of olives, and diamond duft : they are afterwards polifhed on another copper wheel with tripoli and water.
Emeralds, hyacinths, amethylts, garnets, agates, and other ftones lefs hard, are cat on a leaden wheel, with fmalt and water, and polifhed on a tin wheel with tripoli.

Turquois, of the old and new rock, lapis girafol, and opal, are cut and polifhed on a wooden wheel with tripoli.

Lapidary is alfo ufed for a virtuofo Akilled in the nature, kinds, \&c. of precious ftenes; or a merchant who dials in them. See Gexs.

Lafro

Lapidary Style, denotes the fyle proper for monumental orother infcriptions.

This is a kind of medium between profe and verfe; the jejune and the brilliant are here equally to be avoided. Ciccro has preferibed the rules of it: "Accelat oportet oratio varia, vehemens, plena fpiritus. Omvium fententiarum gravitate, omnium verborum ponderib:s, celt utendum."
The lapidary ftyle, which was loft with the ancient monnments, has been retrieved, at the begimning of this agr, by count Emanuel Teforo: it is now ufed varisus ways at the beginning of boolss; and even epitles dedicatory are cumpoled in it, of which we have no example among the an. cients.
LAPIDES Picri, in Nafural Hifory, a termufed by Langins, to exprefs fuch flones as are found with the delineations of fifles, trees, and thells, as well as leaves of ferns and other plants, very perfectly reprefenting the things themfelves, but fcarcely at all ftanding out above the furface of the flone, and having in themfelves fcarcely any thicknefs. It is very evident, that the bodies reprefented are not here, in reality, but the whole configuration is owing to the natural reins of the ftome, and the coalefcence of the feveral finall maffes of which each large fone is compofed, and to the vapours from within the carth, getting into the natural fine cracks in the flones, and tinging their fides with blacknefs.
LA $H$ IDESCENT, any thing which has the faculty of petrifying, or turning bodies to a flony nature.
Naturalits fpeak of a lapidefcent principle, a lapidefcent fpirit, a lapidefcent juice, \&c
Lapidescent Waters, or Springs, are fuch as, having flony particles diffolved and fwimming in them, do depofit the fame on wood, leaves, and other bodes immerged therein ; which, being incrufted herewith, are commonly mittaken for petrifactions.
LAPIDIFICATION, in Chemiffry, an operation whereby any fubfance is converted into a fort of tuene.
Lapidification is practifed in metals, fixed falts, and falts of plants.
The termis alfo ufed for the making of artificial fones.
LAPIN, in Zoology, the Rabbit. See Lepus Cunisulus.

LAPIS, in the general fenfe. See Stose.
Laprs Arabicus, in the Natural Hiflory of the Ancients, the name of a ftone of a fine white colour, refembling the pureft ivory ; and which, though naturally of a firm, folid, and compact texture, yet, when burnt, became light, porous, and fpungy, and aftumed the figure and appearance of a pumice; and was ufed like it in the compofitions of the ancient phyficians for cleaning the teeth.
Lapis IErofus, in Natural Hifory, a name given to feveral forts of Itones, and other foffils, which had laie in the neighbourhood of copper-mines, and been impregnated with particles of copper, though not in a fufficient degree to be thought worthy the name of copper ores. See Pyrites.
The fame fort of fones were alfo fometimes called chalcities, which made fome confufion, as it gave occafion to confound them with the true chalcitis.
Lapis Abbefos. See Asbestos.
Lapis A.tites. See 压tites.
Lapis Armenus. See Armentan Stome:
Lapis Alfius, in the Natural Hifory of the Ancients, the name of a itone, called alfo farcophagus, from its power of confuming flefh.

It was a ftone much ufed among the Greeks in their fepulchres, and is recorded to have always perfectly confumed the flefh of human bodies, buried in it, in forty days. This property it was much famed for, and att the ancient natu-
ralifts mention it. There was another very fingular quality alfo in it, but whether in all, or only in fume pecular picces in it, is not known; that is, its turning imto thone any thing that was put into veffels made of it. Thas is recorded only be Mutianus and Theophrafus, except that Pliny has copied it from thefe authors; and fome of the later writers on thele fubjects from him.
This effect might probably be a kind of incrufation, formed on fubtarices inclofed in veffels made of this itone, by water paffing through its pores, diflodging from the commen mals of the ftone, and carrying with it particles of fuch fpar at: it contaired; and afterwards falling in repeated drops on whatever lay in its way, it might gain depofit them in fuch fubtances, in form of sncruitations.

The place from whence the ancients tell us they had this flone was Affos, a city in Lycia, in the neighbourhood of which it was dug: and De Bot informs us, that in that country, and in fonse parts of the Eatt, there are alfo ltones of this kind, which, if tied to the bodies of living perfons, would, in the fame manacr, confume their fleth. Hili's Nows on 'Theophraltus, p. If.

Lapis Iflebeianus. See Islebelanus lapis.
Lapis Judaicus. See Judacus.
Lapis Lazulio. See Lazvolite.
Lapis Lucis, the fone of ligbt, in the MTateria Medica of the Arabs, a name given to the braffy marcaife or pyrites. The Arabians have adopted this. Avicenna fuppofes this fubtance to be called fo, becaufe it was ufed, after calcination;, for difeafes of the eyes. It is very probable, that where vitriolic medicines take place, the caput mortuum of this foffil, which is only a colcothar of vitriol, may be of ufe. But its virties in this refpect can never be fuppofed fo eminent, as to have intitled it to the pompous name it bears. It feems more probable, that it was called the flone of light, either from its glittering appearance where fref broken, or from its giving large fyarks of fire, when flruck agaiuf a

## L A P

feel. It was from this quality that it obtained the name of tyrifes, or fire-ttone, it giving fire on the collifion with fteel nuch better than flint does.

Lapis Iydius. See Linius hapis.
Lapis AIarmoreus, a marble flone about twelve feet long and three feet broad, placed at the upper end of Weftminfteio hail ; where was likewife a marble chair erected on the micdle thereof, in which our kings anciently fat at their coronation dinner, and at other times the lord-chancellor. Over this marble table are now ereeted the courts of chancery, and king's-bench. Orig. Juridical. 37.

Lapis Meliikes. See Melitites.
Laprs Morochthus, or French chalk. See Monochtnes.
Lapis Medicamentofus, or the medicinal ttone, is a compolition of rock alum, litharge, colcothar of vitriol, Armenian bole, and vinegar, boiled to the confiltence of a hard fone. It was ufed to falten the teeth, preferve the gums, heal and dry up ulcers and wounds; and alfo ininjections, and in compofitions for fore eyes.

LapIs MIuficalis, the mufic-fone, in Natural Hiffory, a name given hy Mr. Sivers to a fone found in Pruffia, carrying naturally on it all the mufical characters found on the thell, commonly called the mufic-flecl. He defcribes the ftone, which feems to have been a fingle fpecimen, and as this author is the only one who ever met with it, it is much to be fufpected that either fraud or fancy has had a great thare in the matter.

Lapis Nephriticus. See Nepuritic fone
Lapis Ollaris, See Potstone.
Laris Specularis. See Specelars.
Lapis Thyites. See Thytes.
LAPITHA, in Ancient Geograply, a town of Cyprus, on a river of the fame name; 24 miles W.N.W. of Nicofia. 23 lat. $35^{\circ} 23^{\prime}$. E. long. $32^{\circ} 33^{\prime}$. See Lapatius.

LAPITHEUM, a mountain of Laconia. Steph. Byz. Paufaniat (1, iiii. c. 20.) mentions a town of this name in the Peloponnefus, on mount Taygetus, in the fame canton.

LAPLAND, in Geography, the moft northerly country in Europe, extending from the North-Cape, latitude $71 \frac{1_{2}^{\circ}}{}$ N., to the White fea, under the Arctic circle, is inhabited by the fame people though the country is fubject to different powers. When the name Lapland was firlt given to the country, and that of Laplanders to the people, is uncertain. . Saxo Grammaticus, in his commentaries; Adam of Bremen, in his account of the Danes; and Sturlefton of Iceland have been cited on this fubject, as having named the people in queftion "Scrittfianar,"" "Scricfinnar," or "Finnar ;" and at prefent they are generally called Finns by the Norwegians. The name of Laplanders has been fuppofed to originate from their attachment to forcery: lapp, in their language, fignifying a uizard.

Lapland is bounded on the north by the North fea and Frozen ocean ; on the ealt by the White fea; on the fouth by Sweden and the gulf of Bothnia; and on the weft by Norvay. On the northernmoft fide, are what have been denominated the Frozen Alps, or Alps of Snow, which compofe that chain of mountains called Severnoi, the declivity of which, towards the eaft and fouth, confifts of lower - mountains, deferts, forefts, fens, and lakes. The furface is fuppofed to contain from feventy to eighty thoufand fquare miles, but its population cannot be afcertained with any degree of precifion.

Lapland is divided into three parts, viz. Io That v :hich is fubject to Denmark, and is called Norwegian Lapland; this part lies between the Nurthern fea, the river Pais, and the lake Enarak. 2. Swedifh Lapland, which includes all the conntry from the Baltic to the mountains that feparate

Norexay from Sweden. It is divided into fix diftricts, de. nominated marcks, or territorics, which are diftinguifhed by the names of rivers, as Aungnerland, Elma, Peta, Lula, 'Torna, and Kimi. 3. The eaftern part is fubject to the crar of Mufcovy, lituated between the lake Enarak and the White fea: this part of Lapland is divided into three prefectures; namely, that of the fea-coaft to the north, called " Mourmankoi L.cporic !" that upon the coaft of the White fea, denominated "Jerfkui Leporic :" and the inland part, known by the name of "Bellamorefkoi Leporic." In Swedih Lapland, the provinces or marcks are fubdivided into fmaller difriets called biars, confilling each of a number of families, among which the land is parcelled out by government. The whole country confilts of huge congeries of frightful rocks and ftupendous mountains, interfperfed, however, with many pleafant vallies, watered by an infinite number of rivulets that fall into the rivers and lakes, which difcharge themfelves into the gulf of Bothnia. The chief towns are Kola and Tornea. There are many confiderable lakes, as the Great Uma ; the Great Windel; the Storavan, \&cc. Some of them are faid to extend 60 leagues in length, and contain a great number of iflands. Stor-avan is computed to contain 365 ; and Enara contains fo many, that it has been affirmed, that no Laplander has lived long enough to vifit each particular ifland. For the hiftory of this country, we mult refer to that of thofe countries to which it is fubject, and alfo to the article Finsss. The climate is exceedingly cold during the winter months; the lakes and rivers are at that feafon completely frozen over, and to a great thicknefs: the whole face of the country is covered with fnow to the depth of four or five feet. While this continues loofe, it is impoffible to travel, but if a partial thaw takes place, the furface of the fnow is formed by a fucceeding frot into a hard impenetrable cruft, over which the inhabitants, by means of their rein-deer, travel with the utmoft celerity. While the thaw continues, the air is furcharged with vapours, and the climate is rainy, but fo long as the north wind blows, the fky is beautifully ferene, and the air is clear. The heat of fummer is almoft as intolerable in Lapland as the cold of winter. In the more northerly parts of the country, the fun never fets for three months jn the fummer, and in the winter there is an uninterrupted night of the fame duration, but this is qualified by a conflant revolution of dawn and twilight, by a ferene fky, moon-light, and aurora borealis, fo that the inhabitants are enabled to tifh and hunt, and to proceed with their ordinary occupations. During the fummer feafon nothing can be more enchanting in many parts, than the valt profpects of mountains, forelts, lakes, and rivers. At this feafon, notwithitanding the clinate, the rofes are feen in full fiower on the banks of the lakes and rivers, with all the beauties of colour which appear in thofe cultivated in our gardens. In the intervals between the mountains, great part of the country is flat, covered with brown dufky forefls of fir and pine trees, and thefe are often fkirted by wide extended moraffes, the flagnating waters of which in fummer produce myriads of mifchievous infects, that are more intolerable than even the cold of winter. The foil of Lapland is very barren, owing chiefly to the want of cultivation. In fome diftricts the land will bear large crops of rye; there are many varieties of berries, as currants, Norwegian mulberries, that grow on a creeping plant; rafpberries, cranberries, juniper berries, and bilberries. There are very fiue woods of birch, pine, and fir, in feveral inftances difpofed by mature, as if they had been planted in regular ropes by the hand of art. The fervice-tree, the willow, the poplar, the elder, and the cornel are found here. Among plants, the angelica

## LAPLAND.

angelica is mofe cultivated, and highly efleemed : the forrel is ufed as an antifcorbutic. They have likewife other kinds of herbs, different fpecies of grafs, heath, fern and mofs, but the vegetable which is in the greatelt plenty is the lichen. This mofs covers the whole ground; its colour is a pale yellow, which when dry changes to white ; the regularity of its flape, and the uniform manner in which the furface of the ground is decked with it, appears fingular and firiking; it has the femblance of a beautiful carpet. Thefe plants grow in a fhape nearly octagonal, and approaching to a cirele, and as they join each other, they form a kind of Mofaic work, or embroidery. As this mofs is very dry, nothing can be more pleafant to tread upon, nor can there be any thing fufter for a bed: Acerbi, and his companions, in their journey frequently flept upon it. In fome places it feems to be the only herb that will grow; the neighhouring birches and firs appear to vegetate with difficulty, as if deprived of their nourifhment by the mofs: in fhort, fays the writer, "this moifs appeared to be a royal plant, which ruled abfolute over the vegetable kingdom of the country, and diltributed its bounty and influence among a particular race of men and animals." With refpect to the mineralogy of the country; filver and lead have been difcovered in the provinces of Pitha and Lula; in the dillrict of Torna there are two copper mines, and fome excellent veins of iron. Here are found cryltals of a very large fize, and fo hard and fine, that when polifhed they refemble real diamonds. In fome parts amethyfts and topazes are found: alfo curious ftones too hard to be worked by the common tools of the mafon. In a few of their rivers they filh for pearls, which are generally pale; but fome of them are as bright as the oriental pearls, though larger and more round. Lapland is infefted with a great number of grey wolves and bears, with which the natives are perpetually at war. The country likewrife abounds with elks, beavers, and otters, which live here unmolefted, and find plenty of fifh for their fubfitence. The forelts of this country furnifh haunts to a great number of beautiful martens and fquirrels, which change their colour every winter from brown to grey. Here are alfo ermines, weafels, hares, large black cats which attend the Laplanders in hunting, and little dogs trained to the purfuit of game. But the moft remarkable animal of Lapland is the rein-deer. The woods, mountains, and rivers, are well ltocked with wild fowl, and all forts of aquatic birds that build and breed in northern climates. Early in every fpring the fwans go thither in numerous flights from the German ocean:- the lapwings follow in fuch fwarms that they darken the fky. The rocks and mountains are frequented with eagles, hawks, kites, falcons, and other birds of prey. The rivers abound with falmon, which afcend from the gulf of Bothnia, trout, bream, and perch of excellent flavour, and amazing niagnitude. The infects are extremely numerous; they often obfcure the face of day; and are fo venomous that the reindeer, to avoid them, fly to the tops of the liighelt mountains for fhelter, and the inhabitants betake themfelves to the feafide, which is lefs infefted than other parts by thefe peffilent vermin.

The commerce carried on by the Laplanders is more confiderable than one would expect in a defert country, inhabited by a favage and ignorant people. They export large quantities of fifh to Bothnia and White Ruflia. They trade with the neighbouring countries of Norway, Sweden, Mufcovy, and Finland, by the fale of rein-deer, fine furs, bafkets, toys of their own manufacture, and cheefe made of the reindecr's milk. They receive in return rix-dollars, woollen cloths, linen, copper, tin, flour, oil, hides, cutlery, £pirits, and tobacco. The Laplanders march in caravans to the
fairs in Finland and Norway; thefe are compofed of a lons Atring of 30 or to rein-decr tied to one another, the foremof being led by a Laplander who walks in front. At night, when they have fixed upon a fpot to relt on, they form a large circle of their rein-dect and pulkas or fedges, ready yoked, and the animals lying down quietly on the fnow, are fed with mofs by their matters. The people kindle great fires, areund which they fit and fup, and fmoke and fleep. The revenue arifing from this country is not of much confequence; it is partly paid in rix-dollars, but chiefly in furs, and the tribute from the poorer clafles is taken in dried fifh. Part of the taxes is allotted for the maintenance of the clergy:

The Laplanders are fhort, few of them being five feet high; in their drefs they ufe no kind of linen; the men wear a fort of pantaloons reaching to their fhoes, and their doublet is made to fit the fhape; over this is a clofe coat with narrow fleeves, which is faftened round them with a leathern girdle. To the girdle are attached their knives, their pipes, and their inftruments for friking fire. The drefs of the women is very much like that of the men, but in addition to it they wear handkerchiefs, fhort aprons, rings on their fingers, and in their ears, from which among the rich are fufpended chains of filver, which pafs twice or thrice round the neck. They are much addicted to finery, and to the ufe of embroidery manufactured from brals wire. They change their habitations according to the feafon, living in houfes in the winter, and in fummer they make ufe of tents. Their houfhold furniture confifls of iron or copper kettles, wooden cups, bowls, fpoons, and fometimes tin or even filver bafons, to which matt be added the implements of fifhing and hunting. The inhabitants are chiefly divided into fifhers and mountaineers. The former build their habitations near fome lake, from which they derive their fubliftence. The others feek their fupport on the mountains, poffefing herds of rein-deer more or lefs nu. merous; thefe are very rich in comparifon of the fifhermen. It is ufual to affign to every child at its birth a number of thefe animals, which, with their produce and increafe are to belong to it, fo that when he arrives at man's eftate, he finds himfelf mafter of feveral hundred rein-deer. The following defcription of a Lapland family was given from the life by an intelligent traveller: "it confifted of an old man and his wife, with a child about two or three months old. The infant was trufled up in a kind of cradle, refembling, in fhape, a fiddle cafe, made of the thick bark of a tree, fo formed that it exactly contained the child, which was fixed in it with a kind of brafs-chain. It was covered with fine and foft mofs, over which was fpread the fkin of a young rein-deer- The cradle was fwung on a rope, which was faftened to the top of the hut." The Laplanders are averfe from war, and will forfake their homes, to which they are much attached, rather than engage in it. Their manners and habits are fincly defribed by Thomfon, who, in comparing them with the martial hordes of the north, fays,
"Not fuch the fons of Lapland: wifely they
Defpife th' infenfate barbarous trade of war :
They afk no more than fimple nature gives;
They love their mountains, and enjoy their forms.
No falfe defires, no pridc-created wants
Difturb the peaceful current of their time ;
And through the rettleis ever-tortured maze Of pleafure or ambition bid it rage.
Their rein-deer form their riches. Thefe their tents, Their robes, their beds, and all their homely wealth Supply: their wholefome fare and cheerful cups."
Great pains have been taken by the Danes and Swedes to in -
form

## L A P

## L A P

form the minds of the Laplanders on the fubject of religion, but the majority of them continue to practife fupertitions and idolatics, as grofs as any that are to be met with among the moit uninftructed Pagans. They rely on augury and witchcraft, and have been confidered by many of our counfrymen, who have vifited thofe parts, as 』ilful in magic and divination. Their magicians make ufe of what they call a drum, an inftrument like the tambourine. On this, thofe who profefs to be Chriftians draw the figures of their own gods, as well as thofe of Jefus Chrilt, the apollles, the fun, moon, flars, rivers, \&c. : on different parts of this inftrument and its ornaments are placed fmail brafs rings, which, when the drum is beaten with a little hammer, dance over the ligures, and according to their progrefs the forcerer prognofticates. They retain the worfhip of many Teutonic gods, and have among them confiderable remains of Druidical inftitutions. They believe in the tranfmigration of the foul, and have feftivals fet apart for the worfhip of certain genii, who, they imagine, inhabit the air, and have the direction and fuperintendence of human actions. A black cat is reckoned one of the moll valuable appendages in each houfe: they talk to it as to a rational creature, and in their hunting and fiflaing parties it is their ufual attendant. To this animal the Danifh Laplanders communicate their fecrets; they confult it on all important occafions; and among the Swedifl Laplanders, the drum is kept in every family for the purpofe of confulting the devil.

The account given by M. Maupertuis of the rigour of this climate, when he went to the polar circle to afcertain the real figure of the earth, deferves to be noticed in this article. He obferves, that in the month of December fpirits froze within their houfes; and if the door of a warm room were opened only for a moment, the external air inftantly converted all the vapour within into a kind of fnow, whirling it round in vortexes. When they went abroad, they felt as if the air was tearing their breafts to pieces, and within doors, the cracking of the wood, of which the houfes were built, continually warn them by its contraction of an increafe of cold. In fpeaking of the atmofpheric appearances, and of the heavenly bodies; he fays, the brightnefs of the moonlight, the twinkling of the ftars, and the effulgent corrufcations of the aurora borealis, afford a light fufficient for moft of the occafions of life. No fwoner, fays he, are the fhort days clofed, than fires of a thoufand figures and colours light the fky, as if intended to make up for the abfence of the fun. Thefe lights are perpetually variable. Sometimes they begin in the form of a great fcarf of bright light, with its extrenities upon the horizon, which, with the motion refembling that of a fifhing-net, glides foftly up the Ney, preferving a direction nearly perpendicular to the meridian, and commonly after thefe preludes all the lights unite at the zenith, and form the top of the crown. It would be difficult to enumerate the different figures which thefe meteors affume, and the various motions with which they are agitated. Their motion is moft commonly like that of a pair of colours waving in the air, and the different tints of their light give them the appearance of fo many ftreamers of changeable filk. "I faw," fays the philofopher, "a phenomenon of this kind, that in the midit of all the wonders to which I was now every day accuftomed, excited my admiration. To the fouth a great fpace of 1 ky appeared tinged with fo lively a red, that the conftellation of Orion looked as if it had been dipped in blood. This light, which was at firft fixed, foon moved, and changing into other colours, violet and blue, fettled into a dome, the top of which ttood a little to the fouth-weft of the zenith. In this country, where there are lights of fo many different colours, I never faw
but two that were red, and fucli are always taken for prefages of fome great misfortune. It is not at all furprifing, if people, with an unphilofophic eye, difcover in thefe phenomena armies engaged, fiery chariots, and a thoufand other prodigies. To the enlightened and rational philofopher, Lapland every where prelents fubjects of reffection and contemplation: no arts flourihh here; we no where meet with temples, houfes, wrecks of columns, or of other monuments, but a fine opportunity is afforded of Itudying among the wandering tribes the firlt elemeats of focial life; of foriety in its moft ancient form." Acerbi's Travels into Sweden, Lapland, \&cc. Confett's Tour to Lapland.

LAPMARK. See Finmark.
LAPOUTI, a mountain of Afia, between Caflgar and Little Thibet.

LAPPA, in Botany, the Latin name for any kind of Lur, or feed that fticks to the coats of animals. See Arc* tium, Aparine, and Xanthium.

LAPPAGO, a name for the Galium Aparine, or Goofe-grafs, alluding to the bur-like nature of its feeds. (See Lappa.) It is now appropriated by Schreber to a particular genus of graffes; fee the next article.

Lappago, fo named by Schreber, on account of the bur-like afpect of the feed invefted with its muricated hunks. —Schreb. 55. Willd. Sp. Pl. v. 1. 484. Mart. Mill. Diet. v. 3. Sm. Prodr. Fl. Grac. Sibth. v. 1. 76. Ait. Hort. Kew. ed. 2. V. 1. 182. (Tragus; Hall. Hirt. vo 2. 203. Desfont. Atlant. v. 2. 386.)-Clafs and order, Triandria Digynia. Nat. Ord. Graminá, Linn.

Gcu. Ch. Cal. aggregate, each glume of one valve, fingle-flowered, lanceolate, pointed, ventricofe, angular, furrowed, permanent, muricated at the back with a triple row of cartilaginous prickles, hooked upwards. Floret folitary, feffile. Cor. of two valves, fmaller than the calyx, awnlefs, fmooth, membranous and whitifh; its glumes lan. ceolate, acute, concave; the outermolt oppofite to the calyx, ribbed, inner more delicate and but half the fize of the outer, embraced by the calyx. Nectary of two lanceo. late acute leaflets. Stam. Filaments three, capillary, the length of the glumes; anthers fhort, deeply divided. Pj/. Germen fuperior, ovate; ftyles two, capillary, rather hort; ftigmas cylindrical, feathery. Peric. none, except the per: manent corolla. Seed unconnected, elliptic-oblong, with a longitudinal furrow.

Eff. Ch. Calyx muricated, of one valve, fingle-fowered, ageregate. Corolla of two valves, awniefs.

The only known fpecies is
I. L. racemoft. Branching Bur-grafs.-Sm. Fl. Grec. Sibth. v. 2. t. 1or. Hoft. Gram. Auftr, v. 1. 28. t. 36. (Cenchrus racemofus; Linn. Sp. Pl. 1487. Schreb. Gram. v. I. 45. t. 4. Gramen caninum maritimum afperum ; Bauh. Prodr. 2. Theatr. 16.)-Native' of the fandy fea-fhores of the fouth of Europe, as well as of Arabia and India. It is a hardy annual with us, flowering in the warmeft part of the fummer. The root confifts of downy fibres. Stems numerous, a fpan high, jointed, unbranched, leafy, round, fmooth, decumbent and taking root at the bottom. Leares fpreading, lanceolate, very acute, flat, ftriated, fmooth, except the edge, which is fringed as well as toothed; the bafe is heart-haped ; the upper leaves are very fhort: fheaths rather fwelling, ftriated, fmooth, the upper ones longeft. Stipula fhort, fringed. Spikes terminal, folitary, two or three inches long, erect, cylindrical, obtufe, many -flowered, generally purpliitho and of an unufual afpect on account of the prickly hufks. Their common falk i6 hairy. Flowers three or four on cach little zig-zag partial ftalk, alternate, rather
rether difant, erect, the uppermof generally abortive. 'The lower part of the fpike is thin and flraggling.

Compofice Semiflofculofe, Linn. Cichoracea, Juff.

Gen. Ch. Common Calyx ovate, fomewhat cylindrical, angular, of about eight equal, linear, keeled, channelled. acute fcales, with a few fmall imbricated ones at the bafe, all per. manent. Cor. compound, imbricated, uniform ; the florets hermaphrodite, about 16 , more or lefs, equal, each of one petal, ligulate, abrupt, with five teeth. Stam. Filaments five, capillary, very fhort ; anthers united into a cylindrical tube. $P \mathrm{i} / \mathrm{t}$. Germen rather oblong; ftyle thread-fhaped, as long as the ftamers; ftigma cloven, reflexed. Peric. none, except the permanent fcales of the calyx. Seeds folitary, oblong, angular, contracted at the top, upright or fpreading, dettitute of wing or down. Recept. naked.

Eff. Ch. Receptacle naked. Caly $x$ with fcales at the bafe, its inner fcales equal, channelled. Seeds without down, contracted at the top.

1. L. communis. Common Nipple-wort.-Linn. Sp. Pl. IT4I. Engl. Bot. t. 874. Curt. Lond. fafc. r. t. 59. Fl. Dan. t. 500.-Calyx of the fruit cloled, unchanged, fmonth. Seeds loufe. Stem panicled. - Frequent in wate or cultivated ground throughout molt parts of Europe, flowering in fummer. The ront is annual. Stem erect, two or three feet high, roundith, nearly fmooth, much branched in a panicled manmer, leafy in the lower part. Leaves foft and rather hairy, toothed; the radical ones lyrate, the others ovate, acute, alternate. Flowers finall, yellow, on long, flender, alternate ftalks. Seeds nearly flraight and erect, angrular and Ariated, furrounded by the dried, fmooth, permanent, fcarcely changed calyx, but unconnected with it, and at length falling out, leaving it empty. 'This plant is faid to be called Papillaris, in Pruffia, a name fynonymous with. Nipple-wort; becaufe it is faid to cure ulcerated breafts.

A varicty of this, with the margins of its leaves curlett. and more deeply as well as unequally touthed, is L. crijpa of Willdenow, laid by him to contimue conftant from feed. Linneus confidered it a variety, nor do we find reafon tor fwerve from that opinion.
2. L. Mellata. Starry Nipplcowort-Linu. Sp. P1. 14 11. Gaertn. v. 2. 354. (L.n. 3; Gerard. Gallopr. 175. Kagadiolus itcllatus; Willd. n. ィ. Ragadiolus altera; Celalo. 511. Hicracium ftellatum; Bauh. Hif. v. 2. borq. II. narbonenfe falcatum ; Lub. Ic. 2q0. H. falcatum Loobelii; Ger. em. 298.) -Seeds awl-fhaped, fpreading, fomewhat incurved, embraced by the muricated calyx-fuales. Stem widely fpreading. Radical leaves obovate, fomewhat runcinate. - Native of the fouth of Europe. Reab annmal. Stoms feveral, widely fpreading or decumbent, branched. Leaves thin and nearly finooth, except a little roughnefy about the edge; the lower ones obovate, rather acute; taperings and nearly entire at the bafe; more or lefs rancinate about the middle, with numerous Gharp teeth, each tipped with a little pale callous point: the upper leaves are linear-lanecolate, undivided and nearly entire. Flozvers fmall, yellow, (w) long fpreading ftalks. Calyx rough with minute afcending brittles or prickles. Perfect feeds generally cight, $\frac{3}{4}$ of an inch long, widely fpreading in the form of a ftar, awl-fhaped. flender, fmooth, each embraced by one fcale of the calys, which rather exceeds it in length, and is externally rough with little prominent prickles, efpecially towards the point. About two or three very much incurved, fmaller, apparently abortive feeds are found in the centre, each in like manner invelted with its rough calyx-fcale. All the feeds, as well a: the calyx, ale firmly united together to the tumid receptacle, which they entirely cover, till they are loofened by time or accident.

We unite, without the leaft fcruple, the L. Jellata and L. Rbagadilus of Linnæus as one fpecies, on the authority of his own fpecimens, as well as that of his and our learned friend Gerard. They differ only in having more or lefg tonthed radical leaves. Every other part precifely accords. Whether the two following be ciftinct from this now defcribed may admit of fome doubt, but we are perfuaded they are fo.
3. L. Rbagadiolus. Bird's-foot Nipple-wort. - Scop. Carn. ed. 2. v. 2. 119. (Ragadiolus edulis; Gærtn. v. 2. 354. Willd. n. 2. Rh. lampfanæ foliis; Tourn. Cor. ${ }^{2} 6$ ? Rh. alter: Tourn. Inft. 480. t. 272 . Rh. fig. I. Lamarck Illultr. t. 655. Ragadiolus; Cxfalp. 5 II.)—Secds few, awl-fhaped, widely fpreading, fomewhat recurved, embraced by the fmooth calyx-fcales. Stem fpreading. Ra, dic 1 leaves deeply runcinate, with rounded lobes.- Native of the fouth of Europe. We have garden fpecimens, named L. flellata, from Mr. Davall. The radical leaves are decply and regularly pinnatifid in a lyrate manner, with two or three pair of oppolite lobes, all rounded and blunt like the terminal one, but each tipped neverthelefs, as in the former, with a little callous or glandular point. The calyx is perfectly imooth, beth in flower and fruit. Perfect feeds ge. nerally but four, fhorter and thicker than in the laft, coloured, recurved, or, as Scopoli obferves, deflexed, well compared by Cxfalpinus to a bird's foot, from which de. fcription and Tournefort's figure there can be no doubt of this being the plant both thefe authors meant, though Tournefort appears to have reverfed the two fpecies of Cæfalpinus; and hence perhaps arofe the almolt inextricable confufion among following authors. Linnæus could not correct this, as he never faw but one fpecies. We believe the two to be truly diftinct. The refemblance of the radical leaves of the prefent to $I_{\text {. }}$ communis, makes us retain the

[^1]Q 4
fynonym
fynonym of Tournefort's Corolla, though with a mark of doubt.
4. L. Koelpinia. Lincar-leaved Nipple-wort.-Linn. Suppl. 348. (Kotlpinia linearis; Pallas It. v. 3. 755. t. L, 1, f. 2. Kbagadiolus Koclpinia; Willd. n. 3.)Seeds numerous, awl-haped, fpre:ding, incurved, enbraced by the muricated calyx-fca'es. Leaves all linear-lanceolate, entire. - Found by Pallas in only one moilt valley, by mount Bogden, in the defert of Altrachan. We have a wild fpecimen from Alcppo, given by fir Jofeph Banks. It flowers in the middle of May, ripening feed by the end of the month. The yellow blofloms open to the morning fun, and clofe at noin. This is a very flender plant, with a fmall annual root. The fensis are from ten to cighteen inches long, fcarcely branched, loofely fpreading, fnooth; fquare and furrowed towards the top. Leares diftant, all linear lanceolate, acute, entire, pliable, fmooth, obfcurely three-ribbed. Flowers folitary, on thort fcattered ftalls, from the very root to the extremity of cach ftem. Calyx clothed with incurved prickles. Ripe feeds numerous, about twelve or fourteen, fpreading from their bafe, but ftrongly incurved, each invelted with one of the calys-fcales, whofe numerous, incurved, hooked prickles are much more remarkable than in either of the two laft, fome of them forming a recurved ftar at the top of each feed. This fpecies is more akin to L. Acelloda perhaps than any other, but the characters given above feem fufficient to keep them ditinct. Pallas fuggefted the propriety of feparateng the three laft-defrribed fpecies from Lapfana, by the name of Koclpinia; fee that article. - Whether they ought to form a genus, is, to us at leait, doubtful. Schreber has agreed with Pallas if this point, only properly preferring the name of Rbagadiolus for the genus, as given by Ceffalpinus and Tournefort, and correetly derived from jayss iacalos, a cleft or fiffure, whether it alludes to the reputed virtues of thefe plants in healing cracks of the fkin , or to the cut (or flar-like) afpect of the feeds. In habit they fufficiently accord with the original Lapfana, and the difference in the pofition of the ripering feeds is their only difitinction. We ought rather perhaps to admire the fagacity of Linnous in perceiving their agreement, than the ingenuity of thofe who have diftinguifled then. Pallas himfelf, with great modefty, merely fubmits his opinion to the decifion of thofe who take the lead in botany. In the fame uncertainty we wifh now to leave it.L. Zacyntha feems to be feparated from the relt with more propriety, as its feeds have a feathery crown, and the nature of the torofe calyx is more like that of Crepis. Juffieu includes it under his genus Hedypnois; fee that article.

Three much more dillimilar plants are ranged under Lapfana by Willdenow. Thefe are Hyoferis factida and minima of Linnæus, with L. virgata of Desfontaines, Fl. Atlant. v. 2. t. 215.-The firlt is on the awthority of Haller and Scopoli, who fay the feeds are without down. We have never feen them, but the ftemlefs habit of the plant, and its whole afpect, exactly like a Leontodon, are fo foreign to Lapfana, that the natural characters of the genus would be overfet by its admiffion.-Hyoferis minima, Gxrtner's Arnoferis, t. 157, is indeed lefs unlike in habit, though temleis; but the feeds have an elevated border, and do not agree with Lat fana.

The third, virgata, has fo great a number of florets as to take off an importan: part of its generic affinity, and its habit is more like an Hedypnois. "Having feen no fpecimen, we can decide nothing as to this fpecies. It is neceffary to know whether the feeds have an elevated border, in which eafe it might very well be placed along with Hyoferis minima, wherever that remains; or whether they be truly all without
a crown, and contracted at the fummit, as in the true fpecies of Jajfana. S.
LapSARII. Sce Infralapsarit, Sublapsami, and Suphalapsamid.

LAPSE, in Lazt, a flip or omiffion of a patron to prefent a clerk to a bencfice within fix months of its teing void: in which cafc, the bencfice is faid to be in lapfe, or lapfed, and the right of prefentation devolved to the ordinary.

And if the ordinary recglect to prefent during the fame time, the right of prefentation accrues to the metropolitan, and to the king by neglect of the metropolitan. This right of lapfo was firt eflablifhed in the reign of Henry II., when the bifhops firit began to exercife univerfally the right of inflitution to churches (Bract. 1. 4. tr. 2. c. 3.) : and therefore, when there is no right of intitution, there is no right of lapfe; fo that no donative can laple to the ordinary, unlefs it hath been augmented by the king's bounty (it. I Geo. I. It. 2. c. 10.); but no right of lapfe can accrue when the original prefentation is in the crown. (St. I7 Edw. II. c. 8. $2 \operatorname{Int} .273$.) In cafe the benefice becomes void by death, or ceffion through plurality of benefices, there the patron is bound to take notice of the vacancy at his own peril; but in cafe of a vacancy by relignation, or canonical deprivation, or if a clerk prefented be refufed for infufficiency, thefe being natters of which the bilhop alone is prefumed to be cognizant, here the law requires him to give notice thereof to the patron; otherwife he can take no advantage by way of lapfe. (4 Rep. 75. 2 Inlt. $6 \mathbf{3}_{2}$.) Neither fhall any lapfe accrue thereby to the metropolitan or the king. If the bifhop refufe or neglect to examine and admit the patron's clerk, without good reafon afligned or notice given, he fhall have no title to prefent by lapfe (2 Roll. Abr. 639 .) ; and if the right of prefentation be litigious or contelted, and an action be brought againft the bifhop to try the title, no lapfe fhall occur till the queftion of right be decided. (Co. Litt. 3+4.) If the bifhop be both patron and ordinary, he fhall not have a double time allowed him to collate in (Gibf. Cod. 769.) ; and if the bithop doth not collate his own clerk immediately to the living, and the patron prefents, though after the fix months are lapfed, yet the prefentation is good, and the bihop is bound to intitute the patron's clerk. (2 Inft. 273.) If the bifhop fuffer the prefentation to lapfe to the metropolitan, the patren alfo has the fame advantage if he prefents before the archbithop has filled up the benefice: yet the ordinary cannot after lapfe to the metropolitan, collate his own clerk to the prejudice of the archbifhop. (2 Roll Abr. 368.) But if the prefentation lapfes to the king, the patron fhall never recover his right, till the king has fatisfied his turn by prefentation; for nullum tempus occurrit regi. But to prevent the inconvenience of the church's continuing void for ever, unlefs the king fhall be pleafed to prefent, the law has lodged a power in the patron's hands of, as it were, compelling the king to prefent. For if, during the delay of the crown to prefent, the pation himfelf prefents, and his clerk is inflituted, the king indeed, by prefenting another, may turn out the patron's clerk; or, after induction, may remove him by quare impedit: but if he does not, and the patron's clerk dies incumbent, or is canonically deprived, the king hath loft his right, which was only to the next or firt prefentation. 7 Rep. 28. Cro. Eliz. 44. Blacklt. Com. vol. ii.

## Lapsed Legacy. See Legacy.

LAP-SIDED, in Ser Language, denotes the fate of a mip, which is built in fuch a manner as to have one fide heavier than the other, and confequently to retain a conftant

LARADA, a town of Tripoli; 30 miles S.E. of Mefurada.

LARAGNE, a town of France, in the department of the Higher Alps, and chief place of a canton, in the diftrict of Gap; 9 miles S.S.E. of Serres. The place contains 664 , and the canton 3673 inhabitants, on a territory of $192 \frac{\mathrm{r}}{2}$ kiliometres, in 8 communes.

LARANDA, in Ancient Geography, a town of Afia, in Cappadocia, belonging to Antiochiana, according to Ptolemy, who joins this canton to Lycaonia, but by other authors it is united with Pifidia and Ifauria.

LARASSA, a town of Afia, in Media, not far from Ecbatana. Ptol.

LARBOARD, in Sea Language, the left-hand fide of the fhip, looking forward from the fern.

LARBORUM, in Ancient Geography, an epifcopal town of Afia, in Caria.

Larceny, or Larciny, in Lazu, is a theft of perfonal goods or chattels, in the owner's abfence. See Theft.

The word comes from the French larcin; and that from the Latin latrocinium, theft.

Larceny is dittinguifhed by the law into two forts; the one called fimple larceny, or plain theft, unaccompanied with any other atrocious circumftance; and mixed or compound larceny, which includes in it the aggravation of taking from one's houfe or perfon.

In refpect of the things itolen, fimple larceny is either great or fraall.

Larceny, Great, Grand, is when the things Itolen, though feverally, exceed the value of 12 d .

Larceny, Pefty, or Peftit, is when the goods folen exceed not the value of $12 d$.

Simple larceny is defined the felonious taking, and carrying away, the perfonal goods of another: fo that in order to conflitute this crime, there mult be a tuking, which implies the confent of the owner to be wanting; and therefore no delivery of the goods from the owner to the offender, upon truit, can ground a larceny. By the common law it was no larceny in a fervant to run away with the goods committed to him to keep, but only a breach of trult : but by flatute 21 Hen. VIII. c. 7. if any fervant embezzles his mafter's goods to the value of 40 s. it is made felony, except in an apprentice and fervants under eighteen years old. But. if he had not the poffeffion, but only the care and overfight of the goods, as the butler of plate, the fhepherd of fhcep, and the like; the embezzling of them is felony at common law. (1 Hal. P. C. 506.) By the declaratory act of 39 Geo . III. c. 85. entitled "An act to protect mafters againit embezzlements by their clerks or fervants," it is enacted and declared, that if any fervant or clerk, or any perfon employed for the purpofe in the capacity of a fervant or clerk, to any perfon or perfons whomfoever, ce to any body corporate or politic, fall, by virtue of fuch em-
ployment, reccive or take iuto his poffeffion any money, goods, bond, bill, note, banker's draft, or other valuable fecurity, or effects, for, or in the name, or on the account of his matter or matters, or employer or employers, and thall fraudulently embezzle, fecrete, or make nuay with the faune, or any pare theriof; every fuch offender fhall be deemed to have felonioully Itolen the fame; although fuch money, goods, dxe, was or were not otherwife received into the polfefion of fuch maller or matters, \&cc. than by the actual poffeffion of his or their fervant, clerk, or other perfon fo employed. And every fuch offender, his advifer, procurer, aider, or abettor, bcing thereby lawfully convicted or attainted, thall be liable to be tranfported to fuch parts \$cc. for any term not exceeding fourteen years, in the difcretion of the court befure whom he fhall be convicted or adjudged. Several ftatutes have alfo, at various times, paffed to protect public companies from depredations by their officers and fervants; as 15 Geo. II. c. 13. f. 12. with refpect to thofe of the bank of England, rendering cmbezalement a capital felony; 35 Geo. 111. c. 66. f. 6. and 37 Geo . III. c. $4^{6}$. touching certain annuities payable at the baik of England, and contaming the fame provifions as the. 15 Geo. II. c. 13. f. 12 . The 24 Geo. II. c. II. f. 3. contains the fame provifions refpecting the officers and fervants of the South Sea houfe. So if a gueft robs his inn or tavern of a piece of plate, it is larceny (i Hawk. P. C. go.); and fo it is declared to be by 3 \& 4 W. \& M. c. g. if a lodger runs away with the goods from his ready furnifhed lodgings. There muft alfo be a carrying azway; and a bare removal from the place in which be fomind the goods, though the thief does not quite make off with them, is fufficient. But this mult be felonious, i. e. done animo furandi, or, as the civil law exprelles it, lucri coula. (Inlt. 4. f. 1.) The ordinary difcovery of a felonions intent, is where the party doth it clandeftincly, or, being charged with the fact, denies it: befides which, there are other circumftances that evince a felonious intent, which are left to the confideration of the court and jury. Moreover, this felonious taking and carrying away mult be of the perfonal goods of another. Of things that adhere to a freehold, as corn, grafs, trees, and the like, or lead upon a honfe, no larceny could be committed by common law ; but the feverance of them was, and in many things is atill, merely a trefpafs: however, if the thief fevers them at one time, whereby the trefpafs is completed, and they are converted into perfonal chattels, in the conAtructive poffeffion of him on whofe foil they are left or laid, ald comes again at another time, when they are fo turned into perfonality, and takes them away, it is larceny; and alfo if the owner, or any one elfe, has fevered them. (3 Intt. 109. I Hal. P. C. 5 10.) And by 4 Geo. 1I..c. 32. to Ateal, or fever with intent to fteal any lead or iron fixed to a dwelling-houfe, or out-houfe, or in any court or garden belonging to it, is made felony, liable to tranfportation for feven years. And by 21 Geo. III. c. 68. he who fhall fteal, rip, cut, break, or remove, with intent to fteal any copper, brafe, bell-metal, utenfil, or fixture, fixed to any building, or in any garden, orchard, court-yard, fence, or outlet, belonging to any building, or iron-rails, or fencing, \&cc. and alio his aiders and abettors, and all who fhall knowingly buy or receive the fame, fhall be guilty of felony, and tranfported for fevens years, or detained in prifon and kept to hard labour, not exceeding three years, nor lefs than one, and within that time, if the court fhall think fit, fhall be once or oftener, but not more than thrice, publicly whipped. Moreover, to fteal underwood or hedges, and the like, to rob orchards or gardens of fruit growing therein, to fteal or otherwife deftroy any turnips, or the roots of madder
when growing, are, by 43 Eliz. c. \%. 15 Car. II, c. 2o $3^{1}$ Geo. II. c. 25. 6 (yeo. IIl. c. $4^{8 .}$. 2 Geo. III. c. 4 r. ${ }_{13}$ Geo. 111. c. 32. punifhable criminally by whipping, fmall fines, inprifitonment, and fatisfaction to the party wronged, according to the mature of the offence. Moreover, the ftealing by night of any trees, roots, fhrubs, or plants; to the value of 5 s. is by 6 Geo . III. c. 36 . made felony in the principals, aiders, and abettors, and in the purchafers knowing the fame to be folen: and by 6 Gco . III. c. 48 . and 13 Geo. III. c. 13. the flealing of any timbertrees, as oak, beech, chefnut, walnut, afh, clm, cedar, fir, afp, lime, fycamore, birch, poplar, alder, larch, maple, and hornbeam, and of any root, fhrub, or plant, by day or night, is liable to pecuniary penalties for the firlt two offences, and for the third is conflituted a felony, liable to tranfporsation for feven years. Stealing ore out of mines is no larceny, except the ftealing ore out of mines of black lead, which is felony without benefit of the cler ry by 25 Geo. II. c. 10. Stealing of writings relating to a real ellate is no felony, but a trefpais (s Hal.P.C. 510. Stra. 1137. ): bonds, bills, and notes are goods of which larceny cannot be committed by common law (8 Rep. 33.) : but by 2 Geo. II. c. 25 . they are put upon the fame footing with refpect to larcenies, as the money they were defigned to fecure. And by 7 Geo . III. c. $5^{\circ}$. if any officer or fervant of the pot-office fhall fecrete, embezzle, or deftroy any letter or packet, containing any bank-note, or other valuable paper, fpecified in the act; or fhall fteal the fame out of any letter or packet, he fhall be guilty of felony without benefit of clergy. Or if he fhall deftroy any letter or packet with which he has received money for the poitage, or advance the rate of poitage, and fecrete the money, he flall be guilty of fingle felony. By 26 Geo. II. c. 19. plundering or ttealing from any fhip in diftrefs, whether wreck or no wreck, is felony, without benefit of clergy. For the laws relating to firh and game, fee Slealing of Fish and Game.
Of all valuable domettic animals, as horfes, and of all aninals, domita nature, which ferve for food, as fwine, fheep, poultry, and the like, larceny may be committed; and alió of the Hefh of fuch as are firce nature, when killed. I Hal. P. C. 511 .

Although no lareeny can be committed, unlefs there be fome property in the thing taken, and an owner; yet, if the owner be unkrown, provided there be a property, it is larceny to fteal it; and an indictment will lie, for the goods of a perfon unknown. (I Hal P.C. 512.) This is the cafe of flealing a flroud out of a grave; which is the property of thofe, whocver they were, that buried the deceafer, but ltealing the corpfe itfelf, which has no owner, (though a matter of great indecency, ) is no felony, unlefs fome of the grave clothes be ftolen with it.

By the Roman law, the penalty of fimple and fecret larceny was the returning it two-fold; and of manifef larceny four-fold: manifell larceny was, where the crimimal was taken in the fact ; fimple, where he was not. The Lacedxmonians ncver punifhed larceny provided the perfon was not caught in the fact, but, on the contrary, it was applauded as a mark of dexterity and addrefs. See Lactdismonians.

The laws of Draco at Athens, which are faid to be written in blood, punifhed it with death; but Solon afterwards changed the penalty into a pecuniary mulct: and fo the Attic laws in general continued. By the Jewifh law, theft was only punifhed with a pecuniary fine, and fatisfaction to the party injured. (Exod. chap. xxii.) From thefe examples, as well as the reafon of the thing, many learned and icrupulous men have queftioned the propriety, if not law.
fulnefs
fulnefs, of inflicting capital puninment for fimple theft; and propofed either a pecuniary or a corporal punithment. Sir Thomas More in his Utopia, p. $4^{2}$. and more lately the marquis Becearia, Efr on Crimes and Punihments, chap. axii. have propofed that kind of corporal punifherent, which approaches neare? to a pecuniary fatisfaction, viz. a temporary imprifonment, with an ohligation to lalyour, firlt for the party rubbed, and afterwards for the public, in works of the mo!t flavih kind: neverthelefs the pummment of theft Atill continues, through the greatelt part of Europe, to be capital. Puffendorf (Law of Nat. 1. 8. c. 3.) and fir Matthew Hale (I Hal. P. C. I3.) are of opinion, that this mult be always referred to the prudence of the legifisture; yet both writers agree, that fuch pumifhment hould be cautioufly inflicted, and never wi:hout the utmolt neceffity. It is obferved, that our ancient Saxon laws nominally punithed theft with death, if above the value of I2d. but the criminal was permitted to redeem his life by a pecuniary ranfom: as, a:nong their anceftors the Germans, by a thated number of cattle. (Tacit. de Mor. Gerin. c. I2.) But in the ninth year of Heary I. this power of redemption was taken away, and perfons guilty of great larceny directed to be hanged, which law continues in force to this day. (i Hal. P. C. iz. 3 Init. 53.) See Felony. Pefif larceny hy common law is only punifhable by whipping or imprifonment. (3 Inlt. arso) Or, by 4 Geo. I. c. 1r. the punifment may be extended to tranfportation for feven years; but the punithment of grand larceny, or ttealing above the value of 12d. which fun was the Itandard in the time of king Athelftan, eight hundred years ago, is, at common lax, regularly death : upon which fir Henry Spelman obferved, above a century fince, when money was at twice its prefent rate, that while every thing elfe was rifen in its nominal value, and become dearer, the life of man had continually grown cheaper. And though the jury may exercile a kind of unwarrantable clemency, by bringing in larceny under the value of 12 d . and the benefit of clergy is allowed for the firl offence; yet in many cales of fimple larceny this is taken away by the ftatute: as from horic-llcaling (i Edw. VI. c. 12. 2 \& 3 Edw. VI. c. 33. 31 Eliz. c. 12. ), taking wool-len-cloth from of the tenters (ttat. 22 Car. II. c. 5.), or linen, fultians, calicoes, or cotton goods from the place of manufacture ( 18 Geo. II. c. 27 .), itealing theep or other cattle fpecified in the acts (I4 Geo. II c. 6. I5 Geo. II. c. 34 ), thefts on navigable rivers above the value of fos. ( 24 Geo. II. c. 45.), plundering veftels in difzefs, or that have fuffered fhipwreck (I2 Ann. ftat. 2. c. 18. 26 Gco . II. c. 19), Tealing letters fent by the poit ( $7 \mathrm{Gco}. \mathrm{III}. \mathrm{c}. \mathrm{50),}$. and Healing deer, hares, and conies under the circumitances recited in the Waltham Black act, ftat. 9 Geo. I. c. 22.

The Circaffians are faid to honour theft at this day ; infomuch that at their public fealts, their youth are not fuffered to drink, if they have not performed fomething remarkable in that way. Solinus tells us, that in Sardinia there was a fountain that had the virtue of difcovering a perfon that had committed larceny-

Compound or mixed larceny is that, which, befides all the properties of the former, has the aggravation of taking from one's houfe or perfon. With refpect to larceny from the houfe, fee Burglary and House-breaking.

It may be here obferved, that the benefit of clergy is denied: 1. In all larcenies above the value of $12 \%$. from a church, or from a dwelling-houfe, or both, any perfon being therein. 2. In all larcenics to the value of 5 s . committed by breaking the dwelling houre, though no perfon be thersin. 3. In all larcenies to the value of 40 . from a dwelling-houfe, or its out-houfes, without breaking in, and
whether any perfon be therein or no. 4. In all larecries to the value of $\bar{j}^{5}$. from any fhop, warehoufe, coach-houte, or ftable, whether the fame be broke open or not, and whether any perfon be thercin or no: whether thefe offences are committed by day or by night.
Larceny from the perfon is citlier by privately nealing; or by open and violent alldult, ufually called rolbery. The offence of privately Healing from a man's perfon above the value of $12 d$. as by privately picking his pocket or the like, without his knowled de, was debarred of clergy, fo early a ; by the flatute \& Fliz. c. I4. For the other kind of larceny foom the perfon, fee Rorbery. See alfo Felony.

Perluns who buy or recetive any ftolen goods, knowing the fame to be ftolen, fhall be deemed acceffaries after the fact: 3 W. c. 9 ; and by 4 Geo. c. nt they may be tranfo ported for fourteen years: and by 5 Ame, c. 3 t . fuch perfuns, and thofe who conceal any felons or thieves, fhall be deemed acceffary to the felont, and beng convicted on the tellimony of one witnefs thall fuffer death as a felon convict: but within clergy. If the principal felon cannot be taken, fo as to be profecuted and consicted, yet the buyer and receiver of tholen goods may be profecuted for a mildeme fnor. and punifhed by ine and imprifonment, or other fuch corpo: ral punilhment as the court flall think fit; which fhall exempt him from being punifhed as acceffary, if the principa? Thail be afterwards tuken and convicted. Receivers of atolens lead, iron, copper, brafs, bell-metal, and folder, fixed to or being in any houfes, out-houfes, mills, \&c. fhall, on conviction by due courfe of law, although the principal hath not been convicted, be tranfported for fourteen years. Sufpected places may be fearched, and fufpected perfons may be apprehended, and carried before two juftices, and if the perfon from whom the goods were received be not produced, or fome credible wituels do not depofe upon oath the fale or delivery of them, or roo fatisfactory account of them be given, they fhall be adjudgred guilty of a mifdemefnor. Every perion, to whom fuch geods fhall be offered for fake, or to be pawned, fhall apprehend the perfon offering them: and if it fhall appear, to the fatisfaction of two jultices, that fuch perfon did not apprehend, \&ec. the perfon who brought or offered the fame, then he fhall be acjudged guilty of a mifdemefor. And perfons for the two former mildemefnors, in having or carrying any of the faid goods, fhall forfict for the firit offence yos., for the fecond $4 \%$, and for ciery fubfequent offence $61 \%$; and for rot carrying a fuipectel perfua before a jultice, he fhali forfeit for the firt offence 20s., for the fecond 405., and for every fubfequent effence 4\%. ( 29 Geo. II. c. 30 ) By 21 Geo. ©I1. c. 69, every perfon who Shall buy or receive any pewter put or other vellel, or any pewter, knowing the fame to be ftolen os unlawfully come br, or thall privately buy or receive any tholen pewter, he thall, though the principal perfon be not convicted, be tranfported not exceeding: feven years, or detained in prifon and kept to hard labour not more than three years nor lefs than one; and within that time be once or oftener, but not more than thrice, publicly whipped. Perfons offering for pawn or fale goods fufpected to be itoler, may be feized and conveyed by a conilable or other peace officer before a juftice, who may commit them for any tirse not excceding fix days for examination, and afterwards, if the goods were itolen or clandefo tinely obtained, to the common gaol or houfe of correation. ( 30 Geo. II. c. 24.) Perfons advertiling a reward for helping to folen goods, and alfo the printer and publiher of fuch advertifement, fhall refpectively forfeit 50 . with colts ( 25 Geo. II. c. 36.). And by 4 Geo. c. 110 thofe who receise fuch reward, without apprehending the felso and bringing

## L $\Lambda \mathbf{R}$

him to trial, flall be guilty of felony in the fame manner as if they had tolen the fame. The charges of profecution and conviction, in refpect of any grand or petir larceny, may, by order of court, and at the prayer of the profecutor, be paid by the county treafurer, with a reafonable allowance for his time and trouble.. ( 25 Geo. II. c. $3^{66}$.) And by 18 Geo. III. c. 19, the fame charges fhall be allowed to the profecuter, whether the perfon tried be convicted or acquitted, provided that in this latter cafe it fhall appear to the court that there was reafonable ground of profecution, and that the profecutor had bond fide profecuted. And by ${ }_{27} \mathrm{Geo}$. II. c. 3. 18 Geo. 11I. c. 19. reafonable charges may be allowed and paid in the fame mamer, to a poor perfon who is required to give evidence: in Middlefex thefe charges fhall be paid by the overfeers of the poor where the perfon was apprehended. It is provided by flatute, that every perfon who thall apprehend any one guilty of houfebreaking or private ftealing, to the value of $5 s$. and profecute him to conviction, and all the executors or adminiftrators of a perfon flain in endeavouring to apprehend a houfebreaker or felon, fhall have a certificate without fee, under the hand of the judge, certifying fuch conviction, \&cc. which certificate fhall be inrolled by the clerk of the peace of the county where it is granted, and may be once affigned over and no more. By virtue of this certificate the original proprietor, or affignee of the fame, thall be difcharged from all parihh and ward offices, within the parifh or ward where the felony was committed. (Io \& 11 W. c. 23.) Every fuch perfon, and alfo the executors and adminiltrators of a perfon killed as before, fhall alfo have another certificate, which, on being tendered to the fheriff, and demand made, fhall entitle him to the fum of 401 . without fee, in one month after the tender and demand; on pain of forfeiting double with treble colts. ( 5 Anne, c. 31.) See Discoveri of Accomplices.
'The fheriff, on producing the certificates and the receipts for the faid rewards, may deduct the fame from his accounts; and if he have not money in his hands, he flall be repaid out of the treafury, on certificate from the clerk of the pipe; or he ray immediately apply to the commiffioners of the treafury, who fhall pay the fame without fee. 3 Geo. c. 15 .

LARCH-Tree, Lariz, in Botany. Linnæus refers this to the genus of pine. See Pinus Larix.

It is the common name of a kind of pine or fir tree, the leaves of which are long and narrow, and are produced out of iittle knots or tubercles, in the form of a painter's pencil; the cones are produced at remote diftances from the male Howers on the fame tree; the flowers are very like friall cones at their firlt appearance, but afterwards ftretched out in length. Thefe trees are propagated by feeds, which fhould be fown in the beginning of March, upon a bed of light foil, expofed to the morning fun only; or they may be fown in pots or boxes of light earth, and placed near a hedge, where they may be expofed to it. The feed fhould be covered about half an inch thick with fine light earth, and in very dry weather fhould be gently refrefhed with water. In about fix weeks, if the feeds be good, the plants will come up, at which time they fhould be carefully guarded againft rapacious birds, which would otherwife pull off the heads of the plants, as they thrult themfelyes out of the ground with their covers on them; and refrefh them with water in dry weather, efpecially if they are fown in pots or boses; alfo keep them clear from weeds, which, if fuffered to grow among the young plants, will foon deftroy them. In October, if they are in boxes or pots, remove them into a fituation where they may be defended from fharp winds,
which are fometimes hurtful to them, while young ; but afterwards they will endure the fevereft weather of our climate. Thefe trees are very proper for the fides of barren hills, where few other forts will thrive fo well; nor are they very delicate in regard to foil, but will grow much better on poor, ftrong, forny land, than in rich ground; during the fummer, they appear very beautiful; but in autumn they calt their leaves, and are not evergreen like the fir.

It has been obferved in the fifth volume of the Annals of Agriculture, that "larix wood is poffeffed of fo many valuable qualities, that to enumerate the whole would appear an extravagant hyperbole. It is known to refint water, without rotting, almoft for ever. The piles of larix timber on which the houfes of Venice were built many hundred years ago, when examined, are ftill found as frefh as when firlt put in. And he has been told, ftakes of it have been tried in the decoys of Lincolnfhire, which, between wind and water, have already out-worn two or three fets of oak fakes, and do not yet difcover any fymptoms of decay. It is alfo known to poffefs the valuable quality of neither fhrinking nor warping, when put into work; nor is it liable to be pierced by worms in our climate, as many of the paintings of Raphael Urban, which are done on this wood, and are ftill perfectly entire, fufficiently prove. Experiments have not yet afcertained whether it will refilt the fea-worm in tropical climates, like the Bermuda cedar; but there is reafon to think it would, as, in many of its other properties, it refembles that wood very much. Along with thefe valuable properties, it is known to be one of the quickent growing trees in this climate, remarkably hardy, and extremely beautiful when growing. It is, befides, much more eafily reared than the oak, and could be fpread over a great extent of mountains, if fufficiently bare of herbage, at sext to no expence, by the natural fhedding of its feeds, like birch or fir in foils that favour them, merely by leeping out cattle from thofe fields in which fmall clumps of this kind of wood had been planted fome years before. In this way very extenfive tracts in the condition juit defcribed might be entirely filled with this valuable timber. The ufes to which it might be applied are innumerable. It would be valuable not only for fhip-plank, but even crooked timbers might be obtained by uling a little art, when young, to bend it, as the Bermudians do their cedar; for flood-gates in navigable canals and wet-docks it would exceed every thing that can be obtained in this climate. For barrel-ttaves it would be inimitable, ond would enable us to furnihh that article as cheap as any other nation whatever; and in building it would anfiver all the purpofes to which fir is now applied, being much itronger and more durable than that wood. And wher it is alfo adverted to, that it is nest to incomburtible, the reader will not think it ftrange that he in this manner fo ftrongly recommends it to the attention of his countrymen, particularly thofe in the moft rugged and barren diftrits; for, in fuch fituations, it would be eafy to fhew, that, at a very trifing charge, they might, in a fhort period of years, bring their eftates to a hundred times the value they bear at prefent, or even can be made to bear by any other kind of improvement. This would be a much more eligible plan of bettering their fortunes than that of trying to fqueeze, with difficulty, from a poor people, a raifed rent, for a fubject that does not adurit of proportionable improvement. See Planting.

The common cone-bearing larch-tree grows naturally upon the Alps and Apemnines, and has been lately much propagated in England. Thofe trees raifed from feeds thrive beft in the worlt foil and fituation. There are two varieties of this tree, one of which is a native of America,

## I $\AA \mathrm{R}$

and the other of Siberia; neither of which thrive well in this climate. In Switzerland the wood of the commen larch-tree is ufed for building and covering the houfes; and in other countries, where it abounds, it is preferred for every purpofe to all the kinds of fir. In many places there are thips built of this wood, which are faid to be durable; and, therefore, this may be a very proper tree for planting upon fome of the cold barren hills in many parts of Eng. land, which, befides the profit they would yicld to their proprietors, would allo conduce to national benefit. The Venice turpentine is extratted from the larch-tree. Sce TurwENTIVE.

LARCHE, in Geography, a town of France, in the department of Correze, and chief place of a canton, in the diftrict of Brives. The place contains 569 , and the canton $66_{79}$ iuhabitants, on a territory of 135 kiliometres, in nine commumes.
LARCIANO, a town of Eitruria : five miles S. of Piloia.
LARDNER, NAThaNicl, in Biography, was' born at Hawkherti, in the county of Kent, on the Gth of June, 168 \%. He probably received his grammatical learning at Deal, which was his father's refidence, and where he was pattor of a congregation of Proteftant Diffenters; and from fchool he was removed to a diffenting academy in London, under the care of the Rev. Dr. Johua Oldfield ; but after flaying here a fhort time, he was fent, in the ycar 1699, and when he was only in his fixteenth year, to profecute his fludies at Utrecht, under profeffors D'Uries, Grevius, and Burman. In his journey he was accompanied by Mr. Martin Tomkins, and on their arrival they found there Mr. Daniel Neal. After fpending fomewhat more than three years at Utrecht, Mr. Lardner removed to Leyden, where he ftudicd about fix months. In 1703, he returned to England, and from this time to $1 \% 09$, we have no memorials concerning him. In the laft mentioned year he preached, for the firlt time, at Stoke Newington, from the words of the Aportle Paul, "For I am not athamed of the gofpel of Chritt," \&c. "There could not," fays his biographer, the excellent Dr. Kippis, "have been a more proper text, for a man who was deflined, in the order of divine providence, to be one of the ableft advocates for the authenticity and truth of the Chriftian revelation that ever exifted." In I7 $_{7} 3$, Mr. Lardner undertook the tuition of Mr . Brindley Treby, fon of fir George Treby, knt. late lord chief juftice of the common-pleas. Having conducted the ftudies of the young man, about three years, in lady Treby's houfe, where he was domeftic chaplain, he accompanied him in an excurfion into France, the Autrian Netherlands, and the United Provinces, which employed them about four months. It does not appear how long his connection, in lady Treby"s family, as tutor, lafted, but he continued to refide in the houfe till the died, in 1721. In 1723, Mr. Lardner was engared with a number of minitters, in carrying on a courfe of lectures, on a Tuefday evening, at the Old Jewry. The gentlemen who conducted the fe lectures preached a courfe of fermons on the evidences of natural and revealed religion. The pronf of the credibility of the gofpel hiltory was affigned to Mr. Lardner, and he delivered three fermons on this fubject, which probably laid the foundation of his great work, as from this period he was diligently engaged in writing the firlt part of the Credibility. In 1727, he publifhed, in two volumes octavo, the firlt part of "The Credibility of the Gofpel Hiftory ; or the facts occafionally mentioned in the New Teftament, confirmed by paffages of ancient authors who were contemporary with our Saviour, or his Apoftles, or lived near their time." This has been efteemed by perfons of all parties an invaluable performance, that has rendered the molt eflential fervice to the caufe of

Chriftanity. It has paffed through feveral editions. $I_{12}$ the ycar ${ }^{17} 2 \mathrm{~S}$, Mr. Lardner's life was long defpaired of, by the attack of a violent fever, from the offects of which lie flowly recovercd. With all his great merit, Mr. Lardncr, defirous of a fettlement as a diffenting minifler, did not receive an invitation for this purpofe till he was 45 ycars of age. It was in $x 729$ he became affillant to Dr. Harris, minither at Crutchedor Crouched Friars. About this period he publifhed "A Vindication of three of our bleffed Saviour's Miracles ; viz. The Railing of Jairus's Daughter, The Widow of Nairn's Son, and Lazarus," in anfwer to Mr. Woollton's attack on the fcripture account of Chrill's miracles. In 1733 , appeared the firft volume of the fecond part of "This Credibility of the Gofpel Hiftory ;" this volume comes down to the year 178 , and is prefaced by an introduction, giving a clear and very luminous hiftory of the New Tellament. It was immediately tranflated into the Low I)atch and Latin languages. The fecond volume was publifhed in 9735 , and concludes the author's remarks out of Chrittran writers of the fecond century. In 1736, he was attacked with another dangerous fever, the effects of which prevented him from preaching for feveral months. In $1 / 3 \mathrm{~S}$, Mr. Lareser publifhed the third volume of the fecond part of "The Credibility," ending with the year 233 ; in $15 \neq 0$, the fourth volume, which comes dorn to the year 248 ; and, in 1743 , he publifhed the fifth volume, which concludes with the year 306. About the fanie period he fent into the world another performance, entitled "The Circumitances of the Jewith People, an Argument for the Truth of the Chrifian Religion, in three Difcourfes." He brought out the remaining volumes of "The Credibility," at intervals between this period and the year 1755 , and in the next two years he added to this great and valuable work a fupplement, in three volumes, compriing a hiftory of the apofles and evancelins, with remarks and obfervations upon every book of the New Teftament. Our author, on account of his very high merit as a writer, had, in 1745 , received a diploma, conferring upon him the degree of doctor of divinity. In the year 1751, he retigned the office of preacher at Crutched Friars, having, during the preceding year, publifhed a volume of Scrmons, the fubjects of which are entirely of a practical nature ; and, in 1760 , he gave the world a fecond volume of thefe fermons. He had alfo publifhed many other fmaller pieces which were well received by the public; fuch was a fermon entitled "The Counfels of Prudence, for the Ufe of young People," for which he was thanked by Dr. Secker, at that time bithop of Oxford. The difcourfe has been very frequently printed, and has at the prefent moment a large fale. Lardner had alfo publifhed "A Differtation upon the two Epiftles afrribed to Clement of Rome, \&c.;", "An Effay on the Mofaic Account of the Creation and Fall of Man ;" "The Cafe of the Demuniacs, mentioned in the New Teitament ;" "A Letter to Jonas Hanway, Efq." to fhew that Mary Magdalen was not the linner mentioned in the feventh chapter of St. Luke's gofpel, but a woman of diftinction and excellent character, who for a while laboured under bodily indifyofition, which our Lord miraculoufly healed: and that, therefore, houfes intended for the reception of penitent prottitutes, ought not to be denominated Magdalen houfes. in $\mathrm{I}_{7} \mathrm{~h}_{2}$, he publifhed "Renarks on the late Dr . Ward's Differtations on feveral Pafliages of the facred Scriptures;" to which fucceeded, in 1764, "Obfervation:s upon Dr. Macknight's Harmony, fo far as related to our Saviour's Fiefurrection." Amidit thele varions productions of a fmaller nature, $\mathrm{Dr}_{\text {r }}$. Lardner continued the profecution of his grand object, and in the laft mentioned year he gave the world the firit volume of "A large Collection of ancient Jewih and Heathen

Teflimonies
'Tentimonies to the 'Iruth of the Chriftian Religion," comprifing the Jewith and Heathen authors of the firit century. The remaining three volumes were publifhed in intervals between this and the clofe of the year $176 \%$, and in them the biblical itudent is prelented with a noble trafure of curions and valuable information, and of able and judicious criticifin, for which the Chrittian woild is deeply indebed to the author. They complete the graad defign which had occupied 2 large portion of forty-threc years of Dr. Lardner's valual te life; and by them, though far from prolitable, he has raifed a monument to his fame, which can never perifl. Dr. Larduce lived to a very advanced age, and, with the exception of his hearing, retained the ufe of his faculties to the latt, in a remarkably perfect degree. In the ycar 1768 , he fell into a gradual decline, which carred him off in a few weeks, at Hawkhert, his native place, at the age of eighty-five. He had, previoully to his latt illnefs, parted with the copy-right of his great work for the niferable fum of 15 ol. but he hoped if the bookfellers had the whole interelt of his labours, they would then do their utmolt to promote the fale of a work that could nut fail to be ufeful in promoting the interelts of his fellow creatures, by promulgating the great truths of Cbrittianity on a rational foundation. After the death of Dr. Lardner, fome of his pofthumous pieces made their appearance ; of thefe the firit confitt of eight fermons, and brief memoirs of the author. In 1776 , was publifhed a fhort letter, which the doctor had writien in 1762, "Upon the Perfonality of the Spirit." It was part of his defign, with regard to "The Credibility of the Gofpel Hiltory," to give an account of the herctics of the finft two centuries. In 1780, Mr. Hogg of Exeter publithed another of Dr. Lardner's pieces, upon which he had beftowed much labour, though it was not left in a perfect fate; this was "The Hiltory of the Heretics of the firt two Centuries after Chrilt, containing an Account of their Time, Opinions, and Teftimonies to the Books of the New Teflament; to which are prefixed General Obfervations concerning Heretics." The lalt of Dr. Lardner's pieces was given to the world by the late Rev. Mr. Wiche, then of Maidllone in Kent, and is entitled "Two Schemes of a Trinity confidered, and the Divine Unity afferted;" it conlifts of four difcourfes; the firft reprefents the commonly received opinion of the Trinity ; the fecond defcribes the Arian fcheme; the third treats of the Nazarene doctrine; and the fourth explains the text according to that doctrinc. This work may perhaps be regarded as fupplementary to a piece which he wrote in early life, and which he publifhed in the year 759, without his name, entitled "A Letter written in the Year 1730 , concerning the Quction, Whether the Logos fupplied the Place of the FIuman Soul in the Perfon of Jefus Chritt;" in this piece his aim was to prove that Jefus Chritt was, in the proper and natural meaning of the word, a man, appointed, anointed, beloved, honoured, and exalted by God, above all other beings.

For the nany teftimonies given of Dr. Lardner's charaEter, the reader mult be referred to Kippis's life, pretixed to a complete cuition of his works, publifhed in 1788 , in eleven very large volumes, by the late J. Johnfon. One or two only fhall be quoted in this place. "The name of Lardner is well known in the literary world. No writer, from the very exiftence of Chriltianity, ever conferred fo effential fervice upon true religion, or contributed more to clear up its evidence and elucidate its antiquities. Accordingly, there is no country, where the Chriftian religion is profeffed, in which his name is not held in the greatelt efteem. Every church would have been proud to boalt .of him as their member, and his voluminous productions
have been tranfated into almoft all the languages of Eltrope."
"Dr. Lardner," fays his mott excellent biographer, "may be held out, in particular, as a line example to thofe of his own profeflion. As the Diffenters had the honour of producing Dr. Lardner, he will naturally be the object of emnation to the diffenting clergy. They will fo far took up to him as their pattern, as to endeavour to qualify themifelves for appearing, when occafions call for it, in the great departments of literature, and efpecially in the caufe of religious truth and liberty, and in defence of the facred writings."

The piety of 1)r. Lardner was fincere and ardent ; it was the governing principle of all his actions, and founded on jult and enlarged views concerning the nature of religion. The love of truth appears manifeftly in all his works; and no one ever feems to lave preferved a greater impartiality in his enquiries, or to have been more free from any undue bias. He foliowed truth wherever it led him ; and for the attainment of it he was admirably qualified, both by the turn of his difpofition and his underltanding. The candour and moderation with which he maintained his own fentiments, conflituted a prominent feature of his character. Benevolence, as well as piety, entered deeply into Dr. Lardner's character : he was ready to promote every good work; and to perfons in dittrefs he was ever willing to contribute, to the higheft degree which his fortune would admit. His manners were polite, gentle, and obliging ; and he was attentive in every refpect to the laws of decorum.

We may obferve, that to Dr. Lardner's great works we are usqueltionably indebted for Dr. Paley's "View of the Evidences of Chriftianity ;" nor is it too much to fay that if the former had not been publifhed, the latter, probably, would never have appeared; and jultice requires us to add, that fufficient acknowledgments were not made for the affitance which was derived from the labours of the excellent Lardner. It mult, however, be admitted, that the deficiencies of the aimable Paley have been fupplicd by his biographer Mr. Meadky; who, in fpeaking of his "View of the Evidences of Chriltianity," which appeared in 1794 , in three volumes, $12 m 0$. but which have in all fubfequent editions been printed in two volumes, 8vo. Mr. Meadley fays, "the direct hittorical teltimony for the authenticity of the Chriltian revelation, alrcady adduced by the indefatigable Larduer, is admirably felected and arranged in this important work: and the general argument drawn up with great clearnefs and felicity. The moit itriking of thofe collateral proofs of the credibility of the golpel hiltory, produced by the fame writer, are alfo here again prefented, in a novel and impreffive manner, and eftablifhed by auxiliaries of a different kind." Of Dr. Paley's works, a : id of his motives in the publication, too high encomiums cannot be paid, and it is to be regretted that in his preface he had not acknowledged his obligations to our author. Paley's View is capital as an abridgment of Lardner, Douglas, $\& c$. and his work has been twice, at lealt, abridged or analyfed: one of thefe abridgments was publifhed at Cambridge in ${ }^{5} 795$, and another in London in 1810 . Lardner's Works, and Life by Kippis; Meadley's Life of Dr. Paley ; and private information.

LARENSIS, in Ancient Geography, an cpifcopal fee of Africa, in the Proconfular province.

LARENTINALIA, in Antiquily, a feaft held among the Romans on the 23d day of December, but ordered to be obferved twice a year by Auguftus; by fome fuppofed to have been in honour of the Lares, but by others, with more probability, in honour of Acca Laurentia; and to have been the fame with Laurentalia.
LA REOLA, in Gegrapby. See La Reola.
LARES, among the Ancients, derived by Apuleius, De Deo Socratis, p. 689, from lar, familiaris; a kind of domeltic genii, or divinities, worhhipped in houfes, and efteemed the guardians and protectors of families; fuppofed to refide more immediately in the chimney corner.

The Lares were diftinguifhed from the Penates, as the former were fuppofed to prefide over houfe-keeping, the fervants in families, and domeftic affairs; and the latter were the , protectors of the mafters of families, their wives and children: accordingly, the Lares were dreffed in fhort fuccinct habits, to fhew their readinefs to ferve, and they held a fort of cornucopia in their hands, as a fignal of hofpitality and good houfe-keeping. According to Ovid there were generally two of them, who were fometimes reprefented with a dog at their feet. Falt. 5. v. 146 .

Plutarch diftinguifhes good and evil Lares, as he had before done good and evil Genii.

There were alfo fome public, others private Lares.
Apuleius tells us the domeftic Lares were no more than the fouls of departed perfons, who had lived well, and difchargrd the duties of their flation; whereas, thofe who had done otherwife, were vagabonds, wandering about, and frightening people, called Larve and Lemures; which fee.

The Lares were alfo called Penates, and were worfhipped under the figures of little marmoufets, or images of wax, filver, or earthen-ware.

The public Lares were alfo called Compitales, from compitum, a crofs-way; and Viales, from viat, a way, or public road; as being placed at the meetings of roads, and in the highways, and efteemed the patrons and protectors of travellers.
Their private Lares took care of particular houfes and families: thefe they alfo called Prafites, from preffo?
"Quod preftant oculis omnia tuta fuis." Ovid. Faft.
They gave the name Urbani, i.e. Lares of cities, to thofe who had cities under their care; and Hofiliz, to thofe who were to keep their enemies off. There were alfo Lares of the country, called Rurales, as appears by feveral antique infcriptions.

The Lares were alfo genial gods, and were fuppofed to take care of children from their birth. It was for this reafon that when Macrobius tells us the Egyptians had four gods who prefided over the birth of children, viz. the Genius, Fortune, Love, and Necelfity, called Prafitits, fome interpret him as if he had faid, the Egyptians had Lares; but they have mentioned that there was a great difference between the Lares of the Romans, and the Praftites of the

## LAR

Egyptians. However, the learned Mr. Bryant affirns that they were the fame.

The ancients differ extremely about the origin of the Lares. Varro and Macrobius fay, that they were the children of Mania: Ovid makes them the iffue of Mercury, and the naiad Lara, whom Lactantius and Aufonius call Larunda; Apuleius affures us they were the pollerity of the Lemures; Nigridius, according to $\Lambda$ rnobius, made them fometimes the guardians and protcctors of houfcs. and fometimes the fame with the Curties of Samothracia, which the Greeks call Idai daisyli. Nor was Varro more confiftent in his opinion of thefe gods; fometimes making them the names of heroes, and fometimes gods of the air.
T. Tatius, king of the Sabines, was the firft who bailt a temple to the Lares. The chimney and fine-place in the houfe were particularly confecrated to then.
Tertullian tells us the cuflom of worhipping the Lares arofe from this, that they anciently interred their dead in their houfes; whence the credulous people took occafion to imagine their fouls continued there alfo, and proceeded to pay them divine honours. To this it may be added, that the cultom being afterwards introduced of burying in the highways, they might hence take occafion to regard them as gods of the highways.

The victim offered to the Lares, in the public facrifices, was a hog: in private, they offered them wine, hiconte, a crown of wool, and a little of what was left at the tab e. They alfo crowned them with flowers, particularly the violet, myrtle, and rofemary. Their fynibol was a dug, which was ufually reprefented by their fide, on account of its fidelity, and the fervice it does to man, in watching his houfe. They were fometimes alfo reprefented as clothed in a dog's kin.

See farther on the Lares, in Arnobius, Laetantius, Augultine de Civit. Natalis Comes, Lambin. on Plaut. Aulul. and on Hor. Cafaubon on Sueton. \&c.

The term Lares, according to Mr. Bryant, was formed from laren, an ancient word by which the ark was reprefented; and he fuppofes that the Lares and Manes were the fame domeltic deities under different names; and that by thefe terms the Etrurians and Latins denoted the dii arkita, who were no other than the arkite anceftors, or the perfons preferved in the laren or ark; the genius of which was Ifis, therreputed parent of the world. He obferves farther, that they are defcribed as dxmons and genii, who once lived on earth, and were gifted with immortality. Arnobius, hib. iii. P. 124. fty!es them Lares quoflam genios \&o fundorum animas; and he fays, that according to Varro de Ling. Latin. lib. viii. p. 113 , they were the children of Mania. Huetius Demonft. Prop. 4. p. I39. adds, that Mania had alfo the name of Larunda; and fhe is ftyled the mother of the dxmons. By fome the is called Lara, and was fuppofed to prefide over families; and children were offered at her altar in order to procure her favour. Macrob. Sat. lib. i. c. 7. P. ${ }^{154}$. In lien of thefe they in aftertimes offered the heads of poppies, and pods of garlick. Anal; of Ancient Mythol. vol, ii. P. 449, \&sc.

The pantheons. or images reprefenting feveral gods at once, were allo called Lares. Harpocrates was one of thefe.
Lares, or Laris, in Ancient Georraphy, a town of Africa Propria, according to Ptolemy, who places it in the territory of Cirtha.

LARNE, in Gegrapt,y, a fea-port and poit-town of Ireland, in the county of Antrim. It is fituated on the north-weltern extremity of Larne Lough, and has a good yarn market once a month. There are great falt-works here, and its exports contift of falt, lime, limellone, and fome provitions. It is 97 miles N. by E. from Dublin. N. lat. $54^{\circ} 51^{\prime}$. W. long. $544^{\prime}$.

Larne Lsugh, a bay on the eaft coaft of this countr of Antrim, Ireland, called Oldheet haven by Boate, and Tíolderfrith in the enumeration of the havens by Stanihurft. It is formed by the peninfula called Ifland Magee, and is faid by M•Kenzie to be a fmall but fafe harbour, where veffels that draw not above ten feet water may ride on clean goodholding ground. It is about fix miles long and one wide.

LARNIC, or Lariica, a fca-port town on the coalt of the illand of Cyprus, the fee of a Greek bihop, and the refidence of feveral European conful;. The Turks have a nofque, and the Greeks have three churches. It is now a poor place, though the road-ftead is good; 30 miles S.W. of Fainagofta.

LARNTUKA, or Lariruntuks, a fea-port town on the S. fide of Ende, one of the Molucca inlands, with a good harbour. S. lat. $\mathrm{S}^{\circ} 15^{\prime}$. E. long. $123^{\circ} 57^{\prime}$.

LAROAH, a town of Hindooftan, in Guzerat ; io miles E. of Baroach.

LAROCHE, a town of France, in the department of the Sambre and Meufe, and chief place of a canton, in the diltrict of Marche. The place contains 1006, and the canton 6167 inhabitants, on a territory of 250 kiliometres, in 20 communes.
LAROS, a town of Turkifh Armenia, on the coant of the Black fea; i8 miles S.W. of Gonieh.
LAROTAVA, a town of the illand of Teneriffe.
LAROW, a town of Hindoottan, in Bahar; 10 miles S. of Gayah.

LARRAGA, a town of Spain, in Navarre; in miles E. of Eftella.

LARRASOANNO, a town of Spain, in Navarre; 12 miles N.E. of Pamplona.

LARREA, in Botany, named by Cavanilles, in honour of Don John Anthony Hernandez de Larrea, dean of Saragoffa, a liberal encourager of chemiftry, botany, and agriculture. 'The author had, in his fourth volume of Iconcs, p. 63, fuppreffed this name, given by his countryman Cr-: eega to another genus, and had changed it to Hofrmarl fegix,

## I. A R

being then, as if feems, not fo fenfible of the dean of Saragoffi's botanical merits at he afterwards becance. -Cavan. 1 : v. 6. 39. - Clafs and order, Decandria Almaisyriaz. Nat. Ord, Graimales, Limn. Rulacee, Juff.

Gen. Ch. Cal. I'erianth inferior, of five ovate, concave. rather unequal, decidunus leave: Cor. P'etals five, equal, ovate, with claws. Stam. Filaments ten, rather fhorter than the corolia, awl-fhaped, equal, each furnified at its bafe, on the infide, with a cloven feale, applied clofe to the germen ; anthers heart-fhaped, erect, fimple: 12if. Germen fuperior, globofe, with live decp furrows; Ityle awl-thaped, with five angles, nearly equal to the ftamens; ftigma fimple. Peric. Drupas five, dry, cohering by their acue inner margin, externally convex, of one cell. Nuts folitary, ovateoblong.

OUf. There are the radiments of feveral feeds in the young fruit, though only one of them comes to perfection in each nut. The genus comes near Zyrob/yiluma and Fogonia.

Efr. Ch. Calyx of five leaves. Pecats five. Nectary of five cloven leaves, covering the germen. Drupas five, finglufacued.
i. L. nilida. Shining-leaved Larrea.--Cavan. Ic. t. $55 \%$ Leaves pinnate. Fruit fmooth.-Gathered at Buenos Ayres by Louis Née, flowering in April. It has been railed with good fuccefs in the garden of Madrid, and we lave fpecimens from Cavanilles himfelf. The fent is frubby, nine feet high in its mative country, hayd, knotty, very, much branched, the branches round, rather zig-zag, repeatedly fubdivided, fpreáding, two-ranked, leafy, rough, vilcid. Leaves oppolite, feffile, twice as long as broad, about half an inch in lengeth, Maining, glutinous, fmouthint, minutely dotted, each compofed of about feven ur eight pair of crowded, two-ranked, oblique, feffile, obiong, ubw tufe, entire leaflets, of which the two uppernort are unequal and very finall, looking as if there were an odd one at the evd. Stipulas oppofite, triangular, acute, reddifh. Filowers axillary, Lolitary, alternate, deep yellow, on roughin Railse, thorter than the leaves. The germen is hairy, though tive fruit is naked, or only clothed with fine fhort down. Its outer coat is coriaceous and rugged. Nh:'s withont, ralver or futures.-The whole plant exudes a corions glatinous refin, of a flrong feent, fill sery powerful in the dised feccimens, and intolerably fo on their beins moi!encd with proct fpirit, whichextrats from them abuaduce of a yeilow fetid folution.
2. L. ditarichti. Spreadiog lobed Iarrea-Cavan. Ir.
 Fruit hairy. Fourd wth the fomer, flowering at the fame feafon. The fora is fhrubby, fix feet high, with much of the habit of the foregoing; but the learies are fimple, very deeply cloven into two fpreadiug acute lobes. The forers are yellow, larger than thofe of $\mathcal{L}$. nitida, with obtufe petals; and the fruit is befet externally with long prominent hairs.
3. L. cuadifoita. Wedge-Inaved Larrea, - Cavan. Ic. t. 560.f. 2.-Leaves wedge-?naped, cloven at the end, with an intermediate briftle- This appears to differ in foliage only from the lafk, along with which it was fourd.
Thefe plants promife to be not unworthy of attention for their dyeing qualities. Cavanilles fays, ten leaves of the divaricafa, boiled in a quart of water, with the litele brancli on which they grew, tinged the whole liquid of a deep faffron colour.

LARREY, Isacic de, in Biogra, b;, born of a noble French family in 1638, was brought up to the profeffion of the law. It sece! fome time as an sdvocate in his na-

## L A R

tive province, but having been educated in the reformed religion, he was obliged to quit his country at the repeal of the ediet of Nantes. He went from France to Holland, and obtained the office of hiftoriographer to the States-general. An invitation from the elector of Brandenburg induced him to remove to Berlin, where he died, in 1719 , at the age of eighty-one. His principal works are "Hittoire d'Angleterre," 4 volso: "Hiltoire de Louis XIV." 3 vols. quarto ; "Hittoire d'Augufte "" "Hiftoire des Sept Sages," 2 vols. 1713 . Of thefe his Hiftory of England is moft efteemed, and was in high reputation on the continent till that of Rapin was publifhed. Larrey was a man of great integrity, zcalous for his religion, and warm both in praife and cenfure, Moreri.

LARRISOUN, in Geograpby, a town of Perlia, in the province of Mazanderan ; $6 ;$ miles S.W. of Fehrabad.

LARROQUE, MATTHEw De, in Biography, an eminent French Protellant divine in the 17 th century, was born at Leirac, a fmall city of Guienne, near Agen, in the year 1619. He was educated with a view to the church, and applied himelf, in early life, with great diligence to the fudy of the belles-lettres, philofophy, and theology. Having made great progrefs in all the various branches of ufefuil knowledge, he was admisted a minifter with great applaufe in the province of Guienne. He was afterwards appointed, by the duchefs de la Tremouille, miniter of the church of Vitrè, in Brittany. Here he officiated nearly thirty years, during which time he applied himfelf mott earneftly to the Itudy of the fathers, and Chrittian antiquities. He was tiext invited to become both minifter and profeffor of divivity at Saumur : he readily accapted the former office, but $i$ icclined the latter, not thinking it to be confifent with the courfe of ftudy in church-hifory, to which he had a preva$b_{c}{ }^{6}$ inclination. Before he could take poffeffion of his office, he received a prohibition from the intendant of the province, forbidding him to enter upon its duties. He therefore continued at Vitrè, and emplojed his time very ufefully in compofing works of merit. In a fhort time he received three invitations at once, from three of the moft confiderable churches in the kingdom, viz. thofe of Montauban, Bourdeaux, and Rouen. He made choice of the latter, at which place he died in 1684, at the age of fixty-five. His works are numerous, and they acquired for the author a high reputation for real learning, as a theologian. He was a pious and faithful paftor in the church; and in the world an honelt man. Mureri.

LARRY-BUNDER, in Geography, a fea-port of Hindooftan, in the prorince of Sindy, on a branch of the Indus, called the Pitti, about 20 miles from the fea. It has a good road for fhipping, and the river is navigable for frall veffels. The town contains about 100 houfes, and is defended by a fort; $4^{8}$ miles W.S.W. of Tatta. N. lat. $24^{\circ} 45^{\prime}$. E. long. $66^{\circ} 42^{\prime}$.
Larry-bunder is alfo the name of a branch of the Indus; which fee.
LARS, a town of Ruffia, in the government of Caucafus ; 56 miles S.E. of Ekaterinograd.

LARSMO, a fmall inand on the E. fide of the gulf of Bothnia. N. lat. $63^{\circ} 4^{6^{\prime}}$. E. long. $22^{\circ} 39^{\prime}$.

LARV $A$, in Natural Hifory, a name given by Linoxus to infects in that ftate, called by other writers eruca or eaterpillar. See Entomology and Insects.
 her or lars, fignifying prince or lord, denoted the ghofts of the deceafed, confidered as vicked and mifchievous. Hence is formed the term larvatus, i. e. larva indutus, or demoniac.

The ingenious Mr. Farmer urges the etymology and ufe of this term to prove, that the heathen demons were deified human ghofts. The term lar was applied not only to their domeffic, but alfo to their celffial gods, the dii majorum gentium, who were all natives of this lower world; and anfwers to the word Daspayo Quos Greci dxppevas, noltri, opinor, lares. Cicer. in Timæo. 3. (See Lares.) The larve were cqufidered as mifchievous fpirits : and this author fays, that the larvati were demoniacs; but the larve, with which they were poffefed, were human ghofts; fuch alfo as demons were. Eff. on the Demoniacs, p. 27, \&c.

The larve were alfo called lemures.
LARUCACHI, in Geograpby, a town of Peru, in the diocefe of La Paz; 110 miles N. of Chucuito.

LARVIGEN, or LAUkwig, a fea-port town of Norway, in the diocefe of Chriltiania, and capital of a county, deriving from it its name, fituated at the conflux of two rivers near the fea. Its trade is confiderable, and its ironworks are the moft valuable in Norway ; 56 miles S.S.W. of Chriftiania. N. lat. $59^{\circ} 3^{\prime}$. E. long. $10^{\prime} 15^{\prime}$.

LARUNS, a town of France, in the department of the Lower P'yrenées, and chief place of a canton, in the diftrict of Oleron'; 18 miles S . of Pau. The place contains 3607 , and the canton 3855 inhabitants, on a territory of 445 ki liometres, in S communes.
LARUS, in Ornithology, a genus of the order Anferes. In this tribe the bill is ftraight, acute at the edges, hooked at the tip, and deflitute of tecth; the lower mandible gibbous below the point; noftrils linear, broader on the fore part, and placed in the middle of the bill. Thefe are the gulls of Englifh writers; a race of birds very widely diffufed throughout the globe, fome of the fpecies inhabiting Afia, $f_{1}$ frica, and Europe, others Europe, Afia, and America, but the far greater number of fpecies are natives only of the northern regions of America and Europe, as Hudfon's bay, Iceland, Greenland, and the north of the European continent, beyond which, towards the fouthward, their number materially diminifhes. Many of the fpecies found in northern latitudes inhabit the Britifh ifles, refiding on our fhores the whole year; others are extremely rare with us, or at lealt can be confidered only as accidental vilitors driven from more northern countries in fevere winters. The haunts of the gull tribe are the borders of the fea, and marthes immediately in its vicinity, or in the depth of winter they fometimes retire inland, but only into fuch parts as are abundantly firpplied with water, their food confifting principally of fifh and worms. The gulls have a light body, the wings long; tongue rather cloven; legs fhort, naked above the knees, and the hind toe very fmall. They are very voracious, and when terrified are faid to caft up the indigefed food they have lately fwallowed. The fpecies of this genus are not very clearly difcriminated, owing to the variations that prevail in the colours of the plumage in different ftates of growth, till the birds have attained thcir third year. This genus is divided into two fections, in the firlt of which the nolfrils are without a cere, and in the other are covered by one.

Ictuyztus. Snowy; head entirely, and neck to the middle, deep black; eyelids white. Pallas. Larus albus, \&c. Oedm. Die grofe Lacbrocve, Gmel. Great blackkeadedgull.

A natire of the borders of the Cafpian fea. The fize that

## LARUS.

of the bernacle goofe, or larger. The bill is fcarlet, with yellow bafe, the tip yellow with a brown fpot; the inlide of the mouth red; tail white, even at the end, and reddiif brown. This fpecies lays its eggs on the bare fands; the eggs are of an elongated oval form, marked with brown fpots intermingled with others paler. When in llight it utters a hoarfe cry like that of a raven.

Rissa. Whitifh; back hoary; quill-feathers white : pofterior toe unarmed. Larus rific, Limn. Gmel, \&c. Larus tridactylus, Lath. Kittizwake Penn. Donov. Br. Birds, \&c.

Length fourteen inches; the bill yellowifl; mouth faffron withn; head, neck, belly, and tail fnowy; wings hoary, the outer edge of the firlt and tips of the four or five feathers next fucceeding white; legs dufly; pofterior toe refembling a wart. It varies in fometimes having behind the ear a dullky fpot.
This kind of gull inhabits the cliffs on the north coatts of Wales and Scotland, from whence it extends as far as Greenland, Spitzbergen, and Iceland, the aretic coatt of Aha, and Kamtfchatka. The leetanders call it Riffa. Fabricius, in his Faun. Groen. detcribes this as the adult Itate of tha Tarrock, an affirmation contradicted by fonte authors and admitted by others, while again fume few are of opinion they may be the two fexes of the fame fpecies.

Tridactylus. Whitifh, back hoary; tips of the tailfeathers, except the outer one, black; feet three-toed. Linn.

Larus tridactileusf, Lath. Kuu/se-gef, Klein. Tarrock, Will. Donov. Br. Birds, \&c.
Frequents the fane rocky coants of the fea as the former. The eggs, two in number, are greenifh-ah, fpotted wih brown; they are noify, fwim well, and remain on the wing for a confiderable time. The flefl andeggs are efteemed by the natives of Greenland, and their fkins ufed as garments. Length fourteen inches; bill and legs dully; ; head, neek, and body beneath white; wings varied black and white; tail black at the tip.

In the Bankfian collettion is a fuppofed variety of this fpecies exceeding the common tarrock in fize, being five inches longer ; in this the wings are marked by an oblique black band, and the chin white; the outer tail-feathers entierly white. This inhabits Kamtfchatka.

Minutus. Snowy; head, and beginning of the neck black; back and wings ruffet; bill brown-red ; legs fcarlet. Pallas. Gmel. La plus petite des mouettes, Vieill. Little gull, Lath.

Size of a thrufh ; irides blueifh ; tail equal and white ; in'habits near rivers in Siberia and Ruffia.

Eburneus. Entirely white; bill and legs lead colour. Gmel. Phipps, \&c. Larus niveus, Act. Holm. Larus candidus, Fabr. Fis. Gr. La mouette blanche, Buff. RathJeer, or Ratzher, Ray. Ivory gull, Arct. Zool.

The length of the fpecies is fixteen inches, the breadth thirty-feven; the bill paler at the tip; wings much longer than the tail; Iegs lead colour, the claws black. This bird inhabits the Frozen fea between Afia and America. From its ftately gait when walking on the ice, and the ftrength of its voice, it is faid to have obtained the name of Ratzher, or Senator. The flefh of the morfe conltitutes its favourite food; befides which it fublints on worms and fiftes. During the fummer, it vifits the little ines and lakes in the interior, where it forms a neft compofed of dried herbage, and lays four eggs of a white colour. The young are fpotted with black principally on the back and wings, and the beak is of the fame colour.

Candus. White; back hoary; primary quill-feathers
black at the ends, the fourth and fifth with a black fyot at the tip, the outer one black without. Lath.-Larrus Canus, White, back hoary. Linn. Fn. Suec. Larus cinercus minur. Common fea-merv or mall, Ray. IV bile web-footed gull, Albin. Common gull, Arct. Zool. Donov. Brit. Birds, \&c.
Common on the coalt of Britain, and in various parts of Europe and America. The length feventeen inches; bill yellow; legs greenifl-white, or fometimes reddifh. It forms a neet chicfly of fea-weeds; the eggs are large, deep olive, and marked with dark irregular blotches, (Vide Brit. Birds.) This kind of gull extends as far north as Iceland and the Rufian lakes, and occurs alfo on the borders of the Cafpian fea, the various fhores of the Mcditerrancan, and thofe of Greece. Its breeding places are the hollows in rocks and cliffs near the fea.

Hybernus. Cincreous; bencath fnowy; head white. varied with fufcous fpots; neck above fufcous; wings varied; tail-feathers white, with a black band.-Larus Hybernus, Gmel. Larus canus B, Lath. Gavia byberna, Briff. Larus machlatus, Brunn. Mouctle d'byver, Buff. Guaca-guacu, Ray. Winter mesu, coddy modity, Wi.1. Donov. Brit. Birds. Whinter gull, Lath. Synop.
Feeds on reptiles and fmall fifhes. This kind is very common in England, and is obferved to iwhabit further inland than any other of the gull tribe. In Ind. Orn, of Larham it is defcribed as the young of the foregoing fpecies. Length feventeen inches.

Runibuxdus. White; head blackifh; bill and legs red. Ed. Nov. Act. Stockh. Larries rudibundus, Linn. Larus albus erytbroceptblis, Klein. Brozin-beadral gull, Albin. Donov, Brit. Birds, \&c.
Length fourteen to fifteen inches; the eye-lids the fame colour as the bill and legs; firlt, ten quill-feathers white, with the edge and tip black. Inhabits Europe and Ame. rica, and makes a laughing kind of noife. The eggs, three in number, are greenifh-brown, fpotted with tawny. Gmetin admits two varieties of this fpecies: one of a white colour, with hoary back, and the head and bill blackiih, as defcribed by Nozena; the other is white, with blue legs, the bill at the bare blue, at the tip yellow. Latham in Ind. Orn. confiders as varieties of rudibundus the Limnaan larus cinerarius, and alfo larus erythropus of Gmel., both which are placed as diftinct fecies in the preceding publication. Gen. Syn.

Marinus. White; back black. Linn. It. Wgoth. Larus dorfo nigro, podibus rubris, CEd. Gooland noir, Buff. Great black and zubite gull, Ray. Black-backed gull, Arct. Zool. Dunov, Brit. Birds, \&c.

Native of the maritime parts of Europe and America, the Cape of Good Hope, New Holland, \&c. The length twenty-nine inches; the bill yellow, with a red fpot near the tip, and in the middle black; quill-feathers black, with the tips white, and the legs flef3-colour. Feeds on fin and young birds.

Nevius. White; back cinereous; tail-feathers at the tip black. Gmel. Wagellus corrubienfium, Ray. Wagel. gull, Will., \&e. Donov. Brit. Birds, \&cc.

This fpecies inhabits the fhores of European feas.- It length is about two feet ; the bill black; legs dirty fehmcolour. This is by fome efteemed the female of the foregoing (marinus), and by others as either a variety rather than a diftinct bird, or as the younger bird. The bird defcribed by Brunnich under the name of larus argentatus, the filvery gull of Latham, is likewife confdered as a variety of L. marinus.

Fuscus. White; back brown. Linn. Fr. Suec, La-
, 8 ius srifous, Brili. Larus cincrcus maximus, Marld. Goè. Land ì manteau gris-brun, Buff. Merriag gull, Will. Donov. Brit. Birds, Sic.

Inhabits Europe, America, and Afia. The length twenty-three inches; bill and legs in the adult bird yellow; eyes thaw colour. The birds feed on the herring, the nioals of which it purfues, and thus directs the fifhermen to the capture of that fifh. The eggs, three in number, are whitin?, fpotted with black.

Graveus. White; back and wings hoary; quill-feathers tioped with white; bill yellow, at the ancle faftron. CEd. Luarus albus, Olaff. Goeland cendré, Bulh. Burgermeifer, Martens. Gluucous gull, Arct. Zool.
luhabits. Sweden; is larger than the herring gull, very voracious, and feeds on fmaller birds, fifh, and carrion.

Atmenles. Whitin; head blackinh; bill red; legs -hlack. CEd. Gavia rudilunda, Brift. Laras albus, Scop. Larus minor, S's. Klein. Dalhuer's great a/b-colourcel fea-mew, Will.

Length eightcen inches. Flies in flocks, with a continual clamour; builds in pine trees, and inhabits America and Europe.

Atricilloides. Reddifl-white; head, orbits, and neck black; back and wings cinereous; legs fcarlet. Falck. Gmel. Siberian gull.

Smaller than the former. This" inhabits the falt marfhes of Siberia.
** Nofrils covered ruils a Ccre.
Parasiticus. 'Two middle tail-feathers very long. Linn. Sierna, EJc. It. Wgoth, Catarracla parafitica, Priinn. Siercorarius, at ficroorarius longicaudatus, Briff. Avis Norwegical $k_{j u z f} f_{b}$, Ol. Labbe à longue queue, Buff. Araic bird, EXwards. Arctic gull, Donov. Brit. Birds, \&x.

Length twenty-one inches; the bill and legs dufky; hody above duky, beneath, with the temples, and front white; breaft with a dukky band; female brown beneath. Very rare in Britain. 'The fpecies is found in the north of Europe, and alfo in Afia and America. It is of a rapacious dilpofition, and will purfue the leffor gulls in the air till they mate, when, infantaneoully darting down, it dexterouny catches the excrement before it reaches the water, and devours it. The eggs are cinereous, fpotted with black.

Crepidatus. Dufky-white and brown, varied; two middle tatl-feathers longer ; anterior half of the feet black. Donov. Br. Birds. Larus crepilatus, Gmel. Hawkefw. Catarrafla copphes, Briun. Stcrcorarius fliatus, Briff. Blackjoed gull, Arct. Ziool. \&c.

This, like the former, is very fcarce in Britain; its length is fixteen inches; the bill black, with the tip orange; brealt and belly whitif, with numerous darkifh lines. The two middle tail-feathers longer than the relt; and the anterior half of the feet black; the polterior, with the legs, paler and yellowifh, or, as it fometines appears, blueif.

The defcription of the black-toed gull in Dr. Latham's Kynopfis, is an exteact from Pennant's Britifh Zoology, befides which Dr. Latham mertions another bird of the fame kind in the late Leverian mufeum, which had the lghter half of the feet, with the legs, yellow inflead of blue. In the defeription of this Latter bird Dr. Latham obferves, how ever, that "the two middle tail feathers are not particularly longer than the others;" and arrain in Ind. Orno, this author hefitates apparentily from this circumftance, in addi. tion to the yellow colour of the legs, whether it fhould be al mitred as a variety of larus crepidatus, or be efteemed a diftinet fpecies. It becomes therefore detirable to add that the defoription afforded us by Dr. Latham is not, in this
refpect, entirely free from crror; that able ornitholowit was, in fome manner, deceived, perbapa from the fituation of the bird itfelf, which might preclude the posfibility of an attentive infpection. Be this as it may, the Leverian fpecimen recorded by Dr. Latham, and alfo another from the fame collection, are both in the mufeum of the writer of this article; in one of thefe (which we conceive to be the male) the two middle tail feathers are nearly as confpicuounly longer than the refl, as in the Arctic gull projecting begond them fcarcely lefs than two inches; and in the other, which we apr prehend muft be the female, they are advanced above an inch beyond the rett; in other particulars they accord pretty generally with D r. Latham's defeription, and, as that writer obferves, the lighter parts of the feet, with the legs, are ycllow. We have befides this another example of this bird, a fpecinen recorded as being fhot near Oxford, in which the legs are black and yellow, as in the former, from whence wo may conclude thofe to be the true colours, except perhaps in certain varieties.

Cataractes. Greyifh; quill and tail-feathers white at the bafe; tail fub-cqual. G.mel. Catharafa fkua, Bruinn. Larus fufcus, Briff. C'atarrafles, Gefn. Skuabycri, Cluf. Goiland-brun, Buff. Corniff gannt, Ray. Brown gull, Albin. Skua gull, Donov. Brit. Dirds, \&c.

Length two fect; the bill dufky, and much hooked; upper mandible covered half way down with a black cere; body brown; beneath rufty-cincreous; legs blackifh, rough, and warty: claws hooked and black; pofterior toe fhort, and armed with a flarp hooked claw. This voracious bird inhabits Europe, Afia, and America, and is remarkable for its roracity and ferocious difpofition, efpecially in the brecding feafon. It feeds on fifh, and all the fmaller kinds of water-birds, and is the terror of the leffer birds of its own tribe, which it haunts on the wing, till they mute or vomit up what they have eaten, and then devours it.

Kreask. Brown; wing-coverts variegated with white; tail black, fpotted and tipped with white. Lath. Ind. Orn. Esquimaux gull, Arct. Zool. \&c.

Inhabits America, as far as Hudfon's bay; the length is twenty-two inches; the bill and legs black; toes and :embrane half black, half white. It arrives at America in April, conftructs a flight neft of grafs, and lays two pale ferruginous eggs fpotted with black.

LARYNGEAL, in Anatomy, an epithet applied to parts belonging to the larynx. The laryngeal arteries are the veffels more commonly deferibed under the name of thyroid arteries. The laryngeal nerves, fuperior and inferior, are branches of the par vagum. See Nehve.

LARYNGOTOMY, (from $\lambda \alpha$ fuy $\xi$, the upper part of the windpipe, and $\tau+\mu v a$, to $c u t$,) an operation in Surgery, which confits in making an artificial opening into the larynx with a knife, a meafure fometimes neceflary in certain cafes of difeafe to prevent fuffocation, as well as to enable the practitioner to inflate the lungs in inftances of fufpended animation. The incifon is now generally made in the windpipe. itfelf, and the operation called tracheotomy. See Tracheotomy.

LARYNX, in Anatomy, a hollow organ, placed between the root of the tongue and the trachea, giving paffage to the air into and out of the lungs in refpiration, and producing the voice,

The organs of locomotion, whether thofe of the limbs or of the trunk, are the principal means by which man re-acts on thofe extermal objects which have acted on him through the medium of the felles. They are particularly deftined, in the natural ftate, to provide for the wants of digeftion, of which they collect the materials. They alfo fumifh the animal with

## I $\Lambda R Y N X$.

the means of oftence and defence, of which digention is in general the immediate object. But focial man has vally extended the domain of this function. Subnitted, through the cercbral nerves, to the direction of intellect, it is the influment by which moft of the conceptions of the latter are execured: and if the valt fiold of activity opencel io our view in the arts fhews the extentive agency of this power, it proves no lefs clearly how greatly the fothere of action of the locomotive organs has been iucreafed. Man in fociety not only derives from his voluntary mufeles, by acguiring extreme precifion in their motions, much greater advantages than thole to which the limited operation of iuttinct confines anmals, but he has allo given to them another direstion-they ferve him as a falent language, and a mede of intellectual communication. The head, the arms, the eyes indicate to us what the volce does not difclofe ; but geftures are in general only fup. plementary to the latter function.

Speech is the chief means of cur intellectual communications: and here we have occafion to obferve how vait!y the functions of the larynx are extended by man in fociety. 'This extenfion is fill greater than that which the locomotive agents offer to our view in the arts where indultry has been pufhed the fartheft. Originally nature beftowed on man merely a voice, the chief object of which was, to ettablifh thofe relations which bring together the fexes. Hence the clufe connection between the voice and the generative organs: it has, like them, a true period of puberty, whether in animals in whom it does not exill at all until that epocha, or in thole, where, exilting antecedently, it undergoes at this time a remarkab'e change. Remove thefe organe, and a new and peculiar moditication of the voice foon thews iffelf. Each fex has a voice dittinguithed by particular characters : energy and force belong to that of the male; flexibility, deliwacy, and grace to that of the female. Moit animals em. ploy their voice chiefly at the rulting feafon; many are dumb at all other times: We camot therefore avoid the conchfron, that, in the natural late, the communications of the two fexes relating to gencration are the particular object of the preduction of found. Wan in fociety has deltroyed this original deltination, and at the fame time created another, of which the extent is bounded only by the limits of his inteiligence. 'The mere voice, which fufficiently enables the individuals of both fexes to exprefs the mutual wants connoeted with the generative functions, is inadequate to the conveyance of thofe which have arifen out of the Itate of fo. ciety. It has therefore been modified; fpeech is the refult of that modilication; and thenceforth the larynx has performed a part in fociety not lefs impertant than that of the locomotive organs. Thefe two modes of communication, which man enjoys, are almoit equally empioyed, and produce, each in its way, neariy equal effects. If one be the organic inftrument of all the arts, and of all the affections which the mind experiences in the focial date through the eyes, the other is the agent of all that belongs to the domain of inceligence, of all that the mind perceives throush the ears. Compare the valt itock of iteas, which are cranfantied from man to man, with the material objects employed in their reciprocal commere, and you will hind the amount of each nearly the fame. Yet, although the fum of the locomotive agents forms more than half of the entire volume of the body, the vocal inthrument takes up a little room in a fmall gart of the fame hociv. The great difproportion between the organs of the wice and the important effects which they produce in fociety, is very friking.

The voice, from its detination, would raturaily fall wher the imasediate capire of the brain. Hence the fituc.
ture of the largnx has ruveh annlogy to that of the iocentio. tive apparatus. It is compofed of cartikymous Ineces, moved in various directions by voluntary mufeles, on the motions of which the habits of focicty have conferred a pre. cilion foreign to the natural fate, as it has on thofe of the fugers in certain arts, and on thofe of the lower limbs in cthers. Thus the voice is to fpecch, in relation to the mufcless of the larynx, what the rude movencurs of the fingers of the favare are to the precife and delicate motions of the non who has employed himfelf on a mechanical art, in reiatton to the mufcles of the upper extremity. "I'he princuple is the fame, the refults only are different. It is a general law in the organs of voluntary motion, that they acquare per fection. by exercife, that they are in fhori fufceptible of education.

This dependance of the functions of the larynx on the brain is not only marled in the thate of heath, but alfo in difeafes. Paralylis, convulfions, and fpafms of the mulcies of this cavity have the fame characters as in the locomotive organs, and have no analogy to the affections of involuntary parts. Hence Bichat has followed the indications of nature, in feparating the vocal organs from the lungs in his phytiological and anatomical arrangement: their proximity has generally led to their being conffdered together, in treatifo of anatony and playifology.

The following arrangement will be adopted, in confiderises the vocal organs: t!t, General confiderations on the larynx $;$ adly, Particular defcription of the component parts ; $s^{3} \| y$, The affomblage of thefe paris in the general conformation of the cavity; 4 thly, Mechamifm of the larynx; 5 thiy, Its developement in various ages; 6thly, The organs of fyeech; Fthly, The phyfrolory of the voice and fpeech.

Gencral Confelerations. . The larynx is a cavity compofed of moveable pieces, of a form not. ealily defined, and occupying the anterior and fuperior region of the neck. It is fituated on the median line, and confequently regular and fymmetrical in its form, like all the crgans of the animal life. It eerminates the trachea above, and forms a ftrikinc: contralt with the lower extremity of that organ, which, formed by the bronchi, and concerned merely with the fuiictions of the organic life, is made up of two lateral porsions not refembling eath other. The lateral portions of the larynx are, on the contrary, exactly finilar. This fymmetry of the larynx is neceflary to the harmony of its functions: a difeordant woice would inevitably refult from different organizations of the two fides, or from inequality in the powers of the mufcles of the right and left fides. The organ is placed below the os hyoides, to which it is fixed: it is fuperlicial in front, and rells behind on the vertebral column, from which the pharynx alone feparates it.

Dettived, on the one hand, to allow a continnal paffege to the air in $r$-fpration, which is to a certain point molurtary; and concerned, on the other, in pioducing the voice en*ircly under the influence of the will, the larynx offers to our view a tructure accommodated to thefe two very dife ferent phenomena. Several cartilages umited tugether form its cavity, and their elattictty provents it from being ever clofid: hence a free paffage is fecured for the air. ' 'lo Weic tnoveable cartilages are attached mufcles, of which the voluntary contraction may increafe or dimiunt the dimenfions of the cavity ; circum? ances wheh are effertial to the production of the vorce. One of thele cartilages, very difforent in its itructure from the others, can clele the savity momertariv, by being deprefed on its sperture Lailly, a macous membane, conemous with that whinh lizes the mouth, lines shl thefo parts, and is prolonged into the fugero following all the ramitations os the bronchi.

## LARYNX.

'The fize of the laryns does not follow the proportions of the general ttature: it may be as large in a little perfon as in one of couliderable height; and this correfponds to what we know of the voice, the furce or weaknets of which do not depend on the fize of the individual. It would be an interelting refearch to compare the different kinds of voice with the organization of the larynx. We cannot doubt that the tenor, counter-tenor, \&c. are produced by fome peculiarities in the laryugeal ftructure; bitt the impoffibility of knowing, in the cafe of fubjects employed for diffection, what kind of soice the individuals poifeffed, prevents us from afcertaining any thing concerning this point. The difference in the voices of man and woman cannot but have been always obferved; and their larynses exhibit, on a merely fuperficial infpection, a great difproportion in fize. The organ is large and broad in man: it appears contracted in woman, fo as to be about one-third lefs: often it is not more than half as large as that of the male. This does not depend on ftature: a large woman and a fhort man have this diftinguifling character, as well as two individuals of equal fize, or as a tall man and fhort woman. The fame circumftance runs through all parts of the larynx : it is obferved alfo in the neighbouring organs, as the trachea, the os hyoides, and their dependencies; it takes place alfo conitantly.
The general form of the organ is nearly the fame, or at leat the differences are much lefs remarkable than thofe which affect the fize. However, the fexes are diftinguifhed in feveral points. The two plates of the thyroid cartilage are much more oblique and proportionally lefs feparated in man than in woman: hence they form in the former, where they are united in front, a much more confiderable prominence under the integuments, and a much more acute angle. This projection is named pomum Adami: in women the angle is very obtufe. The excavation which terminates it above is fuperficial and roundcd in the female: much deeper and terminated by an acute angle in the male. The cricoid cartilage fhews no difference in the two fexes in front. The male and female larynxes are diftinguifhed alzolt folely by their fize behind; yet, as the two fides of the thyroid are more widely feparated in women, there is in them a greater relative breadth in the triangular fpaces which feparate this cartilage from the proper cavity of the larynx. The organ is furmounted in man by a much broader and thicker os hyoides than in woman. The epiglottis is alfo broader, more prominent above, and thicker: its general form is the fame in both fexes. The glottis is alfo of the fame form in both, and diftinguifhed merely by its dimenfions. As the arytenoid cartilages are longer, and confequently more elevated in man, the ventricles of the larynx are more decply feated, and more difant from the external opening. The only difference obferved below is the greater circumference of the cricoid in man. The trachea correfponds in fize to the larynx, and is confequently fmaller in women than in men. From the preceding obfervations it appears that the form of the larynx, although differing flightly in the two fexes, as well as the texture, which is the fame in both, cannot be the effential caufe of the differences in the key or pipe of the voice, which appear much rather to depend on the ftriking difproportion in fize. It will be feen afterwards, that the particular character of the voice in the infant depends on the fame caufe.

Defcription of the Parts of the Larynx.- We may diftinguifh, in this organ, the cartilages which effentially compofe its cavity, and give it folidity; 2. The ligaments which fie thefe together; 3. The mufcles moving the cartilages, and thereby conftituting the active inftruments of the voice ;
4. The glandular bodies fituated in the neighbourhood of the cavity; 5 . The membranous lining. The firt four divilions mult be examined in detail; the common membrane will be defcribed with the larynx taken altogether.

Cartilages of the Larynx.- Thefe are five in number. The firlt, named the thyroid, is broad and tolerably thick; it covers the organ in front, but is no farther concerned in forming the cavity than by the attachment it affords to certain ligaments and mufcles. The fecond or cricoid cartilage, which poffeffes, as its name implics, an annular figure, forms the folid part of the cavity. Two arytenoid cartio lages, fituated behind, and much fmaller than the others, give to the glottis that mobility which makes it the feat of the voice. Laftly, the epiglottis, a true fibro-cartilage, has the office of clofing the larynx occafionally.

The thyroid or fcutiform cartilage occupies the front and lateral part of the larynx, meafuring more from fide to fide than from above downwards, and being broader above than below. It confifts of two lateral portions obliquely united in front, where they form a more or lefs prominent acute angle, correfponding to the median line, and producing a confpicuous prominence in the neck of the male, already mentioned by the name of pomum Adami. This angular prominence is bifurcated above, fimple and rounded below. Each of the lateral divifions offers in front a nearly plane furface, flightly concave, covered principally by the thyrohyoideus mufcle. An oblique line bounds this furface ex. ternally, and affords attachment to the thyro-hyoideus, fterno-hyoideus, and the inferior conftrictor of the pharynx. Behind it is a fmall furface covered by the two latter mufcles. This cartilage prefents behind a concavity in the median line, correfponding to the front prominence: the ligaments of the glottis and the thyro-arytenoidei mufcles are attached to this. Two plane furfaces, floping backwards, correfpond above to thefe mufcles, from which a fatty cellular fubftance feparates them, and below to the lateral cricoarytenoid mufcles, and to fome fibres of the crico-thyroidei.

Four edges terminate the furfaces of the thyroid cartilage. The fuperior is the larget, affords attachment throughout to the thyro-hyoideal membrane, has in its middle the notch furmounting the angle of union of the two pieces, then proceeds outwards on each fide nearly horizontally, prefenting a night prominence correfponding to the external oblique line, and terminates beyond this by an appendix which will be mentioned. The inferior edge is florter, concave in the middle, and has on the fides two convex prominences correfponding to the lower ends of the external oblique lines, and then two depreffions. It affords attachment to the crico-thyroid membrane and to the crico-thyroidei mufcles. The potterior margins, two in number, are directed obliquely, and reft againft the fpine: rather çoncave above and convex below, they afford attachment to fome fibres of the ftylo and palato-pharyngei. A rounded procefs, of different lengths in different fubjects, directed obliquely backwards, furmounts each of thefe margins, and is connected by a ligament to the extremity of the os hyoides: thefe are the fuperior cornua of the thyroid cartilage. A fimilar rounded procefs, fhorter than the former, directed rather forwards, terminates each of the perpendicular margins below: thefe are the inferior cornua, and are articulated by their extremities to the fides of the cricoid cartilage.

A round opening is fometimes feen on each fide of the cartilage, towards its upper part, tranfmitting an artery and nerve to the cavity of the larynx.
The cricoid or annular cartilage occupies the lower and

## L A R Y N X.

back part of the larynx, of which it more particularly compofes the cavity by its ring-like figure. Its general figure is completely circular. It is narrow in front, where it is placed immediately under the lower margin of the thyroid; grows broader at the fides, and fwells behind into a confiderable fize, where it rifes into the middle of the interval left between the two polterior borders of the thyroid. The external furface muft be every where convex, from the circular figure of the part: in its middle and front portion it is covered only by the integuments; on the fides by the crico-thyroidei mufcles; and further back by the thyroid cartilage, whofe inferior cornua are articulated to two fmall rounded furfaces. The broad pofterior furface is nearly quadrilateral, and prefents, in the middle, a perpendicular rifing, covered merely by the membrane of the pharynx; on the fides, two ftrongly marked depreffions, in which the pofterior crico-arytenoidei mufcles are placed. The internal furface of the cartilage, every where concave, is lined by the laryngeal membrane. The fuperior circumference prefents in front a broad and fuperficial excavation, to which the crico-thyroideal membrane is attached, and on the fides of this the infertion of the lateral crico-arytenoid mufcles. Behind, the edge of the cartilage rifes confiderably, and prefents two fmooth furfaces for articulation with the arytenoid cartilages: thefe two furfaces are oblique, narrow, and convex; between them the arytenoid mufcle is in contact with the cricoid cartilage. The inferior circumference is placed horizontally, and forms nearly a circular outline; the margin is a little convex in front, then flightly concave; rather convex again where the thyroid is articulated to it, and flightly hollowed at the middle of the pofterior portion. It is joined to the firft ring of the trachea by a membrane fimilar to that which joins together the other rings, and affords attachment behind to the pofterior tracheal membrane.

The arytenoid cartilages, two in number, a right and a left, are much fmaller than the preceding, placed at the back of the laryma, on the upper edge of the broad pofterior portion of the cricoid. When viewed in the dead fubject, before the membranes and mufcles have been removed, they form a fingle prominence, concave above, fo as to refemble flightly the mouth of an ewer, from which their name is derived. They are moveably articulated to the criooid cartilage, and caufe, by their motions, the enlargement or diminution of the glottis, by which the voice is produced. The form of the arytenoid cartilage is triangular and pyramidal ; but the apex is bent backwards, or towards the pharynx. It poffeffes a pofterior concave furface, filled by the arytenoid mufcle; an anterior convex one, with excavations filled by the arytenoid gland; an internal flat and perpendicular one, turned towards the oppofite cartilage, and covered by the membranous lining. Thefe furfaces are united by three angular edges; an internal, an ex. ternal, and anterior: in the latter there are fometimes inequalities. The bafis offers behind a concave oval articular furface, covered by a fynovial membrane, directed downwards and outwards, and refting on the convexity of the cricoid, to which it is articulated. In front of this there is a confiderable triangular eminence, forming the fide of the glotris behind, fometimés confifting of a fmall diftinet cartilage, and always affording attachment to the aryteno-thyroid ligament. The apex, brought to a fharp point, is inclined backwards and inwards. It is commonly furmounted by a fmall tit of cartilage, connected to it, involved in the mem. brane, and turned towards the pharynx. Soemmerring calls thefe cornicula laryngis. Another frall rounded portion is feen on each fide in the membrane, which paffes from the

[^2]epiglottis to the arytenoid cartilage. The fame author calls thele cartilagines laryngis cuneiformes.

All thefe cartilages have a common ftructure. Theit denfe and folid tifue, and greyifh colour, which is not fplendid like that of the articular cartilages, approximate them to the bony fyttem. In the progrefs of years, they come ftill nearer to it : they are conflantly found offified in old fubjects, particularly the thyroid and cricoid. Even before this time we very frequently find in them reddifh points, the nuclei of an incipient and often extenfive offitication. An areolar fubltance, analogous to the fpongy texture of bones, forms at the fame time, and contains a little medullary texture, from which an oil may often be expreffed.

Fibro-cartilage of the Epiglottis. - This has not the fame ufes as the parts juft defcribed. Situated at the upper part of the larynx, between it and the root of the tonguc, it varies in its direction. It is perpendicular in the ordinary ftate, fo as to leave the glotis free for the purpofes of refpiration: it becomes nearly horizontal at the moment of deglutition, fo as to cover the glottis, and prevent the entrance of the food into its cavity. (See Deglutition.) Its form has been compared to that of a myrtle leaf; it is flattened in its figure, and has its extremity flightly recurved. We divide it into a lingual and a laryngeal furface, and a circumference. The lingual furface is concave from above downwards, but convex tranfverfely : it is directed anteriorly, or towards the mouth, in the perpendicular pofition of the organ ; fuperiorly, or towards the pharynx, in the horizontal ftate. It is covered by the macous membrane of the mouth, continued to it from the tongue, and forming three folds between thefe two organs. The middle, which is the moit ftrongly marked, is prolonged on the lingual furface : this is fometimes called fronum epiglottidis. The lateral duplicatures are loofer and lefs confpicuous, and end on the circumference of the epiglottis. The frenum, being flretched when the epiglottis is depreffed, muft affift a little in elevating it, when the tongue is carried forwards : but if we cut the frænum, the epiglottis ftill recovers its perpendicular pofition, fo that this fold carr affect it but very lightly. The two other duplicatures have no connection whatever with the motions of the part. In the inferior part of its anterior furface the epiglottis is feparated from the thyrohyoideal membrane by the peculiar tiffue conftituting the epiglottic gland. The laryngeal furface is convex from above downwards, and concave tranfverfely: it is covered by a continuation of the laryngeal membrane, and its afpects, in the different pofitions of the organ, may be underftood, from what is faid concerning thofe of the lingual furface. The circumference of the epiglottis is free above, and here the membranes covering its two furfaces are continuous. From each fide a fold of the mucous membrane is continued to the arytenoid cartilage. The lower part, fometimes called the bafis of the epiglottis, where the two fides are united into an acute angle, is connected to the hollow furface of the thyroid.

The fibro-cartilage, compofing the epiglottis, is thicker below than above, on the median line than on the fides: it belongs to the membranous fibro-cartilages. (See Fibrocartilage.) Its two furfaces, particularly the laryngeal, prefent a great number of fmall holes, like the prickings of a pin, lodging glandular bodies: thefe are clofed by the mucous membrane, and may be feen by removing that part. Several of them communicate from one furface to the other.

Articulations of the Larynx.- Its cartilages are united to each other, or to the furrounding parts, by fibrous and mem-

S f
branous

## L A R Y N X.

branous connections: we finall confider at prefent only thofe of the firlt kind, the others belong to the gencral defeription of the organ.

The thyroid is connected to the cricoid cartilage in front and on the fides. In the former fituation, a membrane, called the crico-thyroid, proceeds from the upper edge of the cricuid cartilage, and is attached to the middle of the lower border of the thyroid; it is lolt infenfibly on each fide on the mucous membrane of the larynx. It is deepeft in front, and grows narrow and lefs diltinct towards the fides; it has a fibrous appearance in the former, which it lofes in the latter of thefe fituations. Covered on the fides by the crico-thyroidei mufcles, it is fubcutaneous in front, and corrcfponds to the laryngeal membrane behind. It allows a confiderable motion between the two cartilages. On the fides there are two fmall articulations, formed between the inferior cornua of the thyroid, and the lateral articular faces of the cricoid: they are lined by loofe fynovial membranes, and lubricated by a tolerably copious fynovial fecretion. The furfaces, which admit readily of a gliding motion on each other, are held together by very difinct ligamentous fibres. An anterior fafciculus is continued obliquely downwards and forwards from the front of the thyroid cornua to the fide of the cricoid cartilage. A pnfterior goes from the back of the fame procefs, and afcends to be fixed to the back of the cricoid under the arytenoid cartilage. There are fome irregular fafciculi, befides the two firit defcribed.

The oppofed furfaces of the aryteroid and cricoid carti. lages are covered by very loofe fynovial membranes, lubricated by a copious fecretion, and ftrengthened by ligamentous fibres at fome parts. The moft remarkable of thefe fibres are on the infide and behind; externally they are little apparent, and feem often hardly to exift at all.

Each of the arytenoid cartilages is connected to the thyroid by a fibrous fafciculus, particularly important on account of its concern in the production of the voice. They are called the aryteno-thyroid ligaments, ligamenta glottidis, or chordæ vocales. The ligament compofed of parallel fibres, and about half an inch in length, arifes from the anterior prominence of the bafis of the arytenoid cartilage, paffes horizontally forwards and iuwards, and is fixed to the concavity of the angle formed by the junction of the two fides of the thyroid, uniting at this point with that of the oppofite fide. It is covered externally by the thyro-arytenoid mufcle, and correfponds every where elfe to the mucous membrane. The flit-like aperture left between the right and left ligaments is the glottis, or rima glottidis.
The two arytenoid cartilages are connected together merely by the membrane of the larynx, and by the arytenoid mufcle. It is faid that a tranfverfe fibrous fafciculus is fometimes placed in front of the latter, to prevent the two cartilages from being feparated too widely.

The acute and elongated angle, which terminates the epiglottis below, gives origin to a narrow fibrous fafciculus, about half an inch in length, which is covered in front by the epiglottic gland, and is fixed to the angle of the thyroid, juft above the attachment of the ligamenta-glottidis.

The arytenoid cartilages are not connected to the epiglottis by any fibrous union; two confiderable membranous folds, forming the principal part of the upper aperture of the larynx, proceed from the former to the fides of the latter ; they feem to be the ligamenta thyroidea fuperiora of Soemmerring.

Mufcles of the Larynx. - The organ is moved by two kinds of mufcles, of which one is common to it with other parts, the cther belongs particularly to it The firft are the muf.
cles of the os hyoides, and move the whole organ together = thefe, as well as the os hyoides, are defrribed in the article Deglutimon. The others are concerned in moving on each other the parts of the larynx.
The crico-thyroideus is a thin quadrilateral mufcle, fituated in front of the larynx, and often divided into two parts by a fatty line. It is attached to the front and fides of the cricoid, and proceeds upwards and outwards to the inferior edge of the thyroid, to which, as well as to a little of the pofterior furface, the internal fibres are fixed. The external are longer, and reach to the front of the inferior thyroid cormaa. An interval appears between the right and left mufcles, in which the crico-thyroid membrane is vifible. It correfponds in front to the fterno thyroideus, and to the inferior conltrictor of the pharynx; behind to the cricothyrond membrane, and to the crico-arytenoideus lateralis.
The crico-arytenoideus pofficus is a ftrong mufcle, flattened on its furface, triangular, and placed at the back of the larynx. Its origin fills the lateral excavation of the pofterior furface of the cricoid. The fuperior fibres are the fhortett, and proceed nearly tranfverfely; the following are longer, and gradually more and more oblique from below upwards and outwards.; they are attached to the poterior and outer part of the balis of the arytenoid, between the infertions of the arytenoideus, and of the crico-arytenoideus lateralis. In front it correfponds to the cricoid cartilage, and behind to the membrane of the pharynx.
The crico-arytenoideus lateralis is a thin and flattened mufcle, rather elongated and quadrilateral, proceeding from the fide of the cricuid to the fide of the arytenoid cartilage. It arifes from the fuperior margin of the former, pafles obliquely backwards and upwards, and is fixed externally to the bafis of the arytenoid. It is connected in front with the thyro-arytenoideus, feparated on the outfide from the thyroid cartilage by cellular fubftance, and lined on the infide by the laryngeal membrane.

The thyro-arytenoideus is a thin and flattened mufcle of irregular figure, fituated within the concavity of the thyroid cartilage. It arifes near the angle of that cartilage, from the lower part of its pofterior furface, proceeds backwards and outwards, becoming rather narrower, and is inferted in the front of the arytenoid cartilage, below the preceding, to which it is clofely connected. It correfponds externally to the thyroid cartilage, and internally to the laryngeal membrane.

The arytenoideus is the mafs of mufcular fibres filling the pofterior concavities of the arytenoid cartilages, and occupying the interval between them. The fibres arife from the concave furface of one cartilage, go acrofs, and are inferted into the correfponding part of the oppofite cartilage. They are partly oblique and partly tranfiverfe; the former confilt of a few fuperficial fibres croffing refpectively from the bafis of one to the apex of the other cartilage, and confequently decuffating like the two parts of the letter X. The great mafs of the fibres has however a tranfverfe direction. From the different courles of thefe two deferiptions of fibres, two arytenoidei mufcles have been dítinguined; viz. an obliquus and a tranfverfus. Thefe fibres are placed between the membranes of the larynx and pharynx: in front they are alfo partly in contact with the arytenoid cartilages.

Under the names of thyreo-epiglotticus, major and minor, fome anatomits have deferibed a few flender fibres proceeding from the pofterior furface of the thyroid cartilage to the fide of the epiglottis. Others do not admit the exiftence of thefe mufcles, which are allowed by all not to be found generally. Haller regards thefe fibres, when they

## LARYNX.

exilt, as a part of the thyro-arytenoideus. The motions of the epiglottis, in the human fubject, are all entircly of a mechanical nature, and not performed by mufcular action.

Glands of the Laryn:- - There are three bodies of this defcription in the neighbourhood of the organ; viz. the epiglottic, the arytenoid, and the thyroid.

Glands of the Epiglottis. - In front of, and below the epiglottis, a triangular lpace is left, bounded behind by this cartilage, in front by the thyro-hyoideal membrane, below by the thyro-epiglottic ligament, and on the fides by the lateral folds of mucous membrane which line the two fpaces left hetween the fides of the thyroid and the cricoid cartilage. This \{pace is filled by a body, manifetly cellular and adipous for the moft part, but covering below fmall granular glands, fometimes united together, fometimes infulated, and findiag prolongations into the holes with which the epiglottis is pierced. The latter open on the laryngeal furface of the organ by very diftinet apertures. The glandular bodies are fometimes fo much covered and concealed by the furrounding fat, that they can hardly be diftinguifhed. In all cales we may remove by diffection the le bodies from the openings in the epiglottis, which then appear as empty fpaces. We may dittinguifh as many as thirty of thefe. The fuperior excavations of the epiglottis contain fmall diftinct grains: the epiglottic gland and its cellular tillue belong only to the inferior half of the organ. The openings in the epiglottis are of different fizes; they are very regularly formed, with rounded edges, and penetrate always itraight through, never obliquely.

Arytenoid Glands.-In the fold of mucous membrane, proceeding on each fide from the epiglottis to the arytenoid cartilage, a fmall body is found, evidently of a glandular nature, prefenting fmall diltinct grains, very analogous to thofe which compofe the lacrymal gland, and generally of a greyifh hue. It may be compared in form to a carpenter's iquare. The perpendicular branch, which is rounded, and may be felt by the finger, when we feize the fold that contains it, lies againtt the front of the arytenoid cartilage, and is loofe abore. The horizontal branch runs along the fuperior fold of the ventricle of the larynx, and is lefs promineat than the other. The. Gituation, at which the two branches form their angular union, is in front of the bafe of the arytenoid. The glandular grains of this fmall body, probably, have excretory ducts terminating on the edge of the fuperior aperture of the larynx : but thefe apertures are not vifible like thofe of the ducts of the laft-mentioned glands.

Thefe epiglottic and arytenoid giands furnith a mucous fecretion, and are of the fame nature as the others which belong to the laryngeal membrane. The paffage of the food in deglutition, and of the air in refpiration, requires that thefe organs thould be defended by a mucous fluid.

The thyroid gland is one of thofe organs, of which the ufe is entirely unknown to us, although its conftant exiftence, through all periods of life, and the great number of veffels which it receives, do not allow us to doubt that it performs fome important office. Its fituation immediately below and in front of the larynx, leads us to connect its hiltory with that of this cavity, although we are ignorant whether it bas any concern in the fame functions. This organ, as well as the fpleen, capfulx renales, \&c. fuggelts a very important reflection; wiz. that our notions concerning the general relations of the functions of the animal economy muft ftill be neceffarily very imperfect, and that we fhould deceive ourfelves if we fuppofe that we can embrace the plan of nature in one general view, and raprefent it accurately in our phyfiological claffifications. Can we
doubt that the unkrown functions of thefe vifecra are.connected to the general plan, and make an effential part of it? How then can we be certain that a knowledge of them would not either partly overturn, or conliderably modify our prefent notions on thofe fubjects. Why is the theory of foctal exiffence fill fo obfcure? Becaufe the tunctions of feveral organs, at that time perfectly developed, and in a very active flate, efcape our obfervation, and we camnot arrive at ge neral refults when the particular facts are unknown.
The bulk of this gland, which is always very confiderable, varies much in different individuals: perhaps no organ prefents more fitiking variations. No particular condition of the body, no modification of any particular function, no differences in tiature, in the tiate of the larynx, trachea, lungs, \&ic. have been obferved to accompany thefe varieties. Its form is tolerably conflant; but in this refpect there are alfo varieties. It is compoled of two diftinct portions, nearly pyramidal in their figure, occupying the fides of the larynx, and of the upper extremity of the trachea, fo that the bafe is placed downwards and forwards, and the apex Itretches upwards and backwards. Variations are obferved in the extent and direction of thele two lateral portions. They are united in front by a frall fateened tranfverfe band, which may be large and thick, fmall and narrow, or made up of diftinct tubercles ; inceed, we fcarcely find it the fame in two individuals fitcceflively. In a few inftances this part does not exift, fo that there are two diftinct thyroid glands, one on each fide. It does not extend above the trachea, fo that the whole larynx is uncovered in front, nearly fubcutaneous, and embraced by the curve formed by the two lateral portions of the gland united by the intermediate band.
In front the thyroid gland is covered by the fternothyroidei, fterno-hyoidei, omo-hyoidei, and latiffimi colli. It relts behind and towards the outhide on the vertebral column, to which a loofe cellular fubitance connects it, and where, according to its bulk, it conceals or leaves expofed the nerves and blood-veffels of the neck. Internally, or towards the middle line, it covers the fides of the firt rings of the trachea, part of the cricoid and thyroid cartilages, the crico-thyroidei, thyro-hyoidei, and infer:or conArrictor of the pharynx. Exactly in the middle and front it conceals the two firft rings only of the trachea. A luofe tiflue feparaies it from all thefe parts.
It is furrounded by no membrane: the exterior cellular tiflue is rather more denfe and compact than the reft, as in the pancreas and falivary glands; but it forms no proper mentrane. It never contains any fat.
With this external covering fome mufeclar fibees are blended; not noticed by Albinus, nor by inoft other anatomifts, but forming the levator gland. thyr. of Fiailer, the mufculus giand. thyr. of Soemmerring. It does not exit conftantiy; is generally a fingle mufcle, fituated in the middle of the larynx, fometimes is placed towards the right or left, and fometimes, but very rarely, is double. It anfes by a narrow tendinous llip from the bafis of the os byoides; defcends in a ftraight courfe, growing broader, and has its fibres expanded on the froat of the gland, and blended with the covering of the organ. It muit apparently have the effect of fulpending and fupporting the gland. Mufcular fibres have fometimes been feen, extending over the furface of the gland from the crico-thyroideus. Beides the effect, which thefe and the fibres juft defcribed may produce oa the gland, it will be expofed to powerful compreciion againft the larynx and trachea by the ferno-hyoidei and liernothyroidei, which embrace it very clofely.
The proper tiflive of the thyroid gland varies confiderably
in colour and denfity: it is often red, and even dull brown, like the fpleen, fometimes yellowifh or greyifh. It may be flabby or compact; but its denfity varies lefs than its colour. The fubfance of the organ, like that of other glands, is difpofed in diltinct lobules, which are collected into more or lefs voluminous lobes. This conglomeration is never fo perceptible as in the falivary glands, the pancreas, \&c. ; excepting, however, certain cafes of jncreafed volume without organic change, where the furface of the organ is tuberculated and irregular from the unequal prominence of the lobes. In the natural fate of the part, we may diftinguifh the lobes by diffection, as the great vafcular trunks run in their intervals: the latter, which are hardly perceptible at firlt view in confequence of the lobes being preffed againlt each other, become apparent by the ufe of the knife. A fine cellular tiffue, never containing any fat, and fmall in quantity when compared to what is found between the lobes of orher glands, is feen in thefe intervals.

The lobes of the thyroid gland are mixed in fome fub. jects with rounded veficles, containing fometimes a yellowifh, fometimes a tranfparent and colourlefs fluid. In moft fubjects thefe cyfts do not exift, and in many we cannot obferve the flightelt traces of them. Yet flices of the gland recently cut give us a peculiar feeling of vifcofity, not obferved in other glandular bodies, and proceeding from the fluid juit mentioned. If an acid be poured on the cut furface, a fight whitenefs is produced, as in moft other crgans.

Although provided with a great number of blood-veffels, the thyroid gland contains in its capillary fyftem lefs blood than the liver, the kidney, \&c. It only difcolours the water of maceration once or twice, which arifes evidently from the fmall number of its capillaries. It is not by the large veffels, in which the blood is influenced by the heart's action, but by the capillaries, that we may judge of the quantity of blood habitually contained in an organ. As putrefaction generally proceeds more quickly, in proportion as the quantity of blood remaining in the organs after death is greater, the thyroid gland undergoes this change lefs readily than moft others. Slices of it dried are greyifh and friable. When boiled, they curl a little before ebullition, and then become confiderably harder and corrugated as almof all the animal folids do. But, inftead of growing foft again, like the mufcles, tendons, \&c. they are rendered ftill harder, like the glands, by a continuance of the boiling. Acids and alkalies have no peculiar operation on the tiffue of the thyroid gland.

Nothing like an excretory duct has hitherto been difcovered in this body: no communication has been pointed out between it and the trachea or larynx. The emphyfema, of which it is fometimes the feat, proves nothing in this queftion; for the air is contained in the cellular tiffue which unites the glandular lobes, and is introduced in confequence of its general diffution in the cellular tiffue of the neck. By inferting a blow-pipe into the fubftance of the organ, and inflating forcibly, it may generally ba diftended fo as to form an artificial emphyfema. The air, in this cafe, is not contained in the veficles, but in the cellular interltices: it follows the courfe of the vafcular trunks.

Some fexual differences may be noticed in the thyroid gland. It is generally larger in the female, and its lateral divifions are more prominent in front ; which diminifhes the apparent prominence of the thyroid cartilage. In man, on the contrary, the two lateral portions are thinner and proportionally flatter; and lie more clofe on the fides of the larynx, below the external oblique line of the thyroid cartilage. But there are fo many varieties in other points, that this fexual difference is often little obfervable.

The differences from age are few. The gland is proportionally larger in the foctus and child than in the adult. Its front prominence is more ftriking at the firit period : and its colour is deeper and brownihh. Its proportional excefs of volume cannot, however, be compared to that of the thymus, capfulx renales, \&c. : indeed, it is not fufficiently remarkable to authorife us in concluding that the ufe of the part is particularly relative to fcetal exiftence, although feveral authors feem to have believed this.

The thyroid gland has four large arteries, two on each fide, one of which is derived from the external carotid, the other from the fubclavian trunk. No part in the body has fo confiderable an arterial fupply as this organ; that of the brain is very much lefs in proportion. The inferior thyroid artery in the child is as large as the remaining trunk of the fubclavian after its origin. Thefe veffels are connected in the gland by large and numerous inofculations. The veins correfpond in number and magnitude to the arteries, and terminate in the jugular and fubclavians. The abforbing veftels are alfo confiderable, and join the jugular glands. The thyroid arteries are accompanied by nervous filaments from the great fympathetic ; but it cannot be eafily decided whether the proper fubftance of the gland receives any nervous fupply.

As we have ftated already that the ufe of this organ is unknown, we fhall not fatigue the reader with mentioning and refuting the affigned offices. Although they are very numerous, they are not grounded on any facts worthy of attention. Soemmerring, in his 6th vol. De corporis humani fabrica, $§ 56$, gives a long lift of "opiniones de glandulo thyreoider ufu;'" and there is a fimilar catalogue in Haller's Elementa, lib. ix. fect. I. § 22

## Of the Larynx in general.

General Conformation.-The larynx is a cartilaginous cavity moved by various mufcles. It is broad above, narrower below, and poffeffes an external figure, which does not correfpond to that of the internal hollow. In fact, the latter, being effentially formed by the cricoid and arytenoid cartilages, and the membranous coverings belonging to them, poffefles nearly an uniform diameter throughout; and it is moft contracted towards the upper part. This arifes from what we have faid of the thyroid cartilage, which rather protects than forms the larynx, although it is effential to its ftructure and action, from the attachment which it affords to muicles and ligaments. We may confider, in our view of this organ, the external and internal furfaces, the fuperior and inferior extremities.

The external furface, confidered in front, prefents, on the median line, the prominence formed by the union of the two portions of the thyroid, which exhibits, above, a confiderable depreffion, particularly in man ; then the membranous interval, which feparates the two crico-thyroidei, and below it the convexity of the cricoid: on the fides we fee the two flat furfaces of the thyroid cartilage, covered by the hyothyroidei, the external oblique line, the triangular furface covered by the inferior conftrictor, and terminated by the inferior cornu, lower down the crico-thyroideus, which, at this point, almoft entirely covers the cricoid cartilage. Behind, the external furface of the larynx, more depreffed in the middle than towards the fides, prefents, on the median line, the middle prominence of the cricoid: on the fides of this, the hollows lodging the crico-arytenoidei poftici, then a triangular fpace, broad above and narrow below, filled with a more or lefs adipous cellular fubtance; laftly, two rounded edges, bounding the fpaces juft mentioned, more prominent than any other parts in this afpect, and refting on the vertebral column, fo as to allow a free motion
to all the effential parts of the organ, particularly to the arytenoid cartilages.

The internal furface of the larynx, lined throughout by the mucous membrane, may be divided into two parts, one folid, the other moveable. The firft is inferior, in point of fituation, and formed entirely by the cricoid ring. The proportions of this part are conitantly the fame; and it contains nothing worthy of notice. The moveable portion is above, formed behind by the arytenoid cartilages, in front by the thyroid and epiglottis, on the fides by the folds of mucous membrane, continued between the epiglottis and the arytenoid cartilages. In the ordinary ftate this is triangular, broad in front, and narrow behind ; but the motions of the epiglottis and arytenoid cartilages change its figure confiderably. This part forms the opening by which the larynx communicates with the pharynx: the aperture is placed juft behind and below the root of the tongue, and is often called the glottis, although it has no fhare in the formation of the voice. Of its relation to the pharynx, in refpect to deglutition, fee a further account in that article. The part, at which thefe two divifions of the larynx are united, is remarkable for the two membrannus folds, called ligamenta glottidis, or chordx vocales. Thefe arife from the bafes of the arytenoid cartilages, and pafs obliquely, forwards and inwards, to meet together at the concavity of the thyroid, where they are fixed juft under the epiglottis. They leave between them a triangular \{pace, of which the bafis is behind, and the apex forwards : this is the true glottis, and is placed about half or three quarters of an inch lower down than the opening defcribed above: as the meafurement of the opening from behind forwards confiderably exceeds the tranfverfe dizmeter, it has a flit-like appearance, from which the name of rima glottidis has been applied to it. The folds, which form the fides of the upper opening, differeffentially in their compofition from thofe of the inferior aperture. The former are merely membranous: the latter contain the fibrous fafciculi, defcribed already under the name of the thyro-arytenoid ligaments. The interval left on each fide between the fuperior and inferior folds conftitutes the ventricles of the larynx, or facculi laryngis. Their form muft correfpond to the direction of the folds, which have been juft defcribed; their depth is inconfiderable. Sometimes the mucous fecretion of the internal lining accumulates here for a fhort time: fometimes foreign bodies become engaged in them, and produce fuffocation by ftopping the rima glottidis, or caufe great diltrefs until they are removed. The ventricles, as well as the fuperior laryngeal folds, correfpond on the outfide to the thyro-arytenoidei mufcles: the inferior folds feparate thefe mufcles from the crico-thyroidei, which complete towards the outfide the fpace feparating thefe folds from the circumference of the cricoid.
The inferior extremity of the larynx, formed by the infes rior circumference of the cricoid cartilage, is exactly circular. It is united to the firlt ring of the trachea by a fibrous membrane, fimilar to thofe which unite to each other the remaining rings of this tube. Behind, the pofterior tracheal membrane is attached to it.

The fuperior extremity, much larger than the inferior, is formed in front and at the fides by the upper edge of the thyroid cartilage. This edge is connected to the os hyoides, which is immediately above it, by the loofe and foft thyrohyoideal membrane: this is thicker in front than towards the fides, has very little fibrous appearance, but feems rather of a cellular nature. It is covered by the hyo-thyroidei and fterno-hyoidei ; it correfponds behind to the epiglottis, from which the epiglottic gland feparates it, and to the la-
ryngeal membrane. It is Thorter in the middle than at thic fides; confequently the cornua of the os hyoides can be elevated to a greater diftance from the thyroid cartilage than the bafis of the fame bone, and the bafis of the tongue, which is fupported by the os hyoides, can be drawn up higher at the fides than along the middle line; which difpofition of parts is favourable to the formation of the channel, along which the food is conveycd towards the offophagus. The two extremities of the os hyoides are connected to the fuperior cornua'of the thyroid cartilage by long, denfe, and round ligaments, generally containing granular bodics of a cartilaginous or bony nature. Thefe are named ligamenta hyo-thyroidea lateralia, to ditinguifh them from the former, which is called lig. hyo-thyroid. medium. The length of thefe lateral ligaments, in addition to that of the thyroid cornua, meafures the diftance between the os hyoides and the thyroid cartilage behind, which is about double the front interval.

Behind the edge of the thyroid cartilage, and in front of the epiglotis, there is a triangular fpace filled by the epiglottic gland, and its adipous cellular fubitance. This fpace is bounded above by the fold of mucous membrane continued from the bafis of the tongue to the epiglottis, and, moreover, by a kind of fibrous membrane, which lies immediately under the former, and over the gland. The membrane in queftion is ftronger in the middle than at the fides: it arifes from the concavity of the os hyoides, and is attached to the middle of the epiglottis. Behind this face we fee the epiglottis, and behind it the fuperior opening of the larynx, already mentioned. As the breadth of the epiglottis, which forms the front of this opening, is always the fame, while the arytenoid cartilages, which compofe the back part, admit of confiderable motion, the figure of the aperture can undergo little change in front, while it may vary much more confiderably behind. The pofition of the opening is rather oblique, from before backwards and downwards.

Membrane of the Larynx.- The interior of the cavity is lined by a mucous membrane, forming part of the general fyltem common to the refpiratory and digeftive organs. It proceeds backwards from the bafis of the tongue over the front of the epiglottis, forming, as it paffes, the three folds already defcribed: it is reffected over the loofe edge of this fibro-cartilage, covers its pofterior furface, and then enters the larynx. On each fide it is continued directly backwards to the aryteroid cartilages, being loofe and unconnected at its edge, and correfponding only to the thyro-arytenoidei mufcles. At the pofterior edge of the opening of the larynx, it is continuous with the membrane of the pharynx. When it has arrived in the cavity of the laryny, and towards the bafis of the arytenoid cartilage, it forms on each fide a horizontal fold, directed obliquely forwards to the concavity of the thyroid, to which it is fixed, joining that of the oppofite fide. Below this point it lines the cavity of the ventricle, then forms another fold, which bounds this cavity below, and embraces the thyro-arytenoid ligament: it afterwards lines the lower portion of the larynx, and is continued into the trachea. In the whole of its extent the mucous membrane is of a pale rofe.colour, and diftinguifhed by that character from the lining of the mouth, of which it is a prolongation, and which is much redder. Its denfity is confiderable, particularly on the cartilages, where it is united with the perichondrium: in other parts it is more thin and loofe in its texture. On the laryngeal furface of the epiglottis, it is perforated by feveral holes, which are the terminations of excretory duals. Mucous glands are apparent in feveral points of its furface. The capillary fyftem of this membrane is not very confiderable, and hence arifes its palenefs,
palenels. It polfencs rery acute fenfibility from the fuperior opening to the glottis; but is much lefs fenfible below. For an account of the relation, which this property bears to the functions of the part, fee Deglutition. The fenfibility is not excited by the contact of air, as that is liabitual ; but it is quickly roufed by vapours diffeminated in the atmofphere, particularly when they are at all acrid.

Mechanifin of the Larymx.- The motions of this part are of two kinds, general and particular. The former, in which the whole larynx is moved, take place in deglutition, and in the pronunciation of different founds. For an account of the former, and of the powers which act at that time, fee Deglutition.

The laryns is moved in the fame way, and by the fame mufcles, in the pronunciation of different founds. When an acute found is uttered, it afcends very fenfibly: and this afcent, which is gradual, according to the tone, may be felt by placing the finger on the thyroid cartilage, while we go through the gamut. In the formation of grave founds, there is, on the contrary, a very fenfible depreffion. Thefe motions can be very clearly feen in the throat of a finger : the rapid and confiderable changes which take place in that mode of exerting the voice, render the motions very perceptible. The aicent of the larynx is neceffarily accumpanied by an elongation, and its defcent by a fhortening of the trachea; in the former cafe its diameter is diminifhed, and in the latter increafed. Some have fuppofed that thefe changes in the trachea are concerned in producing the alterations of tone; but if they produce any effect on the founds, it is very fight, and they feem rather to be merely confequent on the movements of the larynx.

What connection is there between the founds uttered and the general motions of the largnx ? We know very little on this fubject. We may obferve that they have no relation to the force or weaknefs of the found ; folong as the voice remains at the fame tone, the larynx does not move, however the found may be changed in ftrength or weaknefs.

The thyroid and cricoid cartilages admit of reciprocal motion; the former can be brought downwards and forwards upon the latter; in this cafe the chordx vocales are relaxed. The crico-thyroideus mufcle has this effect.

But the motions of the arytenoid cartilages are the mof important, on account of their connection with the chordæ vocales. They may be brought towards each other, until, indeed, they come into actual contact; this is attended with a proportionate approximation of the chordx vocales. When the cartilages tonch each other, the rinia glottidis is completely clofed; this is done by the arytenoid mufcle. This flutting of the aperture is fometimes produced fpafmodically, as when the parts are irritated by acrid vapours, or by foreign bodies coming into contact with them. Refpiration muft experience a termporary obftruction under fuch circumftances. When thefe cartilages are moved away from each other, the chordx vocales are feparated, and the rima glottidis proportionally enlarged ; this is the aftion of the crico-arytenoideus polticus. The arytenoid cartilages admit alfo of being moved forwards and backwards; the chordx vocales are rendered tenfe in the former ftate, and are relaxed in the latter. The thyro-arytenoidei and crico-arytenoidei laterales carry them forwards; and the crico-arytenoidei poftici backwards.

Developentent of the Larynx.-The differences of this organ, according to the age of the individual, are not lefs confpicuous than the fexalal diftinctions in the adult. They refer to two principal periods ; viz. the years which precede, and thofe which follow puberty; for the great changes \#, the ftructure of the larynx, which in this relpect follows the
developement of the fexual organs, take place sbout this epocha. In the foetus and child there are no differences in the larynxes of the two fexes: until the period of puberty, the fame fize, the fame rounded form, and the fame want of prominence are obferved both in the male and female. At this time the organ is much fmaller in proportion in both fexes, but more particularly in the male, than it will be in the fequel. 'This' will appear in a more ftriking point of view, if we compare the larynx to the os hyoides, which furmounts it. That organ, already much advanced, in confequence of its connection with the tongue, which is developed ea:ly in life, projects before the larynx; while in the adult, and efpecially in the male fubject, the larynx projects before it. The thyroid cartilage can hardly be faid to have a prominent angle in the child. It is rounded at this part in either fex. Nothing particular is to be obferved of the cricoid cartilage ; and all the parts at the back of the larynx prefent the fame difpotitions as in the fequel, excepting the difference in fize.

The nature of the voice is influenced by this diminutive fize of the larynx, and by the famenefs of its conformation in the two fexes. At this period of life we remark that its pipe or key is flender, and that its character is the fame in both fexes. If there be any difference, it is not fuch as that which in the fequel diftinguifhes the voice of man from that of woman.

As the growth proceeds, the larynx approaches to the ifate in which we find it in the adult. Yet it does not follow the fame courfe of developement as moll other organs. In children of fix months it is often as large as in thofe of two years. Sometimes in a fubject of three years it will be imaller than in one of a year, although the flature of the two may be fuitable to their refpective ares.

A change almolt fudden, or at lealt much lefs gradual than any which had occurred before, in the functions of the larynx, is remarked at the epocha of puberty : this indicates an alteration in the organization of the cavity, and a more rapid developement of its ftructure. The change is much more remarkable in man than in woman, becaufe the larynx remains much fmaller in the latter than in the former, even after puberty. At this time the larynx is enlarged in all its dimenfions by a fpeedy growth analogous to what is obferved in the generative organs. But while this change is going on, for feveral months, the voice has a peculiar pipe, which is neither that of infancy nor of adult age.

After puberty the larynx undergoes no well marked change: its form becomes more fixed, and the prominence of its thyroid cartulage more coufiderable in man.

In the old perfon, as the cartilages are conitantly receiving frefh depolitions of earthy matter, they at laft nearly equal bone in hardnefs. This change affects the thyroid firk: then the cricoid, and laitly the arytenoids. The epiglottis is lardly ever affected, probably on account of its peculiar organization, which refembles that of the cartilages of the nofe, ears, \&c. This exemption is very favourable to its functions, which require pliancy. The voice always becomes weak and broken in the aged: the weaknefs of the mufcles and the fliffuefs of the joints account for this, as analogous changes explain fimilar phenomena in the organs of locomotion.

The remarkable change in the pipe of the voice produced by the removal of the telticles has been mentioned in the article Gexeration. It has not been afcertained whether there is any change in the organization of the larynx in thefe cafes.

The parts hitherto defcribed are the inftruments by which the voice is produced: the action of other organs is required,
quired, in order to modify this, fo as to form it into articulated founds or fpeech. Of thefe the tongue and the os hyoides are the molt important: the latter bane is the balis of the tongue, the fixed point from which its mufcles proceed, as alfo the point of attachment of the chief mufcles of the larynx. The defcription of thefe organs, and of the mufcular powers em. ployed in moving them, will be found in the article Deglutition. A knowledge of the parts about the throat, which anatomills generally term the fauces, is alfo effential in confidering the fubjeet of the voice. The larynx opens into a large membranous cavity, defeending from the bafis of the Ikull in front of the lix upper cervical vertebre, and named the pharynx. A large opening in the front of this, and between the tongue and foft palate, leads into the mouth: this aperture may be either free or clofed. A nother palfage goes above the palate into the nofe; but this in not fo changeable in its dimenfions as the former. Thus the air, expelled from the larynx, muft proceed either through the month or the nofe, or both. The mouth is the large faice bounded by the lips and cheeks, the tongue and palate. Into it the tongue projeets below, with free power of motion in every direction, and in the ordinary flate nearly fills the cavity. The two rows of tecth form a kind of divifion into an outer and an inner cavity. For the more particular defcription of all thefe parts, fee Deglutition:

It was formerly held that the palate and uvula had a condiderable influence on the voice: but this feems doubtful. The foftnefs of the part, which is drawn down againft arother foft part, the tongue, renders it unfit for producing any modification in the found. Animals, for the moft part, lave no uvula, and we know that the organ may be varioully difeafed without affetting the fpeech: "Wherefore, fays Haller, (Elem. Phyfiol. lib. ix. fect. 2. § 17.) if affections of the uvula have produced any confiderable alterations in the voice, I fhould be rather inclined to alcribe them to fome undue paffage of the found from the velum palati being at the fame time injured. Thus, when the nofe is difeafed, a peculiar modification of the voice takes place, not becaufe the noftrils are moved in the vocal functions, but becaufe they tranfmit or reflect the fonorvus tremors of the air. Thus, too, when the woice is injured by deftruction of the bony palate, an artificial plate, which rellores the power of reflection, without adding any motion, remedies the deficiency. I have the fame opinion concerning fpeech. The guttural letters may be lefs perfectly formed, when the organs about the throat are difeafed, becaufe the allifions of parts carnot take place in the natural way: but the uvula is concerned in the pronunciation of no letter, and we might quote numerous authors who have feen it entirely cut away, or deftroyed by difeafe, or originally deficient without the fpeech being impaired."

The paflage from the pharynx, above the velum palati, leads into a large and irregularly formed bony cavity, lined with a foft membrane, and increafed by many excavations in the neighbouring bones. This is the cavity of the nofe, divided by a nearly perpendicular partition into two halves, the right and left nettrils. This cavity is defcribed under the articles Cranium and Nose. The air emitted from the larynx, rufhes into thefe bony hollows, when they are not filled with mucus, ftrikes their fides, and throws the whole of the furfaces into vibrations, from which important modifications of the voice enfue.

Pby fology of the Voice and Specch. - The voice, like all other Sounds, isa vibration communicated to the air; and it offers to our obfervation, like them, three diftinct kinds of qualilies, independent of each other. I. The tone, or the various degrees of acutenefs and gravenefs; which depend on the ve-
locity of the vibrations. 2 . The intenfity, or the degrees of force, which depend on the extent of the vibrations. 3. The character or key, which arifes from circumftances hitherto undetermined, and relasing to the ftructure, the fublance, or the figure of the fonorous body. The human voice is fufceptible of a fourth order of modifications; viz, that which we reprefent by the letters of the alphabet, and which is itfelf divided into two other orders; the one relative to the principal founds, which we reprefent by the vowels; and the other to their articulations, which conltitute the confonants. We do not exactly know on what the two latter modifications depend : and although we perceive to a certain point the circunitances under which they are executed, we are not jet able to imitate them by artificiai inftruments.

The found is produced by the paffage of air through the rima glotidis, or the nit-like ovening left between the two chorde vocalcs. Almoft invariably it is the paflage of the air from the lungs, in exfpiration, that produces the found : but there are fome rare exceptions to this. In hiccough, and under fome circumftances in coughing, found is produced during infpiration. Many conceive, moreover, that the phenomena of ventriloquifm are to be explained by the exertion of the vocal organs, when air is admitted into the cheft.

That the larynx is the primary organ, in which the original found is produced, is proved by the circumftance, that difeafes and accidents affecting it deftroy or modify the voice. If an opening be made in the trachea, below the larynx, fo that no eir fhall pafs through the latter, no voice is produced. When, on the contrary, an opening is made immediately above the glottis, the voice is not affected. Bichat made an incilion between the os hyoides and the thyroid cartilage, and through the membrane, which connects the tongue to the epiglottis: through this tranfverfe opening he drew out the epiglottis with a hook, fo that the found, inftead of paffing through the mouth and nofe, came directly by the external wound. The voice was as Itrong as before, and very little changed in character. He drew the glottis between the fides of the wound, fo that the found could not pafs at all into the mouth and nofe: the refult was fill the fame. In thefe experiments the epiglottis may be completely confined, or even cut away, without affecting. the phrnomena, fo that it can have no consern in the formation of the voice. When the arytenoid cartilages were cut through, or the thyroid divided longitudinally, as in the operation of bronchotomy, the woice was deftroyed.

The two elaftic ligamentary and membranous bodies, which form the chordx vocales, ure analogous, in the human inftrument of the voice, to the various provifions for producing vibration in the different wind inftruments. No found is produced by blowing into a tube through a fimple opening ; the only effect is a motion of the air, incapable of producing found, unlefs it meets with a body fufceptible of being thrown into vibration. It is, moreover, afcertained that the fides of the inftrument are not the vibrating parts:. For the fubltance of which they are compofed, or the manner in which they are held, produces no change in the tone or key. On examining the parts, to which the mouth is applied, in the various wind inftruments, it afpears, that vibrations are produced in the air contained in the tube, as they are in the external air; that is, the intervention of an elaftic body is neceffary, which the blowing of the player agitates, and the vibrations of which are communicated to the air in the tube; or at leaft fome angular body, againit which the air may break as it paffes with violence, and thereby be thrown into vibration. In the flute with a mouth piece, in organ-pipes of various kinds, in the.
hautboys

## LARYN.

hautboy, baffoon, \&c. in trumpets, horns, \&e. there are different provifions of this kind, to which the chordx vocales are perfectly analogous. The tube then produces no found itfelf, it only modities, directs, or augments that which it produced at its embouchure by the fonorous body againit which the air breaks. The trachea of an animal is a continuous tube without any contraction, or any piece fufceptible of vibration, except at its upper extremity, or the glottis. As the found is only formed at the end of the trachea, that tube cannot ferve to modify it ; it can only be compared to the pipe of the bellows of an organ, or to any canal which may convey air to the embouchure of the inftrument; and the only part of the vocal organ in the mammalia, which can be compared to the tube of one of our wind inftruments, is that placed in front of the glottis, viz. the mouth and nafal cavity. If we confider, not only the want of refemblance between thefe two cavities and all the inftruments which we are acquainted with, but alfo the almoft infinite number of means by which we can change their length, diameter, figure, and vents, -means which it is almoft impoffible to determine with fufficient exactnefs to deduce from them phyfical confequences, we fhall not be furprifed at the difficulties which the theory of the human vocal organ prefents.

But the mere paffage of the air through the glottis is not fufficient for the purpofes of this function. The voice connects us with the individuals of our own fpecies, enables us to communicate our thoughts to them, and muft, confequently, be under the regulation of the will. Hence it is produced by voluntary motion, and does not take place except under the influence of volition. We are conftantly breathing during fleep, without the production of any found : and we may exfipire, as ftrongly as we pleafe, in the waking ftate without the voice being formed, until we exert a particular act of volition. Again, although the whole ftructure of the larynx is entire, the ligature or fection of the recurrent nerves, or of the nerves of the eighth pair, deftroys the voice. An injury of one nerve deftroys half the vocal powers, but the voice is completely loft by operating on both. Galen performed this experiment repeatedly on pigs: Vefalius, and other more modern phyfiologitts, have afcertained that the effects are correctly ftated by Galen. In fhort, all the changes and conditions of the vocal organs, of whatever defcription, neceffary to the production and modification of found, are produced by the mufcles of the part, under the influence of the will. The exact nature of the mufcular motions, required for producing the voice, is not known. Bichat obferved, in the experiments already alluded to, that the rima glottidis was contracted whenever a found was uttered; and that this contraction was the more fenfible, in proportion as the found was ftronger. He ftates that it never was dilated during the formation of found. He obferved, moreover, that infpiration and exfpiration were conftantly attended refpectively by dilatation and contraction of the glottis.

The air expelled from the lungs through the opening, prepared for its paflage by the action of its proper mufcles, throws the fides of this aperture, the chordæ vocales, into a ftate of vibration: the fame effect is produced in the larynx, whofe cartilaginous ftructure renders it particularly fufceptible of fuch vibrations, and in all the furrounding organs. The found produced by the tremulous motions of all thefe parts is the voice. Hence we underftand why hoarfenefs and fmallnefs of the voice accompany catarrhs, in which the unufual coverings of mucus render the parts lefs fufceptible of vibration; why thofe animals which have the greateft quantity of cartilage and the leaft membrane in
their vocal organs, have the ftrongeft and moft fonorous voices, and vice verfa? We fee alfo that all animals provided with a pulmonary organ will have a voice; fince nothing more is required, for the production of this found, than the accumulation of air in fome receptacle, its expulfion in a mafs, with a certain force, and its meeting on its paffage with elaftic and vibratory organs. Fiihes, which have gills, and infects, in whom the diftribution of air is by means of trachex, produce no found.

It feems impoffible to explain how the paffage of air through the human glottis fhould produce vocal founds diftinguifhing man from all other animals, and how each animal fhould have his peculiar and characteriftic voice, where the differences of ftructure, in a part of fuch fimple formation, mult be very flight. Yet it feems true that the glottis alone produces the fpecific character of the voice in each animal. Numerous and refpectable authors affirm, that the inflation of air through the glottis is fufficient, even in the dead animal, to produce its particular voice : this has been afferted of the human fubject, the cow, pig, cat, rabbit, hare, goofe, and frog. It is directly adverfe to what we have already flated concerning the neceffity of fome mufcular action to the production of the voice, and is fo contrary to thofe principles, by which thefe functions are fubjected to the will, that we cannot help doubting the whole affertion. After reciting what others have ftated, Haller adds, "with me thefe experiments have not been fo fuccefsful: I have fometimes obtained a found, that might be recognifed as the voice of the animal, but could never imitate the character of the voice in the pig or dog, and much lefs in man." Elem. Phyfiol. lib. ix. fect. 3. \$ 4.

As the found, formed in the larynx, or the voice, proceeds through the mouth and the multiplied hollows of the noftrils, it undergoes various modifications, according to the nature of thefe parts, which produce in it changes affecting its key or pipe.

Ventriloquifm is, perhaps, one of the mof fingular phenomena connected with the vocal functions; and certainly one, of which the nature is very little undertood. This name, as well as the Greek term of engaftri-muthifm, proceeds on the fuppofition that the found comes from the abdomen: but we cannot doubt, in general, that the vocal organs alone are concerned, however unable we may be to explain the exact nature of the procefs. Ammann, the Swifs, whofe philofophical labours on the fubject of language, and particularly in the inftruction of the deaf and dumb, entitle him to much confidence, fays, that he faw an old woman who could fpeak during infpiration, and others have explained ventriloquifm in the fame way. We believe that the point has not been fufficiently afcertained by actual obfervation : and others, in their attempts at explanation, even fuppofe that it is produced, like ordinary fpeech, during exipiration. Some conceive that the tongue is fixed, and that fome motions of the pharynx and velum palati do the bufinefs. Richerand obferved, that a man who could give a dialogue between two fpeakers, with different voices, as if placed at fome diftance from each other, did not infpire while he was doing this, but that he expelled air in much. fmaller quantity than ufual. The fame author obferves, that a Mr. Fitz-James, who poffeffes the power of ventri-. loquifm in wonderful perfection, does it by means of an extremely gradual exfpiration, in which the air is brought out in a very flender ftream. He precedes this by a very deep infpiration: hence a full ftate of the flomach renders the exertion of his talent difficult, which all individaals, who have had the art in queltion, feem to experience. By accelerating or retarding the exit of this air, Mr. Fitz-James
can imitate different voices, make his auditors believe that the interlocutors in a dialogue, which he carries on alone, are placed at different diftances, and produce the mott complete illufion on thefe points. See Richerand, Elemens de Phytiologic, § 2, P. 339.

In hawking the air is violently forced, by a kind of interrupted action, through the trachea, larynx, and fauces, fo as to detach the fecretions of the parts, or any thing elfe which lics on the furface. The peculiar noife is produced by the air thus violently dafhed againt the parts.

Snoring is produced by a kind of tremulous of cillation of the velum palati, generally in infpiration, but fometimes alfo in exfpiration. Wailing, or the plaintive found produced in weeping, is the confequence of tremors of the foft palate, gradually diminifhed in force as the air is ex. fpred.

In humming the mouth is clofed, and the expired air enters the nafal cavities with tremulous motions of the mufcles of the fauces.
When the tongue is drawn upwards and preffed againft the palate, and then fuddenly depreffed, fo as to allow the air to pafs quickly, the noife called chuckling takes place. By drawing the lips between the teeth, and ther quickly feparating them, we can imitate the trot of the horfe; and by exercife we can even produce a found like the clapping of hands.

When we wifh to afcertain the odorous properties of any body, we fniff at it ; that is, the infpired and exfpired air is conveyed through the nofe with a tremor of the alr nafi caufing a particular noife.

Hiffing is produced by expelling the air between the teeth, when brought clofe together.

In whiftling, the tongue is rendered concave on its fuperior furface, and applied to the bony palate, and upper teeth, fo as to have a paflage for the air between it and thofe parts; the lips are at the fame time contracted into a round aperture; and the point of the tongue is in contact with the front lower teeth. The vibrations of the parts through which the found paffes produce the peculiar effect, and the motions of the tongue and lips increafe or diminilh the dimenfions of the openings through which it paffes. The prodution of a loud found requires a large quantity of air, a ftrong and accelerated exfpiration, and a confiderable tremor of the chord $x$ vocales. The lungs mult therefore be large and admit eafily of diftention; the trachea and larynx muft alfo be ample, and the reflexion of the found in all the paffages unimpeded. A diftended flate of the flomach is un$\mathrm{f}_{\text {dvourable }}$ to the production of fuch founds, as it impedes the defcent of the diaphragm. The impervious ftate of the lungs in the confumptive muft be equally unfavourable; and we accordingly find that the voice becomes weaker, as the difeafe advances.

In forming high or acute founds, a contracted fate of the glottis, with tenfion of its ligaments, are required; the air paftes rapidly through the narrow opening, and numerous ofcillations of its fides are produced. The whole larynx is carried upwards and forwards; and, in uttering the moft acute founds, the head is thrown backwards, that the larynx may be elevated through a wider range. This elevation equals nearly half an inch for one octave. That the changes above-mentioned take place, is proved, by placing the finger on the laryns, which gives us immediate demonfration of its afcent, when we utter acute founds; by the comparatively acute voice of children and women, in whom the larynx is fmall, and the glottis confequently narrow; by comparative anatomy, which fhews us that the glottis is fmall and narrow in finging birds, large and relaxed in aniVol. XX.
mals which utter deep founds; by the blowing of wind in. ftruments, in which the opening for the paffage of the air is always contracted in order to produce the high notes; and alfo by this general fact, that the founds are always more acute in proportion as thefe inftruments are of fmaller fize.

If we talk too impetuoully, the quick paffage of the air throws the chordx vocales into too rapid ofcillations, and the voice fuddenly becomes exceedingly frill. Thefe changes have nothing to do with the loudnefs of the found; a weak as well as a fltrong found may be either acute or grave in its tone.

In the production of deep or bafe tones, an oppofite flate of parts is required; the larynx is carried downwards, and the head itfelf brought towards the cheft. This defcent, like the afcent, is about half an inch for an octave: In the male fex, where the larynx is larger, and the glottis confequently more ample than in the female, the voice is habitually deeper toned. Eunuchs and women may be taught to fing foprano, but not bafs. When very low tones are formed, in which the chordx vocales are greatly relaxed, the production of found ceafes altogether.

A human voice that has been much exercifed, can pars through about two octaves and a half in either direction from the middle; confequently it has a range in the neck of nearly three inches.
The queftion has been much agitated among phyfiologifts, whether the changes of tone in the voice depend on alterations in the diameter of the opening, or in the flate of terfion of the ligaments forming its fides. By the advocates of the former opinion, the organ of the human soice is compared to wind inftruments, in which the enlargement of the aperture renders the found grave, and its diminution acute; and by thofe of the latter to ftringed inftruments. We admit, in the preceding account, the efficacy of both kinds of changes, but we confider the alterations in diameter as the molt efficient. The change of the voice from acute to grave, at the time of puberty, when the larynx undergoes a remarkable developement, as well as its acutenefs in females, whofe glottis is lefs by one-third than that of man, fhew that the fize of the aperture has a great influence. Obferving, on the other hand, that the chordæ vocales admit of confiderable tenfion and relaxation, we muft allow that thefe variations will render them fufceptible of executing, in a given time, vibrations more or lefs extenfive and rapid. And although they are neither dry, ftretched, nor ifolated, which are neceflary conditions to the production of found in thofe ftringed inflruments to which the larynx has been compared, yet they are analogous to vibrating bodies placed at the tcp of wind inftruments, as the reed in hautboys, the mouth piece in flutes, \&c. and equally contribute to the formation and varied inflexion of vocal founds. Haller, in his Elementa Phyfiologix, lib. ix., has given a long and very inftructive account of the whole controverfy. We fhall be furprized at feeing how very fmall a change can alter the tone, when we refled that the breadth of the rima glotidis does not exceed a line at its broadeft part, and that there is an almoft innumerable variety of tones diftinetly perceptible.

Singing is the expreffion of love and joy, common to birds with the human fubject. The pronunciation of words or letters is not effential to its nature. It includes the greatelt variety of acute and grave founds, and the moft rapid tranfition from the one to the other. In general the tone of finging is more acute than that of talking. The great difference between thefe two modes of vocal exertion is in the tranfitions of finging; in order to execute thefe, the larynx, inftead of relling, is fultained in a kind of equilibrium betweea the elevating and depreffing powers. A perfon will foon Tt
perceive

## L ARYNX.

perceive this by placing his finger on the larynx while he fings, or by obferving the throat of another. As finging requires the exertion of many mufcles, it foon fatigues. It alfo exercifes the mufcles of refpiration; as a large quantity of air is frequently required. 'I'he rapid paflage of the air in finging dries the parts quickly.

Speech is the formation of the voice, produced, as we have already defreibed, by means of the organs about the throat, nofe, and mouth, into articulated founds, by which men communicate their thoughts to cach other. All mals have a voice, bat manalone fpeaks in the fenfe now alluded to. Some, indeed, which have a broad tongue, have been taught to pronounce a few words; but they exprefs no thoughts by thefe founds. We believe that no fufficient reafon can be drawn from organization, why man invariably fhould poffefs, and animals invariably want the power of fipeech.

The tones are not fo quickly changed as in finging, confequently the larynx is much lefs moved. Recitative is a kind of mixture of finging and fpeaking, partaking equally of the characters of each.

If we confider a letter to be a found, that cannot be refolved into more fimple elements, fpeech is the formation of the voice into the founds expreffed by letters, and the compofition of words from there.

Letters are divided into vowels and confonants. The former (vocales) are produced fimply by the voice paffing through the mouth opened to a greater or lefs degzee, without the tongue being applied to the lips or to any other part. Thele founds are produced in laughing, and fomething like them may be obferved in the viices of animals.

In the formation of the vowels, the paffage through the nofe is clofed ; the voice proceeds fraight through the tongue and lips, and the mouth is open. The larger the fpace left for the voice along the tongne and through the lips, or the lower the tongue is placed in the mouth, and the wider the lips are apart, the more deeply do the vowels found. Thefe founds are the moft clear and diltinct, becaufe the canal, through which they proceed, is free and unconfined in every direction.

The confonants are founds pronounced with the vowels, and modifying or limiting them. They muft therefore have vowels either before or after them. The found of the vowel in thefe cafes is altered by the tongue being applied to fome part in the cavity of the mouth, Itriking againlt the teeth or lips, \& c c.

The confonants are diftinguifhed into different claffes according to different principles of arrangement. Soemmersing gives the four following claffifications.

1. 2. Nafales; $n, n, n g . \quad$ 2. Orales; $l, r$. 3. Sibilantes; $f, g, b, a h, f$. 4. Explofive ; $b, d, k, p, q, t$. 5. Compohite; $x, z$,
II. I. Nafales; $m, n, n y$. 2. Liquidx; $1, r$. 3. Mutx; $f, b, c h, f, \approx, f c b, t h, v, w .4$. Explofive; $b, p, d, t, k, g$.
III. 1. Mutr; $k, p, t$. 2. Explofive et vocales ; $g, r$. 3. Explofive ; $f, b, f, f c b$. 4. Vocales ; $b, d, g, f, m, n$.
IV. 1. Gutturales ; $g, c l, h$, th. 2. Palatinæ; $d, l, n, r$, f. 3. Labiales; $b, f, m, p, w$. De corp. hum. fabrica, t. 6. p. 110 .

To point out the motions by which all thefe founds are produced, would lead us into too wide a field. We refer the reader to the ivork of Soemmerring already quoted, "and to Haller's Elementa Phyfiologix, lib. ix.

The remarkable change which occurs in the voice, at the time of pubert $y$, mult be referred to the fudden developement which the organ undergoes at that time, as we have already flated. The various affections of the mind are accompanied
by the utterance of particular founds; and this is floongly feen alfo in animals. In them, the wants comrected with the generative functions, afford the molt frequent caufe for the exertion of the yocal crgans. But we may obferve further, both in birds and quadrupeds. that certain modifications of the voice exprefs fear and anger, affiction for the off pring, joy and pain, that other are ufed in calling the aflembly together, and, in the cafe of sregarious animals, in imparting to each other fomething which we do not undertand. Similar vocal expreffions of what is paffing internally are obferved alfo in the dumb, who have not fearned to fpeak; and even animals diftinguifh in man the founds denoting anger, approbation, \&c. In the founds which we utter, on many of thefe occafions, in civiluzed fociety, there may be fomething arifing from imitation or habit, or referrible in fome way to a conventional origin ; but much of it is fo completely inartificial, that we feem to obey merely a ! pecies of inftinct, and to exprefs the fimple voice of nature. Various malformations and difeafes of the organs concerned in \{peech impair or entirely deftroy the power of pronunciation. From the important fhare which the tongue has, in producing articulated founds, we fhould expect that extenfive injuries of it would be very injurious in this way. But experience fhews us that it may be very extenfively injured without greatly impairing the powers of fpeech. Indeed feveral letters may be pronounced without its aid. Mr. Louis has collented feveral cafes in his "Memoire phyfivlogique et pathologique, fur la Langue ;" in proof of this point, he itates, that after very ferious injurics the power of £pecch was at dirf greatly impaired; but that it gradualy returned. Memoires de 1'Acad. de Chirurgie, t. vo

Stammering may be caufed by too large and thick a tongue, by great lengt of the frxnum; by any caufes that impair the motions of this organ, whether they be referrible to organization, or to the ftate of the nervous fyltem, as in drunkenuefs, apoplexy, \&c.
Too great confinement of the organ, by its frxnum, fometimes prevents children from learring to fpeak.

Want of the front teeth, as well as unduc fize of the tongue, produces lifping.
The confinement of the tonguc in the aged, confequent on the diminution of the cavity of the mouth from the lofs of the teeth, very much impedes the powers of pronunciation:

When we affign certain organieal defects, as the caufes of defective pronunciation, we do not mean to affert that this is conitantly true. A perfon who ftammers, for example, will often be able to fpeak clearly, if he will fpeak nowly.

The obftruction of the paffage of the found through the nofe, either by clofing the front openings of the noftrils, or by the elevation of the velum palati belaind, produces a peculiar modification of the voice, which is Atrangely enough termed, in common language, fpeaking through the nofe. Difeafes of the palate, or its velum, ulcerations, and preternatural openings in them, have alfo very confiderable effect on the voice ; the fame may be obferved of difeafe affecting the bones of the nofe.
Dumbnefs may be accidental, or may fublift from birth. In the former cafe, it arifes from organic injury; which either affects the mechanifm of the paris, or which intercepts the communication between the vocal mulcles and the brain. In dumbnefs from birth, deafnefs feems to be always the caufe; fo that the abfence of fpeech fhould here rather be called filence. This, at leaft, is conitantly the cafe, according to the obfervation of Sicard on the numerous pupils committed to his care. Here there is an abfolute ignorance of founds, and of their reprefentative value in letters of the alphabet. The vocal organs exhibit no marks of deficiency;
they are fit, in thort, to fulfil the ufes for which nature has deltined them, but they remain in a flate of inaction, becaufe the deaf infant is not confcious that he has the means of communicating his thoughts. See the article DumbNess.

Bichat, Anatomie Defrriptive, t. ii. Soemmerring, Dc Corporis humani fabrica, t. vi. I-Ialler, Elementa Phyfivlogix, lib. ix.

LasAIA, in Grography, a town of Naples, in Principato Citra; 21 miles S.S.V. of Cangiano.

LASANON, a word ufed by different authors in vety different fenfes; fome applying it to the trivet commonly ufed in kitchens; others to a clofe-ltool; and others, anong whom are Hippocrates, and the ancient phyficians, for a fort of chair, contrived for a woman in labour to fit in, as being fo made, that the weight of the child, when born, thall hielp to draw away the fectudines.

LASCARIS, Constantine, in Biography, a learned defcendant of the imperial family of that name, was born at Conflantinople. He quitted his native city when it was taken by the 'Turks in ' 5 . 5 ', and went to Italy, where he was moll amicably received by duke Francis Sforza of Milan, who placed his own daughter, a child of ten years of age, under the care of Lafearis for inftruction in the Greek language. For her ufe be compofed his Greek grammar. From Milan he went to Rome, and from thence, at the invitation of king Ferdinand, he repaired to Naples, where he opened a public fchool for Greek and rhetoric. Having fent fome years in this employment, he was defirous of repofe, and embarked with the intention of fettling at a town of Grecce; but having touched at Meffina, he was urged by fuch advantageous offers to make it his refidence, that he complied, and paffed there the remainder of his days. Here he received the honour of citizenfhip, which he merited by his virtues as well as his learning, and by the inflex of fcholars which his reputation drew thither, among whom was the celebrated Bembo. He lived to a very adranced age, but the time of his death has not been exactly afcertained. He bequeathed his library to the city of Meflina. Hiṣ Greek grammar was printed at Milan in 1476 , and was the firlt book that iffued from the Italian prefs. A better edition of it was given in 1494, by Aldus Manutius: Erafmus confidered it as the beft Greek grammar then extant, excepting that of Theodore Gaza. Lafcaris was author likewife of two tracts on the Sicilian and Calabrian Greek writers.

Lascaris, Joan Axbiew, a learned Greek of the fame family with the preceding, came over to Italy, on the ruin of his country. He fludied at Padua, obtained a high reputation for his knowledge in the learned languages, and received the patronage of Lorenzo de Medici, who Sent him into Greece with recommendatory letters to fultan Bajazet, in order :o colleet ancient manufcripts. After the expulfion of the Medici family from Florence, in I49t, he was carried to France by Charles VIII., after which he was patronized By Louis XII., who fent him, in 1503, as his ambalfador to Venice, in which office he remained till 1508. He joined the purfuit of literature with his public employment, and held a correfpordence with many learned men. After the termination of his embalfy, he remained fome years at Venice, as an inftructur in the Greek language. On the election of pope Leo $X$. to the popatom in 1513 , he fet out for Rome, being perfuaded that he thoald meet with a favourable reception frem that patron of learning. At the inltigation of Laicaris, Len fuunded a college for noble Grecian youths at Rorie, at the head of which he placed the author of the plan. In 2588 , he quited Rome
for France, whither he was invited by Francis I. ; here he was employed by the monarch in forming the royal libraryHe was alfo fent as his ambaffador to Venics, with a view of procuring Greek youths for the purpofe of founding a college at Paris fimilar to that of Rome. After the accomplifhment of other importaut mifinons, he died at Ronse in 1535, at an advanced age. As an author he compored epigrams in Greek and Latin ; he tranfíted into the Latin language, a work extraEted frem Polybius, on the military conllitutions of the Romans; and he printed at Florence a magnificent edition of the Greek Authologia. By his contemporaries he was greatly praifed, on account of the eminent fervices which he performed for the extenfion of literature.

LASCHE, in Gcography, a town of Bohervia, in the circle of Chrudim; eight miles E. of Chrudim.
LASCHI, in Bigrafby, an admimble finger and actor in the firlt burletta band of fingers which arrived in England during the autumn of 1748 , when ferious operas were difoontinued by the abdication of lord Middlefex, who was as unfuccefsful in his opera regency, as James II., in en. deavouring to eftablifh the Roman Cathoic religion in this country.

The new troop confifted of Pertici, as luffocaricato, La chi, tenor, and Guadagni, ctaunter tenor, (then very young, as ferious men. Frali, and, afterwards, Mellini, for fericus women; and the comic female parts by the wives of Pertici and Lafchi, the two beft comic actors we ever faw on any flage, formed a very good troop, and in the comic operas of "La Comedia in Comedia,", "Orazio," "Don Colafcione," " Gli tre Civifbei Ridicoli," \&c. cumpored by Latilla, Mitale Refla, and Ciampi, who came over as maeftro to the company, pleafed the public and filled the theatre very fuccefsfully during the whole winter. Lafchi was certainly the beft firft buffo, except Lovatini, that has ever appeared on our Alage: and the acting of him and Pertici was undoubted'y the moit amufing and ingentous that can polfibly be innagined.

LASCIGO, in Grography, a town of Naples, in Principato Citra; 18 miles W. of Policaftro.
LASCO, Jons A, in Biography", a zealous promoter of the Reformation, was born in Poland, of a noble family, about the clofe of the fourteenth century. He received the early part of his education in his own country, and then travelled into foreign parts for improvenient. In Switzerland he became acquainted with the celebrated Zuingle, by whofe influence he determined urpo fludying divinity, and having by the example of his friend imlibed the firit of the reformation, he returned home with the defign of propagating the principles which he regarded as having their foundation in important truth. At firf he was pronoted to a high flation in the Catholic clurch, and at length was nominated bifhop of Vefprim, in Ilungary. His honours, probably, did not fit ealy upon him, and he determined to make an open avowal of his fentiments; by this decided courfe he drew upon himfelf the vengeance of the Catholic bilhope, who did not hefitate to pronounce him an heretic. He appealed to the king, but the fovereign was either unable or unwilling to extend the fhield of his authority in protecting his bifhop, and he was obliged to quit Hungary in the year 1540. In 1542, he was chofen minifter of a church at Embden, and in the following year he went to Oldenburgh, to eltablifh the doctrines and dilcipline of the reformation in that diftrict. In 1544, he was invited into Pruffa, by duke Albert, for the fame purpofe, but as he was not altogether a Lutheran, he was obliged to relinquilh this miffion and to return to Friefland. Here her refled about ten years,
wiles

## LAS

when the publication of the Interim by the emperor Charles V. compelled him to feek another afylum, which he found in England, on the invitation of Edward VI., which was conveyed to him by archbifhop Cranmer. Here he became minifter to a German Proteftant church, which afo fembled for divine worfhip at Auftin-Fryars. Of thefe Proteftants, almolt four hundred were admitted to the honour of citizenfhip; they were not tolerated, but guaranteed by royal patent, in the confcientious difcharge of their duties to God, while numbers of his majefty's natural born fubjects were grievoully perfecuted on account of their inability to join in all the ceremonies enjoined by the eftablifhed religion. The preamble to the patent referred to, is a curious document confidering the times; it admits that the German church made profeffion of pure and uncorrupted religion, and was inftructed in truly Chriltian and apoltolical opinions and rites, and it was permitted them to enjoy and exercife their own rites, ceremonies, and difcipline, though they were different from thofe ufed in this kingdom. Lafco avowed the fame npinions as thofe held by Hooper, Latimer, and other illaitrious divines of that day: he was, however, permitted to live in peace during the reign of the youthful monarch; but upon the acceffion of the infamous Mary, he and his congregation were ordered to leave the kingdom. They embarked with their families and property, and at the commencement of a very fevere winter arrived off the coaft of Denmark, but were not permitted to land on account of their known tenets. For the fame xeafon they were refufed an afylum at Lubec, Hamburg, and fome of the cities of Saxony ; at length, after they had been driven from place to place, they were hofpitably received at Embden in March $1554^{\text {. }}$. In the following year Lafco went to Frankfort upen the Maine, and obtained leave from the fenate to build a church for foreign Proteftants. In 1556, he wrote a letter to Sigifmund, king of Poland, in vindication of himfelf and his doctrines, from certain mifreprefentations which had been cireulated by his enemies. In 1557, he publifhed an apology for the church of the reformed Proteftants at Frankfort, on the fubject of the variation in their creed from that of the confeffion of Augfburg with refpect to the Eucharit. He was anfwered by Weltphalus, who, feeling that he had the weakelt fide of the argument, exhorted the fenate to interpofe its power, and to withdraw its protection from the difciples of Zuingte, whom he denomirrated rank heretics, and the Devil's martyrs. Lafco, after a thoufard vicififudes, returned to his native country; but fcarcely had he arrived, when the bifhops and other ecclefiaftics fet about every method to ruin him. A fynod was convoked to meet at Warfaw; the refult of their deliberations was, that Lafoo was a heretic; he was accufed before the king, and a petition was drawn up praying that he might be banifhed. The fovereign nobly rejected their demand, and he was permitted to live free from perfecution, though he was daily affailed by the dark calumnies of his enemies. He died in 1560 , leaving behind him many works which teftify that he was a man of great talents and profound learning. He was the friend of Erafmus, who acknowledged the obligations he was under to him; and Peter Martyr calls him his moft learned patron. He was highly efteemed, and frequently confulted by Sigifmund, king of Poland; and he is commended by contemporary hiltorians as a man poffefling many virtues, and the moft unafiected piety. Gen. Bing.

Laser Cyrenaicum, in the Materia Medica, a-name fuppofed to be given by the ancient Greeks to the gum we at this time call alfa foxtida. The word affa, or, as it was originally written, afa, was evidently formed on the lafer of the Grecks; but there was allo an afa mentioned by the old authors very different from this, being a fragrant and fweet-fcented gum. This fweet gum was evidently the lafer and afa, or affa, of the ancient Greeks: and the filphium was the plant which produced it. This plant grew in Cyrenc, and furnifhed it a long time; but in the days of Pliny it was in a manner loft. The people of Cyrene found it more profitable to feed their cattle upon the filphium, than to gather its gum.

Pliny continues to tell us, that by the feeding cattle on this plant, it was fo perfectly deftroyed, in a courfe of years, that there had been, of a long time, only one plant of it feen, and that reckoned fo great a curiofity, that it was fent as a prefent to the emperor Nero.

When Cyrene no longer afforded the filphium, it was fought for in other places. The original afa, or lafer, had the fmell of myrrh, but more mild and agreeable; and the afa of fucceeding times had that of leeks or garlic, and thence was diltinguifhed by the name forado lafirum.

LASERPITIUM, in Botany, Laferwort; an ancient name of uncertain derivation, fynonymous with the onatoon of the Greeks. Lac ferpitium, alluding to its milky juice, or lacipitium, becaufe that milk y juice has a pitchy fmell, both fuggetted by etymologitts, afford little fatisfaction. The word is evidently compounded of Lafer, the riame of the gum which it produces, and from which $A f a$ is by fome thought to have been corrupted. Hence Afar-jatida has been fuppofed the true Lafer, or gum of the $\sigma t \lambda \hat{\lambda} \frac{10 n}{}$, which is known to be of a fetid nature. Ambrofinus afferts Lafer to be a corruption of Latir, from lac, milk. Whatever the csipooy of the Greeks, or the Laferpitium of the Latins may have been, the Silphium of modern botanilts is a genus of the fyngenefious clafs, and the Laferpitium is one of the umbelliferous tribe, of which we are now to fpeak. It fo far accords with the ancient plant, that feveral of its fpecies difcharge, when wounded, an acrid and ftrongly fcented relinous gum.-Linn. Gen. 136. Schreb. 186. Willd. Sp. Pl. v. r. 1414. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v 2. 138. Sm. Prodr. Fl. Grixc. Sibth. . . 1. 191. Juff. 222. Tourn. t. I72. Lamarck Illuftr. t. 199. Grertn. t. 85: (Siler; Gxrtn. t. 22.)-Clafs and order, Penlandria Dighnia. Nat. Ord. Umbellata, Linn. Uribellifera, Julf.

Gen. Ch. General umbel very large, of from twenty to forty rays; partial of many rays, flat. General involucrum of many leaves, fmall; partial of many leaves, fmall. Perianth of five teeth, fcarcely difcernible. Cor. Univerfal uniform; all the flowers fertile; partial of five freading, nearly equal, petals, their points bent in fo as to form the fhape of a heart. Stam. Filaments five, brifle-fhaped, the length of the corolla; anthers fimple. Pij. Germen infcrior, roundifh; flyles two, rather thick, pointed, difant; ftigmas obtufe, fpreading. Peric. Fruit oblong, with eight longitudinal membranous angles, feparable into two parts. Seeds two, very large, oblong, femicylindrical, flat on the inner fide, furnifhed each with four dorfal and marginal membranes on the other.

Eff. Ch. Involucrum both general and partial Fruit oblong, with membranous angles. Petals uniform, inflexed, emarginate, fpreading.

The fpecies of Laferpitium are in general of a larger proportion, with more ample foliage, than moft other umbel. liferous plants. To this neveribelefs there are fome excep-

## LASERPITIUM.

tions, for we perceive a prodigions difference between the gigantic L. aquilcgifolium, Jacq. Autr. t. $8+7$, and the little lo.fimplex, Jacq. Mifc, v: 2. t. 2. 'The 14thedition of Sylt. Veg. has fourteen fpecies, comprehending Forfter'y genus Acipbylla; Willdenow has twenty-three. In each of thefe lifts, however, there are fome ambiguous or doubtful plants, which, from variations incident to this tribe, relative to the occafional abfence or prefence of an involucrum, are fuppofed to be defcribed twice over in the Linnæan fyftem. Such is the cafe with $L$. Chironium, fufpected to be the fame as Pafinaea Opopanax, we believe juftly. Willdenow doubts whether L. Archanselica of Jacquin, Ic. t. 58, be diftinct from this plant of Linnæus, but we are quite clear on this point, and are almolt as perfectly fatisfied that $L$. Cbironium is Pafinaca Opopanax, which laft name Linnxus, in his note on the fubject, has accidentally written Coflina, apparently from having Bauhin's fynonym in his head; yct Reichard, Willdenos's and Laicharding copy him without reflection or remark.

Indubitable fpecies of Laferpitium, which will ferve to give a competent idea of the genus, are the following. None are natives of Britain.
L. latifoliun. Broad-leaved Laferwort. Linn. Sp. Pl. 356. Jacq. Auitr. t. 146. (Libanotis Theophratli major; Ger. em. 1010.) - Leaflets obliquely heart-fhaped, undivided, with fharp-pointed teeth.-Native of mountainous dry woods in various parts of Europe, flowering in July, ripening feed late in autumn. Jacquin obferves that it varies greatly in fize and roughnefs, being only a foot or two high on the Alps, while in lefs elevated fituations it rifes to four or five fect, with ample and handfome foliage. He afferts alfo that wild plants of a very rough habit, on being brought into the garden, became fmooth the next feafon. Hence he determincs the L. afperum of Crantz, Diff. falc. 3.50. t. 1. f. 2 , and glabrum of the fame author, 54 , to be one and the fame fpecies. This $f$. 2 . of Crantz very correctly expreffes a leaflet of our plant, fuch as is preferved in the Linnxan herbarium, and exhibited by Jacquin as above. The radical leaves are twice or thrice compound, with large, heart-fhaped, ftalked, undivided leaffets, unequal at the bafe, veiny, from one to two or three inches long; fmooth and dark green above; paler, and more or lefs rough with rigid briftles, beneath; the margin befet with ftrong broad tharp ferratures, the bafe entire. The fem is fmooth and round, bearing a few fmaller more entire leaves, whofe common ftalk is greatly dilated and inflated at the bafe. The umbels are broad. Flowers fmall, white. Wings of the feeds, according to Jacquin's plate, even, and fcarcely at all undulated, rounded not angular at their fummit, agreeing very well with the firft figure of the feed annexed to Morifon's Sect. 9. t. 19. f. 1, fo that, if he be right, his whole fig. I. mutt belong to our plant, though it is not a very good one. We cannot help thinking too that the Laferpitium of Rivinus, Pentap. Irr. t. 21, is the fame fpecies. Profeffor Willdenow, however, feems to have been led by Crantz and Lamarck to eftablifh another fpecies, by the name of L. Libanotis, for which he quotes this plate of Rivinus, as well as another figure of Morifon, Sect. 9. t. 19. F.6. This he fupiofes to be the glabrum of Crantz, who cites as a certain though rude figure Libanotis alpina latifolia, femire $\epsilon$ rifpo, Bocc. Muf. 24. t. 3The plant of Boccone, according to all appearance, we have from Italy, and can aver its being totally different from $L$. latifolium and all the fynonyms of Willdenow's L. Lilanotis, being, as far as we can tell, not yet defined by any fyrtematic author. The wings of its feeds, though called srifped, are nearly even, and terminate in a lateral angle at
the top, like Morifon's t. 19. f. G, which may polfibly be.a bad delineation of Boccone's plant. Willdenow does not mark his L.. Libanolis as one that he had feen, and he might well be led into confufion by the writers on whom he has depended. Among thefe the moft blameable is Crantz, who roundly afferts his afpcrum, (our latifolium,) to be I.. Chironium of Linnæus, which we can politively contradict, and which nobody but Lamarck has believed. The latter feizes with alacrity the opportunity of cenfuring Linnæus on the fubject of his fynonymi, though in this inftance unjuftly, while he himfelf defcribes under the name of L. Libanotis, with extremely confued fynonyms, what appears clearly by his account to be $L$. trilobum of Linnæus, of which we thall now fpeak.
L. Irilobum. Three-lobed Broad Laferwort. ILinn. Sp. Pl. 357. (L. Libanotis; Lamarck Dict. v. 3. 423, by the very excellent defcription, Ligufticum Rawwolfii, foliisaquilegix; Bauh. Hith. v. 3. p. 2. 148. Pluk. Phyt. t. 223.f.7. Siler foliis aquilegix; Rivin. Pentap: Irr. t. 64.) -Leaflets broad-ovate, threc-lobed, cut and fharply ferrated.-Native of Italy, and we believe alfo of Switzerland; though Profeffor Lachenal, from whom we have a fpecimen of the true plant, afferts the $n, 793$. of Haller, taken for this, to be only a variety of latifolizm, which according to him has occafionally two or three lobes in its lower leaflets. A Swifs fpecimen from Schleicher feems to be the real trilobum, but it wants the lower leaves, and therefore cannot be abfolutely determined. The leaflets of L. trilobum differ from the foregoing, in being by no means heartfhaped at the bafe, but either ovate or tapering, and more or lefs deeply three-lobed, fometimes to the very bafe; as well as cut and tharply ferrated. The umbel is very large and fpreading, with long purple rays. Flowers fmall, white. Wings of the feeds even, and very narrow. Lachenal feems, when he wrote his remarks above alluded to, in Act. Helvet. v. S. 145, not to have diltinguifhed this from the following, though they are widely different.
L. aquilegifolium, Great Columbine-leaved Lalerwort. Jacq. Auftr. v. 2.-Leaflets feffile, rounded, bluntly lobed and cut. Winge of the feed very narrow.-Native of Auftria, Sivitzerland, and the Bithynian Olympus, firf well determined by Jacquin. It is five or fix feet high, with ample leaves, much refembling thofe of a Columbine ia their rounded obtufe torm and fegments. The umbels are very large and fpreading. Flowers white. Wings of the feed even, and very narrow. Crantz makes it a Siler, and mifquotes under it fynonyms which belong to the lait, and which he therefore jultly fays "could never be gueffed tobelong to the prefent." Why then, as they certainly do. not, are they quoted?
L. Siler. Mountain Entire Laferwort. Lim. Sp: Pl. 357. Jacq. Auftr. v. 2. 27. t. 145. Sm. Prodr. Fl. Græc. Sib. v. r. 19r. (Siler montanum officinarum; Ger, em. r-48.) -Leaflets elliptic-lanceolate, entire, ftalked.Found on the mountains of Auftria, Switzerland, France, Greece, and other parts of the fouth of Europe. It is of more humble growth than any of the former, and diftinguifhed by the form of its lenflets. The feeds are thaped and winged much as in the lalt. They are aromatic and very bitter. Haller complains of its being neglected as a medicinal plant, though ftrong in aromatic virtues.
L. pratenicum. Pruffian Laferwort. Linn. Sp Pl. 357. Jacy. Aultr. t. 153. Ehrh. Herb. 93. (L. minus; Rivin: Pentap. Irr. t. 23.)-Leaflets pinnatifid; their fegments lanceolate, acute, decurrent, entire. Stem birpid.- Fourid in Prulfia, Aufria, Switzerland, \&x. The flem is about two feet high, erect, hairy, as well as the deaf-1talks,

Leaves light green, fmooth, bipinnate; their leaflets pinnatilid, with elliptic-lanceolate, decurrent, pointed fegments. Umbels tather large, white, with white-edged involucral leaves. Sceds fmall, their wings broadifh and wavy.
L. birfutun. Hairy Fine-leaved Laferwort. Lamarck Diet. v. 3. 425, with a wrong reference to Linnxus. (L. Halleri; Villarf. Dauph. v. 2. 625 . L. n. 795; Hall. Hitt. v. I. 3.53 . t. 19.)-Leaves hairy, many times decompounded, with lanceolate decurient fegments, often threecleft. Involucral leaves with membranous fringed edges, Native of the alpine parts of Switzerland, Savoy, and France. We gathered it on Mount Cenis, flowering in Augult. The broad, extremely compound, finely cut and hairy leaves, at once diltinguifh this fpecies. The umbels are large, denfe, and white. Wings of the feeds rather broad, pale, and flighty crifped.

Laseleitita, in Gardening, $\mathcal{E}^{\circ} c$. The plants of this genus grow naturaliy in the fouth of France, in Italy, and Gerinany, and are prelerved in botanic gardens for the fake of variety; they have no great beauty. It has been generally fuppofed, that the filp? ium of the ancients was procured from one fpecies of this genus, but from which of them (if any) we are at prefent ignorant. All the fpecies, if wounded, drop a very acrid juice, which turus to a refinous gummy fubtance, very acrimonious. This was externally applied by the anciants to take away black and blue fots that came by bruifes and blows, as alfo to take away excrefcences: it was alfo by foune of the ancients prefcribed in internal medicines, but o.hers have cautioned people not to make ufe of it this way, from the effects which they mention to have feen produced from the violence of its acrimony.

All thefe plants are extremely hardy, fo will thrive in moft foils and lituations. They are propagated by feeds, which, fown in autumn, will afford plants in the fpring, that may be tranfplanted in the following autumn. Miller.

LASERRA, in Geography, a town of Corfica; 10 miles N.E. of Sarcena.

LASERWORT, in Betary, \&ce. See Laserpities.
LASGRUFVA, in Geograpby, a town of Sweden, in Hellingland; 58 miles E. of Hudxick fwal.

LASH, or to la $\beta$, is to make fatt the booms, anchors, \&c. by feveral turns of rope, to prevent their moving by the mosion of the fhip.

Lafbirg, which alfo denotes a piece of rope ufed to faften or fecure any moveable body in a fhip, or about her maits, fails, and rigging, is chiefly ufed for binding up to the frip's Gide, mukees, butts of water or beer, or pieces of timber to make fpare tom-malts.

LASHERS are properly thofe ropes only which bind faft the tackles, and the breeches of the ordnance, when they are haled or made faft, within boaid.

LASHOM JAmisas, in Geografby, a town of Egypt, on the coait of the Mediterranean; 12 miles N.W. of Damietta.

LASIA, in Ancient Geograbby, an ifland fituated on the coalt of Lycias. Pliny.-Allo, an inend on the coalt of the Peloponnefus, over-againit Troëzené.-Alfo, one of the names of the ifle of Andros.

Lssia, in Botaity, from azowe, bairy or brifly, becaufe the plant is befet with numerous little briftes or prickles. Loureir. Cochinch. Br.-Clafs and orèer, Tetrandria Mínogyrnia. Nat. Ord. Piperite, Linn. Aroidce, JuT.

Gen. Ch. Cal. Spatha awl-fhaped, twifted, coloured, very long. Spadix florter than the \{patha, entirely covered with florets. Cor. Petals four, flethy, obtufe, concave, clofel embracing the organs of impregnation. Stam. Fila-
ments four, fhort, flat, hidden by the petals; anthers two to each filament, rounded, concave, protruding beyond the corolla. Pij. Germen fuperior, roundifl; ftyle none; fligma rather abrupt. Peric. Berry finall, roundifh, unequal. Seed folitary, roundifh.

Eff. Ch. Spadix covered with florets. Petals four, flefhy, inferior. Anthers two to each filament. Berry with one feed.

1. L. aculeata. Cu chaóc gai, of the Cochin-chinefi. Native of the moilt plains of Cochinchina. A femlefs plant, fix feet high, with large, pinnatifid, leaves, on long, round, upright lalks. Flozerer-lalk radical, quite fimple and naked, about as tall as the leaves. The leaves, and all the falks are covered with numerous little short curved prickles. Loureiro juflly indicates the affinity of this plant to Potbos, and no lefs jufly prefers placing it in the fourth clafs, rather than in Gynandria. 'The prickly pubefeence, if we may to term it, is very curious in this family. It is to be prefumed the anthers are each of one cell only, or rather that each filament bears one anther, of two feparated lobes and cells.

LASIO, in Ancient Gcography, a town of the Peloponnefus, or Triphylia.-Alfo, a mountain in the ifland of Crete, on which was the tomb of Jupiter.
LASIOPETA LUM, in Botany, from 7.x506, hairy, and -sfancy, a petal, alluding to the hairinefs of the flower.-Sm. Tr. of Linn Soc. v. 4 216. Venten. Malmaif. 59. Bitlard. Nov. Holl. v. 1. 63. Ait. Hort. Kew. ed. 2. v. 2. 36.-Clafs and order, Peritandria Mcrogyzia. Nat. Ord. Rbamni, Julf.
Gen. Ch. Cal. Perianth inferior, of one leaf, wheelfhaped, hairy, in five deep, equal, ovate, folded, at length expanded feginents, permanent, often coloured. Cor. Petals five, minute, roundifh, inferted into the bafe of the calyx between its fegments. Stam. Filaments five, very flort, eppofite to the petais; anthers terminal, ovate, twolobed belind, opening by two pores at the top. Pjff. Germen fuperior, grobofe, with three furrows, very hairy; ftyle Short, itraight, fmooth; lligma fimple, acute. Peric. Capfule invelted with the calyx, nearly globofe, with three angles, downy, of three ceils and three valves, partitions from the centre of each valve. Sceds few, roundifh, ipferted into the inner edge of the partitions.

EIT. Ch. Calyx wheel-fhaped, in five deep folded fegments. Petals five, minute, oppofite to the dtamens. Arthers opening by two terminal pores. Capfule fuperior, of three cells, and thrce "valves, with the partitions from their centre.

ObF. The late excellent M. Ventenat, erroneouny quoted as the author of this genus in the new edition of Hort. Kew. has juftly corrected its original defcriber, who miltook for a corolla what is truly the caly x . This correction is the more important, as it leads to a knowledge of the true natural order to which the genus belongs, as given above. M. La Billardiere has obferved a fpecies with five intermediate abortive ttamens, and no petals.
I. L ferrugineum. Rully Woolly-bloftom. Andr. Repof. t. 208. Venten. Malmaif. t. 50.-Leaves alternate, linearoblong, dependent. Flowers racemofe.-Native of marfhes in New South Wales, from whence the feeds were received in 1791, by Meffrs. Lee and Kennedy. It flowers during moft part of the fummer, being fieltered in winter in the green-houfe, and allowed but a fmall fupply of moiture. Stem fhrubby, upright, flender, round, leafy, clethed with denfe, ru!ty, Ilarry pubefcence, and, in its native fituations, throwing oit long, nender, extremely tough branches, to the extent, as it is repurted, of many yards, amongft other
fhrubs.
sirubs. Leaves alternate, ftalked, dependent, linear-oblong, bluntifh, entire or flightly wavy, from two to four inches in length, and half an inch broad; heart-fhaped, rather dilated, and often fomewhat angular at the bafe; deepgreen and fmoothifh above; white and downy, 1 th a rully rib, beneath. Flowers in hort, lateral, deflexed clufters, nearly oppofite to the leaves, with three or more linear rufty bracteas clofe to each flower. Calyst half an inch broad, light green, befprinkled on both fides with denfe, ftarry, rather rufty down. Patals and anthers brown. The whole fhrub is more remarkable for fingularity than beauty: Sometimes, according to Ventenat, the flowers are four-cleft and tetrandrous only.
2. L. Iedifolium. Rofemary-leaved Woolly-boffom. Venten. Malm. at p. 59-Leaves oppofite, linear-lanceolate, fpreading. Stalks lingle-flowered. Bracteas remote from the flower. - Seen by M. Ventenat in the herbarium of M. Thibaud, profeflor of botany at Strafburgh. We prefume it mult be, like the former, and all the known fpecies befides, a native of New Holiand. It is defcribed as varying with broader and crowded, or narrower and more diftant, leaves; and as being remarkable for the fituation of its brafleas, in the middle of the flower-ltalk.
3. L. purfureum. Purple Woolly-bloffon. Ait. Hort. Kew. n. 2.-Leaves oval, catirc.-Found in New Holland by Mr. Brown. Sent to Kew in 1803 by Mr. Good. It is a green houfe fhrub, flowering from April to July. Of this we have no further knowledge, not having feen any fpecimen.
4. L. a-borefens. Nettle-trec-leaved Woolly-bloflom. Ait. Hort. Kew. n. 3.-Leaves heart-fhaped, deeply toothed. - Native of New South Wales, from whence it was fent by Mr. George Calcy i: 1802, through fir Jofeph Banks, to Kew, It fowers from May to July, and is fheltered in the green-houfe.
5. L. triphyllim. Three-leaved Woolly.blofom. Billard. Nov. Holl. v. 1. 63 . t. 88 -Lcaves three together; the middle one largeft and lobed. Stamens ten, the intermediate ones abortive. Petals wanting.-Gathered by M. La Billardiere in Van Levin's land; by Mr. Menzies at King George's found, on the weft coalt of New Holland. We received a fpecimen in flower, by favour of Mr. Aiton, from Kew garden in May lait. It is a $\int$ riab, kept, like others of its genus, in the green-houfe. The whole plant is clothed with rather foft flarry pubefcence, like fome of the mallow tribe, which affumes a rulty hue on the ftalks, and on the veins of the leaves. The foliage is remarkable. Three leaves grow on ftalks from one fpot, (at the fides of the branches,) of which the middlemoft is much the largeft, from one to two inches long and nearly as wide, heart-flhaped at the bafe, more or lefs ditinctly five-angled, or five-lobed, and fomewhat finuated, its footitalk nearly its own length; the fide ones are unequally heart-fhaped and entire, on very fort ftalks, and refemble tipulas. Long dimple cluffers, of feveral flowers, grow folitarily, oppofite to the large leaves, between the fmall ones. The calyx is blufl-coloured, hairy, with pointed \{egments. Antbers dark brown, with yellow tips ; the barren ones fmaller and paler.
6. L. quercifolium. Oak-leaved Woolly-bloffom. Andr. Repof. t. 459 . Ait. Hort. Kew. n. 4.-LLeaves three to. gether, all finuated; the middle one largelt and three-lobed, fomewhat pinuatifd. Stamens five. Petals wanting.-Gathered by Mr. Menzies, at King George's found, on the weft coaft of New Holland. Mr. Brown alfo obferved it in that country. Seeds were fent to Kew, by Mr. Peter Good, in $\leq 803$. This is moft akin to the laft, but abund-
antly diftinct. The leaves are finaller, fomewhat glancous, and much nore harfh, owing to the more rigid and prominent flarry brilties un their upper furface; the three which grow together are more fimilar in fize and figure, being all finuated, though the middle one is much the moit deeply lobed: the edges are flighty revolute. The forucrs have their calyx of a deeper rofe-colour, with lefs pointed feg. ments. We perceive no barren flamens, nor any petals.
7. L. corniculatum. Horned Wooily-blufom.-Leaves three together, cut and crenate; the lateral ones very fmallo. Petals with linear points as longr as the cadyx. - Gathered by Mr. Menzies, at 'King George's found.-The leaves are more denfely and unifurmiy bairy than in the laft, as well as fofter to the touch. The flowers are racemofe, as in that, but much fimaller, and are eflentially diftinguifhed by the long prominent linear apperdages, or horns, of their petals, which equal the caly $x$ in length, and in its dry fhrivelled thate extend much heyond it.

Several more frecies of this genus are in our poffeffion, but we forbear to attempt their defnition from imperfect dried fpecimens, as they will doubtiefs be more correctly and amply illuitrated in the Proliromus of Mr. Brown, who has had the advantage of feeing them alive, ard whofe meritorious labours we never feel a defire to foreltall. S.

LASIOSTOMA, fo called by Schreber, from hazb:; bairy, and $5 \sigma \mu x$, the mouth, in allufion to the hairinefs which covers the upper fide of the flower, and furrounds its orifice. Schreb. 75. Wiild. Sp. P1. v. 1. 624 . Mart. Mill. Dict. v. 3. (Rouhamon; Aubl. Guian. 93. Lamarck. Illuftr. t. 81.) - Clafs and order, Tetrandria Blonozyaia. Nat. Ord. Apocinee, Juff.
Gen. Ch. Cal. Perianth inferior, of one leaf, very fhort, in five deep acute fegments, with two fmall oppofite fcales at its bafe. Cor of one petal, funnel-fhaped tube cylindrical ; limb in four acute equal fegments, villous on their upper fide. Stam. Filaments four, capillary, villons at their bafe, inferted into the tube of the corclla; anthers oblong. $P_{i j}$. Germen fuperior, ovate; fyle longer than the corolla; ftigma obtufe. Peric. Capfule orbicular, of one cell, with a brittle bark. Seeds two, hemifpherical.

Eif. Ch. Calyx five-cleft. Corolla funnel-fhaped, hairy about the mouth. Capfule fuperior, brittle; of one cell, with two feeds.
I. L. cirrofa. Willd. (Rouhamon guianenfis; Auble Guian. 93. t. 36. Lamarck. Illultr. 322.)-Gathered by Aublet on the banks of rivers in Guiana, bearing fruit as well as flowers in November. Roukamon is the Caribean name. The woody trunk is feven or eight feet high, with many very long, knotty, oppofite branches, climbing over the neighbouring trees, and clothed with reddifh down. Leaves oppofite, on fhort ftalks, elliptical, pointed, entire, pale, fmooth, three-ribbed. Tendrils'axillary, fimple, rather longer than the leaves, recurved and thickened at the extremity, not always prefent. Flosvers fmall, white, in axillary tufts. Capsfule rather large in proportion, an inch in diameter, yellow- -Jufficu refers this plant to the genus Strychnos, apparently with great reafon.
LASK, a term ufed by Farricrs, for a loofenefs in horfes, often fatal to them.

Lask, or Lafko, in Geography, a town of the duchy of Warfaw ; 30 miles N.E. of Siradia.

LASKi:TS, or Latches, in a Ship, are fmall lines, $^{\text {a }}$ like loops, faftened by fewing into the bonnets and drablers? in order to lace the bonnets to the courfes, or the drablers to the bonnets.
LASKING, a fea-term for going large, or veering.
LASNE.
I.ASNEBOURG, in Geography, a town of France, in The department of Mont Blanc, on the Arc, at the foot of mount Cenis, the paffage of which is the principal fupport of the inhabitants. The fun is hidden from this town by the mountain during two months in the year; 20 miles N.N.W. of Sufa.

LASOY, a town of Thibet; 40 miles N.N.W. of Tacpoy.

LASSA, the capital of Thibet, is called by different names, which have occafioned no fmall degree of confution. Its proper rame, in the language of Thibet, is faid to be Baronthala; but the Tartars call it Laffa or Lahaffa. Others call it Tonker, and apply the names Laffa and Baronthala to the diftrict which contains Laffa and Putala. Others again give the name of Putala, inftead of Laffa, to the capital of rhibet. Rennell fays that we ought to apply the name Laffa or Lahaffa, to the capital, and to confider Puta1 as the cattle and palace of the Lama, and his ordinary place of refidence. Laffa, which is not confidered as a large city, is fituated on an extenfive plain; the houfes are of itone, and are fpacious and lofty. The mountain of Putala (La Puta, the hill of Puta or Boodh, la fignifying a hill in the native tongue), on the fummit of which flands the palace of the grand lama, the high prieft and fovereign of Thibet, (fee Lama , is about feven miles E. of the city. On the north of Laffa ftands another range of mountains, covered with fnow, which are clearly feen from Kambala, a very high mountain on the N . of the lake of Palté. Laffa is in the province of Ou , and almoft in the centre of Thibet. The river Sanpooa Burrampooter runs at the diflance of 24 miles from the city. The royal palace at Laffa is called Laprang, where, among other ornaments, are maps of the various provinces, painted about 1665 , by the orders of the king Tifri, on 16 walls. Laprang is alfo one of the celebrated academies or fchools of Thibet, which are frequented by the youth of many furrounding countries, as far as Cafhgar, Yarkend, Camul, Turfan, and fome from Kokonor, Amdoa, and China. The courfe of ftudies employs twelve years, occupied in logic, aftronomy, philofophy, medicine, and, above all, the theology of Boud, or Xaca. In the city of Laffa are many foreign merchants, and the women have bzen recently polifhed by their converfation with the Chinefe. A beneficial traffic is carried on with Laffa, by exchanging gold dult for filver bullion. N. lat. $30^{\circ} 30^{\prime}$. E. long. $91^{\circ} 40^{\prime}$.

LASSAN, or Lessan, a town of Anterior Pomerania, on a lake formed by the Peene; $3^{8}$ miles S.S.E. of Stralfund. N. lat. $53^{\circ} 5^{\prime}$. E. long. $13^{\circ} 5^{\prime \prime}$.

LASSAY, a town of France, in the department of Mayenne, and chief place of a canton, in the diftrict of Mayenne; 9 miles N.N.E. of Mayenne. The place contains 2976 , and the canton 14,258 inhabitants, on a territory of $132 \frac{1}{2}$ kiliometres, in I4 communes. N. lat. $48^{8} \cdot 27^{\prime}$. W. long. $0^{\circ}{ }^{2} 4^{\prime}$.

LASSEUBE, a town of France, in the department of she Lower Pyrenées, and chief place of a canton, in the diftrict of Oleron ; 6 miles E. of Oleron. The place contains 2884, and the cantor 4974 inhabitants, on a territory of 330 kiliometres, in 5 communes.

LASSIELI, a town on the E. coaft of the illand of Bouro. N. lat. $3^{\circ} 30^{\prime}$. E. long. $127^{\circ} 34^{\prime}$.

LASSIGNY, a town of France, in the department of the Oife, and chief place of a canton, in the diftrict of Compiègne; 6 miles W. of Noyon. The place contains 518 , and the canton 10,575 inhabitants, on a territory of 135 kiliometres, in 24 communes.

LASSIRA, in Ancient Gcography, a town of Spain, in the Tarragonenfis, in the interior of the country of the Edetani. - Ptolemy.

LASSITI, in Geography, a town of the illand of Candia; 22 miles S.E. of Candia.

LASSITUDE, in Medicine, a fenfe of wearinefs and debility, independent of fatigue, by which a perfon is induced to feek for repofe and quiefcence.

A laffitude is felt in almoft febrile difeafes ; and in many chronic affections, in which the circulation is fceble and unequal, as in fcuryy, chlorofis, \&c.; and in diforders of the flomach, liver, and alimentary canal. 'This feeling of wearinefs and indifpofition to exertion, is indeed often the firtt and only perceptible fyn⿰ptom of approaching illnefs, as was remarked by Hippocrates: "Laffitudines fpontanere morbos' prenuinciant." (Aph. ii. 5.) It is a confequence alfo of moft acute difeafes, which leave the ftrength confiderably impaired; and in this cafe it diminifhes in proportion as the fyitem regains its vigour in the progrefs of convalefence. As it is to be confidered only as a fymptom of various morbid ftates of the body, it requires no particular remedies to be fpecifically adopted for its removal ; the cure of it will be effected by remedying the particular morbid conditions with which it is connected.

LASSONe, Joseph Maria Francis de, in Biggraphy, an eminent French phyfician, was born at Carpentras; on the 3d of July, 1717. His parents quitted their native province, to procure him the advantages of education afforded by the capital; and the ultimate fuccefs of the plan evinced their wifdom and prudence. In his early years, however, young Laflone was not remarkable for his perfeverance in ftudy: on the contrary, his family were frequently alarmed by the propenfity which he fhewed for the gay pleafures of youth; but he as often raifed their hopes by fome ingenious performances, which merited academic honours, as well as the elteem of his preceptors. He wrote a comedy, which his parents infifted that he fhould fupprefs, and facrifice the imprudent production: he fubmitted, and was never afterwards willing to declare the title of the piece, which had neverthelefs been acted with much fuccefs, under a different name, and ftill remains on the theatre. This juvenile work, foreign as it was to his ftudies, gave an extraordinary proof of the facility and flexibility of his genius, which afterwards enabled him to acquire in the different fciences a juft and elevated reputation. Determining upona ftrict attention to ftudy, he devoted himfelf wholly to the purfuits of anatomy, in which he made fuch rapid progrefs, that, at the age of twenty-five, he was received into the Academy of Sciences as affociate-anatomift. He examined, with great care and perfeverance, the ftructure of the bones, and of the arteries, and demontrated the mufcular coat of the latter. He alfo inveftigated the ftructure, and inquired into the economy and ufe of the fpleen, attempting to reconcile the different accounts given of that vifcus by Ruyfch and Malpighi. He had ftrong hopes of difcovering the office of this vifcus, when an extraordinary event put a period to his anatomical purfuits. In felecting among fome dead bodies a proper fubject for diffection, he fancied he perceived in one of them fome very doubtful figus of death, and endeavoured to reanimate it : his efforts were for a long time vain ; but his firft perfuafion induced him to perfift, and he ultimately fucceeded in bringing his patient to life, who proved to be a poor peafant. This circumftance imprefled fo deep a fenfe of horror on the mind of the anatomift, reflecting on the confequences of his having felected this unhappy object for difection, that he declined thefe purfuits
in future. Natural hifory fucceeded the fludy of anatomy; and mineralogy became a favourite object of his purfuit : he publifhed his obfervations on the crydallized free-ttones of Fentancbleau. But chemitry, a feience to which he was thus led, finally became the beloved occupation of M. de Latione. His numerous memoirs, which were read before the Royal Academy of Sciences, prefented a valuable train of new oblervations, ufefulboth to the progrefs of that Itudy, and to the art of compounding remedies; and in every part of thefe he evinced the fagacity of an attentive obferver, and of an ingenious experimentaliit.
M. Laffone, although he had, by the number of his works, given every one reafon to fuppofe that he had devoted himfelf exclufively to the fciences, had not neglected the practice of medicine. After having exercifed it for a long time in the hofpitals and cloiters, he was fent for to court ; and he was the only example, except the celebrated Fernel, of one individual holding the office of firit phyfician at Verfailles, fucceffively to two queens, and afterwards to the king: the minifters and the courtiers had been all changed, but he preferved the friendilhip of his fovereigns. He lived in friendihip with Fontenelle, Winflow, D'Alembert, Buffon, and other fcientific characters; and the affability of his manners, and his ardent zeal for the advancement of knowledge, among the young fcholars, whofe indultry he encouraged, and whole reputation was become one of his molt fatisfactory enjoyments, gained him general refpect. When from a natural delicacy of contitution, M. de Laffone began to experience the inconveniences of a premature old age, he became forrowful and fond of folitude; yet reconciled to his fituation, he calmly obferved his death approaching, and expired on the sth of December, $I_{j} 88$. Laffone, at the time of his death, held the appointment of firlt phyfician to Louis XVI. and his queen; he was counfellor of ftate, doctor-regent of the faculty of medicise at Paris, and penfionary-veteran of the academy of fciences, member of the academy of medicine at Madrid, and honorary affociate of the college of medicine at Nancy. Hutchinfon, Biog. Med. Eloy. Diet. Hitt. Hift. de l'Acad. Roy. des Sciences, 1788.
LASSOTH, in Grography, a town of Silefia, in the principality of Neiffe; Io miles N. of Neiffe.
L.ASSOUR, a town of Hindooftan, in the circar of Aurungabad; $3^{2}$ miles N.W. of Aurungatad.

Lassus, Orlaxides, or, as he is called by the Italians, Orlando di Laffo, was a native of Mons, in Hainault, born in 1520 , and who not only fpent many years of his life in Italy, but had his mufical education there, having been carried thither furreptitiounly, when a child, on account of his fine voice. The hittorian Thuanus, who has given Orlando a place among the illultrious men of his time, tells us that it was a common practice for young fingers to be forced away from their parents, and detained in the fervice of princes; and that Orlando was carried to Milan, Naples, and Sicily, by Fierdinand Gonzago. Afterwards, when he was grown up, and had probably loot his voice, he went to Rome, where he taught mufic during two years; at the expiration of which, he travelled through different parts of Italy and France with Julius Cæfar Brancatius, and at length, returning to Flanders, refided many years at Antwerp, till being invited, by the duke of Bavaria, to Munich, he fettled at that court, and married. He had afterwards an invitation, accompanied with the promife of great emoluments, from Charles IX., king of France, to take upon him the office of mafter and director of his band; an honour which he accepted, but was flopped on the road to Paris by the news of that monarch's death. After this event he returned tp Mu-

Vot. XX.
nich, whither he was recalled by William, the fon and fuecentor of his patron Albert, to the fame office which he had held under his father. Orlando continued at this coure till his death, in the year 1593, at upwards of feventy years of age. His reputation was fo great, that it wass faid of him: "Ific ille Orlandus I, alfins, qui recreat orbem."
As he lived to a conliderable age, and never feems to have checked the fertility of his genius by indolence, his compofitions exceed, in number, even thofe of Paleltrina. There is a complete catalogue of them in Drandius, amounting to upwards of fifty different works, confifting of maffes, magnificats, paffiones, motets, and pfalms: with Latin, Italian, German, and French fongs, printed in Italy, Germany, France, and the Netherlands.

As Orlando di Ladfo was the contemporary of Cypriano Rore, a compofer of equal renown in the 1 fth century, and who to much refembled him in genius, abilities, and reputation, we fhall here draw a parallel between them, as the two principal mafters of Flemiih and Netherlandifh counterpoint. 'Io form a comparative idea of the ftyle of thefe two compofers, with that of Palefrina, the fpecific difference feems to be this: that the two Netherlanders, by having fpent the chief part of their time in the courts of princes, had acquired a lighter and more fecular calt of melody than Paleftrina, who, refiding conttantly at Rome, and writing chiefly fur the church, had a natural and characteriftic gravity in all his productions. Indeed, the compofitiona a capella of Cyprian Rore and Orlando Laffo are much inferior to thofe of $\mathrm{P}_{2}$ leftrina in this particular; for by triving to be grave and folemn, they only become heavy and dull; and what is unaffected dignity in the Roman, is little better than the ftrut of a dwarf upon ftilts in the Netherlanders. They were, however, great mafters of harmony, and, out of the church. prepared the colours, and furnifhed the mufician's pallet with many new tints of harmony and modulation, which were of great ufe to fubfequent compofers, particularly in dramatic painting.

In the fame collection of fongs, printed r 555 , we have a Latin poem, fet by Orlando di Laffo, in the manner of x madrigal, in which the modulation is curious; but thougl elaborate and recherchée, it is pleafing, and has had many" imitators.

Cyprian and Oplando were the firft who hazarded what are now called chromatic paffages. At the end of the fourteenth book of fongs in four parts, printed at Antwerp by Tylman Sufata, there is an irregular Latin ode by Cypriano, fet likewife in the madrigal ityle, in which not only" an $A$ 決, but an A b, appear, for the firit time, in the fame movement, and almoft every accident incident to modern mufic. Part of this curious compolition is inferted in Burnéy's General Hiitory of Mufic, vol. iii. as a Ipecimen of the author's frequent attempts at new harmonies and modulation, which, as it is laid before the learned mufical reader in fcore, it will afford him much better information concerning the real hittory and progrefs of the art of counterpoint at this time, than all the catalogues of books, and defcriptions of their contents, which diligence and language could furnifh. Many of the forced, crude, and unexpected modulations in the motet of Cyprian Rorc, however they may have been admired for their boldnefs and novelty, were never adopted by fubfequent compofers. Bcautiful, natural, and pleafing paffages and effects are foon rendered common by plagiariim and imitation; whereas the unnatural and diflicult are long left in the poffeffion of the original proprietorPerhaps in a feries of years, fome other compofer, unable to attonifl by his inventions in a natural way, and detemine?

U u
to produce fomething that thall, at leaft, feem new, will propofe them again to the public, who will again reject, and fo on; ad infnitum. But thefe mulical hunters after novelty, without genius to find it, forget that fuch palfages or modulations muft have prefented themfelves to thoufands in the courfe of their Itudies and ricercate, but that good talte and found judgment hat rejected them. It is at all times eafy to prodnce new arrangements and combinations of founds, if nature, grace, and propriety be renounced; but at once to be nesu and natural, belongs only to genius of the firit order.

The fongs in the fame collection by Orlando, are faid by the publither to have been compofed "a la nouvelle compofition d'aucuns d'Italie.' We find but little melody in any of them, though much modulation, different from the ather Flemifh matters of this period. There is another effential difference in the notation, as the diminutions into crotchets and quavers, particularly in the fongs alla Napolitana, are more frequent than in any other compolitions of the mid. die of the 1 Gth century. The chromatic accidental femitones are exprefled by a fharp, and no longer left to the mercy and fagacity of the finger, as was before the conftant cuttom. The occalional changes in the intervals, which are neceffiry in counterpoint, though formed upon ecclefiaftical melodics, were at firt fmuggled into harmony, perhaps by fingers whofe good ears fuggelled them, though the compoler had not dared to point them out, lelt he hould be accufed of cormpting the modes. Orlando feems the firit who, in fpite of ancient prejudice and pedantry, when he wifhed to alter a note, dared to exprefs his intentions in writing. In this more gay and comic ityle, however, the modulation is overcharged with wanton and unneceffary tranfitions from one key to another, without remaining long enough in any one to fix it in the hearer's attention.

Of the two compolitions by Orlando di Laffo, and Cypriano di Rore, to Latin words, the firlt is in hexameter and pentameter, and the fecond an irregular ode, partly in the choral meafures of the Greek tragedies. At this mark + , in Orlando's compolitions, the firit A 桜 occurs that we had ever feen ufed in counterpoint of equal antiquity; and this feems to have been fuggefted by the words novzmque melos. Which of thefe productions was firlt compofed, we know not, as they were both publifhed together at Antwerp, in 1555. The only copy of this work which we have ever feen, is preferved in the Britifh Mufeum. The madrigals, in general, of both Cypriano and Orlando, to Italian words, are excellent, in the thyle of the times. But as the fingularities in the two compofitions before us feem innovations, and preparatory to that revolution in the art, which takes place foon after, they feemed proper fubjects of difcuffion; for the laboured and equivocal modulation, attempted by thefe compofers, who, though often learned and ingenious, by abandoning the fimplicity of their contemporaries, thefe productions border fometimes fo much on caprice and affectation, as to fatigue the attention and offend the ear.

The pedantry of cride harmonies, and learned modulation, only fuits depraved ears, that have grown callous to every thing that is eafy and natural. The Italians, when they quitted madrigals, and no longer afpired at the applaufe of faftidious chamber-critics, whofe approbation was beftowed on no compofitions that did not fmell of the lamp, fimplified their fecular mufic, and inftead of puzzling and goading the hearer with complicated contrivances and extraneous modulation, aimed at grace and facility in their melodies, which they clothed with fuch plain and tranquil harmony, as, in*ead of difguife and fuffocation, added greatly to their ener-
gy and effect. Dramatic mufic was not yet even in idea, and concerts, or other affemblies of gay and unlearned hearers, feem now not to have exifted; fo that mufical compofers could not be faid to write for the public, who will ever prefer fuch plicafure and amufement as give them the leaft trouble. Authors of all kinds, who feek for applaufe, conform to the talte of their judges; and we find, in out own times, that thofe muficians who are qualified by their genius and abilitics, to direet and govern the public opinion, think it neceflary, however falfe and corrupt it may be, to humour and flatter it, by all the conceffions in their power. The art never long remains flationary at any one point of cultivation ; and if perfection could be attained, its reign would inevitably be fhort. In mufic, the learned are few and filent; the ignorant numerous and noify : in the chamber it was right to pleafe the former, and in the theatre, where

$$
\text { " } \begin{aligned}
& \text { Govern the fair, the gay, the young } \\
& \text { numbers of each fong," }
\end{aligned}
$$

there is no choice. A public and mixed andience is fuch a many-headed montter, that all its ears cannot be pleafed at the fame time; and whether the good or the bad predeminate, the greater number mult be gratified at the expence of the lefs.
'Two of Orlando di Laffo's fons, Ferdinand and Rodolph, were able muficians, and both in the fervice of Maximilian, duke of Bavaria; the eldeft as chapel-matter, and the other as organit- to that prince. Thefe collected their father's motets, as well thofe which had been publifhed during his life, as thofe which remained unpublifhed at his deceafe, and printed them in a very fplendid and fumptuous manner at Munich, in feven volumes, large folio, 1604, with a dedication to their patron, the fovereign of Bavaria. The general reception, however, of thefe compofitions, feems not to have equalled the expectations of the editors. Other productions had taken poffeffion of the public ear and favour. It is, we fear, in vain to hope for the revival of old mufic ; too many are interelted in the fuccefs of the new ; and fuch are the vicifitudes of what are called tafte and expreffion in this art, that if fufficient probity and zeal could be found in fafhionable performers to incline them to attempt doirg juftice to the productions of former times, it is hardly poffible for them to fucceed; the accent, energy, and expreffion are either loft in the execution, or unintelligible to the hearers. There is, indeed, as little chance for a mufician of the prefent age to perform fuch productions in the ranner of the times in which they were compofed, as to pronounce a foreign language as well as his own; and if, againt all calculation, he fhould facceed, this mufic will ftill be an unknown tongue to the public.
LAST, or Lest, in general, fignifies the burden or load of a hhip.
Last is alfo ufed for a certain weight and meafure, which is various in various countries; though, in the general, the laft is eftimated at four thoufand pounds weight. A lalt of cod-fifh, white herrings, meal, and afhes for foap, is twelve barrels ; of corn, or rape-feed, ten quarters; of gunpowder, twenty-four barrels, or two thoufand four hundred pounds weight ; of red herrings, twenty cades ; of hides, twelve dozen ; of leather, twelve diekers ; 'of pitch, or tar, fourteen barrels ; of wool, twelve facks; of itock-fifh, a thoufand: of flax, or feathers, one thoufand feven hundred pounds weight.

Last, in the marhes of Kent, a court held by the twentyfour jurats, and fummaned by the bailiffs; wherein ordors
are made to lay and levy taxes, impore penalties, \& $\&$. for the prefervation of the faid marfhes.

Last Heir, is he to whom lands come by efcheat, for want of lawful heirs; which, in many cafes, is the lord of whom they are held: but in others the king.
Last Will. See Will.
Last, Port. See Port-Laf.
LASTAGE, or Lestage, according to Raftal, is a duty exacted in fome fairs and markets, for carrying things bought whither one will.

Lastage, according to another author, is properly that cuflom which is paid for wares fold by the lafl.

In the law of Richard II. laftage is taken for the ballaft, or for lading of a flip. Sce Bahlast.
Lastage is fometimes alfo ufed for garbage, rubbifh, or fuch filth.
LASTEIN, in Geography, a town of Pruffia, in the pro. vince of Samland; 15 miles S.E. of Ragnitz.

LASTISANA, a town of Italy, in Friuli ; 7 miles E. of Concordia.

LASTRES, a fea-port town and cape of Spain, on the N.E. coaft of Afturia; 30 miles N.E. of Oviedo. N. lat. $43^{\circ} 33^{\prime}$. W. long. $5^{\circ} 19^{\prime}$.
LASTRINGE, a town of Sweden, in Sudermanland; 12 miles N. of Nykoping.

LASULA, a fmall illand near the E. coaft of Luçon. N. lat. $13^{\circ} 27^{\prime}$. E. long. $123^{\circ} 57^{\prime}$.

LASUS, in Biography, was born at Hermione, a city of Achaia, in the time of Darius Hyitarpes, in the 5 Sth Olympiad, 538 years B. C. Diogenes Laertius fays, that he deferves to be ranked among the feren fages. He was generally allowed to be the firit among the Greeks who wrote about mulic, and was not only a theorilt and great practitioner, but a dithyrambic poet, perhaps the inventor of that kind of poetry in honour of Bacchus, which was fung in the Phrygian mode at the public games, and partook of all that fire and hilarity which the god to whom it was addreffed infpired.

Plutarch fays, that he introduced new rhythms in his poetry and dithyrambic mufic, and upon the lyre, imitated the compais and variety of the flute; for which he is mentioned, in the Dialogue on Mufic, as a great innovator. Among the corruptions complained of, in the nerw mafic, the frequent and licentious tranfitions from one mode and genus to another, was not the lealt. If the object for multiplying the flrings of the lyre, and the holes in the flute, fo much complained of by the adherents to the old fchool, may be fuppofed to have occafioned the convenience by having an inftrument nearly tuned for all the modes, like our harpfichords, it feems probable, that Lafus and other innovators might have been temperers, and have accommodated their doarine to their praciice.
Theon of Smyrna teftifies that Lafus, as well as the Pythagorean Hippafus of Metapontus, made ufe of two vafes of the fame fize and tone, in order to calculate the exact ratio or proportion of concords. For by leaving one of the vafes empty, and filling the other half full of water, they became octaves to each other: and filling one a fourth part full, and the other a third, the percuffion of the two reffels produced the concords of $4^{\text {th }}$ and 5 th ; from which procefs refulted the proportions of thefe three concords contained in the numbers $1,2,3,4$.
This affertion, which has been taken upon truft, like the anvil ftory of $P_{\text {ythagoras, }}$ is equally falle: to tune glaffes by water has been lately practifed, and thought a new difcovery; but that their tones are altered in the proportions given above, is by no means true. Moft glafles are lowered
about a whole tone, by being half filled with water, and not more than a major 6th if quite filled.
Lata, Ligamenta, in Anatomyo See Licamintuss. LATABI, in Gcography, a town of Africa, in the kingdom of Aquamboc.

LATAC, or Ladak, a town and country of Thibet, forming a kind of detached fovereignts: "The town is feven miles N. of the river Lachu, which falls into the Ganges. N. lat. $30^{\circ} 55^{\circ}$, E long. $74^{\circ} 34^{\prime}$.

LATACUNGA, a town of South America, and a jurifdiction in the audience of Quito. This jurifdiction is called Affiento Latacunga; affiento denoting a place lefs than a town, but larger than a village. This place is fituated on a wide plain, having on the E . fide the eattern Cordillera of the Andes, from which projects a very high mountain, at a fmall diftance from the foot of which is fituated Latacunga, in S. lat. $55^{\prime} 14^{\prime}$. W. long. $\overbrace{}^{5} 16^{\prime}$; ; miles S . of Quito. This affiento is large and regular ; the ftreets broad and ftraight ; the houfes of flone, arched and well contrived; but on account of the dreadful carthquakes to which it is fubject, confitting only of one flory ; one of thefe happened in June, 1698 , and its effect was fuch, that of 600 Itone houfes, which the affiento then contained, only a part of one, and the church of the Jefuits, were left ftanding in a damaged Itate, and moft of the inhabitants were buried under their ruins. The ftone of which the houfes and churches are conftructed, is a kind of pumice, or fpongy fone, ejected from volcanoes; inexhauftible quarries of it being found in the neighbourhood. This jurifdiction contains feventeen principal villages. The temperature of the air is cold: as this affiento is only fix leagues diflant from the mountain of Cotopaxi, which, not being lefs in extent and height than thofe of Chimborazo and Cayamburo, is, like them, covered with ice and fnow; but the temperature is very different in the feveral villages of this jurifdiction; being hot in the vallies, temperate on the plains, and often exceffively cold in places bordering on the mountains. The villages are generally larger, and more populous, than thofe of the other jurifdictions in the fame province. Their inhabitants are Indians, Meftizos, and a few Spaniards. The affiento, befides a parifh church, ferved by two priefts, one for the Spaniards, and the other for the Indians, has convents of Franciicans, Augultines, Dominicans, the Fathers of Mercy, and a college of Jefuits. The inhabitants amount to between ten and twelve thoufand, chiefly Spaniards and Meftizos. The Indians live in a feparate quarter, as they do at Quito. In this affiento all kinds of trades and mechanic arts are carried on; and, as in all the other parts of this jurifdiction, it has a confiderable number of manufactories of cloth, bays, and tucuyos. Great quantities of pork are falted here for exportation to Quito, Guayaquil, and Riobamba. The neighbouring country is fowed with clover, and interfperfed with plantations of willows, the perpetual verdure of which gives a chearful afpect to the country. The Indians of Pugili and Saquifili, two villages in this jurifdiction, are noted for making earthenware, as jars, pans, pitchers, \&c. which are much valued. The clay of which they are made is of a lively red colour, and emits a fort of fragrancy. The workmanhip is very neat and ingenious. Juan and Ulloa's Voyage to South America, vol. i.

LATAKIA, the ancient Laodicea (which fee), a feaport town of Syria, in the pachalic of Tripoli, is fituated at the bafe, and on the fouthern fide of a fmall peninfula, which projects half a league into the fea. Its port, like all the others on the fame coaft, is a fort of bafin, environed by a mole, with a very narrow entrance. It is capable of
containing twenty-five or thirty veffels, but the Turks have fuffiered it to be choaked up, fo that it can fearcely admit fuar. Ships of above foo tons cannot ride here; and hardly a year paftes in which one is not flranded in the entrance. Neverthelefs, Latah " carries on a very great commerce, partly of olives, but chic@y of tobacco, of which upwards of twenty cargoes are annually fent to Damietta; the returns from thence are rice, which is bartered in Upper Syria for oils and cottons. In the time of Strabo, inftead of tobacen, the exports confilted of its famous wines, the produce of the declivities of its hills. Even then, Egypt was the market by way of Alexandria. Neither Latakia nor Tripoli can be mentioned as places of ttrength; they have neither cannon nor foldiers: a fingle privateer would conquer them both. Each of them is luppofed to contain from four to tive thoufand inhabitants; 50 miles S. of Antioch. N. lat. $35^{\circ} 36^{\circ}$. E. long. $35^{\circ} 50^{\prime}$. Volney's Travels in Egypt, \&c. vol. ii.
I. ATALATTA, one of the Molucca iflands. S. lat. $0^{\circ} 3^{\prime}$. E. long. $1275^{\prime}$.

LATANG, a town of Thibet; nine miles S. of Dfaprong.

LaTANIA, in Botany, a name given by Commerfon to a kind of palm, found in the Ifle de Bourbon, anid which feems to be barbaroufly conflructed of the French word Iate, a lath, this palm being called in that language latanicr. -Juff. 39. Lamarck. Diet. v. 3. 427 - Chafs and order, Diseciz Alonadelphia. Nat. Ord. Palmue.

Eff, Ch. Male, Spatha of numerous imbricated leares. Spadix branched, its branches fingered at the top, catkinlike, fomewhat cylindrical, of many imbricated fingleflowered fcales. Corolla in fix deep fegments; the three outer ones fmalleft. Stamens 15 or 16 ; anthers oblong, two-celled. Female unknown.
I. L. Borbonica. Lanarck.--Its trunk is Araight, fimple, cylindrical, leafy at the top. Leaves Italked, fan-fhaped, glaucous; their ribs cottony at the back. Fooffalk without ipines. Spathat at the bafe of the foliage. The flowers are yel.ow, imbedded in each fcale of the catkin. Filaments united at their lower part into a thick column.
I.ATATSI, in Geography, a mountain of Thibet. N. lat. $31^{\circ} 35$. E. long. $77^{1} 14^{\prime}$.

LATCHA, a lake of Ruffia, in the government of Olonetz, about 32 miles long and eight broad. N. lat. $61^{\circ}$ to $61^{\circ} 20^{\prime}$. E. long. $38^{\circ} 30^{\prime}$.

## LATCHETS. See Laskets.

LATCHOU, or Lache', in Geography, a river of Thibet, which runs into the Ganges, No lat. $30^{\circ} 50^{\prime}$. E. long. 77.49 .

LATE, a town of Peru, in the jurifdiction of Lima.
LATEEN SAll, in Sea Language, a long triangular fail extended by a lateen-yard, trequently ufed by xcbecs, polacres, fettees, and other vefiels navigated in the Mediterranean fea.

Lateral. See Collateral, Multilateral, and Quadmlateral.

Lateral Equation, in Alrebra, denotes a fimple equation; an equation whofe root is of one dimenfion.

Lateral Ligaments, in Anatomy, are thofe placed at.the fides of the joints. See Joint.

Lateral Line. See Line.
Lateral Operation for the Siene. See Lithotomy.
Lateral Palfy. See Palsy.
Latcral Sinufes, in Anatomy, the right and left; are the two branches into which the fuperior longitadinal finus of the dura mater is divided at the intermal tranfverfe ridge of ite occipital bone. See Vias.

LATERAIIS Monnes, a name given by fome writens. to the pleurify.
Larenums Naris ATufoulus, a name given by many authors to that mufele of the face which Albinus has called, from its. office, the levator labii fuperioris alaeque nafi. It is alfo called the obliquus nafi.
L.aterahris Regus Capiis. Sce Rectus.

LATERAN was originally the proper uame of a man, whence it defeended to an ancient palace in Rome, ard to the buildings fince erected in its place; particularly a church called St، John of Lateran; which is the principal fee of the popedom.

Lateman, Councils of the, are thofe held in the bafilica of the Lateran: of thefe there have becn tive, held in 1123, $1139,1179,1215$, and 1513.

Literan, Canons regular of the Congregation of the, is a congregation of regular canons, whereof that church is the principal place, or feat.

It is pretended there has been an uninterrupted fucceffion of clerks, living in community from the time of the apofe, tles; and that a number of thefe were eftablifhed in the Lateran in the time of Conflantine. But the canons were not introduced till the time of Leo I. and thefe held the church eight hundred years, till the reign of Doniface, who took-it from them, and placed fecular canons in their room: one hundred and fifty ycars after, the regulars were reinfated.

LATERCULUM, among the Romans, was ufed for a roll or lilt of all the magittrates and military officers under the Roman emperors, with an account of their refpective offices and fees.

LATERE, A, a Latin term ufed to denote the qualifcation of cardinals, whom the pope fends as legates intoforeign courts; who are called cardinals d latere, as being his holinefs's counfellors in ordinary, and afliftants. See Legate.

The guards of princes were heretofore called latcrones, becaufe always attending at their fides, à lateren
Du Cange, in his Gloffary, fays there were aneiently counts à latcre, and monitors a latere.

LATESA, in Geography, a town of Naples, in Abruzzo. Citra; 10 miles S. of Lanciano.

LATEWA, a town of Bengal; 45 miles N.W. of Ramgur.

LATEX, in Chemiflry, a name by which Van Helmont has, in feme of his writings, called the famous menttruum, which he boalts Paracelfus and himfelf to have been poffeffed of, and which he ufuaily calls alkabeg.

LATH, in Building, llips of wood ufed in plaftering, tiling, and flating. Thefe are what Feitus calls ambrices; in other Latin writers they are denominated templa; and by Gregory of Tours, ligatura.

In plattering, the narrower the laths are the better they are for the purpofe, fo as they are of fufficient breadth to hold the nails, as the number of interflices are increafed, the lime or ftuff will hang more readily, and the shicker they are they will be the better adapted to refift violence; but then they would be much more expenlive. The laths are generally made of fir, in three, four, and five feet lengths, but may be reduced to the ftandard of five feet. Laths are fingle or double; the latter are generally about three-eighthsof an inch thick, and the former barely one quarter, ard about an inch broad. Lath is fold in bundles; the thiree feet are eight fcore to the bundle, four feet, fix fcore, and the five feet, five fore. The lath for plain tiling is the fame as that ufed in plaltering. Laths are alfo diltinguifhed into heart and fap-laths; the former hould always be ufed
in plain tiling, and the latter, of an inferoor quality, is mon frequently ufed by the platlerer. Heart-ofonak laths, by the flatute Edw. IIl., fhould be one inch in breadth, and half an inch in thicknefs: but now, though their breadth be an inch, their thicknefs is feldom more than one quarter of an inch ; fo that two laths, as they are now made, are but equal to one lath. According to the faid ftatute, pan-tile laths are nine or ten feet long, three-quarters of an inch thick, and one and a half inch broad, and fhould be made of the beft yellow deal : the bundle confifts of twelve fuch laths. A fquare of plain tiling will require a bundle of laths, more or lefs, according to the pitch. The ditance of laying laths one from another is various, differing more in fome places than in others; but three and a half, or four inches, are ufual diftances, with a counter-lath between rafter and rafter : but if the rafters Itand at wide intervals, two counter-laths will be neceflary. Laths are employed for various other purpofes as well as plaftering and tiling, as in filleting for fultaining the ends of boards; in naked flooring and roofing; for furring up the furface: ; and in every kind of fmall work, where the dimenfions of the parts do not exceed the fcantling of laths.

In lathing for plaftering, it is too frequent a cuftom to lap the ends of the laths upon each other, where they terminate upon a quarter or batten, in order to prevent cutting them; but though this practice faves a row of nails, it leaves only a quarter of an inch for platter, and if the laths are very crooked, as they frequently are, there will be no fpace whatever left to ttraighten the platter: the finifhed furface mult, therefore, be rounded, contrary to the intention and to the good effect of the work; but if the ends are to be laid upon each other, they thould be thinned at the lapping oat to nothing at the extremity, or othervife they fhould be cut to exact lengths.

Laths fhould be as evenly fplit as poffible: thofe that are very crooked fhould not be ufed, or the crooked part fhould be cut out; and fuch as have a fhort concavity on the one fide, and a convexity on the other, not very prominent, fhould be placed with the concave fide outwards.

The following is the method of fplitting laths: the lathcleavers having cut their timber into lengths, they cleave each piece with wedges into eight, twelve, or fixteen pieces, according to the fcantling of the timber : the pieces thus cloven are called bolts; then, in the direction of the feltgrain, with their dowl-ax, into fizes for the breadth of the laths: this operation they call felting; and, laltly, with their chit they cleave them into thicknefs by the quartergrain.

Latil Bricks are bricks made much longer than the ordinary fort, and ufed inltead of laths for drying malt upon; for which purpofe they are extremely convenient, as not being liable to catch fire, and retaining the heat much longer than thofe made of wood, fo that a very fmall fire is fufficient after they are once heated.

LATHAM, in Geograply, is a townfhip in the parifh of Ormkirk, hundred of Weft Derby, Lancafhire, England, fituated 210 miles from London, and containing 43 thoufes, and 2179 inhabitants. In this townfhip is Latham-luoufe, the feat of Edward Wilbraham Bootle, efq. M. P. This place is noted in the Topographical Anmals of Lancafhire as the ancient feat of the Lathams in the reign of Edward III., and afterwards of the Stanleys, and lattly, of the Bootles. In the civil wars of the Izth century, 1, atham-houfe was heroically and gallantly defended by Charlutte, countefs of Derby, who was befieged here by colunels Egerton, Rigby, Afhton, and Holcroft, from the 28 th of July, 10ft, to the ${ }_{2 j}$ th of the following May. This is a memorable intance
of femmine courate and fortitude: a fimilar crample, however, was manifetted in Blanch, lady Arundel, at War-dour-caftle, in Wilthire. A particular accomnt of the former is recorded in the "Hiltury of the Houfe of Stahley," Svo. 239; and of the latter in Britton's "Beauties of Wiltfhire," Svo. vol. i. Latham-park is about five miles in circumference, and contains fome fine forett feenery. Nearly in the centre is the houfe, built of flone, after a defign of Lconi. In this townhip is alfo Crofs-hall, once belonging to the earls of Derby, but is now the property of colonel Stanley, M. P. Near it is Blythe-hall, the feak of Thomas Langton, efq. Beauties of England, vol. ix.
LATHE, an engine of the molt extended application in the incclanic arts, for forming wood or metal into any article of a circular figure. The mode of action in a lather is eflentiaily different from any other method of cutting, as the work is caufed to revolve in a circle, while the tool is held upon a fixed fupport, and prefented to it to cut away any parts projecting beyond the circle defcribed by tho motion of the work. To the mechanic the lathe is an invaluable machine, as a very great proportion of all the parts of machines is formed in it, and as it is the only method of: working metal which may be conlidered as perfect. All. things which can be turned are made in the lathe, both for accuracy and expedition. The common wooden lathe, in ufe among, wood-turners for making articles of houtho'd furniture, is fo generally underitood, that it is needlefs to give a minute delcription of it ; we have, therefore, given drawings in Plate (Latbe) of a metal lathe, the molt perfect of its kind, proper for turning accurate and delicate works. for mathematical inftruments, or machinery: it was made by Mr . H. Maudllay, London, who has a great number of different fizes, but on a fimilar conltruction, in conaltant ufe, at his manufactory for theam-engines, and other machinery, in the Weftminter-road. Figs. 1. and 2. of the plate are a front and end elevation of the whole lathe, where $\mathrm{A} A$ is a ftrong mahogany bench, fupported on iron ftandards $\mathrm{B}, \mathrm{B}$, which are fhewn fully in fig. 2 ; beyond thefe are fuits of drawers $\mathrm{C}, \mathrm{C}$, to contain the tools, Sc . : the Itandards B . carry the axis D of the great foot-wheel E, which gives motion to the work when it is turned by its crank 1 ) and treadle F , on which the workman preffes his foot, at intervals, to turn the whecl round. The lathe itfelf, which is fixed upon the bench, confiits of a triangular har $G$. See alfo fig. 3 , which is an enlarged ligure of it; it is fupported. on Imal! tandards $a, b, c$, fixed to the bench A by fcrews going through it : upon this bar the puppets $\mathrm{H}, \mathrm{I}$, and K , are fitted with perfect accuracy, and $H$, which is called the back puappet, can be faltened at any part of the bar by afcrew beneath it; the other two puppets, I, K, are ferewed dowin upon the itandards $a$ and $b$, and are connected together by a piece of metal $d$ litting upon the bar, and calt in the fame piece with them: thele two puppets fupport the mandrel, or fpindle L, one having a fcrew with a conical itvel. point to enter a hole in the end of the fpindie, and the other having a hard fteel collar to receive the neck of the findle, which fits it with the molt perfect ascuracy, to turn round freely (by a band encompalin ig its pulley M.), but without any thate in its collar; on the end of the fpindle, beyond the collar, is a fmall fcrew to fix on the work to be turned. The back puppet $H$ has a hole through the top of it, exactly in a line with the fpindle, and a feel pin $e$, with a conical point fitted inte it to fupport the erded of a long prece of work; the point is fattencd bry a fcrew $\delta$ in the top of the puppet, and has a fcrew $f$ behind it to force it forwards: the bar G, alfu, has the rett, or fuppurt, for the tool fixed upon it, by a pieca of metal gr, (fg. 1.) fitted upon
the bar; a nlider is fitted upon this piece to flide in a direction perperdicular to the bar, and the fame fcrew beneath faltens the reft upon the bar at any place, and the fider at any length acrofs the bar. On this flider is a focket to receive a pin, on the top of which is a crofs-piece, formed like a ' T , upon which the tool is laid; this ' T can be adjuted to the height of the work the tool is to be applicd to, and can be fatened at any height by the ferew in the fide of the focket. The various kinds of work to be turned are faftened to the end of the fpindle, fo as to be turned round with it, by means of what are called chucks: thefe are pieces of wood, or metal, fitted to ferew falt upon the end of the fpindle, and a hollow, like a difh, being turned out in it; the piece of wood or metal to be turned is driven into this hollow, and thus held to be turned, by holding a tool over the T of the reft, which is previouny fixed clofe to the work, and prefenting the edge to the work as it revolves by the treadle F , turning the foot-wheel, \&c.; this, by its band turning the pulley M , and the work with an increafed velocity. A chuck of this defcription is fhewn mounted in fig. 1 , with what is fuppofed to be a plate of brafs, held in it to turn the flat face. Some chucks are flat, with holes through them, and the work is held by fcrews againtt it ; others are provided with three jaws, like a vice, which can be altogether caufed to advance to, or recede from, the centre, by turning a fcrew, fo as to encompais a piece of work of any dimenfions. This method of chucking is adopted to form all kinds of flat or hollow work, as cups, boxes, circular rings, or płates, wheels, \&c. which are, therefore, termed chuck-work; but articles of confiderable length are fupported at both ends, which method is called turning between centres. In this method the puppet H is flid along the bar to the length of the work, and fixed there by its fcrew : the point $e$ is now, by its fcrew $f$, thruft forwards, and its point enters a fmall hole, previoufly drilled in the end of the work: the ferew $g$ is now tightened, to faften the point $e$, upon which one end of the work revolves as a centre, the other end is received into a fquare hole in the end of a chuck fcrewed to the fpindle. In other cafes, the fpindle has a chuck ferewed to it, terminating in a conical point fimilar to that at $e$; this forms a fupport for the end, and an arm, projecting from the chuck, intercepts a pin or arm fixed to the work, and by this means turns it round with the fpindle. This method of turning between centres is employed to turn fpindles of wheels, bolts, fcrews, rollers, the outfides of cylinders, or any other articles of greater length than their diameter. When a piece of work is to be turned, which is larger than the lathe will admit, the bar is to be drawn out, as in fig. I, and fupported by an additional ftandard $c$ fcrewed to the bench. In the fame ftate it will admit longer work.

The particular manner of holding the tool to the work is not eafy to defcribe in words, but is foon acquired by practice. The tools for brafs are fquare or flat bars of fteel, the ends of which are cut off obliquely, to form an edge like a chiffel, but with a very obtufe angle. It is held in fuch a pofition, that its upper flat furface points to the centre of the work to be turned: it is to be held down as firmly as pofiible to the reft, and advanced to the work at intervals, whenever it ceafes to cut, by having removed all the projections of the work without the circle it defcribes. For turning with extreme accuracy, the flide-reft is a very ufe. ful addition to the lathe. It is a reft with two fliders in different directions, to one of which the tool is fixed : by means of fcrews with handles, the fliders and the tool can be moved in either direction, to bring the tool to the work. Figs. 3, 4, and 5, explain the ingenious piece of mechanifm. NA
is a piece of metal, fitted to the bar of the lathe, and provided with a ferew to faften it at any place: upion the upper fur. face, which is flat, two pieces of brafs are ferewed, to form a dove-tailed groove, in which a glider, $b$, is fitted, to move with freedom and precifion; a fcrew, $i$, is mounted in the frame N , and is lapped into a piece projecting from the lower fide of the flider, fo that the fcrew, when turned round by a handle fitted on its 〔quare, advances or draws back the flider in its groove. Upon this fider, $h$, is a frame $k$, having at the top of it a flider $l$, provided with a fcrew $m$, as the former, to move it, and carrying a piece $n$, with fquare holes through it in two directions to receive the tool $o$, and a fcrew at top to faften it in. The flide-reft being mounted, in the manner of $f . g .3$, upon the bar, the upper flider, $l$, is parallel with the fpindle, and the lower one, $b$, perpendicular thereto. For turning flat work, the tool is put in as there flewn: now by turning the fcrew, $m$, of the upper flider, the tool is advanced in contact with the work, which is mounted as in fy. I; then by the other fcrew, $i$, it is drawn acrofs the face of the work, turning it as it proceeds, to a perfectly flat furface. For turning a cylinder between centres, the tool, 0 , is put through its holder $n$, in a direction perpendicular to that fhewn in fig. 3 ; and then the lower flider, $b$, is moved to adjuft the tool to the diameter of the intended work; and the upper flider is moved, to carry the tool along the length of the cylinder, and cut it as it goes. The flide-reft will alfo turn cones, by the following contrivance: the frame $k$, fupporting the upper flider, is fitted to the lower flider by one pin, upon which the whole frame and upper flider may be turned round and faftened at any inclination, by two ferews paffing through circular grooves. By this means the upper fider is inclined in any angle to the fipindle, to turn a cone either hollow or folid, as the tool is put into its holder in one or other direction.

The flide-reft can be made to cut fcrews by an ingenious application, which is explained in figs. 6 and 7. A fhort bar P , exactly of the fame dimenfions as the large one, is fitted thereon, and faftened by its fcrew $p$. Upon this the nidereft is placed: its fliders now Itand in a direction perpendicular to what they did before, though on the fame level. The fcrew to be cut, reprefented by $Q, f g .6$, is mounted between the centres, and turned to a true cylinder by a tool put in the holder $n$, and carried along parallel to the fpindle, by turning the fcrew, $i$, of the lower flider: this being done, a cog-wheel, V , is fitted on the chuck, at the end of the fpindle, and another, W, is attached to the end of the ferew, $i$, of the lower flider, fo that it will be turned round at the fame time with the fpindle. A tool, with a point of the proper form to cut the thread of the fcrew, is put in the holder $n$, and advanced by the fcrew, $m$, of the upper flider to touch the cylinder $Q$. The lathe being now put in motion, the tool is moved along by the ferew of the lowes flider, at the fame time the work revolves, and upon which it traces a fpiral groove. When it arrives at the end of the fcrew, which it only fcratches the firft time, the tool is drawn back clear of the work, and the lathe turned the contrary way, to return the tool to the place where it firlt fet out. The tool is then fet by the fcrew $m$, to cut deeper than the firft time, and the forew is cut over again: this heing repeated four or five times, the fcrew is completed. By this method a fcrew of any degree of finenefs may be cut, by merely changing the proportion of the cog-wheels, V, W, which connect the fpindle and the fcrew of the lower flider. . It is plain, if thefe wheels are of equal fize, a fcrew will be formed of the fame width of threads as the ferew of the flide-reft at $i$; and if the wheel, W, on the fcrew, is the

## I. A T

largent, the fercw cut will be finer; if, on the other hand, the fmalleit wheel is fixed on the ferew at W , it will cut a forew of a coarier thread than the fcrew i. The lathe is provided with wheels of all the different fizes, fhewn by the dotted circles V, fis. 7, any of which may be dixed on at pleafure, either on the ferew or the chuck. The ferew cut in this manner will have its threads inclined in a contrary direction to the ferew of the flide-relt; and if that is a lefthanded fcrew, it will cut a right-handed ferew, becaufe the flider-fcrew revolves in an oppofite direction to the fpindle. That the lathe may cut ferews of either kind, an intermediate coor-wheel is introduced between the two, to caufe them to turn the fame way. This gives another advantage, viz. that any two whecls may be ufed together; the intermediate wheel communicating motion from one to the other, though they are confiderably diftant from tonching each other. The application of the intermediate wheels is explained in figs. 8 and 9 , where $r$ is a projeting thelf from the itandard $a$; upon this a piece of metal, $s$, is faftened by a fcrew, and a fhcrt hollow fpindle, $v$, is fitted into it, and faltened by proper fcrew-collars which admit its rotation; upon the end of this the cog-wheel W, which turns the forew of the flide-relt, is faftened by a nut: an arm, $a v$, is fitted on the fhort fyindle $v$, fo as to have an angular motion round the centre: the arm has a groove in its length, in any part of which the centre pin of the intermediate wheel, $x$, can be fattened; and by thefe two motions this wheel may be fixed at any joint, fo as to connect the wheels of any fize. The hollow fpindle, $v$, is adapted to receive an arbor or axis $y$, which has a focket in the end adapted to the fquare, upon the end of the flide-reft ferew $i$ : by this method the flide-rell may be fet at any part of the lathe bar; when it is required to cut a fcrew at the end of a long bolt; the arbor $y$, forming the connection between the cog-wheel, W, and the fcrew, for which purpofe it flides through the hollow fpindle $v$, but is caufed to revolve with it, by a feather or fillet projecting from one fide; the focket of the hollow fpindle may be fet and faftened at any required diffance from the lathe bar, and fafened by its fcrew; the flide-reft being fet at a correfpondent diffance from the fpindle of the lathe, by moving it upon the bar P , will admit a large piece of work, when a ferew is required to be cut upon it. R, fig. 7 , is an iron frame, faftened to the lower flider of the fide-reft, to fupport the fcrew from bending by the preffure of the tool, when it is long and flender. The frame is fhewn in plan in fig. - 10, where the holes are fhewn for the two fcrews which hold down the frame upon the lower fider.

The methods of holding various pieces of work in the lathes to turn them are endlefs, and depending in a great meafure upon the ingenuity of the workman to adapt them to the particular occafions he meets with. This fubject, as well as the fgure and manner of holding the tools, will be refumed under the article Turning; an art which, from the facility with which it produces fo many beautiful forms, has become a fafhionable amufement among gentlemen, who .may require many practical inftructions, which would be needlefs to the mechanic regularly educated in the workthop. We thall alfo defcribe the method of turning elliptic work, as well as circular.

Papilionacex, Linn. Legrominofe, Juff.

Gen. Ch. Cal. Periamth inferior, of one leaf, bell-fhaped; its fegments lanceolate, acute ; the two uppermolt florteft, the lower one longelt. Cor. papilionaceous. Standard very large, inverfely heart-fhaped, reflexed at the fides and fummit. Wings fmaller, oblong, fomewhat crefcent-fhaped, fhort and obtufe. Keel femicircular, the fize of the wings but broader, feparating about the middle inwards. Slam. Filamente in two fets, one fimple the other in nine divifions, curved upwards; anthers roundifh. Pif. Germen compreffed, oblong, linear ; Ityle in its upper part erect, flat, broader upwards, acute at the fummit; ftigma on the upper or inflexed fide of the fyle, extending from the middle to the top, hairy. Peric. Legume very long, cylindrical or compreffed, pointed, of two valves and one cell. Seeds feveral, either cylindrical, globofe, or flightly angular.

Eff. Ch. Style flattened, downy above, broader upwards. 'Two upper fegments of the calyx fhorteit.

Tournefort divides this genus into four by the foliage. His Lathyrus, t. 216, 217, has only a fingle pair of leaflets on each footitalk, the latter terminating in a compound tendrıl ; his Clymenum, t. 218, has many leaffets to each falk; his Niffolia, Intt. 656, has fimple leaves without any tendril; and his Aplaca, t. 223, bears. 1tipulas without leaves, :at leaft in the adult plant. Thefe, however, are very juftly aleemed by Linnæus mere differences in habit, among the 'fpecies of one great genus, which is on the whole fufficiently natural. His it th edition of Syft. Veg. enumerates 21 fpecies, Willdenow 36 , in three fections. The firit fection, with fingle-flowered ftalks, now and then varying to two Howers, embraces 18 fpccies; the fecond, with two-flowered ftalks, has fix; the third, with many flowers on each ftalk, has 17.-Seven of the genus only are natives of Britain. The reft grow either in the warmer countries of Lurope, or in the north of Africa, fome in America, and one it is faid in Japan. They are ftationed for the moft part in cultivated fields, in meadows, or about hedges and thickets. Thofe referrible to the firlt and fecond fections are, perhaps
without exception, always annual plants, many of them capable of being ufed as pulfe; thofe of the third are generally percmial, with very tenacious, deep or creeping roots; and more calculated for fodder. Examples are here fubjoined.

* Sullks. fingle-flozucred.
L. Apbaca. Linn. Sp. Pl. 1029. Curt. Lond. fafc. $\mathrm{y}^{\circ}$ t. 51. Engl. Bot. t. 1167. (Aphaca; Raii Syn. 320, Ger. em. 1250.) - Flowers folitary. Tendrils leafefs. Stipulas between heart and arrow-fhaped.- Found in the borders of gravelly corn-fields, but rarely. The fem is weak. a foot or two high, fupported by its numerous fimple tendrils, each fpringing from between two large, angular, almoft halbert-fhaped /ipulas, which give the plant a peculiar afpect. One or two of the very firt ftipulas only are accompanied by a pair of fmall leafefs, with or without any elongated tendril. The floweirs are fmall and yellow, very rarely two together on each flower-ftalk.
L. amphicarpos. Linn. Sp. Pl. 1029. (L. minimus pe-
 Morif, Sect. 2. Append. t. 23. f. 1.) -Stalks fingle-flowered, longer than the calyx. Tendrils two-leaved, quite fimple. -Native of Syria. A humble plant, remarkable for producing many of its pods, with perfect feed, immediately from the root, or rather from the fubterraneous part of the ftem; yet thefe are the offspring of perfect flowers, (at leaft as to ftamens and piftil,) though born under ground; as we have veritied by examining the plant in Kew garden 30 years ago. Whether the roots be annual or perennial, we are not certain, but this fubterraneous mode of fructifying is feen in two or three more fpecies of Lathyrus or 'Vicia. Morifon's figure exhibits the prefent plant very tolerably. What rifes above ground bears linear-lanceolate rather glaucous leaflets, in pairs, with half arrow-flaped flipulos, and large folitary dull-purple flowers, which alfo produce feed.
L. arliculatus. Linn. Sp. Pl. 1031. Curt. Mag. t. 253.Stalks with one or two flowers. Tendrils accompanied by many alternate lanceolate leaflets, on a winged ftalk.-Native of France and Italy. A common hardy annual in our gardens, to a place in which it is recommended by its elegante though fecentlefs flowers, whofe crimfon ftandard is prettily contrafted with their uhite wings.
** Stalks tevosforvered.
L. odoratus. Common Swect Pea,-Linn. Sp. Pl. 1032. Curt. Mag. t. 60.-Stalks two-flowercd. Leaflets ovateoblong, two to cach branched tendril. Legumes hairy. -Native of Sicily, and fome fay of Ceylon; but the latter may perhaps be doubted, the plant being in the Englifh gardens fo hardy an annual, as frequently to furvive our winters, when it comes up in autumu. Its great beauty, delicious fragrance, and varicty of colours, render it a general favourite. More than two flowers are frequent on each ftalk, though the uppermoft are commonly blighted.

## *** Stalks many-flowered.

L. tulecrofus. Linn. Sp. Pl. 1033. Curt. Mag. t. 11 r. -Stalks many-flowered. Leaflets oval, in pairs. Stem without wings. Roots tuberous.-A troublefome weed in fome parts of Germany and Italy, fpreading widely over all kinds of cultivated ground, by means of its tuberous flehy perennial roots, hardly to be extirpated. In our gardens it is a beautiful hardy plant, confpicuous for the peculiarly delicate rofe-colour of its blofoms, and we have never heard of its being troublefome in its increafe. The feeds rarcly

## L $A T$

rarely ripen. The kuobs of the root are eatable when boiled.
L. latifolius. The Great Everlafting Pea. Linn. Sp. Pl. 1033. Engl. Bot. t. 1108 . Mill. Illuitr. t. 62.Stalks many-flowered. Leaflets elliptical, in pairs. Stem winged. - Very commonly cultivated in gardens, where its roots endure for a long courfe of years, throwing up tall climbing fems, which bear large bunches of beautiful crimfon flowers, well known to molt people. We rather doubt whether the plant be truly wild in England, yet it appears in fome places to be fo, and finds a place in all our Britifh Floras.
L. Jylvefris. Narrow-leaved Everlafting Pea. Linn. Sp. P1. 1033 . Engl. Bot. t. 805. Curt. Lond. fafc. 6. t. 52.Differing from the lait in the narrownefs of its leafets, and lefs gaudy hues of its flowers, is perhaps a more elegant plant, and certainly wild in many parts of England in low bufhy fpots.
Lathyrus, in Gardening, contains plants of the herbaeeous climbing flowery kinds, of which the \{pecies chiefly cultivated are the fiweet lathyrus, or pea, L. odoratus; the tangier lathyrus, or pea, L.tingitanus; and the broadleaved lathyrus, or everlafting pea, L. latifolius.
But feveral other fpecies may be cultivated where variety is wanted.

The firft of thefe forts has feveral varieties ; as the purpleflowered, the white-flowered, the variegated or painted lady, fiweet-ficented, and the fcarlet.

The fecond fort is a fhowy plant for fhrubberies, wildernefs quarters, arbours, and trellis-work; but too large and rampant for borders of the common flower-garden.

It has many varieties; as the red-flowered, the purpleflowered, the fcarlet-flowered, and the large-flowered.

Method of Culture.-There plants may be readily raifed, by fowing the feeds of the different forts in the autumn or fpring feafons, at different times in patches of fix or eight together, in the places where they are to grow. Where the foil is light and dry, the autumn is the beft feafon, as the plants appear mote early, but in other cafes the fpring fhould be preferred. The plants afterwards only require to be kept clean from weeds, and be properly fupported by branchy fticks.

The laft fort may likewife be increafed by tranfplanting the roots in the autumn; but the plants in this way are feldom fo good as by feeds.

And the two firft forts mult be fown annually, but the laft will remain many years.

It may be noticed that it is the practice with the gardeners who raife the firft forts for the London markets, to fow them in the autumn in pots, and fecure them from fevere weather, by placing them in hot-bed frames: by which means they can bring them much more early to market. They may be continued in flower the whole of the fummer by repeated fowings in the fpring. When fown in pots, they fhould be watered frequently in a nlight manner.

All thefe plants are highly ornamental in the borders, clumps, and other parts of pleafure-grounds, when properly intermixed in their fpecies and different varieties in fuch compartments.

LATIANO, in Geography, a town of Naples, in the province of Otranto; five miles E. of Oria.

LATIAR, a feaft or ceremony, inftituted by Tar. quinins Superbus, in honour of Jupiter Latiaris, or Latialis.

Tarquin, having made a treaty of alliance with the Latins, propofed, for perpetuating it, to erect a common temple, where all the allies, the Romans, Latins, Hernici,

Vgl. XX.

## L A T

Volfci, \&c. fhould affemble themfelves every ycar, hold 2 kind of fair, exchange merchandizes, feaft, facrifice, and make merry together. Such was the inflitution of the Latiar. The founder only appointed one day for this feaft ; the firft conful added another to it, upon concluding the peace with the Latins; and a third was added, after the people who had retired to the Mons Sacer were returned to Rome; and a fourth, after appeafing the fedition raifed on occafion of the plebeians afpiring to the confulate.
Thefe four days were called the Latin ferix; and all things done during the coutfe of the ferix, as feafts, facrifices, offerings, \&cc. were called Latiares.

LATICLAVIUM, or LATUS-CLAVUS, a garment which was a difinction and dignity among the Romans, contradiftinguifhed from the angufticlavium.
The lati-clavium was a kind of tunic or long coat, faced with one or two flips of purple, applied lengthwife to the two fides of the tunic.

- In the latus-clavus thefe lips were pretty broad, and in the anguftus-clavus narrower; though there is nothing about which the learned differ more than the difference between thofe two habits.
There were buttons fet on the latus-clavus, which ap. peared like the heads of large nails; whence fome think it took its name.

The fenators, protors, and the chief magiftrates of colonies and municipal cities, had a right to wear it. The robe called pretexta was worn over the latus-clavus. When the prator pronounced fentence of death, he put off the prxtexta; but retained the latus-clavus.

LATICZOW, in Geography, a town of Poland, in the palatinate of Braclaw ; 60 miles N.W. of Braclaw.

LATILLA. Gaetano, in Biography, an excellent Neapolitan compofer, much efteemed by connoiffeurs, in every fpecies of vocal mufic. His comic operas, however, were the moft ingenious and fuccefsful of all burletta compofitions, till the Buona Figliuola of his nephew Piccini came out, which furpaffed all preceding comic operas fo much, that no other excited any curiofity in the public', till Paefiello's fuperior fertility was known and felt.

Latilla's comic operas, that were performed in London, from 1748 to 1753 , when the Mingotti firft arrived, were "La Comedia in Comedia," "Orazio," and "Don Calafcine," which were admirable. The melodies new, eafy, and pleaf. ing ; humour without buffoonery ; and the actors confidered as well as the fingers, in allowing time for Pertici and Lafchi, thofe nice obfervers of whatever was ridiculous in the voice, countenance, or gefture of man, to convey their obfervations to the fpectators.

We met with poor Latilla 20 years afterwards at Venice, " fallen from his high eftate," and fhrunk into an humble deputy organift, at the church of St. Maca; but found him an intelligent and well informed man, on other fubjects than that of his own profeffion, which, however, he had cultivated in all its departments.

LATIMER, Hugh, the fon of a refpectable Leicefterfhire yeoman, was born about the year 1470. He was initiated in fchool learning in the country, and making a very rapid progrefs in his youthful ftudies, he was, at the age of fourteen, Ient to Chritt's college, Cambridge, where he was diftinguifhed for his rapid proficiency in the fudies of the place. Here he took his degrees, entered upon holy orders, and was at this period a zealous Papift, read the fcriptures and the fchoolmen with the fame reverence, and held Thomas á Becket and the apoftles in equal honour. He had taken alarm at the progrefs of Lutheranifm, and inveighed with great bitternefs, publicly and private!y, againft thofe prin-

## LATIMER.

ciples, of which he was hereafter to become a moft zealous defender. His zeal as a Papilt was fo dittinguifhed in the univerfity, that he was elected crofs-bearer in all public proceffions, an employment which he is faid to have accepted with a high degee of reverence, and to have difcharged with much folemnity. Our good divine was a Papift from conviction, and had a mind open to arguments on all fides of the queltion: he fortunately met with Mr. Thomas Bilney, a cler yman of great piety, and who, by the perufal of Luther's works, had become a fecret favourer of the reformation. By degrees he infufed into the mind of Latimer all thofe doubts which he had formerly felt refpecting the difcordance of Popery with pure Chritianity. Latimer heard the arguments of his friend, and was prepared at firf to difpute the ground inch by iuch. At length he found the ground on which he tood abfolutely untenable; and acknowledged the crrors in which he had been educated. But the temper of the fcholar was not like that of the maller: he could not be a Proteltaut in fecret : he muit come forth holdly and declare the convistions of his heart: he had fought truth as the pearl of great price, and having, as he believed, found it, was determined not to conceal its beauty from his friends and the world. He became an active apoitle in the caufe of Proteltantifm: he preached in public, he exhorted in private, and every where cuforced tie neceffity of a holy life, in oppofition to the fuperlitious ceremonies and obfervances inculcated by the Romifh religion. He foon became obnoxious to the generality of the clergy, but being contented to go through evil as well as good report, he continued on his courfe with more ardour in proportion to the outcry made againft him. He inveighed againtt the ccremonies which encumbered true religion, and expofed the pride and ufurpation of the Romifh hierarchy: but what he moft infilted on was the right of the people to read the fcriptures in their native tongue. Dr. Buckenham, one of the Black-friars, was felected to anfwer, from the pulpit, the arguments of Latimer : he performed the talk with great pomp, but not to the complete fatisfaction even of his own party, and in a fhort time afterwards the whole univerfity met to hear what the reformer had to fay in his defence. Mr. Latimer at firit recapitulated Dr. Buckenham's arguments; placed them in the llrongett light, and gave then much greater importance than the friar had been able to do: he then attacked them with fo much force of reafoning, and fuch abundance of wit, as to render the learned doctor truly ridiculous : he next appealed to his hearers, urging them to relpect their own underlandings, and not to fubnit to be led by the priets, who had ever been accuftomed to treat the people at large with contempt; and he concluded with ardently hoping, that his honeft countrymen might be permitted to have the ufe of the fcriptures, till they fhewed themfelves to be as abfurd interpreters of them as the learned friar. Latimer, by this exertion, and by an anfwer to Venetus, greatly increafed the credit of the Proteftant party at Cambridge. Bilney and Latimer were regarded as the heads of the party: and to them the itudents looked with refpect, attachment, and even veneration. The heaus of the colleges, and the fenior members of the univerfity, were alarmed, and determined to withitand the progrefs of herefy. Frequent convocations were held, and the ftrictef injunctions were laid on all the tutors to be watchful of the opinions of their pupils; but thefe efforts were in vain, and the bifnop of Ely was applied to, and entreated to crufh, by his authority, the new opinions. The prelate, though a Papitt, was mot a friend to perfecution: he was willing to judge for himfalf, and though he went to Cambridge and preached ayainft the heretics, yet he did not feruple to attend himfelf
the fermons of Latimer, and with much candour declared, that the reformer was the beft preacher he had ever heard. Latitimer's enemies next appealed to the court, and tranfmitted very heavy complaints refpecting the increafe of herefy; and Wolfey, contrary, it is thought, to his own inclination, in. flituted a court, confifting of bifhops and other divines, to put the laws in execution againit herefy. Bilney and Latimer were called to aniwer for their conduct, and as the former was regarded as the moft guilty, by being the firft promulgator of the new doctrines, his examination was the moot fevere, and he was pronounced guilty ; but not having a mind formed for the fufferings prepared for him, he recanted, and after fome ignominious treatment was difmiffed. Latimer, and others who were involved in the charge, were, by the management of the cardinal, and the merciful difpolition of Tunttal, bifhop of London, difmiffed probably without a reproach : the cardinal even granted Latimer his licence to preach throughout England. The friends of the reformers received them with open arms; but the fate of Bilney was truly wretched; he was Itruck with remorfe at the thought of his recantation, and the agonies of his mind deprived him for a time of his reafon. In a few years he returned to a fane flate, and determined to expiate his abjura. tion by his death. He accordingly left his friends at Cambridge, went into Norfolk, his native country, and preached moft earnefly againft the corruptions of the eftablifhed religion; he was feized, imprifoned, and executed, at Norwich, exhibiting, at his clofing fcene, a moft admirable example of compofure, firmnefs, and Chriftian courage. Latimer, in the mean time, excrted himfelf more than ever: he was conftant in his exertions, and once or twice he had the honour to preach before the king at Windfor. Encouraged by the gracious reception afforded him hy Henry, he took the liberty of writing a very bold letter to his majefty, againft a proclamation which the clergy had prevailed upon the king to publifh, forbidding the ufe of the bible in Englifh. The king received the letter with good temper, and even thanked Mr. Latimer for his well-meant advice. When meafures were taken for the eltablifhment of the king's fupremacy, Latimer exerted all his powers in forwarding his majefty's defigns. His zeal in the bufinefs procured for him the prefentation of the rectory of Weftkinton, in Wilthire, and, notwithltanding the remonitrances of his friends, who confidered this as the firt itep only to higher dignities in the church, he went to refide on his living. His preaching rendered him very popular, and he was foon after appointed by the mayor of Britol to preach on Ealter Sunday. Public notice of this appointment had been given, and received by the people with great joy; but an order was fuddenly iffued by the bifhop of Brittol, prohibiting any one to preach there without his licence. This was but the firit in Alance of oppofition which the c'ergy in that neighbourhood excited againft him; they traduced his character, and inveighed againlt him with the greateft :iolence; and at length they drew up a fot of articles, in the form of an accufation, which was laid before Stokelley, bilhop of London, who immediately cited Latimer to appear before him. To this mandate he was not obedient, but on a citation from the archbifiop he inflantly fubmitted. He fet out in the midtt of winter, and at a moment when he was grievoully afflicted with the ftone and other acute diforders. On his arrival in London he found the court fitting, but inftead of being examined as to any particular charges, he was ordered to fubfcribe a paper put into his hand, containing the obnoxious docirines againit which he had been preaching. This he pofitively refufed, and he was difmiffed, for the prefent, with an exhortation to reflect upon his conduct, and fubmit.

## L. $\triangle$ TIMER.

Frequently was he brought before the court, and as frequently he rejected the propofal. At length he remonftrated againt their ill-treatment, and was probably refcued by the interpofition of the king. In 1534 , he was appointed chaplain to queen Anne Boleyn, and in the following year he was offered the bifhopric of Worcelter, which he accepted, and difcharged the duties of the office with zeal, piety, and diligence. In 1536, he was called on to attend the parliament and convocation; and it was hoped that this feffion would bring with it many important advantages for the Protefant caufe. The convocation was opened by an eloquent Latin difcourfe from Latimer, who had been appointed to this office on account of his great talents, and becaufe it was known that no other perfon could fo ably expofe the corruptions of the clergy as himfelf, and thus lead them to an netive difcharge of their duty. In a fhort time after this, an Englifh tranflation of the bible was publifhed and recommended by authority to a general perufal. During the fitting of the convocation, an animated but unfuccefsful attempt was made to ftigmatize archbifhop Cranmer and bifhop Latimer, by fome public cenfure. As foon as the convocation broke up the bifhop repaired to his diocefe; he had no tafte for ftate affairs, and he had a mind ill adapted to the manners of a court. It was the cuftom at that period for the bifhops, at the commencement of every new year, to make prefents to the fovereign, and many of them were very liberal in their donations; but Latimer, on this occafion, prefented, inftead of a purfe of gold, a New Teftament, with a leaf doubled down on this paflage, "Whoremongers and adulterers God will judge."

Attempts were frequently made to ruin the bifhop, but hitherto they were unfucceffful; and he continued in favour with the king. After the paffing of the bloody ftatute, or the act of the fix articles, the bifhop protefted againft it by his conduct; he refigned his bifhopric, and retired into the country. Here he intended to pafs the remainder of his days, but an accident, which befel him, by the fall of a tree, obliged him to come to London for furgical affiltance. His arrival was foon known in the metropolis, and the fpies of the bloody-minded Gardiner watched him in every place. At length they ohtained, or made, matter for accufation ; he was charged with fpeaking againft the flatute of the fix articles, and was, wihout helitation, committed to the Tower, where he fuffered a cruel imprifonment during the remainder of king Henry's reign. On the acceffion of Edward VI. Latimer, and all the others who had been imprifoned ia the fame caufe, were fet at liberty. He might have been reinitated in his bifhopric, but he preferred a more private life, accepted an incitation from Cranmer, and took up his refidence at Lambeth, where his chief employment was to hear the complaints, and to procure redrefs for the injuries, of poor "people. No man was fo well qualified for an office of this kind, and he continued in it during two years, interfering very little with public tranfactions. It was, however, known that he affited the archbilhop in compoting the Homilies, which were publifhed, by authority, in the beginning of king Edward's reign, and intended to fupply the want of preaching, which was now at a very low ebb. Being one of the moft eloquent preachers of the age, he was appointed to preach the Lent fermons before the king, during the firft three years of his reign. After this he retired into the couritry, and made ufe of his majelty's licence, as a general preacher, in thofe parts where he thought his labours might be moft ferviceable. He continued in this practice till Popery was re-ettablifhed in the reign of queen Mary, when he was cited to appear before the council in London.- He immediately obeyed, and as he paffed through

Smithfield, the fcene of the moft horrid cruclties exercifed upon thofe who had been denominated heretics, he faid, very cheerfully, to his attendants, "this place has long groaned for me." 'The next day lie appeared before the council, who, after loading him with many reproaches, committed him to the Tower. His imprifonment was rendered uncommonly fevere, but he endured every cvil with refignation, and true Chriftian humility. The weather was exccedingly fevere, but no fire was allowed him, which led him to tell the lieutenant of the Tower, that, however his enemies might expect he fhould be burned, unlefs he was permitted to have a fire this frofty weather, he fhould be firt: ftarved to death with cold. About this time archbifhop Cranmer and bifoop Ridley were committed to the Tower, which became fo crowdicd with prifowers, that the three prelates were confined in the fame roon, a circumitance which, no doub:, they greatly enjoyed. The pleafure, however, was but of hort duration; they were hurried to Oxford under the pretence of a public difputation to be held there by the moft eminent divines on both fides. At this place they were moft clofely confined in thie common prifon, and deprived of every comfort, and of almoft all the neceflaries of life; hence they readily inferred what kind of difputation would be allowed them. They fully expected that the argument of power was the only one that would be reforted to, and having made up their minds to this, Latimer faid he flould give them very little trouble. "I fhall," faid he, "offer them a plain account of my faith, and fay but little more; for I know that any thing more will be to no purpofe. They talk of free difputation; but I am affured, their grand argument will be, as it was that of their forefathers, We bave es lawe, and by our lazw ge ousht to dize"" When he was brought into court, he had a cap on his bead, buttoned under his chin, a pair of fpectacles hanging at his breaft, a new teftament under his.arm, and a flaff in his hand. He was exhaufted in preffing through the crowd, and was permitted to fit down: after a fufficient paufe, he was told he muft difpute againft the articles brought againft him ; he declared he was unable, through age, to do eny fuch thing; "I am not able to debate," faid the venerable old man, "I will arow my faith, and then do with me as you pleafe." He was next enfnared, by the artful conduct of his accufer, to make conceffions which were againft him, and upon this the prolocutor arofe, and exclaimed to the populace, "Here you fee the weaknefs of herefy againt the truth; here is a man, who, adhering to his errors, hath given up the gofpel, and rejected the fathers." The good old man made no reply, but wrapping his gown about him, and taking his new tef. tament and his flaff, walked out with the greatelt compofure. On the foilowing Friday he was again brought into court, was firft excommunicated, and then condemned to death. As foon as the fentence was read, Latimer, lifting up his eyes to heaven, exclaimed, "I thank God mont heartily, that he hath prolonged my life to this end.'

No fteps were taken towards putting the fentence againft the prelztes into execution, for nearly a year and a half; Dut, in 1555, new laws in fupport of the Romifh religion having been enacted, a commiffion was granted by cardinal Pole, the pope's legate in England, to the bifhops of Lincoln, Gloucelter, and Briftol, empowering them to try biftops Latimer and Ridley for herefy. The prelates were ordered before the commifioners, and when Ridley had been examined, bifhop Latimer was brought to the bar, whom the bihop of Lincoln addrefled, in an eloquent, and very pathetic fpeech, earnefly exhorting him to accept the mercy that was offered, and to acknowledge the authority of the fee of Rome. The good bihop was too firmly fixed in his
opinions to give them up through motives of timidity, and the defire of prolonging his life. He was, however, remanded, and on the next day judgment was paffed on him and Ridley. Their execution was fixed for the 16 th of October, and the place fixed on was the north fide of the city, near Baliol college. Left the bloody feene fould excite a tumult, the military were ordered to attend the place of execution. On the day appointed, the vice-chancellor of Oxford, and other perfons of diftinction, repaired to the fpot which was to witnefs the fufferings of thefe worthy men; the prifoners, at the fixed hour, were fent for, and the concern of the fpectators, which was apparent in every countenance, excepting in thofe who were actors in the fcene, was greatly augmented by the itriking contrait of their appearance. Ridley was drefted in his epifcopal habit, fhewing what they had formerly been, and bifhop Latimer wore his prifon attire, by which he exhibited the condition to which they were now reduced. Having heard a fermon, by a Popifh doctor, in which they were treated with great inhumanity, they prepared for their laft trial, and were chained to the itake. The fire was fpeedily kindled, and at the fight of the flames Latimer exclaimed, "Be of good cheer, maiter Ridley, and play the man, we fhall this day light fuch a candle, by God's grace, in England, as I truit fhall never be put out." He then recommended his foul to God, and a few minutes put an end to the fufferings of thefe noble martyrs. Such was the glorious and triumphant end of Hugh Latimer, who had been indefatigable in the difcharge of the duties of life, and who exhibited the moft altonifhing firmnefs and compofuie in the feveral trials to which he was expofed. He was not learned, in the ufual fenfe of the word, for he cultivated only ufeful learning, and he lived rather what the world calls a good than a great man. He was eminent as a preacher, but his fermons, that are extant, are not patterns of good compofition; his manner of preaching was affecting, as he fooke from the heart, and made deep and lafting impreffions on his auditors. He difplayed at all times a noble and apoftolic zeal in the propagation of the truth. No one had a higher fenfe of what became his office, or was lefs influenced by any finifter motive; and none ever reproved vice with more freedom, without any regard to the rank of his hearers. A collection of his fermons was publifhed, in $157^{\circ}$, by Auguftus Bernhere, a Swifs, who dedicated them to Catharine, the duchefs of Suffolk. It confifts of forty fermons, and has been frequently reprinted. In Mr. Fox's Acts and Monuments, feveral of his letters are preferved, among which is the celebrated one to king Heary VIII. for reftoring the free liberty of reading the holy fcriptures. Bing. Brit.

L:ATIN, a dead language, firf fpoken in Latium, and afterwards at Rome, and ftill ufed in the Ronsifh church, and among men of letters.

Some authors rank the Latin among the number of original languages, but by miftake : it is formed principally from the Greek, and particularly from the 压olic dialect of that tongue; though it has a great number of words which it borrowed from the languages of the Errufci, Ofci, and other ancient people of Italy; and foreign commerce and wars, in courfe of time, added a great many more.

The Latin is a ftrong, nervous language, perfectly fuitable to the character of the people who fpoke it. The Romans were engaged in wars and commotions, foreign and domeltic, which for feven hundred years engroffed all their thoughts. Fience, therefore, fays the ingenious Mr, Harris, their language became like their ideas, copious in all terms, expreffive of things political, and well adapted
to the purpofes both of hitory and popular eloquence: But the Romans were no philofophers; and hence the unfitnefs of their language to this fubject; a defect, which even Cicero is compelled to confefs, and more fully makes appear, when he writes philofophy himfelf, from the number of terms he is obliged to invent. Harris's Hermes, P. 411, \&c.

The Latin is more figurative than the Englifh, lefs pliant than the French, lefs copious than the Greek, lefs pompous than the Spanifh, lefs delicate than the Italian, but clofer and more nervous than any of them.

We may here obferve, that the profody both of the Greeks and Romans was carried much farther than our's; or that they fpoke with more, and ftronger, inflexions of voice than we ufe. The quantity of their fyllables was much more fixed than in any of the modern languages, and rendered much more fenfible to the ear in pronouncing them. Befides quantities, or the difference of fhort and long, ace cents were placed upon molt of their fyllables, the acute, grave, and circumflex: the ufe of which accents we have entirely loft, but which, it is well known, determined the fpeaker's voice to rife or fall. (See Accent and Prosody.) We may alfo obferve, that ftrong tones and animated geftures always accompany one another. The action both of the orators and the players in Greece and Rome was far more vehement than that to which we are accultomed. (See Action and Gesture.) When the Barbarians fpread themfelves over the Roman empire, thefe more phlegmatic nations did not retain the accents, the tones and geftures, which neceffity at firft introduced, and cuftom and fancy afterwards fo long fupported, in the Greek and Roman languages. As the Latin tongue was lolt in their idioms, fo the character of fpeech and pronunciation began to be changed throughout Europe. The fame attention was no longer paid to the mufic of language, or to the pomp of declamation, and theatrical action. The arrangement which commonly obtains in the Latin language confilts in placing, firft in the fentence, that word which expreffes the principal object of the difcourfe, together with its circumftances ; and afterwards the perfon, or the thing that acts upon it. Thus Sallult, comparing together the mind and body, ufeg the following expreffion; "Animi imperio, corporis fervitio, magis utimur ;" in which the order renders the fentence more lively and ttriking than when it is arranged according to our Englifh conftruction; "We make moit ufe of the direction of the foul, and of the fervice of the body." The Latin order more gratifies the rapidity of the imagination, which naturally runs firit to that which is its chief object; and having once named it, carries it in view through the relt of the fentence. But though the common arrangement in the Greek and Roman languages is to place that firf which ftrikes the imagination of the fpeaker molt, yet. this does not hold without exception. Sometimes regard to the harmony of the period requires a different order, and to this the ancients attended. The Latin order is more animated ; but the Engli/h is mote clear and diftinct. The Romans generally arranged their words according to the order in which the ideas rofe in the fpeaker's imagination. We arrange them according to the order in which the anderftanding directs thofe ideas to be exhibited in fucceffion, to the view of another. Our arrangement, therefore, appears to be the confequence of greater refinement in the art of fpeech; as far as clearnefs in communication is underftood to be the end of fpeech. The limitation of arrangement in the modern tongues is, in a great degree, owing to the dif. ufe of thofe differences of termination, which, in the Greek and Latin, ditinguifhed the feveral cafes of nouns, and

## LAT

tenfes of verbs; and which, by means of thefe, pointed out the mutual relation of the feveral words in a fentence to one another, though the related words were disjoined and placed in different parts of the fentence. As articles contribute very much to the clearnefs and precifion of language, the want of them in the Latin tongue is unqueftionably a defect, though they recur for the fupply of this defeet to the ufe of pronouns. (See Article and Pronoun.) Blair's Lectures, vol. i.

For a while the Latin tongue was confined almoft wholly within the walls of Rome; nor would the Romans allow the common ule of it to their neighbours, or to the nations they fubdued. Cicero obferved, that even in his time, Greek was ufed almoft among every people, but the Latin only conined to a very narrow compals. By degrees they were brought to grant the ufe of it as a favour; and, in time, became fenfible of the neceffity there was of its being generally undertood, for the conveniency of commerce: and, accordingly, ufed their utmoft endeavours, that all the nations fubject to their empire fhould be urited by one common language: fo that at length they impofed that as a law, which they had before granted as a favour.

After the tranflation of the feat of the empire from Rome to Conftantinople, the emperors of the Eaft, being always defirous of preferving the title of Roman emperors, appointed the Latin to be flill retained in ufe, both in their refcripts and ediets, as appears by the conifitutions of the eattern emperors, collected in the Theodofian Code; but at length the emperors, neglecting the empire of the Weft, abandoned all care of the Latin tongue, and allowed their judges to pafs fentence in Greek; and, accordingly, we find the emperor Juftrian's Novels are compofed in Greek.

Chariemagne, coming to the empire of the Weft, appointed the law proceedings in fovereign comits to be made in Latin; and the notaries were to draw their acts and inflruments in the fame torgue : this practice continued a long time through a great part of Europe; but at length it gave way, and the French took place of the Latin, not only in France, but, in fome meafure, in England too; and the reafon given for it was, that abundance of difficulties arofe about the underltanding of Latin terms. See Law Language.

The Latin, however, was prodigiouly degenerated and corrupted, before it came to be laid afide. The incurfions of the Goths and Vandals into Italy brought an inundation of foreign words and phrafes into it ; infomuch that Valla and. Naud call Boethius the lait Latin author. By command of Theodoric, king of the Goths, it was the hard fate of this worthy man, fays Mr. Harris, to fuffer death; with whom the Latin tongue, and the laft remains of Roman dignity, may be faid to have funk in the weftern world. But that was not all; when it once got into the courts of juftice, it was ftill worfe handled; till, at lalt, being introduced amonglt the monks, and become the common language of milfals and breviaries, it was debauched to that degree, that it was almolt become fcandalous to ufe it.

In this condition it was found at the time of the Reformation, when Vives, Erafmus, \&c. began to open the way for its recovery; fince which time monkih Latinity has been declining, and all endeavours have been ufed to retrieve the pure language of the Auguftan age.

It was faid of cardinal Bembo, that he would never read the breviary for fear of corrupting his fine Latin.

Latin Bible. See Bible.
Latin Cibarafier. See Character.
Latin Church, is a term ufed for the Romifh or weftern church, by way of oppofition to the Greek church. See Сhurch.

LATINI, Brunetto, in Biography, an early reviver of literature in Italy, was born at Florence in the early part of the thirteenth century; he was employed, about the middle of that century, by the Guelphs, in Florence, as ambaffador to Alphonfo, king of Caftile, with the view of obtaining aid againft Manfred, king of Naples and Sicily. By the prevalence of the oppofite party he was driven from his country, and retired to France. At Paris he opened a fchool of philofophy, and wrote feveral books. We find him in his native country in 1284, and acting as fyndic at Florence. He died in 1294. The moft celebrated of his works was his "Teforo," a compilation from various atuthors, in hiftory, philofophy, rhetoric, and morals. He tranflated into the Italian language part of the firft book of Cicero de Inventione, and he was author of a moral work in verfe, entitled "Il Teforetto." He is reprefented as a profound rhetorician and philofopher, and is faid to have been the firft who began to polifh the language, and refine the underftanding of his countrymen. Though he does not appear to have been a public inftructor at Florence, he probably gave private affiftance in the ftudies of his friends, and he is mentioned as having been, in fome meafure, the tutor of Dante.

Latini, Latino, a learned Italian, was born at Viterbo in 1513 . He ftudied feveral years at Sienua, with a view to jurifprudence, which an ill itate of health obliged him to relinquifh. He then affumed the ecclefiaftical habit, went to Rome, and became librarian to cardinal Rodolfo Pio, who, dying in 1564, left Latini the bequeft of his copious library. He was employed in the reformation of the Decretal of Gratian, firft undertaken by defire of pope Pius IV. and publifhed under Gregory XIII. and com. mitted to the care of many of the moft learned ecclefiaftics of the Roman court. He died in 1593, and bequeathed all his books to the chapter of Viterbo. He was highly elteemed for bis learning and indultry, though his modefty did not permit him to publifh any thing during his life-time. After his deceafe there appeared two volumes of his "Latin Letters, Poems, and other fmall Pieces." He communicated many emendations of Tertullian to the edition of that father pubiifhed by Pamelius. His. MS. annotations on the fathers, and on other authors, were given to the public in the "Bibliotheca Sacra et Profana," printed at Rome in 1667. Moreri.

Latini, the Latins, in Ancient Geograpby, comprehended in general all the people of Latium, and particalarly thofe who inhabited the territory along the Tiber from Rome to the fea. They were formed, it is faid, by the union of the Aborigines, or of people whofe origin was not known, of the Pelafgi, who had migrated from Theffaly, and of the Arcadians, brought thither by Evander, 60 years before the war of Troy.
LATION is ufed by fome for the tranflation or motion of a body from one place to another.

LATISSIMUS Colli, in Anatomy, a mufcle of the neck, often called platyfma nyoides. See Deglutition.

Latissimus Dorfi, is a mufcle of the back, defcribed under Dorsi.
LATITAT, in Law, a writ, whereby all men in perfonal actions are called originally to the king's bench.
It has this name, as fuppofing the deferdant lurks, lies hid, and cannot be found in the county of Middlefex, to be taken by bill; but is gone to fome other conaty, to the theriff whereof this writ is directed. See Bile of Middlefex. LATITUDE, in Geography and Afronomy. The latitude of a place on the terreftrial globe is its angular diftance

## LATITUDE.

from the equator. It is meafured on the meridian, being that part of it which is intercepted between the zenith of the place and the equator. See Meridian.

If the place is fituated to the north of the equinoctial line, it is faid to have north latitude; if on the other fide, its latitude is fouth.

When the fpherical figure of the earth was once admitted, obvious methods, founded on aftronomical principles, were immediately invented, to determine the latitude of places, or their relative fituation to the equator. Previous to the eftablifhment of this theory, nothing could be more vague and unfatisfactory than the methods employed by the ancients of determining the relative fituations of the principal cities of the world to each other. But the know. ledge of the truc figure of the earth, not only fuggefted a more fcientifice divifion of its furface by imaginary circles, fuppofed to be drawn on its circumference; but by referring thefe circles to correfponding ones in the heavens, altronomy and geography were combined, and the principles of the former were fuccefffully applied to the inprovement of the latter. Long before the apparent motion of the heavens was known to arife from the real motion of the earth, the two points which we now call the poles were referred to thofe two points in the heavens which were obferved to be flationary; and a great circle of the terreftrial fphere, fuppofed to be every where equally diftant from the poles, was called the equinoctial line, and aflumed as a principal circle, to which geographical fituations were to be referred; and as aftronomers, in taking the ecliptic for their principal circle, had defined the pofitions of the heavenly bodies by their diltances from this circle, and a perpendicular to it, calling thefe diftances longitudes and latitudes; fo, in imitation of this method, geographers affumed the equinoctial tine as their ftandard, and taking another circle perpendicular to it, they referred all pofitions on the earth to thefe circles by the fame name. Hence longitude and latitude, in geography, are not defined in the fame terms as in altronomy, being in the latter always referred to the ecliptic, and on the terreftrial globe to the equator. This circumftance often embarraffes the young fludent in aftronomy, who is naturally at a lofs to comprehend why the fame terms thould have fuch different fignifications, when applied to the terreftrial and celeftial globe. It being once clearly underfood that every point of the convex furface of the earth has at any given inllant of time its correfponding point on the concave furface of the heavens, a number of methods were immediately fuggelted (and quite independent of actual meafurement), for deterniniag the fituation of places, or their latitudes and longitudes as defined above. The molt obvious method of defining the fituation of points on a fphere, is to refer them to two reat circles perpendicular to each other. On the celeftial globe, whether we affume the equator or the ecliptic for one of thefe circles, we can have no hefitation in the choice of the other, becaufe the equinoctial points are fo remarkable, that they naturally indicate the advantage of making the fecond circle pais through them. Still, however, it nult be remembered, that this choice is to a certain degree arbitrary ; we might have aflumed the equator or ecliptic for one principal circle, and for the other, a great circle perpendicular to either of them, which fhould pafs through any remarkable fixed ftar, as Sirius, or Arcturus. The preference, however, has always been given to the equinoctial points, and, accordingly, as we affurne the equator, or the ecliptic, as the principal circle, we define the fituation of the different points by right afcenfion and declination, or by longitude and latitude. See Right Ascensron, and Deellasation.

There is likewife another method occafionally employed by altronomers, but which relates only to their own particular fituation at the moment of obfervation: this is by altitude and azimuth. 'I'he place of a heavenly body determined by this method is not permanent, but changes at every inflant; and fince no two obfervers can have the farne zenith, no flar can have the fame altitude and azimuth at the fame inflant of time to different obfervers. . Sce Altitude, Azimuth, \&c. \&cc.

In this latter method the principal circle affumed is the borizon, and the great circle perpendicular to it is that which pafles throligh any two oppofite cardinal points, as the North and South, or the Eaft and Weft.

Let us now, confider the terreftrial globe. Here the equinoctial line prefents itfilf as the great circle, of all others the moft proper for our purpofe; but what is to guide our choice in the felection of another great circle perpendicular to it? We are not here affilted, as in the celeftial globe, by finding any one point poffefling fume remarkable property peculiar to itfelf; and even if there were fuch a point arifing from local circumftances, it would have no reprefentation in the heavens ; and, therefore, would not facilitate the object of our prefent inveftigation, which is to fhew by what method aftronomers have contrived to determine the fituation of points on the earth's furface, by finding their correfponding zenith points in the heavens.

Finding, therefore, but one great circle on the terreftrial globe indicated by nat:re, attronomers and geographers have been obliged to affume a fecond from circumftances entirely accidental. The firtt meridian has been differently affumed by writers of different countries. The French aftronomers divide the terreftrial globe by two great circles; one of which is the equator, the other a great circle paffing througlt the obfervatory of Paris, and to thefe great circles all other places are referred; hence, according to their definitions, if a great circle be conceived to pafs through any place, and to be perpendicular to the equator, then the latitude of that place will be the arc of this fecondary circle between the equator and the place, and its longitude will be the arc of the equator, intercepted between this great circle and that which in a fimilar manner paffes through the obfervatory of Paris.

Englifh geographers and aftronomers, in like manner, fuppofe their firtt meridian to pafs through the Royal Obfervatory of Greenwich.

Having thus minutely defcribed what is meant by longitude and latitude, both on the celeftial and terreitrial glose, it remains to explain the different problems connected with the fubject, and, agreeably to the arrangement adopted in this work, we fhall confine ourfelves as much as poffible to that part of the fubject connected with Latitude, referring to Longitude that which more immediately belongs to it.
The theory of finding the latitude of a place by aftronomical obfervation is fo fimple, that it may be undertood by merely infpecting a celeftial globe. See Globe.

The meridian (Plate XVI. fir. I47. A/fronomy, rifes (in our latitudes) in the north point of the horizon O , palles through the poie P , through the zenith, and croffes the equator 压 before it meets the fouthern point of the horizon. It is thus divided into four parts:
$\mathrm{PO}=$ the latitude,
$\mathrm{PZ}=$ the co-latitude,
AZ the latitude,
$\mathrm{H} \mathbb{E}=$ the collatitude.

It is evident, that if the value of either of thefe four ares can be determined, the latitude is known.
The moft ancient methol of determining the latitude was

## LATITUDE.

by means of a gnomon ; in this cale the mean of the greateft and leaft altitude of the fun was taken, which is always equal to the co-latitude, or $\mathrm{A} . \mathrm{H}$. The altitude of the equator above the horizon, and the complement of this to 90 , is the latitude of the place. See Gnoson.

We fhall firlt give the methods of determining the latitudes of fixed obfervatories on fhore, and then defcribe thofe which are beft adapted to perform the fame operation at fea.

Method of determining the Lalitude of a fixed Obfervatory.The beft method of determining the latitude of a fixed obfervatory, is by a long leries of obfervations of the pole-flar, made with an 18 -inch repeating circle of Borda. The method of adjulting and obferving with this inftrument has been already fufficiently explained under Circle and Declisation. But as this inftrument is not in this country in very general ufe, we fhall fuppofe the obferver to be in poffeffion of an attronomical circle or quadrant, or fome equivalent inftrument adapted to the determination of zenith diftances by meridional obfervations.

The latitude of an obfervatory may be determined with very confiderable accuracy by zenith ditances of the fun when near the fummer foltice, as the obliquity of the ecliptic is very correctly afcertained; but the moft preferable method is certainly by a regular feries of obfervations on circumpolar ftars. Polaris, and $\beta$ Urfe minoris, are the moft eligible ftars for this purpofe. They fhould be obferved continually, both above and below the pole, and all the oblervations carefully reduced to the firlt of January, of the year in which the obfervations are made. It is evident, that the mean of the altitudes above and below the pole, will be the altitude of the pole itfelf. The accuracy of the refult will depend on the goodnefs of the inftrument, the fkill of the obferver, and the exactnefs with which the neceffary corrections have been applied. When the altitude of a heavenly body is taken with an altronomical inftrument, the oblerver mult firft confider what correction is required from the nature and conftruction of the inflrument itfelf; fach as the error of collimation, or index error, error of divifion, \&c. This being properly allowed for, the obfervation is next to be corrected for refraction, and here attention mult be paid to the flate of the barometer and thermometer, and the mean refraction corrected accordingly. The true altitude, or zenith diltance, being thus afcertained, the next ftep is to determine what would have been the true zenith diftance if the obfervation had been made on the firlt of January, inftead of the given day'. For this purpofe we mult apply the preceffion, aberration, folar and lunar nutation, and likewife a correction ariling from the proper motion of the ftar whenever this can be known. By a careful difcuffion of a feries of obfervations thus corrected, the latitude is to be obtained, and with a good two-feet circle a kilful obferver will never err above a fecond or two from the truth, except from the lititle remaining uncertainty which till attends the fubject of attronomical refractions.

In the Philofophical Tranfactions for 1806, Mr. Pond fuggelted a merhod of correcting the refpective latitudes of any two obfervatories, by means of the catalogues of fars made at each of them, and applied it with fuccefs to the correction of the latitude of Palermo. The principle of the method is this: If the declinations of a number of fars are obferved at two obfervatories, fubject only to the errors of divifion in the refpective inftruments, the pofitive and negative errors may be naturally expected to be nearly equal to each other: if, therefore, the declinations of one catalogue mould be all cithar greater or lefs than in the other, it would
indicate that the efror was in the affumed latitude, which enters as a common element of calculation, and not in the obfervations themfelves. Now if fuch a correction be applied to the latitude of each obfervatory, as will make the fum of the pofitive differences equal to the fum of the negative, the latitudes thus corrected will be much more accurately determined than by any method that can be practifed feparately.

Examples of deducing the latitude from obfervations of the fun; taken from the Greenwich Obfervations of 1810.

This method is fubject to whatever error may exift in the folar tables relative to the declination of the fun. The fol-
lowing method is, therefore, preferable, and is quite independent of the crrors of the folar tables.

Let the fun be oblerved as often as poffible within ten or twelve days of each folftice, and let each obfervation be reduced to the folltice, either by Guerin's tables or by direct calculation. Then, after the proper correction for nutation, parallax, and error of collimation has been duly applied, let the follticial zenith diftances be added together ; half their fum will be the zenith dittance of the equator, or the latitude of the place.

The following example is taken from Dr. Bradley's Obfervations, for the purpofe of determining the latitude of the Royal Obfervatory at Greenwich.

## LATITUDE.

| Winter folltice Summer folltice |  |  | $74^{\circ} 56^{\prime} 54.26^{\prime \prime}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | 21.96 |
| Sum | - |  | - | 102 | 57 | 16.22 |
| Half | r lati | ude |  | 28 | 38.11 |

By taking half the difference, the obliquity of the ecliptic is determined at the fame time.

|  | $\begin{aligned} & 74^{\wedge} 56^{\prime} 54.26^{\prime \prime} \\ & 250021.96 \end{aligned}$ |
| :---: | :---: |
| Sum | 465632.30 |
| Half difference or obliquity of the ecliptic for 1753 |  |

Notwithfanding this method appears fo unobjectionable in theory, the uncertainty of refraction at the winter folltice renders it lefs exact than a feries of obfervations of the poleftar, obferved conttantly above and below the pole.

- Example. - The mean of 94 zenith diftances of the poleflar at Greenwich above the pole, reduced to Jan. 1, 1749, is, according to Dr. Bradley's obfervations,

Mean of IC $9^{\circ}$ below the pole

| $36^{\circ}$ | $29^{\prime}$ | $4.83^{\prime \prime}$ |
| :---: | :---: | :---: | :---: |
| $4^{\circ}$ | 33 | 39.29 |
| 77 | 2 | 44.12 |
| $3^{8}$ | 31 | 22.06 |
| 51 | 28 | 38 |
| 2 | 2 | 17.23 |

On the method of finding the latiiude at fea.-The method of finding the latitude at fea by a meridional obfervation of the fun or flar, differs fo little from that above explained,
and is fo fully deferibed in books which mariners are never unprovided with, that fcarcely any thing need be added on the fubject. Some of the nicer corrections ufed at land may be omitted, and others will be neceflary; fuch as the correction for the depreffion of the horizon, and the index error of the fextant, all which are to be found in every book of navigation. (See Depression.) The latitude may be found either by taking the meridian allitude of the fun, moon, or fixed Itar. But it fometimes happens that, in the winter feafon, a meridian altitude cannot be taken for maris days together: in that cafe, recourfe mult be had to two altitudes of the fun taken at different times, the interval between the two obfervations being fuppofed to be given by a pocket chronometer.

Many able mathematicians have fuccefsfully laboured to improve this problem, and to render it eafy to mariners. Mr. Profeffor Lax of Cambridge prefented a very valuable paper on this fubject to the Royal Society in 1799, in which a method is given of finding the latitude by a double obfervation, with extreme precifion; and Dr. Brinkley likewife conftructed a fet of very ufeful tables, which were for fome time annually inferted in the Nautical Almanacs.

Problems relating to the finding the longitude and latitude of the beavenly bodies, from thair olferved paflage over the meridian, with their zenith dijlance.

We have already explained, under Dechination and Rigut Ascensiox, how thefe quantities are obtained. We fhall now add an example of the calculation, by which the longitude and latitude are deduced from an obferved right afcenfion and declination.

Example.-October 2, 18 iII. The right afcenfion of the comet was obtained from obfervation $6^{5} 23^{\circ} 43^{\prime} \times 3^{\prime \prime}$, and its declination $49^{\circ} 31^{\prime} 2^{\prime \prime} \mathrm{N}$.; required its longitude and latitude.

Example.

t. $\overline{9.0280176}\left\{5^{s} 23^{\circ} 54^{\prime} 42^{\prime \prime}\right.$ longitude.
$O+A=B$
$943 \mathrm{IV} \quad$ t. 11.1018408 $\begin{cases}\text { t. } & \begin{array}{l}9.0280176 \\ \text { Cof. } \\ 9.9975435\end{array}\end{cases}$
Lat. - $5317 \quad 9$
t. 10.1274019
$\left\{\begin{array}{llllll}\text { Longitude } & 5^{\mathrm{s}} & 23^{\circ} & 54^{\prime} & 52^{\prime \prime} \\ \text { Latitude } & 0 & 53 & 17 & 9\end{array}\right.$
Vide Introduction to 'Taylor's Logarithms.
Or thus, as a verification of the preceding method.

f. 9.9407458
t. 9.7587218 Latitude $29^{\circ} 50^{\prime} 42^{\prime \prime} \mathrm{N}$.

When the moon's longitude and latitude are to be deduced from its obferved right afcenfion and zenith diftance, the procefs is much longer; and as the calculation is not given at length in any author we are acquainted with, we thall add an example, with the method of comparing it with the Nautical Almanac.
Firft, compute the mean time by Dr. Mafkelyne's folio tables, or other equivalent folar tables. To the mean time of the tranfit thus found, apply the equation of time taken out of the Nautical Almanac with a contrary fign, and this will be true or apparent folar time. From the moon's horizontal cquatorial parallax, taken from the Nautical Almanac, fubtract the correction, page 75 of Mayer's Lunar Tables, (or, ftill more correctly, a quantity which will be given in a table we propofe to annex to the article PArallax, ) the remainder will be the moon's horizortal parallax. From the obferved zenith diftance of the D's U L or L L corrected for refraction, fubtract the conflant quan. tity $10^{\prime} 3^{\prime \prime}$, which is the angle the vertical makes with the radius, (fee Degree and Figure of the Eartir, and add the log. fine of remainder to the log. fine of $D$ 's horizontal parallax, the fum will be the log. fine of $D$ 's parallax in zenith diftance; which fubtracted from the obferved zenith diftance, gives the corrected zenith diltance. To this add D's horizontal femidiameter, (taken from Nautical Almanac,) if UL was obferved; or fubtract, if LL; and thus the correct zenith dittance of the $D$ 's centre will be obtained. The difference of this quantity, and the latitude of the place, $\pm$ error of collimation, will give the required declination north or fouth, as the firft is greater or lefs than the fecond.

But if the $D$ 's zenith diflance was not obferved exactly at the time of the tranfit of the preceding or fubfequent enlightened limb, this declination mult be corrected by the following proportion

As 12 hours is to the interval of time between the two obfervations, fo is the variation of declination on 12 hours by the ephemeris to the correction required, and which muft be thus applied:

D's declination increafing,
add.
$D$ 's zenith diftance obferved $\{$ after tranfit of limb, $\quad\left\{\begin{array}{l}D \text { 's declination decreafing,.. } \\ \text { add. }\end{array}\right.$ Thus the true declination will be obtained from obfervation.

From log. fine of $D$ 's horizontal femidiameter, fubtract. $\log$. cofine of $D$ 's true declination, the remainder will be log. fine of $D$ 's femidiameter in $A$ : R., which add, if preceding limb was obferved, numely, before the full; or fubtract, if $D$ 's fubfequent limb was obferved' after the full, to or from A. R. of limb; and this will give the true A.R. of $D$ 's centre.

Next with the apparent time previoully found, compute the $D$ 's longitude and latitude by proportion from the Nautical Almanac, and apply the corrections for a fecond difference (from Taylor's Sexagéfimal. Tables). N. B. Compute the proportional part of the moon's motions in longitude doubly by the rule of practice, by changing the fecond and third terms of the proportion for each other, for greater certainty.

Then from the true A. R. and declination found above, and the apperent obliquity of the ecliptic, compute the longitude and latitude by Dr. Mafkelyne's rules, annexed to the precepts prefixed to 'Taylor's Logarithms, and the difference between this and the longitude and latitude, found as above by proportioning from the. Nautical. Almanac,

## LATITUDE.

zives the error of the tables. N. B. Compute the longitude and latitude from A. R. and declination affumed to the neareft fecond over or under; and after the operation, correct it, that is, as much as the true A. R. exceeds or falls
fhort of that found. And as much as the true declination is north or fouth of that aflumed, fo much the true latitude may be north or fouth of that found; which correct accordingly.

Example of the calculation of the moon's longitude and latitude, January 6, 1811 , and compared with the Nautical Almanac.

For the $D$ 's longitude and latitude by Dr . Mafkelyne's rule.

On the fecular variation in Longitude and Latituch of the fixed fars.

We have already explained, under EcLiptic, the caufe of the change of pofition in this circle, which produces a fecular variation both in the longitude and latitude of the fixed itars. The following table by M. Zach is intended to facilitate the calculation of this quantity, and has not yet been publifhed in this country.

Co. ar. cof. 0.0374748 - - fin. 9.6000245

## LATITUDE.

The long. of Aldebaran for $1750=2^{8} \quad 6^{\circ} \frac{1}{} 6^{\prime} 0^{\prime \prime}$ Latitude fouth - $\quad 52916$
Var. in lat. by Table III. for $2^{5} 6^{3}+50.812$
Prop. part for $\mathbf{1 8}^{\prime}$

But the latitude being fouth, the fign muft be changed: the fecular diminution of latitude is therefore $-50^{\prime \prime} .882$.
To find the fecular variation in longitude.-Firft find the fubficíiary angle $\alpha_{0}$.

Arg. lat. $5^{\circ} 29^{\prime} 16^{\prime \prime}$, Table I. - angle $\alpha=2^{\circ} 29^{\circ} 27^{\prime} 0^{\prime \prime}$.
This wil give two arguments with which enter Tab. IV.
Arg. I. $=2^{\circ} 6^{\prime} 18^{\prime}+2^{5} 29^{\circ} 27^{\prime}=5^{8} 5^{\prime} 45^{\prime}=+253.75$
Arg.II. $=2618-22927=11658=-255.04$

Since the latitude is fouth, the fign mult be changed: therefore the fecular increafe of longitude of Aldebaran is $\mathrm{I}^{\prime \prime} .29$.

Auxiliary Angle $\alpha$ for calculating the fecular Variation in Longitude.

Auxiliary Angle for calculating the fecular Variation in Longitude.

The fum or difference of the two quantities taken from this table by the two arguments, will be the fecular variation in longitude, which, when the auxiliary angle $\beta$ is ufed, is to be multiplied by 10.

## LAT

Latitude of a Planct, is an angle, as PTR (Plats XVI Afronomy, fig. 1.48.) under which a planet's dittance from the ecliptic $\stackrel{P}{P}$ is feen on the carth.

The fun never has any latitude, but the planets have; for which reafon, in the common fphere, the zodiac has fome breadth. The ancients only allowed fix degrees on each fide the ecliptic, but the moderns have extended it to nine.

When they have no latitude, they are faid to be in the nodes of the celiptic, or in the interfection of their orbit with that of the fun; and in this fituation it is that they eclipfe, or are eclipfed by, the fum.

Latitude, Circle of, is a great circle, MS T' m, paffing through the poles of the ccliptic. See Circle.

Latitude of the Moon, north ofecending, is when fhe proceeds from the afcending node towards her northern limit, or greatelt elongation.

Latitude, North defeending, is when the moon returns from her northern limit to the defcending node.
Latitude, South defcending, is when the proceeds from the defcending node to her fouthern limit.

Latitude, South afonding, is when fhe returns from her fouthern limit to her afcending node.
And the fame holds grood of the other planets. See Ascending and Descending.

Latityde, Heliocentric, of a Plawet, is its diftance from the ecliptic, fuch as it is feen from the fun.

This, when the planet comes to the fame point of its orbit, is always the fame, and unchangeable.

Latitude, Geocentric, of a Planet, is the dillance of the planet from the ecliptic, as it is feen from the carth.

This, though the planet be in the fame point of its orbit, yet is not conftantly the fame, but alters atcording to the pofition of the earth, in refped to the planet. See Helrocentric, and Geocentric.
Dr. Hailey has fome conliderations, in the Plilofophical Traníactions, which make it probable, the latitudes of fome of the principal fixed ftars, particularly Palilicium, Sirius, and Arcturus, alter in time ; whence it may be argued, the reft likewife alter, though the variation may be lefs confpicuous in thefe, becaufe they are fuppofed at a greater diltance from us. See Stars.
Latitude, Difference of, is an arc of the meridian, or the leart diltance of the parallels of latitude of two places; and it is found when thefe have the fame name, by fubtracting the leffer latitude from the greater; and when they have contrary names, by adding them together.

Latitude, Parallax of. See Parallax.
Latitude, Refraction of. See Refraction.
LATITUDINARIAN, among Divines, denotes a perfon of moderation, with regard to religious opinions, who believes there is a latitude in the road to heaven, which may admit people of different perfuations. This name was given by way of diltinction to thofe excellent perfons in England, who, about the middle and towards the clofe of the 17 th century, endeavoured to allay the contelts that prevailed between the more violent Epifcopalians on the one hand, and the more rigid Prefyterians and Independents on the other, with refpect to the forms of church governmeat and public worhip, and alfo between the Arminians and Calvinilts, with refpect to certain religious tenets. Many of them were zealouny attached to the forms of ecclefiatizal government' and worhip that were eftablifhed in the church of England, and they recommended epifcopacy with all their eloquence; but they did not confider it as of divine inftitution, and abfolutely neceffary to the conflitution of a Chriftian church; and theretore they maintained that thofe who followed other forms of government and worhip were not, on that account,

Vol. XX.
to be excluded from their communion, or to forfeit the title of brethren. Others had no great liking for the liturgy or ceremonies, or, indecd, the government of this church, but yet, for the fake of peace and order, confurmed. As to the dotlrinal part of religion, they took the fyttem of the famous Epifcopius for their model, and, like him, reduced the fun* damental doctrines of Chriltianity, i.e. thofe doctrines, the belief of which is neceffary to falvation, 10 a few points. By this manner of procecding they fhewed that neith:r the Epifcopalians, who, gencrally fpeakng, cmbraced the fentiments of the Arminians, nor the Prefoyterians and Independents, who as generally adopted the docitrine of Calvin, lad any reafon to oppofe each other with fuch bitternefs and animofity, fince the fubjects of their debate were matters of indifference with relpect to falvation, and might be variouly explaised and underftood, without any prejudice to their eternal interefts.
The chicf leaders of thefe Latitudirarians were Hales and Chillingworth: to them may be added the refpectable names of More, Cudworth, Gale, Whitchcot, Wilkins, and Tillotfon. The firf fruits of their charitable zeal were the odious appellations of Atheilts, Deits, and Socinians, Liberally beltowed upou them by the Roman Catholics, and the more rigid of the Proteftant contending parties. However, they were afterwards raifed to the-firit dignities of the church, and defervedly held in general efleem. And at this time the church of England is chiefly governed by Latitudinarians of this kind; and the fpirit of moderation and mutual charity has generally prevailed, with that of liberal enquiry, among the various fects and denominations of Chriftians. Mofheim's Ecel. Hift, vol. iv. and Birch's Life of Tillctfon, P. 40\%. See Compremension.
LATIUM, in Ancient Geograpby, a confiderable divifion of Italy, which acquired importance from its having given name to the Latins, and from its having Rome for its capital. Some authors have thought that this was a denomination given to the whole of Italy, or at leaft to a more confiderable extent of territory, than that to which it was afterwards reftrained. Several of the ancients have fought the etymology of Latium, in the verb latere, to conceal, and they have imagined that this name was given to the country, becaufe Saturn retired hither in order to thelter himfelf from the fury of his children. M. Gébelin, in his Oriental Alle. gories, fuggelts, that the primitive lat tignifies to conceal, and that terra alfo alludes to the application of the foil, for the concealment of the feed that was fown in it. Hence, he fays, Latium might have fignified the country where feed was fown, in contradiftinction to that part which was mountainous and uncultivated. The ancients dittinguifhed Latium into ancient and modern, and under thete appellations it comprehended different territories. Ancient Latium extended from the Tiber to Circeii, and was eftimated at 50 miles in length. Its inhabitants, in fucceffion, were the Aborigenes, the Pelafgi, the Arcades, the Siculi, the Arunci, and the Rutili; and befides there, the Circeii, the Volfci, the Oici, and the Aufones; and by degrees the name Latium extended as far as the river Liris. At the firit, fays Strabo, the Latins had poffeffion of it, and were not fubject to the Romans; but when thefe had vanquilhed the Æqui, Volfci, and Hernici, as well as the Rutili, the Aborigenes, the Rocci, and the Argyruici, and alfo the Privenates; the whole country, thus fubdued, affumed the name of Latium ; and it afterwards extended to Campania, and the country of the Samnites. Among the original inhabitants we may reckon the Siculi; and it was afterwards occupied by various tribes, which migrated thither at different periods; being at this time an inconfiderable terri$\mathrm{Zz}_{2}$
tory.

## LA T

tory, alont the coant of the Tufcan fea, fouth of the Tiber. Whder the Latin kings, it extended fouthward to the Promontorium Circeum, as we have already fated, which was 50 miles beyond the Tiber. Under the condular governnont, the territories of the Requi, Volcci, and Hernici, were annexed to this province, and the river Liris (Garigliany) was held to be the fouthern boundary. At the commencement of the Chriftian cra, Sincuffa, now Sinope, and the circumjacent territory noted for its baths, were iscluded in Latum ; fo that, in its greatelt extent, it comprehended Campagna di Romagna, and a confiderable part of Torre di Lavora. The principal rivers in this province were the Torrer and Liris; which fce refpectavely. The chicf cities and towns were Rome, Olia, Laurentum, Lavinimu, Ardea, Tibur er T'ivoli, Tufenlum or Frefeati, Gahii, now extinct, between Rome and Pranefte, Pixnelle, Alla Longa or Albano, Aricia near Alba Longa, on the Appian way, \&ec. See Italiz.

LATMíOS, or Lataus, a mountain of Afia Minor, party in lonia and parthy in Caria.

LATMUS, orimally a village of Afia, in Cilicia, on the banks of a river of the fance name, which afterwards became an cpifcopal town of Ifauria. The river had its fource in mount Latmus, and clicharged itfelf into the Latmic gulf, near the town Hcraclea. The Latmic gulf was a culf of Ionia, which commenced between the mountains Latmus and Grius, and extended from thence towards the N. W., communicating with another gule at the mouth of the Meander -Alfo, a fmall ifland fituated to the S.E. of the Latmic gulf, n ar t ) and W.N.W. of Heraclea,

LATOAN, in Geograpby, a fmall ifland is the Eaft Indian fea, near the N. cuait of Burneo. N. lat. $7^{\circ}{ }^{16}$. E. long. $117^{\circ} 21^{\prime}$.

LA'TOMIA, Aatopix, derived from the Greek $\lambda x s$, fans, and $\tau \pi \mu \omega$, I cut, properly fignifies a quarry, or place where fones are dug. See Quarris.

Thefe were anciently ufed as gaols for criminals. Dionysits had a place of this kind dug in a rock rear Syracufe, where an infinite number of people were flut up. Cicero reproaches Verres with imprifoning Roman citizens in latonise ; fo that latomia became a general name for a prifon; to proners inclofed in then were called latomarii.

Latoma, in Ancicut Geography, the name of fix fmall inatuds in the Arabian gulf, according to Strabo.

LATONA, a town of Egypt, upon the Nile, which was the capital of a nome called the Nomos Latopolites. Ptolemy.

Latora, in $M I_{y}+$ bclogy, a geddefs of paganifm, whofe hitenry is very obfcure. Heliod makes her the daughter of Titan' Cuëus and Phobe, his fifter. The fable adds, that Apoilo and Diana were her'offgring by Jupiter, and that they advanced her to the rank of cel-ftial deities in fite of Juno. According to Herodotus, fhe wals an Egyptian dicity, the nurfe, and nut, as the Creeks reprefented her, the mother of Apollo and Diana, and was worlhipped at Buto, or Buthos, in Egypt. The inhabitants of Delos crected a temple for her, pretending that Neptune, with a blow of his trident, had made the iland of Delos to ri'e up from the bittom of the fea, to fecure to Latona, perfecuted by Juno, a place where the night, without molellation, bring forth her children: but that at Argos was the moft magnificent, and celcbrated for her ftatue, executed by Praxiteles. Latona, Venus, and Diana, were the three goddeffes moft in veneration aroug the Roman women.
LATOPOLIS, in Ancient Geograpby. See Esxen.
LATOPOLITES Nomos, a dullict of Egypt, the capital of which was dedicated to Latona, and fituated on
the left of the Nile. This nome is mentioned both by Strabo and Pliny.
Latorolitles Nomos, or Hcrmonthites Nomos, another diltriet of Egypt, the capital of which was cailed the town of "Latonum," according to Ptolemy.

LATORCZA, in Geography, a river of Hungary, which rifes near the Carpathian mometains, and runs into the Theyfs, near T'okay.
LATOUCHE's Island, an ifland in the North Pacific ocean, at the entrance of Prince William's found, 13 milcs long and three broad. N. lat. Go'. E. long. $212{ }^{2} 39^{\prime}$.

LATOVICI, in Ancient Gcography, a people of Upper Pannonia.

LATOUR, in Gegrraphy, a town of Hindooftan, in the circar of Aurungabad: 25 miles W. of Aurungabad. . LA'TOWIC, a town of the duchy of Warfaw; 18 mi'es E. of Czerfk.

LATRRIA, $A z \pi \tau_{\xi s \%}$, in Theolory, a religious worfhip, due only to God.
The Romanilts fay, "They honour God'with the worfhip of latria; and the faints with the worfhip of dulia;" but the terms, however diltinct, are ufually confounded.

The worthip of latria, befides its inner characters, has its external marks to diltinguinh it ; the principal whereof is facrifice, which cannot be offered to any other but God himfelf, as being a folemn acknowledgment, or recognition, of the fovereignty of God, and our dependence on him.
M. Dail'e feems to own, that fome of the fathers of the fourth centary aliowed the diftinction between latria and. dulia. See Adoration and Worship.

LATRIS, in Ancient Geograsply, a town of Germany, at the mouth of the Viftula. Pliny.

LATRONICA, in Geography, a town of Naples, in Bafilicata; 22 miles S.W. of 'T'urfi.
LATSCHACH, a town of the duchy of Carinthia; 14 miles S.W. of Clagenfurt.

Lat'lanzio, Gambara, in Biography, a painter of hiltory and portraits. He was the fon of a taylor at Cremona; but being more inclined to painting than the ufe of the needle, he fpent his youthful days in covering the walis and furniture of his father's houfe with drawings in charcoal, and thus drew upon himfelf the difpleafure of his parents; who evinced their diffatisfaction by the unequivocal te!? imony of the foourge.

Giulio Campo, an artift of fome celebrity, refiding at Cremona, happened one day to pafs by when the taylor was exerting his energies upon the back of his felf-willed fon Lattanzio; hearing the caufe, he took the boy home with him, and for dix: years affited and encouraged him in his purfuit of the art of painting. Such was the fuccefs accompanying this act of generofity, that according to Vafari, Gambara became the belt painter of his time in Brefcia, where he took up his refidence; and where many ingenious artilts practifed painting in conjunction or compctition with him.

His principal works are in frefco, and fome are fill to be feen at Brefcia, particularly the cloiter of Sanra Euphemia, wherein he painted a feries of fcriptural and evangelical fubjects. Venice, Parma, and Cremona all poffefs tellimonials of his fkill, which adorn their churches and many of their private houfes. His ftyle is very much like that of Pordenone, an attempt to unite the colour of the Vevetian with the drawing and defign of the Florentine fchool, but it is not fo powerful. He married a daughter of Romanino, but died at the early age of 32 , by a fall from a fcaffold while painting

Trinting in the church of St. Lorenzo in Brefcia, about the year 1570 . Ridulf. Vafari.

LATTIMO, in the Glafs Trade, a name for a fine milk. white glafs. There are feveral ways of mating it, but the belt of all is this: Take four hundred weight of cryltal frit, and fixty pounds of calcined tin, and two pounds and a half of prepared manganefe; mix thefe well with the frit, and fet them in a pot in a furnace to melt and refine. At the end of eighteen hours this will be puritied; then caft it into water, purify it again afterwards in the furnace, and make a proof of it. If it be too clear, add fifteen pounds more of calciued tin; mix it weil with the metal, and let it ftand one day to purify; it will then be of a whitenefs furpaffing even that of fuose, and is fit to work into veifels. Neri's Art. - of Glafs, p. ${ }^{38}$. See Glass.

LatTiN, or Litien, a name by which we ufed to call the plates of iron covered with tin, and now ufually called tin, of which our mugs, and fuch other things, are made. The principal part of the work is to prepare the leaves, beat out to a proper thimefs, fo as that thay fhall readily receive the tin ; for if there be but the fmallett particle of duft on them, or only the flightelt rult in any part, the tin will never fix there.

This fmoothing of the plates is effected by fteeping them in acid water, tili the furface is a little preyed upon by it, and then they are fcowered with fand, which makes them very fmooth and fine. By this means a woman cleans more plates in an hour, than the moft expert workman can do otherwife in many days. M. Roaumur, to whom the world owes the difcovery of this procefs, mentions feveral waters, any one of which will facceed, but the Germans themfelves ufe nothing but common water, made eager with rye. This they make a great fecret of, but the preparation is very ealy. After they have ground the rye grofsly, they leave it to ferment in common water for fome time; and they are thus fure of a fharp and eager mentruum, excellently fitted for their purpofe. With this hquor they fll certain troughs, or tuns, and into thefe they put feveral bundles of the plates of iron : and to make the liquor more eager, and to act the better on them, they keep it in Itoves, where it has little air, and is kept warm with fmall charcoal fires.

There are feveral other ways of making iron ruft, as keeping it in a moilt cellar, expofing it to the dew, fprinkling it with fimple water, or, which is thill better, with water in which fal ammoniac has been duffolved, feveral times a day: and in thofe countries where the pyrites is common, the vitriolic waters, which partake of it, will do it very well. This water may be prepared at little or no expence, only by heaping up large quantities of the pyrites, and letting it moulder in the air, then putting it into common water, and making a lixivium of it. Whichever method of rufting the plates be uied, it is always neceffary to foower them with fand as foon as it is done; and when they are thus cleaned, they muft be inmediately plunged into water, to prevent their rulting again, and they are to be left in this water till the intlant in which they are to be tinned, or, in the language of the workmen, blancked. The people employed in this part of the operation are called llanchers ; and the others, who afilit at the cleaning of the plates, the foalers. The blancher makes as great a fecret of his art, as the fcaler does of his; and it was with great difficulty that M. Reaumur obtained it. The manner of doing it is this:

They flux the tin ia a large iron crucible, which has the figure of an oblong pyramid with four faces, of which two oppofite ones are lefs than the two others. The crucible is beated only from below, its upper part being luted with the furnace ahl round. The crecible is always deeper than the
plate?, whicin are to b e timed, are long; there always prit them in downight, and the ten ought to fwim over them. To this purpole artituers of dherent trachs prepare platen of different fhapes, bit M. Resaumur thinhan them all (xceptionabic. But the Germans ufe mo tort of preazation of the iron, to make it rective the tim, rome than tios keeping it always theeped in water tiif the tame ; aly when the tin is molted in the crucible, they coner it with a layer of a fort of fuet, which is clually two meturn thick, and the plate mult pais through this itfure it con come to the melted tint. The firtt ute of this coverifis is to keep the tin from burning: as if aty part forould take tize, the fuet would foon moiften it, and reciuce it to its primitive ftaee again. The blanchers fay, this fuet is a compeurded matter. It is indecd of a black celour, but M. Reamur fuppofed that to be only an artifice to make i: a fores, and that it is only coloured with fro:, or the fmoke of a chimney; but he found it true fo far, that the conmen urpreyared fuet was not fufficient; for after feveral ateaspis. there was always fomething wanting to render the fuccels of the operation certain. The whole fecret of blanclans, therefore, was found to lie in the preparation of this fues; and this he at length difcovered to confit only in the firt frying and burning it. 'This limple operation not only gives it the colour, but puts it into a condition to give the iton a difpofition to be tinned, which it does furpriingly.

The melted tin mult alfo have a certain degree of heat, for if it is not hot enough, it will not thick to the iros ; and if it is too hot, it will cover it with too thin a coat, ard the plates will have fereral colours, as red, blue, and purple; and upon the whole will have a calt of yellow. To present this, by knowing when the fire has a proper degree of heat, they might try with fmall pieces of inon; but, in general, ufe teaches them to know the degree, and they put in the fron when the tin is at a difficrent thandard of heat, zecording as they would give it a thicker or thinner coat. Sometimes alfo they give the plates a double layer, as they would have them very thickly covered. This they do by dipping them into the tin, when very hot, the firlt time, and when lefs hot, the fecond. The tin, which is to give the fecond coat, muft be frefh covered with fuet, and that with the cummon fuet, not the prepared. Philor. Tranf. No 4 c 6 , p. 634. See Tix.

LATTYPOUR, in Geography, a town of Bengal; 20 miles N . of Kithenagur.

LATUS, in Ichibyolog', the name of a firh of the coracinus, or umbra kind, caught in the Nile, and in the Adriatic and Mediterranean feas. It much refembles the common coracinus, but is larger, and has not the beard which hangs from the chin in that fpecies; and its body is fomewbat rounder. It is efteemed a very delicate dilh. Rondelet. de Pifc. P. I3o.

Latus, in Anatomy, a name given by many authors to one of the mufcles of the anus, now generaily called the levator ani.

Lates Recum, in Conics, the fame with parameter. See Cosic Sections, and Parameter.

Latus Tranferffiun of the hyperbola, is a right line, intercepted between the vertices of the two oppolite fections; or that part of the common axis which is between the vertices of the upper and lower cone. See Hyremeola.

LATZKI, in Geography, a town of Aultrian Poland, in Galicia; 80 miles IW.S.W. of Lembery.

LAVA. This word, in its ftries fenfe, denotes ordy the fufed fony fubfance which iffues from volcanoes during the time of their activity, and according to the degree of fluidity it has acquired, and the quantity in which it is dif-
charged, either colle?ts mear the crater in amorphous groups, or extends its courle to various diffances. But much greater latitude (as we fhall fee hereafter) has been given to the term laza by feveral authors, for not only other volcanic cjections, to which the above deffintion cannot be applied, have been deferibed under that name, but eren fuch unaltered rocks as will be allowed by unbiaffed obfersers to have fearcely any one character in common with real woleanic productions.

Werner has divided lava into two varietics only; wiz. 1. Scorions or flagey lava (Schlackige liva), and 2. Foamy lava (Schaumige lxsi.z.)

The colour of the forious lava is greyifh-black, which paffes into fmoke.grey, yellowifh-grey, reddih-grey; green-in-grey, and through feveral fhades of this into greenifhblack. Decompofition, fulphuric and other rapours, frequently modify the principal colours, and often produce the higher tints of yellow.

It occurs more or lefs knotty and veficular, with velicles of different fize, fometimes glazed over, and empty. Internal lutte between glimmering and gliftening, feldom fhining. Fracture imperfeetly conchoidal, alfo line-grained, uneven. Is commonly opaque, fometimes faintly tranflucent on the edges. It is femi-hard, brittle, eatily frangible, and not particularly heary.

The colour of the foamy lava is generally dark greenihgrey, approaching to greenih-black. Its veficular ftructure, brittlenefs, and lightnefs are indicated by its name.

This the Wernerian fchool carefully dittinguifn from pumice; which fee.

Lava is often porphyritic, but the cryftals of hornblende, augite, \&c. are, according to Werner, wrapped up, not imbedded, in its bafis; and when they occur in the hollows or veficles of lava, are not in the form of drufes, but generally part of the cryitals projects into the cavity, while the other is included in the lava.

Though the Neptunits profefs to find characters fufficiently obvious to diftinguinh lava from unaltered rocks that might be miftaken for it, fuch as the rough afpect which it prefents both internally and externally, \& c.; yet their decifion in dubious cafes is known to be chiefly regulated by the mode of occurrence of the rock; and fubftances, that prefent regular ftrata, not feldom of very confiderable extent and comparative thicknefs, and frequently conformable to all the finuofities of the older formations, can never bc expected to find a place in their catalogue of volcanic productions.

The queftion, whether lava ever occurs in a compact ftate, involves the various controverfies with regard to the origin of bafalt, which will be treated of at large in its proper place. But as it is neceffary in this article briefly to advert to the reafons that have induced Werner, and other Nep:unifts, to exclude compact lava from their fyftems, we fhall extract the excellent obfervations given on this fubject by Mr. Kirwan, in the fecond appendix to his Mineralogy.
" By compact lava," fays this diftinguifhed mineralogit, so volcatic writers denote an earthy fubitance, which, after having been fufed, but not vitrified, becomes, on ceoling, compact, clole, a d folid. Whether this degree of folidity is fuch as totally to exclude that evidently porous and cavernous ftructure, which cellular lava prefents, is not perfettly agreed upon.
"Thofe who are guided by obfervation on modern and undifputed volcanic torrents, allow that no lava, abfolutely compact and deftitute of pores, in an extent of more than
a few fquare inches, is ever found. Thus Mr. Bergman de. fines compact lavas to be "thofe which, though not abfolutely deltiture of cavities, yet contain fo few, that they may be cut into flabs with an almolt entire furface, and polithed like marble." (3 Bergm. p. 201.) To this definition, Mr. Dolomicu, in his notes on Bergman's Differtation, makes no objection; from which we may conclude, that in a fmallexteint, fuch as that of cominon marble ीabs, they never exhibit an uninterrupted furface. This laft mentioned philofopher, indeed, having unfortunately wifhed to comprehend, in his definition of compact lava, Itony mafles, not found in modern and undifputed beds of lava, but in $f_{\text {uppofed ancient }}$ currents, found himelf much embarraffed: There is, fays he, fuch uncertainty in the characters of compact lava, that, independently of local circumflances, the moft experienced eye may be deceived. (Ifles Ponces, p. 171.) Yet thefe circumftances, not properly attended to, are thofe which have feduced him into the molt palpable miftakes.
"Gioeni, though in many inftances mifled by Dolomieu, yet acknowledges that lava, fo compact as to be totally deftitute of pores, is not found. (Lithol, Vefuv. p. 85). Padre Torre, who, independently of any fyltem, has candidly and impartially examined the products of Vefuvius, exprefsly denies the exiltence of lava deftitute of pores, none other but the porous being found in currents of modern date. Galeani, in his catalogue of the lavas of Vefuvius, drawn up in 1772, hardly mentions any compact lavas. Gioeni, in his catalogue, entirely omits this diftinetion; and Mr. Dolomieu acknowledges that not a fingle fpecimen of compact lava is to be found in the cabinet of prince Bifcari.
"Thofe, on the other hand, who, guided by fyftem, beftow the name of lava on flony maffes, which they fuppofe to have anciently flowed, either from real fill fubfilting, or imaginary ancient extinct, volcanoes, find compaa lava entirely deftitute of pores, very farce indeed in the fuppofed currents from modern, but in great plenty in thofe which they afcribe to their fictitious volcanoes now extinct, as well as in the very: bowels of thofe volcanoes.
"Gioeni, after telling us, from Dolomieu, that compact lava occupies the centre of the beds of lava, and porous lava the upper part, acknowledges that this gradation feldom takes place ; 'ferw, however, fays he, are the vifible currents. of lava on Vefuvius, in which we meet this gradation.' It feems, he hould rather have faid, none; for, fome lines after, he tells us, that modern volcanoes have loft the power of producing any. (Lith. Vefuvo xlvii.) The detached mafles that pafs for compact lava, he acknowledges to have been ejected in their folid form by the explofive power of the volcano, and confequently are not real lavas, but rather natural ftones, torn from the fides of the mountain. (Lith. Vefuv. li.). Mr. Dolomicu tells us, that compact lavas are flones which, after having been melted, re-affume their natural ftate and appearance without any change in their external: or internal properties, or fcarce any change; and that fome are perfectly compact (that is, deltitute of pores), namely, thofe that are buried under, not other lavas, but under an entire and immenfe volcano (De Prod. Volcan. p. 162. Ponces. 170. 179.) ; he, therefore, gives up the idea of finding thefe not only in the beds of modern, but even in thofe of extinct ancient volcanoes. Hence he tells us, that they are much more common in extinct volcanoes; and that in $\ldots$ tna they do not con!titute the ${ }^{5}{ }^{2}$-dth part of the whole; whereas in Vivarais and Alvergne they form whole mountains. Now molt of thefe ancient volcanoes of the Vivarais appear to me and many others, to be mere creatures of imagination, and confequently, until the fubitances they contain are proved to have bren io fufiun, no definition, grounded on the appear-

## L $\Lambda$ V $\Lambda$.

ances of thefe fubfances, can pafs for that of real compact lava.
" In beds, however, of real undifputed lava, fome parts are found, that, having been preffed by the fuperaincumbent weight, are more compact than common porous lava; and thele, comparatively to the furmer, may be called compact ; but fcarcely more than a few fquare inches of their fubitance is deflitute of vifible pores.
"Their colour is brown, yellowih, reddifh brown, bluifh, or black, more rarely grey. Their luftre O.I. Tranfparency O.I. Their fracture earthy, or fine fplintery, more rarely foliated, and prefents fmall internal pores, if of fufficient lize, in fome part of the fubltance. Hardnefs from 7 to 9. Specific gravity 2.75 to 2.88 .
"Much circumfpection is requifite in framing a defeription of compact lava, from a view of the fpecimens brought to us from volcanic countries, as they are all collected by perfons, who take indifcriminately from real, and from fuppofed, volcanic currents, even from mountains in which no volcano ever exilted.
"To form a true idea of thefe lavas we fhould attend to the following circumiftances; 1. That the heat of molt volcanoes (I exclude thofe that for the moft part produce only vitrified fubltances) feldom reaches $100^{\prime}$ of WVedgwood; the proof of which is, that almolt all reallavas, whether cellular or compact, are vitrifiable at that degree. Since, therefore, they were not vitrified in the volcano, it is plain, that in it they did not attain that degree; 90 or 95 degrees may then be affumed as the average heat of moll volcanoes. 2. In this heat many ttones of the argillaceous genus, as trapps, hornblendes, and argillites, undergo a clange; for they alter their colour, become porous, alfume a porcelain grain, and confequently begin to vitrify, as I have found on repeated trials; but they never flow in this heat, nor confequently form a lava; but bitumen will flow in this heat, and even in one much inferior, and be decompofed. If, therefore, the argillaceous ftones be mixed with and drenched in bitumen, they will be foftened by it, and flow with it; and where the air, erupting both from them and the decompofing bitumen has molt liberty to efcape, it will tumify, burit through the liquid mafs, and form cellular lava; but, where it is more comprefled, lefs of it will be difengaged, and the lava will be compact, and refemble, in fome degree, the original itone of which it is formed. 3. Stones of the filiceous genus undergo no change in this heat, not even fhorls or feldipar; and hence, though immerfed in the fiery torrent, they cannot with propriety be called lavas, as they are not even foftened by the mixture of bitumen, as flones of the argillaceous genus are.
"Between filiceous and argiliaceous ftones there are many gradations and various mixtures, which mult occafion correfponding varieties in the effects whicle heat and various other circumftances may produce. It is fufficient here to eftablifh the principles on which moft of them may be explained. Compact lavas abound in heterogeneous fubitances which either have not been fufed, or only partially fufed or fcorched, or decompofed by heat, as feldfpar, fhorls, garnets, zeolizes, \&ce. Every volcano has fome that are peculiar to it. Thus the lavas of Vefuvius abound in that called white garnet, and which I call Vefuvian, thofe of Etna abound is feldípar, \&c.
"Hence we mult exclude from the rank of lavas all ftones which do not appear, either from their external characters or local circumitances, ever to have been foftened by heat; and confequently, all thofe detached pieces which are ejected 2t the beginning of an eruption without fufion, and many others which volcanic collectore enumerate among compact
lavas, merely from having found them in the vicinity of volcanoes. Thus Mr. Dolomieus (Lipari, p. 85.) reckons among volcanic Itones one, in the interior of which he diffinctly perceived a leaf of fea-weed. Few indeed are the flones contained in his catalogue which can be deemed really volcanic.
"All real lavas, except thofe of the vitreous kind, affeet the magnetic needle, unlefs the iron they contain be much oxygenated, as it often is in thofe of a red colour; but even thele are frequently maguctic by reafon of the fhoris embodied in them.
"The component ingredients of lavas are various, according to the nature of the original foones, and the accidents they meet with in their liquified flate. Mr. Dolomieu found them to contain from 40 to 60 per ct. of filex, from 16 to 3 of magnelia, from 5 to I of calx, and from 2 to 25 of iron." Ponces, p. 184.

Though the above, and feveral other remarks of the fame tendency, which will be noticed under the articles Traprformation and Volcano, have much contributed to invalidate the teftimony of thofe who contend for the exiftence of compact lava, and the igneous origin of many other fubflances apparently Neptunian, yet volcanills continue to claffify over and over again thofe fubftances which they confider as belonging to their domain; and it is neceffary to be acquainted as well with their mode of viewing the fubject as with that of the oppofite party. . It is with this view that we give the following abitract of the mof complete arrangement of, fo called, volcanic rocks hitherto offered to the world, namely, that of the celebrated Faujas de Saint-Fond which occupies nearly a whole volume of his "Effai de Géologie," publifhed at Paris in 1809. It is almolt fuperfluous to obferve that this arrangement fhould be confulted cum grano falis; as of csurfe almoft all the rocks belonging to the fletz-trapp formation of Werner are introduced into it, as well as other fubftances, which, although ejected, have probably not undergone any alteration by the agency of the fire, and are therefore to be confidered as intruders into an arrangement of lavas.

Class I. Lavas confidered auith regard to their form and external modifications.
Div. 1. Black, bomogeneous, mafive, compaa lava1. Fine-grained; from Otaheite, Staffa, the neighbourhood of Rome, Darmitadt, the Euganean mountains, Auwergne, \&c." 2. Var. of a coarfe grain, from Meiffner, the vicinity of Gottingen, Heffe Caffel, Rochemaure in Vivarais, \&c: 3. Var. of a fcaly texture; from Stolpe in Meiffen, the ifle of Bourbon, Mont Meffin in Vivarais, \&c.
Div. 2. Homogeneous compaz lava in prisms, zuith from three to nine fides (the latter rare).-1. Prifms without joints; Staffa, Expailly in Vivarais. 2. Var. with prifms tranfo verfely divided or jointed; at the Pont de la Beaume in Vi. varais, \&c. 3.Var. with jointed prifms, joints concave at one fide and convex at the other ; Giant's Caufeway, Ireland, left bank of the Volane, i\&c. 4. Var. with prifms laterally compreffed; Rochemaure in Vivarais. 5. Var. with arched prifms; Staffa, inle of Bourbon.
Div. 3. Prijmatic lava, zuitl edges and planes so regular as to appear the rejult of cry/tallization.- In pyramids of four fides, flattened, \&cc.; in Auvergne, \&c.
Div. 4. Tabular lava.- r . Var. in thick tables: from Monts Meffin, Coneron, \&c. in Vivarais. 2. Var. in thin tables; Rochemaure in Vivarais, ifle of France, ifle of Bourbon.
Div. 5. Globular-lava.-1. Vir. in folid balls; from Teneriffe. 2. Far. in hollow balls; ifle of Bourbon. 3. Var. in balls compofed of concentric layers; from Vefuvius,

## I. A V A.

Catel-Gombeto near Vicenza, Montechio Precalcino, \&c. Thefe levas are the refult of a particular kind of decompofition, which takes place in extenfive beds of compact bafaltic lavas, in which they appear as if implanted. Some grobular lavas owe their oricin to the joints of bafaltic pillars, whofe angles and edges decay, while the nuclus remains found, and appears to ifliec from out the prifm.
Div. 6. Tear-flaped liva (lares en larmes).-Small oblony mafles, imitating more or lefs the form of tears, 'They occur from the fize of a hazk-nut to that of an egg, often enclofing within their centre the fragment of a foreign body, fuch as granite, olivine, \&cc. Found on Vefuvius, in the crater of Mout-Bridl, in Vivarais, Auvergne, Eic.

Class II. Peroas lava.
Div. 1. Heary porous lava, - I. For, with large oblong pores; from Vefurus, Etna, Hecha, Vivarais, Auvergne, \&c. 2. I'ar. with large irregukar pores; in all the above places. 3. Var. with pores lefs larec, and generally round; in a partly purons, partly compact lava; from the Meifner in Heflia. 4. Var. with fmall, round, and oblong pores; in a lava remarkable on account of its hollows or depreffions, which exhibit a regular ftrusturs, and, on being broken, convey the idea of paralldograms of different lizes, arranged fide by fide, as well externally as on the internal furface of the lava: fome of thefe parallelograms are more than an inch long, and the fourth part of an inch deep. The origin of this lava, which occurs in the ifle of Buurbon, is thus explained by M. Hubert:- A sreat eruption of the volcano of that illand gave origin to a valt itream of lava, which in its progrefs came in contact with a plantation of palm trees. The trees whe immediatcly fet on fire; but being foon covered by the lava, combultion ceafed, and the wood became corverted into charcoal. Incandefcence long time continued, afterwards produced in the fibrous wood, thus carbonized, contractions and clefts of a certain regularity. The lava next entering the clefts formed $b_{y}$ contraction, and moulding itfelf over the nucleus of the coal, produced the hollows obfervable, as often as the coal is purpofety detached, or delfroyed by fome accidental caufe. 5. Var. of prifinatic tringular form, with oblong and irregular pores; from the neighbourhood of Rochefative, in Vivarais.
Div. 2. Liskt porous lava.-1. With round pores; from Vivarais, Auvergne, ife of Bourbon, Tunis, \&tco 1) esfontaines has gathered at 'Tunis fpecimens of fuch a lava, which the natives employ in the preparation of their woollen thuffs, in preference to the fullers' thille ured in other countrie:. 2. Var. with oblong pores; from Vefivius, Etna, Hecla, from Vivarais, Auvergne, \&c. 3. Var. witls irrefular curved or twited porss; from Velinvins, the ine of $330 u r b o n$, Teneriffe, Stromboli, Vulcano, Vivarais, ice. 4. Var. with decuffated pores; from the iffe of Bourbin, Vefuvius, \&e. 5. Vor. with freaked pres; from Vefuvius, Etna, ine of Bourbon, and Mount Hecla.

The light Atriated lavas, appearing in the thape of cables, ribbands, \&c. aifo belong to this clafs. In general, the porous lavas are nothing but the refult of the more or lefs active or continued develcpement of gafes produced by the peculiar rature of the lavas, and by the more or lefs violent action of fubterraneous fire.

## Class III. Scorified lavas.

A particular modification of porous lavas, produced when, under certain circumifances, the matter of which thefe confift undergoes the firlt degrees of vitrification, and becomes covered with a kind of flining varnih, which dittinguilhes them from ordinary porous lavas. Thefe fcorified lavas are found, 1 , twilted; 2 , cable-fhaped; 3 , ribband-flaped; 4 , in bunches, with round or oblong grains; 5, flalactitical,
thort elongated knobs, feparated or united. An thefe varicties of forms are found at Vcfuvius, Etna, Hecla, in Teneriffe, the ifle of llourbon, \&c.

Class IV. Lavas confulered wuith regard to their component parts, or to the differcent rocks from whichb they originated.
Div. 1. Gruniooid lava.-Thefe lavas, which, according to Faujas.' fyltem, mult have been elaborated at a great depth in the bowels of the earth, owe their origin to rocks analogons to our granite, except that quartz does not enter into their compolition; the fulftance formerly contidered by Taujas and others as quartz, having proved to be feldfpar.
A. Coarfegraised graniovid lava,-1. With bafe of a whitifh-grey colour, compofed of irregular whitifh grains of feldfpar, of a quartzy appearance, but eafily fufed before the blowpipe : a great number of minute, thin, and hexagor al lamine of black mica, diffeminated among the grains of feldfpar, and large cryitals of this fubitance, of a pearly white and parallelopipedic form, are imbedded in this quartzkefs granite. The grains of feldfpar have fuffered a littic by the fire, and the crytals are ilighty calcined. Some of them are even diffolved into capillary feparations, and pafs into a fubltance like pumice. This lava, which is ftrongly attracted by the magnet, is found at Mont-d'Or; but a fimilar variety occurs in the inles of Ponza and Lipari ; at Santa Fiora, in Tulcany, \&ic. 2. V'ar. with bafe of whitifh granular feldfpar, fpotted with dots of black mica, and hornblende of the fame colour, and in fmall cryltals with dull furface; from the Euganean hills, \&c. 3. Var. with large lamime of a fhiving bronze culoured mica, fome of more than an inch in diameter, in a rough uneven purplifh black mafs, which is melted without being glafly, and is pervaded by large pores. It is flightly attracted by the magnet. Found near Andernach. 4. Var. with bafe of reddifh granular. feldipar treaked like pumice, and of white nightly cal-
 mica, minute reddrfh garnets, which are partly fufed, and a black glafy fubltance appearing to be hormblende: it is faintly attracted by the magnet. From Santa Fiora, in Tufcany. 5. Var. with bafe of white feldrpar, in irregular rather fcaly grains, with a great quantity of needies of black hornblende, and altered garne's of a purplifin bue. Very obecient to the magnet. From Tenemfie. 6. Var of a white colour inclining to grey, compofed of a multtude of very fmall and clole grains of white feldfpar ; and of much larger grains of fhining iculy fuldfpar, wich rather pearly luftre, fome of which grains fhow a tendency to cryftllizition. Blackih, dull dots, being common hornblende altered by the iire, are diffeminated in the feldifar. Faugas mentions a fipcimen of this variety, from the Cantal, which is traverfed by a bar of black and white granite, formed of fmall grains of very pure fcldfpar, and of fmall grains of black hormblende, unaltercd by the action of the fire. 7. IFar. with blueifh-black bafe, having timall brilliant points proceecing from the fealy particles of a white llony fubltan:e, with dull fracture ; purplih red, femi-tranlparent garnets, partly flawed, partly fufed, are indiftincily imbedded both in the black and white fubftances. The former of thefe, which is compact, and fufes bifore the blowpipe into a black glafs, has all the characiers of hornblende; the latter is compaet feldfar. From the Cape de Gatte, in Spain.
B. Fine-grained granitoid lava- - 8. Var. furmed by a mixture of fmall, irregular, cloie grains of hornblende, and fmall grains and fcales of white, rather pearly fcldipar. The hornblende being predominant in this mals, it exhibits a black furface ou being broken, or cut by a faw, in which cafe it re. fembles bafalt; but when polifed, fmail white dots and lines appear, which, though delicate, are flith fufficiently vifible on
the black ground of the mafs; found on the fummit of mount Mezin, where, by the action of the atmof phere, it undergoes a ftriking alteration ; for while the particles of feldfpar at the furface become corroded and difappear, the hornblende remains unaltered and freth, projecting over the relt as black granular particles. Lavas fimilar to this, fome of them prifmatic, Mr. Fayjas pretends to have feen in the neighbourhood of Caffel, and near Gottingon. 9. Var. compofed of white feddfpar in fnall grains, rather mealy at the furface, and of a black fubftance diffeminated as dots in the mafs: the latter appears to be altered hornblende. In this mixture are alfo imbedded large white fellfpar cryftals with pearly lultre. Occurs on the right bank of the Rhine, at the foot of the Seven Moumtans, nearly oppofite Coderberg. 1o. V'or. with white grains of felsfpar, harder, frefher, and of clofer texture than thofe of the preceding variety, mixed with black horabiende, difpofed in dots, lineaments, and even as fmall prifinatic crytals, more abundant, and lefs altered, than the hornblende of Nu.9. Alfo garnct cryttals are differminated in it, but cannot be feen without the aliftance of a high magnifier. This variety is attrated by the magnet. It takes a good polifh, and is ufed for building. It is, together with the preceding, found at the foot of the Seven Mountains, where it is quarried. Large feldfpar cryitals have not been found in it. 11 . Var. compofed of fmall irregular white cryftals, difpofed in diitinct lines appearing fcaly, flining, and as rather calcined when viewed through a lens: their length is about $\frac{1}{\Gamma}$ th, their width $\frac{1}{6}$ th of an inch: they are interfected by other prifmatic indeterminable cryftals of the fame dimenfions, of an intenfe black colour, vitreous, almoft metallic external luftre, but rather dull on the furface of fracture. Alfo particles of iron mica, (for cligitte of Haüy, and of magnetic ircn-Itone, are found in this mafs. Faujas has analyzed thefe two ores of iron; according to him they are combined with titanium, and the white cryltals belong to the fpecies of the latter, called Sphene or Titane filiceo-calcaire. This variety was found, in infulated blocks, near the top of the Meifner, in Heflia. 12. Var. differing from the preceding only by the fer oligife it contains being in large laminx, marked with lines, the general difpofition of which produces frall hexahedral laminx. The fphene, which forms the bafe of this mafs, is barder, white, inclining to yellowifh; it confills of cryftalline tranflucid particles; the magnetic iron interfects the fphene in all directions, while the iron-mica is only diffeminated here and there; both thefe iron ores are, like the preceding, combined with titanium. This variety is found near the extinct volcano of Beaulieu, in the ci-devant Provence. Mr. Faujas rema:ks, that no fimilar rock is known to occur, that may be confidered as the original of this, and the preceding volcanic fubitances. He denominates them granitic, becaufe they have much the appearauce of fuch a compound.
C. Scbiffofe granitoid lava.-13. Var. compofed of minute, reddith-brown grains of feldipar, much larger, angular grains of white feldfpar, and a great quantity of frall fix-fided laminx of frining mica, diffofed in a fimilat manner as in gueifs. The white feldfpar is eafily feparated into laminm in the direction of parallel lines obfervable on it, and which are produced by the action of the fire. Sometimes fome duts of horablende are feen in the mafs; but they are of rare occu:rence. 'This is found in Lipari under the pumice defcribed by Dolomieu. 14. Var. with yeilowifh-grey, granular, dull feldfoar, intermixed with white vitreous grains of feldfpar, and much black hornblende in fmall, flender cryitais, difpofed in horizontal lines, reprefenting thin layers, and giving this fubftance a fufle appearance. From Vulcano.

Clase V. Pomplyrcillawa.
Faujas' vulcanic porphyries are compofed of a fufible pafte or bafe, in which more or lefs regular cryttals of feldipar are imbedded, often accompanisd by grans of quartz; hornblende, augite, \&cc. The bafe itfelf he confiders analogous to the " trapps of the Swedes." He fubdivides them as follows.
A. Porphyroid lava quits feldfpar ceryfals -r. Var. with black, hard, and heavs, though rather porous, bafe, and with white feldfpar crythals of loofe texture. Strongly attracted by the magnet. From mount Etna. 2. Var. with more compact bafe, of a decp violet brown colour, with a great quantity of fmall greyim-white, rhomboidal, and parallelopipedic cryftals, and alfo grains of feldipar. It is sery magnetic, and takes a good polinh. Found by Dolomieu in the Ina des Salenes, near the village Amalfa, where, according to this geologit, it appears in the form of iteps of flairs. Faujas adds that a fimilar rock is found in Auvergre, in thin tahles, which are ufed in fome villages for roafing. 3. Var. with purplin brown bafe, including white irregular teldfpar cryftals, without lufter. From Trizac, in the canton of Mauriac, Auvergne. 4. Var. with rather purplifh bafe, abounding with more or lefs regular feldfpar ci yitals of a white celour. Though rather decompofed, it affects the magnetic needle. From Marriac and fome other parts of Auvergne.
B. Porkbyroid lava suith follipar and miac.-5. Var. with rather purpling grey bale, very white irregu'ar fectfpar cryitals, and frmall fometimes fix-fided lamine of an intenfely black mica. It fometimes contains fimall cryltals of filiceo-calcareous titanium. From Leorens, part of the Cantal nountains. The bafe of this has quite a compact fellopar appearance. (6. Vrar. with grey bafe, includins white feld$f_{p a r} \mathrm{crytal}$ and and black mica, but lefs abundant than in the preceding. From Moint d'Or; occurs allo in the ifes of Ponza and Lipari, \&c.
C. Porpbyroid lava suith feldfpar and pyroxene.-7. Tar. of a deep grey bafe, with dots, lineaments and cry fals of white feldipar and black pyroxene, in fmall crytais. Sufceptibe of a good polih. From the extinct volcanoes of Campania, thie neighbourhood of Rome, Santa Fiora, \&c.

1. Porplyrois lava with cryaghls of llack pyroxene and fmall grains of green fyrowne--8. Var. with deep grey, containing a great number of cryitals of black pyroxene, and irregular dots of greenith pyrovene. From Chimborazo, where it was found by Humboldt at the leight of $18+0$ toifes. Faujas fo completely milkakes Humboldt, that but imarines the fratum of this fubfance has $18 A_{7}$ toifes in thickuefs! The fame is found near Puzzuoli; and in the ancient lavas of Vcfuvins. 9. Var. with the fame bafe as the preceling, and, like it, fufceptible of taking a good polifh, with engular grains, needius, and regular cryitals of green pyroxene. Found among the ancient lavas of Vefuvius.
E. Parplayroid lava avills bornblende and feldfper. 10. Var. with purplifh bafe, with a profution of linearnents and more or lefs regular cryltals of black homblende, irreqular grains of white feldfpar, fone of whinch have penetrated into the horablende cryftal. Found at Santa Fiora in Tufcany.
F. Porphyrcid lara witb bornlende only,-11. Var. of a blackilh-grey colour, with large cryttals of very black and fhising hornblende. From Mas de Puilfanton, near Chaunerac, in Vivarais. 12. Var. of deep reddifh-brown colour, with a profufion of brilliant needles and cryflals of hornilende. From the Peak of Tenerife.
G. Porghyroid lava witb bornblende and olivine - I 3. Var. in, which the horubiendr, in irregular fragments, conititates
more than double the weight of the mafs, in which fome pores are obfervable. The grains of olivine which it includes are iridefent. From the Peak of Teneriffe.
H. Porphyroid lava with lcuite cryfalso-14. Var. with opaque white leucites, with rather pearly luftre, the largeft of which have from three to five lines in diameter; they exhibit, when pieces of the lava are cut and polifhed, mis nute rents. The bafe in which they are imbedded is black, compact, hard, very obedient to the magnet, fufible before the blowpipe into a black, opaque glars; it takes a fine polifh. From Capo di Bove, Caprarola, and the neighbourhood of Naples. 15. Var. with large lencites of a dull white colour, fome of them tranfparent, lamellar, and here and there fufed and vitrified. The enveloping lava is of a greyinh-black colour; it is dry, rough to the feel, full of irregular pores, and attracted by the magnet. From the ancient lavas of Vefuvius. 16. Var. with white, opaque, dull crytals, which, though they are fo friable as to be eafily reduced to powder by the preffure of the nail, have -ftill preferved their original form ; they are large and clofely grouped together. The lava which includes them is of a dull black colour, inclining to grey; it has loft part of its hardnefs, but till affects the magnet. In the midft of thefe decompofed cryitals are feen black lineaments and grains of a fubftance which appears to be that of the lava itfelf, and which was perhaps forcibly introduced into the body of the cryflals, through the rents that were produced when the mafs was ftill in a fluid Itate. Found in abuhdance in the vicinity of Viterbo. 17. Var. with white opaque leucites, having fome black points in their centre, and with irregular cryftals of black pyroxene difeminated in the lava. It is black, hard, fufceptible of a good polifh, attracted by the magnet, and fufible into a black brilliant glafs. Found in large maffes, and fometimes in prifms, at Bolfena. A fimilar variety occurs at Civita-Caltellana, and another at Aquapendente, which latter, however, includes pyroxenes of a yellowifh-green colour. IS. Var. with tranfparent, hard, leucite cryttals, of a yellowifh-white colour, accompanied with black hornblende. The including lava is black, compact, hard, and attracted by the magnet. Found at Borghetto, Bolfena, Aquapendente, and Albano. 19. Var. with very fimall white opaque leucite cryftals, clofely grouped togeth $r$, and accompanied by much larger, irregular cryttals of black hornblende; in a black, hard, compact and very magnetic lava, from Tivoli and Aquapendente. 20. Var. with almoft microfcopic white, tranflucid leucite cryitals, fo clofely grouped together as to appear to be in contact with each other, intermixed with irregular black hornblende cryftals. Found abundantly at Bolfena, in the neighbourhood of Civita-Caflellana and of Viterbo. 21.Var. with very fmall, pellucid, white, leucite cryfals, and irregular hornblende cryitals, of a greenith colour. In a purplifh, not very hard, lava, the iron of which has acquired a degree of oxydation, whence it fhews no effect on the maornetic needle. From Viterbo. 22. Var. with large, white, -pellucid leucite cryftals, which are generally of a fcaly nature and full of minute flaws, and fometimes with fmall lineaments of a very beautiful ky -blue colour, of a cryftalline appearance. 'This fubitance, comparable to blue fapphire, or, nore aptly, to lazulite, appears to be of contemporary formation with the rel. The fame fubftance in minute particles is difcrimiuated alfo in the patte of the lava, which is compact and of a blackifh-grey colour. Befides thefe, alfo black fhining dots are obfervable in this lava; they have the appearance of having been fufed, and may perhaps be grains of pyroxene, or biack garnets. Some grains of arfenical pyrites are likewife obfervable in it. From Albano. Some-
times the leucite cryflals, in the lavas of this divifion, are accompanied by fonse mica in fmall fcales; and in the neighbourhood of Rome large nodules are found, fometimes of the thicknefs of a man's fift, and entirely compored of black cryitallized mica and leucite; the latter are clofly cnveloped by the former. and both appear to have acquired their cryflalline form at the fane period. This is not confidered by Faujas as a true volcanic fubltance.

Ciass VI. Variolitic lavas.
The palte is the fame as that of the porphyritic lavas, but inftead of cryitals, it includes globules of feldfpar.

1. Var. with pafte of a greenifh-grey colour, with numerous blackifh.grey globules, of the fize of a pea, and of a finer and harder texture than the bafe; both of them fufible. When the pafte is decompofed by the action of the atmofphere, the round fpots exlibit themfelves as projecting globules. From Teneriffe. 2. Var. with grey patte, and very fmall round fpots of a darker grey colour. This variety, which attracts the magnet, is, like the preceding, compact, and takes a fine polifh. It has a tendency to feparate into thin laminæ when ftruck with a hammer. From Vedrine, in Auvergne. 3. Var. with grey palte, inclining to greenifh; fpots like thofe of No. 1, but four times fmaller. Is ftrongly attracted by the magnet. From Pui en Velai. 4. Var. with white orbicular fpets on a grey ground ; attracted by the magnet. From Pas-de-Compain, Auvergne. 5. Var. like No. 4, but with much fmaller fpots, grouped clofer together, and lefs regularly orbicular. From PuyCreux, Auvergne. 6. Var. of a blueifh colour, with very fmall pores, and numerous white orbicular fpots of about two lines in diameter. From the crater of Mon-Brâl, in Vivarais, where it often occurs in large irregular balls, which feparate into concentric layers when ftruck with a hammer.

Crass VII. Feldfpar lavas; or lavas zuithb bafe of comipaa feldfpar.

Faujas remarks, after Dolomieu, that there are fometimes in the fame lava two different kiads of feldfpar, one of which is compact and fufible, and ferves as bafe to the other, which is more or lefs regularly cryftallized and refractory, fo that the bafe may have been ir complete fufion, while the crytals remained in their original ftate.

1. Var. Feldfpar lava of a black colour, opaque, of a very five grain and conchoidal fracture; it fufes into a white tranflucid glafs, and is ftrongly att racted by the magnet. From Catajo in the Euganean mountains, and from Vulcano. 2. Var. of a light grey colour, inclining to flef red, of a fine grain, trannucid at the edges; fufible before the blowpipe, and faintly attracted by the magnet. From one of the Ponza ifles. 3. Var. of a white colour, heavy, partly vitrified. From the Euganean mountains. 4. Var. of the fame colour, but fhining ; rather glaffy ; compofed of fmall, rather ftreaked, and fometimes fivelled fcales; and, therefore, lighter than the preseding. Is not attracted by the magnet; but is fufible before the blowipipe. From Milo, an ifland in the Archipelago. 5. Var. of greyifh-white colout, here and there with a flight fhade of red, with numerous thining fcales of mica; flldfpar rather calcined. Is not attracted by the magnet; but fufible into a femi-tranfparent glafs. From the ifle of Ponza, and from Puy-deDôme, in Auvergne. 6. Var. white, with fcales of brown fhining mica, and pellucid grains of feldfpar, more cryfalline than the bafe in which they are included. From Mont d'Or, in Auvergne; fimilar varieties are found in the Eugànean mountain, and another from Mont Mezin, in Velai.

Class VIII. Amygdaloid lavas, wuith bafe of traspp.
Thele are confidered, by Faujas, as having originally be-

Tonged to rocks, whefe bate is generally the fame as that of the porphyries; and whofe globules and nodules of calcareous \{par, zeolite, calcedony, \&c. do not owe their exiftence as fuch, to infiltration, but are of a contemporaneous origin with the bafe. 'The volcanic fire which opeated on fuch amygdaloid rocks, though it has rendered them foft and flud, has but little changed their character ; but all, in the opinion of that flrenuous volcanift, bear clearly the ftamp of ignicons origin. They are fubdivided as follows:
A. Amgydaloid laza wuith calcareous globules.-1. Var. with globules of tranllucid calcarcous fpar of a ycllowith colour, of the fize of a pea; in a black, compact mafs; attracted by the magnet. From Vivarais; alfo from Vicenza. 2. Vur. with white, tranflucid, fpathofe globules, fome with a thin, hining, reddifl-brown, others with a fteclgrey coating of the fame kind, in a fimilar mafs, affecting a triangular-prifmatic form. From near Reciefauve, in Vivarais. 3. Var, with white, compact, lenticular grains, tranfucid on the edges, the largett of them of the lize of a comman lertil; in a black compat mafs, of a very fine grain. From the inf of Afcention. 4. For. with white, fpherical globules; fometimes two, three, or four of them together ; fumetimes fingle in cells that are partly empty: bafe like that of the preceding variety. From the valley of Ronca, in the Veronefe territory 5. Var. with fimilar, very frall globules, grouped clofely together, and taking up the whole of the cell; in a reddifh-brown, hard, compact tiafs, attracted by the magnet. From the fame place. 6. Var. with fmall, perfectly orbicular, globules of equal fize, in a deep-grey, compact, foft mafs, containing numeruus grains of olivine, with oxydized ochrey furface. From Vivarais. 7. Var. with white, tranflucid, fcining, radiated glebules of arragonite; in a black, hard, compaEt lava; obedient to the magnet. From the ille of Afcenfion. A fimilar one, but with larger globules, frasa near Roche-Sauve, in Vivarais. 8. Var. with the fame globules, but accompanied by grains and indeterminable crytals of black hor:blende; in a brownifh compact mafs. From near Bais, in Vivarais. 9. Var. with radiated globules, and irregular grains of arragonite, intermixed with grains of olivine. From the ife of Bourboa.
B. Amysdaloid lava wwith globules of meforype.-1. Var. with folid globules of a white filky zeolite, compofed of needles radiating fron the centre; in a black, compact, hard mafs, attracted by the magnet ; including alfo grains of black hornblende. Between Roche-Maure and Meyffe, in Vivarais. A fimilar variety from Staffa, and the ifle of Mull. 2. Var. with very fmall folid globules, of a fnowwhite zeolite, and irregular, almolt microfcopic grains of the fame fubflance, fo numerous as to conflitute lialf of the whole mals; the bafe like that of the preceding variety. From the valley of Ronca, in the Neronefe territory. A fimilar one is found near Rome, in which grains of hornblende are lodged in the very fubftance of the zeolite. 3. Var. with numerous, white, pellucid, zeolitic grains, of about the fize of a millet feed, and clofely grouped together ; in a greyifh black compact lava. From MontecchioMaggiore, near Vicenza. Similar varieties occur in the Lipari iflands, at mount Vefuvius, \&c.
C. Amyrdaloill lava with filhise.-1. With globules of white pearly ftilbite, in a black compact bafe, attracted by the magnet. From Feroc. 2. Var. with timilar globules, furrounded by a cruft of a green, rather friable, fubftance, very like the green earth of Vcrona; in a greyifh-green mafs, not attracted by the magnet. From Feroe. 3. Var. with white radiated filibite, on cryttals of calcareous ipar ; in a black mals, From Iceland. 4. Var. with white ftilbite, Yol. XX.
in indeterminably-flaped norules, in a friable, brownifh malfo From Dumbarton.

1. Amygdaloid lava with analcime-1. With irregular globules of tranfparent analcime, partly cryftallized; in a greyill-black lava, attracted by the magnet. From Mount Litna. 2. Var. with oblong globules of peilucid anakime; in a black compact lava, ftrongly attracted by the magnet. From one of the Cyclopic illes. 3. Far with globules of white compact analcine; in a greyith-black lava, appearing ratheraltered. FromMontecthio-Maykiore. 4. Var. with hollos nodules of white, dull, and opaque analcime, partly in the form of trapezoidal cryflals; in an altered lava, as it is called by our author. From Dumbarton, Scotland. 5. Var. with Imall, infulated, femi-tranfparent, greyifh, dodecaledral cryftals ; in a light grey lava refembling tripoli, and penetrated in a:l parts by numerous, very fmall, fpherical grains of anaicime, of a darker grey colour, and a little tranflucent on the edres; intermixed alfo with fome fmall cryitals of calcareous fpar.
E. Amysdaloid lava, with) farcolite, (referred by Haïy to analcime.)-1. Var. with glubules, and fometimes irregular nodules, of a reldifl ftony fubllance, fimilar to the farcolite of Thompfon; in a greyin, hard, porous, but heavy lava; the red globules accompanied by analcime, white radiated zeolite, cuboid cryttals of calcareous fpar. Fronr Montec-chio-Maggiore. 2. Var. with radiated zeolite, trapezoidal analcine, cuboid calcareous fpar, and femi-tranfparent cry 1 talline celeftine, or fulphat of itrontian, of a light blue co. lour, paffing, in fome fpecimens, into white. In a fimilar mafs, from the fame place.
F. Amygctaloid lava, with chabafe.-1. White chabafie, in a porous, black, heavy mafs, with finall, blueif, elevated, rather mamillary ípets, which are fhofphate of iron. From Val di Noto. A fimila: fubflance is found at Clermont, in Auvergne. 2. War. with fmall primitive cryftals of chabafie, in the orbicular hollows of a biack, hard, heavy, and compact mafs. From the Peak of 'Tencriffe. 3. Var. with fmall globules, and very minu'e cryftals of chabafie, in a black heavy mafs, with fliming black hornblende, and numerous grains of olivine, decompofed into a jellowifh earthy fubftarce. From Teneriffe. 4. Vcir. with primitive cryftals of chabafie, lining the orbicular hollows of a clofe black lava. From Iceland.
G. Amygdaloid lava, with calcedony.-Here M. Faujas mentions leven varieties of nodules of calcedony, fome of them containing water, (known by the name of enhydros,) others folid; found principally in the decompofed liavas of Monte Tondo, Monte Galdo, San Florianc, Mont-Main, in the Vicentine territory. To thefe he adds, by way of appendix, fome calcedonic and quartzy fubftances, which he coafiders as owing their origin to inflitration, and to which he refers the hyalite of Francfort on the Mayne. In another appendix the fame author places the mafles including the granular peridot or olivine, and which he would confider of porphyritic origin, were the olivines ever" found cryfallized in them. He enumerates feveral varieties found in the bafalts and lavas of Vivara:s, Caffel, ine of Bourbon.
Class IX. Voleanic breccias and tufirs.
A. Volcanic breccias formed of more or lefs rounded fragnents of different kinds of lavas, ferzed and enveloped by other lavas in a flate of fufion, -1. V'ar. compofed of angular and blunt fragments of black, hard, compact lawa, of rather porous hlack lava, and of grains of white feldfpar; the whole intimately united by a browninh lava, with itreaked pores. Peak of St. Michacl, in Velay ; as alfo near Roche Sanve, in Vivarais. 2. Var. with irregular fragments of fcoriform femi-vitreous lavas of a fhining black colour, cemented by a
grey friated lava, approaching hard pumice. From Vivarais, and the ille of Lipari. 3. Var. formed of numerous angular fragments of black porons lava, and fome white opraque feldfpar, cemented together by grey pumice with frall pores: from Lipari and Ifchia. 4. ${ }^{4}$ ar. with fragments of white, fometimes yellow and brownih lime-ftone, in a grey hard lava, mixed with white, tranfparent, flawed cry ttals and grains of feldfipar, fome laminx of black hornblende, filvery mica, and grains of green augite; from the vicinity of Albano, and other parts of the Roman territory. 5. Yor. compofed of large fragments of white marble, finegrained yellowihh marble, and another hard flony fubtance formed of lime and filex; in a grey lava, including much black pyroxene ; from the vicinity of Rome, and from near Vefuvius. 6. Var. compofed of fragments of white and grey marble, and rounded pieces of black hornblende; others O\& black fcaly mica; in a grey lava, mixed with particles of filvery mica, and numerous fragments of deep green pyroxene. From Ifchia. 7. Var. with large nodules of olivine, of different colours; fragments of black compaet lava, of porous, almolf fceriated lava, of the fame colour, cemented by a grey mafs formed of more or lefs comminuted detritus of feveral kinds of lava. From the Ifle of Bourbon, of Afcenfion, \&cc.
B. Volanic breccias formed by the fulden contai of free and of suater greatly beated.-I. Breccia formed of fragnents of brown porphyry, porphyry with red bafe, and cryttals of white feldfpar; of fragments of white marble, marked at their points of contact with the lava: with black lineaments that appear produced by an aqueous folution which intimately' united all parts of this breccia, the bare of which is a grey lava, mixed with melted grains of black pyroxene ; it is attracted by the magnet. From the foot of Mount Etna. 2. Var. including angular fragments of black lava, with conchoidal fracture; of grey feldfpar lava, with rough furface (both attracted by the magnet); of glafly blueiihgreen lava, fragments of ahh-grey pumice, fragments of a whitith, femi-tranfparent, volcanic glafs, and a colourlefs glafs ; the whole cemented by a blueilh-grey, foftifh, coarfegrained lava. From the Lipari ilands. 3. $W_{\text {ar }}$. compofed of fragments of black, rather porous, bafalt, including grains of olivine, of large fragments of a yellowifh quartzy Pand-flone with red ftripes, of fragments of grey or red indurated marle, and geodes of brown iron-ftore ; the whole cemented together by a grey lava, compofed of the more or lef's comminuted grains of the fublances that form the breccia, and of fome black pyroxene. From the Habichtfwald. 4. Var. compofed of various fragments of black bafaltic lava, intimately connęted by white and fhining calcareous fpar, fufficiently hard to allow the breccia to be cut and polifhed; fometimes the compact lava adopts the reddifh calour of ochre. From Rochemaure, Vivarais; alfo from Monte-Bolca. 5. Var. formed of more or lefs large frag. ments of intenfely black, fhining, volcanic glafs, cemented by white calcareous fpar, fufceptible of a good polifh. From Val di Noto. 6. Var. compofed of very fmall fragments of a compat, greenih-black, decompofed lava, fome of which include grains of black pyroxene; in a hard filiceocalcareous pafte, which is but little foluble in nitric acid.
C. Vulcanic tuffus, properly fo called, formed by the detritus of different fpecies of granular, pulverulent, or earthy lavas. They appear to owe their origin to various circumtlances. Firft, they may, according to Faujas, be confidered as the refult of the fudden contact of water with volcanic fire ; when, at the time of great fubterrancous convullions, a communication is fuddenly opened between the fea and the igneous gulf. Secondly, the projected pulverulent lavas,
which are fometimes carried to a great dinance, fuch as thofe which buried Herculaneum and Pompeit, or thofe which accumulate at the bottom of the fea in the vicinity of volcanocs, and may, in the progrefs of time, produce depofitions, and even more or lefs regular frrata, of tuffa. Lailly, under fome circumflances, the tuffas that were already depofited in the fea, may have been again deplaced by currents, and mixed with hhells and othcr marine productions, and fometimes even with land productions, fwept into the fea by rivers, \&c. the current may, at different intervals, have depolited thefe tuffas, as more or lefs regular layers.
I. Volcanic tuffa, compofed of white and grey, very light pumice, in fmall fragments, adhering to each other. From Pleyth, near Andernach, where it covers the quarries of trafs. 2. Var. with bafe of pumice reduced to fo fine a powder, as to appear like a clayey fubttance, ferving as a cement to numerous grains of a very light pumice, but lefs rough to the touch than that of the bafe, which, moreover, includes fmall nodules of real porous lava, of a brown colour, and fometimes colourlefs. From the fame place, where it forms a kind of trafs. 3. Var. formed of pumice in grains, and finall angular fragments of black bafaltic lava, fcaly particles of a fomewhat micaceous fchittus, cemented by a patte of pumice reduced to powder. From the fame place; where it forms another sariety of trafs, being of greater folidity, and forming beds of upwards of fifty feet thicknefs, in which fometimes charred wood is found. 4. Var. formed of very fmall grains of lava, which is partly fcoriated, of fome grains of black pyroxene, and other grains of rounded yellowifh olivine, cemented by grey and black pulverulent lava, refembling fand-flone. Is fometimes found in beds at Carliberg, in Heflia. A fimilar tuffa, of a dark grey colour, with white points, is found on an clevated part of the Cantal, in Auvergne. 5. Var. of a purplih-grey colour, and refembling, at firlt fight, a fand-ftone, but in reality compofed of the detritus of a purplifh lava, of a lefs altered compact lava, and fome grains of black pyroxene. Near Rochefauve, in Vivarais, where it forms thick beds, refting on other, tuffas, and overlaid by bafalt. 6. Var. gold yellow, dotted with white, grey, and black, compoled of fmall fragments of bafalt, yellowilh-brown friable lava, fome grains of olivine, and fmall particles of black pyroxene; alfo yellow ochrey nodules are found in it. This tuffa forms confiderable beds, one above 'the other, at Rochefauve, in Vivarais. 7. Var. of a purplifh.brown colour, with yellow ochres, white and blackilh dots, compofed of fmall angular fragments of black compact lava, which has loft fome of its hardnefs; of fmall fragments of a white marle, mised with fome iron ; of particles of porous altered lavas of an ochrey-yellow colour ; of grains of flining black pyroxene, and fome olivine in grains. It is attracted by the magnet. Found at the preceding place, where it forms conliderable fltrata, overlaid by vatt bafaltic caufeways. Alfo, in this tuffa large nodules of ochre are found. The tuffas of the vicinity of Rochc-maure, in Vivarais, are fimilar to this: as likewife thofe of the neighbourhood of Rome, of Naples, Campania, of the Euganean mountains, of feveral parts of the Vicentine territory, \&c.
M. Fayjas enumerates, at the end of this feetion, the various animal and vegetable fubflances, fhells, madrepores, and carbonized fpecies of wood, that have been found imbedded in volcanic tuffas. A fection is alfo fet apart to volcanic pitch-flones, divided into three claffes, viz. wooci, converted into pechftein, by volcanic fire ; flint, which has undergone the fame change; and porphyries converted into what iverner calls pitchltone porphyry. The places affigned to the firtt of thefe varieties are, Afferttein, near Frankfort,
and Upper Hungary; the locality of the fecond is principally Auvergne ; which is alfo that of the fpecimens of volcanic pitchitone porphyry, here enumerated. To the latt of thefe fubitances 1 Faujas refers molt of fuch laves réginites, or réfiniformes of Dolomicu, as contain cryltals of feldfpar, and feveral of which are found at Vulcano. Thefe are faid to form a tranfition into

Class X. Enamels (émauv), obfulians, and other volcanic glafis. - The prototypes of thefe are the different varieties of trapp, compact feldfpar, and porphyry, which, according as they are more or lefs fufible by volcanic fire, are, under circumitances favourable to vitrification, converted into the feveral kinds of glaffes that are found among volcanic productions.
A. Ettimels.-1. Grey, with greyifh-white, or greenifh zones, opaque; fome pores are vifible in the patte, and, with the belp of a lens, alfo cryitals of feldipar, or traces of them. From the ifle of Afcention. 2. Var. of dark-grey colour, befprinkled all over with fmall round fpots of a much lighter grey, and produced by fmall globules in the fubftance of the enamel, which, in fome places, difplays an intenfe, vivid-black colour. This fubitance, which is from the inand of Vulcano, bears diltinctly the characters of a variolitic lava converted into enamel. . 3 . Var. of a blackihgrey colour, hard, opaque, in which lome dots of fufed black pyroxene are fill vifible. From the ifle of Ponza. 4. Var. of an intenfe black colour, approaching obfidian, but more opaque, and of a rather greafy afpect. From the Peak of Teneriffe. This enamel is fometimes covered with a ruft-coloured cruft. In fome fecimens fcarcely any foreign hody is obfervable, except fome traces of white feldfpar; in others the mafs is rather lefs intenfely black and more marked with fpots of white feld!par, melted together with the enamel without having entirely loft their original tint.
B.-Real obfidian, or voleanic glafs.-1. Obfidian of a black colour, of conchoidal fracture, divifible into fharp fragments, of deep black colour, and tranflucid on the edges; thinner fragments almoft completely tranfparent, with fcarcely any traces of a fuliginous tint. It is fufible before the blowpipe into a very white, fhining, tranflucid glafs, with minute fuperficial veficles. From Mount Hecla, Teneriffe, Afcenfion, Vulcano, Lipari, Ponza, \&cc. 2. Vur. of a globular form, black, opaque, but fometimes tranfparent, and faintly turbid or fmoky. From Cap de Gates. Faujas refers this fubitance (which has been called luchs-fapphire by fome writers) to the homogeneous volcanic glaffes, becaufe it eafily melts before the blowpipe into a white enamel, and becaufe the globules are fometimes found imbedded in a greyifh enamel, approaching to lamellar pumice. Thefe globules are not always fpherical. Their fize is from that of a fmall pea to "that of a large hazlenut. They are very light, though not porous; their external luftre is unctuous. 3. Var. forming a very fine black glafs, with well defined, conchoidal fracture; and fragments nearly tranfparent on the edges, and of a weak olivebrown colour. In fome parts white points and fome fmall hollows are feen, which latter are lined with a white fufed, rather vitreous, fubftance, which appears to owe its origin to fuch grains of feldfpar as did not experience a fufficient degree of fufion to amalgamate with the obfidian. From Cerro de las Marejas, in Mexico. 4. Var. with intenfely black ground, and well defined fracture, yielding fharpedged fragments; the whole of the brilliant mafs is filled with fmall, white, opaque, globular, and oblong fpots, clofely grouped together, and appearing like melted enamel, put rather unctuous. From the Lipari iflands. 5. Var, of
a black colour, inclining to olive-grecn, difpofed in more or lefs clongated, rather flexible, capillary flaments, often tevminated by very fmall, round, or oblong globules; fufible before the blowpipe into globutes of a greenifh-black. From the ifle of Bourbon. Lavas with fmall filiform paro ticles of voleanic glafs have alfo occurred in the ifland Vulcano. Thefe are by fome mineralogilts looked upon as filiform crytals of augite or pyroxene ; but M. Faujas fays he has fubjected them to clofer examination, and found them to be volcanic glafs.
C. Pumice fones.-The true pumice, fays Faujas, which we fhould be careful not to confound with the lightef lavas, keeps the midway between the volcanic glaffes and the enamels : it generally derives its origin from a peculiar kind of vitrification of compact feldfpar, and fome porphyritic rocks. Thofe of Lipari and Vulcano are the only known volcanoes that have produced pumice in confiderable quantity: the iffe of Lipari, in particular, is the valt magazine that furnifhes aimolt the whole of the immense ftores of this fubftance, confumed for the purpofes of different arts, in almolt all parts of Europe. In fmall quantity and in infulated fragments it occurs in the neighbour. hood of feveral other volcanoes.
I. Pumice of a white colour, porous, light, rough to the touch, and fufible. From Campo-Bianco, the Eipari ifles, Valle-del-Aqua, near Otto-Jano, \&cc. 2. Var. of a filky appearance, fibrous, and with capillary lineaments. From the fame place. 3. Var. of a dark grey or black, fometimes greyilh-white colour, with twitted pores; fibrous, including, among its fibres, more or lefs indeterminable cryftals of white feldfpar, which, in fome of the fpecimens, are only feen on the rifts. From Ifchia, Procida, from the neighbourhood of Naples. At Lipari, the varietics of black punice are found in the hillock of the tomb of the Nafos. 4. Var. of a whitifh colour, fcaly, light, filvery, and femi-tranfparent. From Lipari. 5. Var. the fane, but heavy. Ibid. 6. Var. of a grey colour, light, fibrous, with blackifh, fhining, fometimes cryftallized, mica. In a pumice from Herculaneum, from the neighbourhood of Naples, from Ifchia, Procida, \&c. $7^{7}$ Light, porous, or fibrous variety, with more or lefs angular nodules, and grains of black volcanic glafs. From Lipari, Stromboli, Capo di Monte, at Scutello, in the neighbourhood of Naples; from Teneriffe, \&c. 8. Var. the fame, but whiter, with fmall thin fragments of a filvery-grey fhiftus. In the tuffa from Pleyth and other places in the vicinity of Andernach. 9. Var. with very fmall angular and irregular fragments of a vitreous, flony fubftance, of a fky-blue colour (now called Latialite, or Hailync). Amcng the varieties of pumice from Pleyth, \&c. io. Var. of a greyinh-white colour, light, with nodules of obfidian of various fizes. From Teneriffe and Lipari. ir. Var. of a dark grey, fometimes rather brownifh colour, heavier than the preceding variety; with veficles, all of which are elongated in one and the fame direction: gives out fome fparks when ftruck with'fteel. From Lipari. 12. Var. of filvery-white, compofed of fmall lamellex, or fcales. Found among the other varieties at Lipari: it is rather lighter than the common white pumice.

Class XI. Sulphur, and various faline fubfances, found fublimated in volcanoes and folfataras.

The falts are: Glauber falt, nitre, alum, Epfom falt, mineral alkali, rock folt, efflorefcent, in filaments and cubes, fal ammoniac, in rhombic, or dodecahedral cryftals, generally of a topaz-yellow colour. Alfo gypfum, and calcarcous fpar; muriate of copper, in fmall deliquefcent cryitals; red and yellow orpiment.

## I. A V

Cleass XII. Voleanic irow, vize titaniferous iron, as fand, and in fimall octahedral crytals, from various places; fpecular iron from feveral wolcanoes in Italy and France; phofphate of iron, as powder in porous lavas from Capo di Dove, Ftus, Val di Noto: or in fmall lamine, from Bouiche, in the department of Allier, \&e. ; iron pyrites, in fine grains; oxyds of iron; muriase of iron, of a yellow colour, from Vefuvius and Etua'; and iron-vitriol, found in volcanic grottos, in the illand of Vulcano.

Several interefting obfervations on the nature of lava, and the varius phenomena it prefents under different circumftances, are given by in William Hamilton, father defla 'Torre, Bohis, Tata, Breillach, Buch, and others, which will be more particuiarly noticed under the article Vozeavo.

The purpofes for which the lava of Vefuvius, Etna, and other volcanoes is employed, are particularly thofe of building and paving. Alfo the ancients made ufe of it for thefe purpofes, as appears from the prefence of Vefuvian lava in the architectural remains and pawements fotind in Herculaneum and Pompcio. That of Etna appears to be fill more generally ufed for building, fince, according to Ferrari, there is not a houfe in its neighbourhood that is not conftructed of it. The rapid progrefs in the rebuilding of Catania was, in a great meafure, owing to the facility with which the building materials were procured. Alfo mill-ftones are made of the lava of Etua, m:any of which are exported to Calabria and Malta; and it has even been manufagured into cammon balls.

LAUACA, in Geography, a fmall illand near the S. coaft of Sardinia. N. lat. $39^{\circ} 4^{\prime}$. E. long. $8^{\prime} 3^{\circ}$.

LAVACRUM, in Botany, a name given by fome authors to the common wild teafel, or dipfacus fylvefirit major, Ger. Emic. Ind. 2.

## LaUADEROS. See Lavatoni.

LAVAGNA, in Geograpby, a fataport town of Genoa, at the mouth of a river of the farne mme, which rifes in the Apennines; is miles IV.N.W. of Brugnato.

LAVAL, a city of France, and capital of the department of the Mayenne, fit:!ated on the river Mayeane. The number of inhabitants is ellimated at If, 154 ; the ealtern divifion containing 6658, and the canton $15,555,07$ a territory of $x_{45}$ kiliometres, in 9 communes; and the weltern divifion comprehending 7496, and its canton 15,000 , on a territory of $122 \frac{1}{2}$ kilionetres, in 6 communes. In the town and its envirens are manufactures of linen, which yield a confderable commerce. N. lat. $48^{\circ} 5^{\prime}$. W. long, $0^{\prime} 4 \mathrm{I}^{\prime}$.

LAVAMUND, a town of the duchy of Carinthia, on the Drave; the fee of a bifhop, fuffragan of the archbifhep of Salzburg; 24 miles $\mathbf{E}$. of Clagenfurt. N. lat. $46^{\circ}$ 44' E. long. ${ }^{1}{ }^{\prime} 37$.

LAVANDULA, in Botany, Lavender; fo called from the Latin word lavo, to wafh or befprinkle, alluding to its ancient ufe in baths or fomentations, or to that of its diftilled water in more modern times. Linn. Gen. 290. Schreb. 386. Willd. Sp. Pl. Vo 3. 60. Mart. Mill. Dict. v. 3. sit. Hort. Kew. ed. 3. v. 3.382. Sm. Prodr. Fl. Grace. Sibth. v. 1. 399. Juff. 113. Tourp. t. 93. Lamarck Illuftr. t. 50. Grertn. t. 66. (Stxebas ; Tourn. t. 95.)-Clafs and order, Didjnamiaz Gymnofpermia. Nat. Ord. Verticillata, Linn. Labiata, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, ovate, ob fcurely toothed at the orifice, fhort, permanent, with a braciea at its bafe. Cor. of one petal, ringent, reverled; tube cylindrical, longer than the calyx; limb fpreading; its larger lip turned upwards, cloven, fpreading ; the other directed downwards, in three roundifh, nearly equal, égtnents. Stam. Filaments four, within the tube of the corolla,
fhort, pointing downwards, two of them fhorter than the relt ; anthers Imail. Pif. Germen four-cleft; Alyle threadflaped, the length of the tube; ttigma of two obtufe co. hering lubes. Perio. nome, except the calyx, which proteets the fceds, its mouth being clofed. Seeds four, obovate. Eff. Ch. Calys ovate, obfcurely toothed, attended by a bractea. Corolla reverfed. Stamens enclofed in the tube.

Obf. The Stactius of Tournefort differs from his Iaavandula, in having the flowers ranged in many rows on the fpike, and the whole crowned with an ornamental tuft of hloral leaves.

Six fpecies are defcribed in the latelt edition of Linnzus, eight in Willdenow, all of them admitted into the new Hortus Kewenfis, but the laft in the litt erroncoufly. The reft are for the molt part known and eiteemed in every garden or green-hcufe. All are flurubby, with blue or purplifh, fragrant, fpiked flowers, and their foliage is likewife aromatic, generally of a grey or hoary-green, narrow, eithę fimple or compound. The fpike is fupported on a longifln, naked, fquare falk.

1. L. Spica. Common Lavender, or Spike. Linn Sp. Pl. 800. Woodv. Med. Bot. t. 55. (Lavandula; Ger. em. 583, 584. f. I-3. Rivin. Monop. Irr. t. 54. f. r, 2.) -Leaves linear-lanceolate. Spike interrupted, naked at the fummit. - Native of the fouth of Europe, hardy with us, and cultivated for the fake of its feent when dried. To be "laid up in lavender" is become proverbial for any thing ftored up with peculiar care. The effential oil and dittilled water are fo gencrally ufed in perfumery, as to be no unimportant articles of commerce. The compound fpirituous tircture, or lavender drops, is a popular cordial, very. commodious for thofe who wifh to indulge in a drani, undel the appearance of ant elegant medicinc. This plant varics in the breadth of its laves', from linear to lanceolate, inclining to obovate; hence the old writers defcribe and ligure two kinds. The flowers are occafionally white, which allo they have not omitted to notice.
2. L. Stiechas. French Lavender. Linn. Sp. Pl. 800. (Strechas arabica; Rivin. Monop. Irr. t. 55. St. five Spica hortulana; Ger. em. 585)-Leaves linear, revolute, hoary. Spike clofe, crowned with a coloured leafy tuft. Bracteas fomewhat three-lobed.-Native of Spain, Greece, the fouth of France, and the north of Africa. It will not bear our winters without the fielter of a greenhoufe. The leaves are much fmaller than in the fermer, more ftrongly revolate. Spiles uninterrupted, fhort, and thick, on but fhortifh flalks, their bracteas more or lefs dif. tinetly three-lobed, purplifh and woolly; thofe which crown the top of the fpike, greatly dilated, wavy, undivided, of a beautiful purple, much paler than the flowers; ravely wanting.
3. L. viridis. Madeira Lavender. L'Herit. Sert. Angl. 19. Ait. Hort. Kew. n. 3. Hoffm. and Link Lufit. v. x. 91. t. 4.-Leaves linear, revalute, rugofe, villous. Spike clofe, crowned with a leafy tuft. Bracteas undivided. Native of Madeira, from whence it was fent to Kew by Mr. Mafton in 1777. It differs from the laft in its rugofe, green and villous, not hoary, leaves, its undivided bracteas, and its green, not purile, crown of the fpike.
4. L. dentata. Tooth-leaved Lavender. Linn. Sp. Pl. 8:. Curt. Mag. 400. t. 40I. (Strechas folio ferrato ; Ger. em. 586.)-Leaves linear, finely pinnatifid, pectinate. Spike clofe, with a leafy crown. Native of Spain, the north of Africa, and fome parts of the Levant, not of Greece.The very neatly-toothed leaves diltinguifh this fpecies Its fpikes ftand on long ftaiks, and are crowded, pale, with all the brafleas large, coloured, and fomewhat membranous, a fers

## L. $\triangle$ VANDULA.

Few at the top being rather the largef, and deftitute of flowers, as in the two lalt. The corolla is often white. This is one of the fpecies that has been longett cultivated in England, having been preferved in the dwelling-houfe before green-houles or thoves were invented.
5. L. pinnata. Pinnated Lavender. Linno fil. Diff. 9. t. I. Am. Acad. v. 10. 52. t. 2. Curt. Mag. 401. t. 400. Jacq. Mifc. v 2. 318. Ic. Rar. t. ro6.- Leaves deeply pinnatifid; their fegments wedge-fhaped, obtufe, nearly entire. Spike linear, fomewhat branched.-Native of Madera, from whenee Mr. Maffon fent it in 1777. The leaves are finely hoary, with little fcent, elegantly pinnatifid, and diltinguithed by their obtufe wedge-like fegments. The Jibiks ftand on very long ftalks, and are much more flender than any of the former, often compound. The bradeas are imbricated, uniform, ovato-lanceolate, pointed, coriaccous, not membranous, llightly coloured, and there is no leafy crown at the fommit. The corolla is of a delicate blueifh-purple, like the Common Lavender, but larger and more fhowy.
6. L. multifilla. Cut-leaved Canary Lavender. Limn. Sp. Pl. 8ou. (L. folio multilido; Rivin. Monop. Irr. t. 54 f. 3. Strechas multitida; Ger. em. 585.)-Leaves doubly pinnatifid, hoary. Spike ovate, mofly fimple. Bracteas woolly, elliptical, with diftant ribs, - Native of Spain, Barbary, and the Canary illands. One of the fpecies longelt cultivated in England, though it requires protection in winter. The Hortus Kewenfis marks this plant as bierto nial, and we have a French fecimen marked anoual. It has certainly more of an herbaceous than fhrubby appearance. The leaves are hoary, doubly and very deeply pinnatifid, with decurrent fegments, whofe extremities are acute, and in fome meafure elliptical. Spikes rather ovate and thick, very rarcly, if ever, producing a fmall branch or two from the bottom. Bratleas membranous, broadly elliptical, bcIprinkled with wool, furnifhed with three ftrong ribs, equally difant from each other, and from the edge. There are no barren leafy bracteas at the top.
7. L. abrotanides. Southernwood-leaved Canary Lavender. Lamarck Dict. v. 3. 429. Willd. no 7. (L. folio longiori, tenuiùs et elegantius diTecto ; Tourn. Init. 198. Comm. Rar. t. 27 .)-Leaves doubly pinuatifid, with linear fegments, nearly fmooth. Spike linear, moftly branched and interrupted. Bracteas firioothin, ovate, with approximated ribs.-Native of the Cazaries, long known in gardens. The flem is fhrubby. Leazes with finer, more linear, and greener fegments than in the laft. The narrownefs and branching nature of the Jpikes more accord with L. pinnata than with mullifda, with which latter this fpecies has long been confounded. The brateas alfo molt refemble thofe of pinnata, but are more membranous, and far lefs hoary. Their ribs generally three, fometimes five, are always clofer together than in multifida.

The eighth fpecies of Willdenow, L. carnofa, Linn. fil. Diff. 9. t. 2. Am. Acad. v. 10. 52. t. 3. (Katu-Kurka; Rheede Hort. Mal. v. 10. İ9. t. go.), found by Koenig on dry walls and rocks at Sadrafs in the Eaft Indies, and fent to Kew in 1788 by fir Jofeph Banks, where it is kept in the Aove, being a tender biennial, is moft certainly not a Lavandula, but a Plectranthus, as its habit, and the large deflexed upper fegment of its calyx, both evince. See Plectranrifus.

Lavandula, in Gardening, comprifes plants of the flarubby evergreen kind, of which the fpecies cultivated are, the common lavender (L. ficica); the French lavender (L.. ftrehas) ; the tooth-leaved lavender (L. dentata).; and the Canary lavender (L. multifida).
The firit fort has varieties with narrow leaves with blue
flowers, and with white flowers willi broad leaves, and desarf lavender.

It may be remarked that this \{pecies is the common lavender; but the narrow-leaved variety with blue fowers is the fort cultivated for its flowers for medicinal purpofes.

And that the broad-leaved fort has much fhorter and broader leaves, and the branches are fhorter, more compact, and fuller of leaves; it continues feveral years without prose ducing flowers ; and when it does, the leaves on the floweringttalks approach nearer to thofe of the common lavender, but are ftill broader; the ttalks grow taller, the fpikes are loofer and larger, the flowers fmaller, and appear a litte later in the fealon.

The fecond kind has varieties with white flowers; and with purple flowers.

The fourth fpecies has a variety which rifes with an upright, branching, fquare taik, four feet high; the leaves longer, and cut into narrower fegments than the Spatiila plant ; they are of a lighter green, and almolt finooth; the naked flower-ftalk is alfo mach longer, and termmated with a clufter of fikes of blue flowers; at two or three inches below thefe are two fmall fpikes, one on each lide; the flowers are fmaller than thofe of the firit fort.

Method of Culture-- All the forts are readily increafed, by planting lips or cuttings of their young fhoots in the fpring: With the firft two forts, a quantity of flips or cuttings fhould be taken off in the early fpring, as March or April, from three or four, to fix inches long, flripping off the under leaves, then planting them in a fiady border, four inches afunder, giving a good watering, and repeating it occafionally in dry weather. When the plants are well rooted in fummer, they thould be tranfplanted into the places where they are to grow early in autumn, as September or October, with balls of earth about their roots.

And where the firlt fort is intended to produce flowers for economical purpofes, it thould be planted in rows, two or three feet afunder, and about the fame dittance in the rows, or in a fingle row one or $t$ o feet afunder, along the edges or divifions of garden-grounds, in a fort of edging or dwarf hedge; in either of which modes the plants grow freely, continuing in root, ftem, and branches feveral years, and produce abundance of fikes of flowers annually for gathering in the latter end of fummer; the culture afterwards is principally to cut down any remaining decayed: flower-ftalks in antumn, pruning or cutting away ang diforderly out-growing branches at top and fides, and digging the ground occafionally in fpring or autumn along the rows of plants.

In regard to the fecond fors, it may alfo often be raifed from feeds, which fhould be form in a bed of light earth in the early fpring, and raked in evenly with a light hand: The plants rife in about a month, when, if there be dry weather, water fhould be given; and after they are three. inches high, they fhould be pricked out in beds, half a foot apart, watering them as they require, until frefly rooted, They fhould itand here till the following fpring, and then. be thinned out, and planted where they are to remain.

The third and fourth forts may be increafed by flips and cuttings, planted in pots, in the early fpring months, and placed under frames, due water, and fhade from the midday fun, being given till they are rooted; when a little advanced in growth, tranfplanted into feparate fmall pots, and managed as other green-houfe exotic plants.

The two firlt forts are ufeful for their fine fpikes or flowers, as well as ornamental in affemblage with other fhrubby plants, in the borders and clumps of pleafuregrounds; and the two laft forts in the green-houfe collection
with other plants. Thofe defigned for firubberies or other fimilar places, being previoully raifed to fome tolerable buthy growth, and a foot ligh or more, flould be planted either in the early autumn, or in the fpring, difpofing them lingly at proper ditlances in the fronts of the clumps, borders, \&c. Sde Lavindea.

Lavandula, Lavereler, in the Maleria Mfedica. The common lavender, or lavandula ípica, was formerly confidered, fays Wuodville, as a fpecies of Nardus, and appears to be the pfeudo-nardus of Mathiolus and Pliny. This plant, which grows fponaneounly in many of the fouthern parts of Europe, appears from Turner to have been cultivated in England previoufly to the year 1568 . Thefragrant fmell of the flowers is well known, and to molt perfons is agreeable; to the talte they are bitterifh, warm, and fomeqwhat pungent : the leaves are weaker, and lefs grateful.
The thowers and fummits of the narrow-leaved or common lavender are, in a very eminent degree, cephalic and nervine. They are often employed as a perfume, and medicinally as mild ftimulants and corroborants, in palfies, vertigoes, lethargies, and tremors of the limbs, both internally and externally:

The flowers are fometimes ufed in the form of a conferve, into which they are reduced by beating them, while frefh, with thrice their weight of double relined fugar. Water extracts by infution hearly all the virtue both of the leaves and Howers: in dillillation with water, the leaves yield a fmall portion of effential oil; but the flowers, in their moft perfect mature fiate, about one ounce from fixty. Woodville obferves, that in order to obtain the largeft quantity of effential oil from thefe and molt other flowers of this kind, they fhould be allowed to grow to their full maturity, and be dried for fome time. This oil is of a bright yellow colour, a very pungent talke, and poffeffes, if carefully dittilled, the fragrance of the lavender in perfection: it is given internally from one drop to five, and employed in external applications for itimulating paralytic limbs, and for detroying cutaneous infects. It is alfo faid, that if Spongy paper be dipped in this oil, and applied to the parts, it immediately kills the pediculi inguinaies. Rectified fpirit extracts the virtue of lavender more completely than water. The fimple fpirit of lavender, prepared by pouring a grallon of proof fpirit on two pounds of the frefh gathered flowers, adding water fufficient to prevent empyreuma, macerating for 24 hours, and ditilling a gallon by a getatle fire, is richly impregnated with the fragrance of the flowers. More compounded fpirits, in which other aromatics are joined to the lavender, have been dittinguifhed by the name of Englifh or palfy drops: the college of London ( 1809 ) directs three pints of the fimple fpirit of lavender, and one pint of firits of rofemary, to be digetted on half an ounce of cimamon, half an ounce of nutmegs, both bruifed, and an ounce of red fanders wood fliced as a colouring ingredient, macerating for 14 days, and then ftraining; the college of Edinburgh, to the fame quantity of both fipirits, orders one ounce of cinnamon, two drams of cloves, half an ounce of nutmegs, and three drans of red fanders. Thefe preparations are taken internally on fugar or in any convenient vehicle, from ten to one hundred drops, and ufed externally in embrocations, \&c.

The medicinal virtue of lavender refides in the effential oil, which is fuppofed to be a gentle corroborant and Itimulant of the aromatic kind; and is recommended in nervous debi1 lities and various affections proceeding from a want of energy in the animal functions. According to Dr. Cullen (Mat. Med. vol. ii.) it is, "whether externally applied or given internally, a powerful ftimulant to the nervous fyttem; and smong the others of this order, named cephalics, the la-
vender has a very good and perhaps the beft title to it." And he further fays, "it appears to me probable, that it will feldom go farther than exciting the encrgy of the brain to a fuller impulfe of the nervous power into the nerves of the animal functions, and feldom into thofe of the vital. It was, however, with great propriety, that profeflor Murray diffuaded its ufe where there is any danger from a thimulus applied to the fanguiferous fyltem. It is however fill probable, that lavender commonly itimulates the nervous fyitem only, and therefore may be more fafe in palfy than the warmer aromatics, efpecially if the lavender be not given in a fpirituous menftruum, or along with heating aromatics, which however is commonly done in the cafe of the fpiritus lavendule compofitus." The officinal preparations of lavender are the effential oil, a fimple fpirit, and a compound tincture, already mentioned.
The broad-leaved lavender, a variety of the former, to which foreign writers have given the name of fpike, is ftronger both in fmell and tafte than the other, and yields in diftillation almoof thrice as much effential oil ; but the flavour of the oil and of the plant itfelf is much lefs grateful: the oil is likewife of a much darker colour, inclining to green. This oil, mixed with $\frac{3}{4}$ ths of rectified fpirit, or oil of turpentine, was the "Oleum fpicæ," formerly highly celebrated as an application to indolent tumours, uld fprains, difeafed joints, \&ic. See Oil of Spike.
LAVANGE, in Geography, one of the Virgin illands in the Weft Indies; three miles S.E. from the ifland of St. Thomas.
LAVANSAARI, an illand of Ruffia, on the coaft of Livonia, So miles from the capital, four miles and a hale long, and two broad, furrounded on the N.W. fide by iflets and fhallows, having three tolerable harhours, and occupied by about 40 families. Some patches of foil are cultivated, and in the middle of the ifland is a fmall lake.

LAVANT SEE, a lake of Stiria; mine miles E: of Neumarck.
LAVARA, in Ancient Geograply, a town of Hifpania, in the interior of Lufitania. Ptolemy.

LAVARDAC, in Geography, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diftrict of Nérac. The place contains 928 , and the canton 9482 inhabitants, on a territory of $182 \frac{1}{3}$ kiliometres, in 13 communes.
LAVARETUS, in Iclithyology, the name of a fmall fifh called by fome the gang $f \mathrm{f} / \mathrm{h}$, and the rhingau, and by Marcgrave the curimata. It leems of a middle nature, between the trout and herring kind, and is caught in valt quantities, in the months of March and April, in feveral of the lakes in Germany, and is pickled, and fent to different parts of the world. It feldom grows to more than four inches long.

## Lavaretus. See Salmo Lavaretus.

Lavater, Jonn Gaspard Christian, in Biogra. ply, was born at Zurich in 1741. He was intended for the Proteflant miniitry, and entered upon holy orders in 1761. He acquired an early reputation by the eloquence of his pulpit difcourfes, and the zeal and benevolence with which he fulfilled the duties of his functions. He felt an early propenfity to read the human countenance, and frequently exercifed the pencil in fketching fuch features as had made a particular impreffion on him; which he fudied with great attention. Accident led him to the ftudy of phyliognomy ; ftanding at a window with Dr. Zimmerman, he was led to make fome remarks on the fingular countenance of a foldier that was paffing by, which induced the phyfician to urge him to purfue and metbodize his ideas. He accord-
ingly began the purfuit, and in procefs of time, with the natural progrefs of an enthufiaftical mind, acquired not only a fondnefs for the ftudy, but a full conviction of the reality of the phyfiognomical fcience, and of his own great difcoveries in it. In 1776, he publifhed the firlt fruits of bis labours in a quarto volume, entitled "Fragments." He took in them a wide range of inquiry, and carried his ideas of phyfiognomy beyond the obfervation of thofe parts of the countenance which exhibit to a common eye the impreffions of mental qualities and affections, and maintained, as a leading pofition," that the powers and faculties of the mind have reprefentative figns in the folid parts of the countenance." Two more volumes appeared in fucceffion, which prefented a moft extraordinary affemblage of curious oblervations, fubtle and refined reafoning, delicate feeling, and philanthropical and pious fentiment, together with a large admixture of paradox, myfticifin, whim, and extravagance. The whole is illuftrated with a great number of engravings; many of which are highly finifhed and dingularly expreflive. The work was foon tranflated into the French and Englifh languages, and for a time became the favourite topic of literary difcuffion. The work now is rarely referred to except for the plates; the fcience itfelf is gone into utter neglect. Lavater is well known for a work entitled "Aphorifms on Man," of which an Englifh trauflation was publifhed in 18mo. in the year 1788. He was a zealous Chriltian, and tranflated into the German language " Honnet's Enquiry into the Evidencez of Chriftianity." His popularity as a preacher and paftor was extremely great at Zurich, where the people exhibited to him tokens of the higheft refpect and the molt affectionate seneration, and he was applied to by perfons of all ranks as the arbiter of controverlies among them. His moral character was exemplary, and his ardent zeal for doing good was fcarcely at any time furpaffed. No man was ever a more determined oppofer to tyranny and intolerance in every fhape; he had the true Swifs zeal for liberty. This noble firit rendered him a friend to the French revolution at the outfet, but when the republican culers began to difplay a fyltem of rapine and extortion, and to extend this even to Switzerland, he was the boldelt of their antagonits. When Zurich was itormed in 1797, he rufhed into the flreets, and received a fevere wound in the breall from a Swifs foldier, on whom he had conferred important benefits. From the effects of this he never entirely recovered; but the activity of his mind was unfubdued till a fhort time before his death, which happened on the 2d of January 1801, when he was in the fixtieth year of his age. A warm defire to promote the honour of God, and the good of his fellow creatures, was the principal feature in his character, and the leading motive of all he did. Next to thefe were an indefatigable placability, and an inexhauftible love for his enemies. Monthly Mag. Ann. Regiter.

LAVATERA, in Botany, fo named by Tournefort, in the Memoirs of the Academy of Paris for 1 106 , after Dr. Lavater, a phyfician of Zurich, who is faid to have written nothing on the fubject of botany, nor have we any information concerning him. Linn. Gen. 354. Schreb. 465. Willd. Sp. Pl. v. 3. 793. Mart. Mill Dict. v. 3. Sm. Fl. Brit. 742. Juff. 272. Cavan. Diff, SG. Lamarck. Illuftr. t. 582. Gxertn. t. 136.-Clafs and order, Monadelphia Polyandria. Nat. Ord. Columnifera, Linn. Malvacea, Juff. Gen. Ch. Cal. Perianth double; the outer of one leaf, three-cleft, obtufe, fhorteit, permanent; inner of one leaf, cut half way down into five fegments, fharper and more erect, likewife permanent. Cor. Petals five, inverfely heart-fhaped, flat, fpreading, their lower parts attached to the tube of the filaments. Stann. Filaments numerous, united
below into a tube, feparating loofely at its top and fides, anthers kidney-fhaped. Pif. Germen fuperior, orbicular depreffed; Atyle cylindrical, fhort; ftigmas feveral, from feven to fourteen, brittic-fiaped, as long as the flyle. Peric. Capfules numerous, equal in number to the thigmas, of two valves, opening inwards, ranged in a depreffed circle round the columnar receptacle, at length deciduous. Seeds folitary, kidncy-fhaped.

Eff. Ch. Calyx double; the outer threcocleft. Capfules. numerous, ranged in a circle, fingle-feeded.

One of the moft handfome of the malvaceons order, at lealt of thofe found in Europe, to which quarter of the world, and the north of Africa, the whole genus is confined; for the Linnzan $L$. americana is no other than Sida abutiloides of Jacquin, and Willdenow, n. 48 . Light fpecies, exclufive of this, are detailed in Syft. Veg. ed. It ; Willdenow has twelve, feven of which are fhrubby, five herbaccous and moftly annual.

In the firt fection are
L. arborea. Sea Trec-Mallow. Linn. Sp. Pl. 972. Cavan. Diff. t. 139. f. 2. Engl. Dot. t. 184r.-Stem arborefcent. Leaves downy, plaited, with feven angles. Flowerttalks axillary, cluftered, fingle flowered.-Found upon rocky cliffs on the fouth-weft coaft of England and caft coaft of Scotland, as well as in other parts of Europe, flowering in July and Auguft. It is naturally biennial, though of a flrubby habit and above fix feet high, for it bloffoms but once, though ic will, in a garden, fometimes furvive many winters before that event takes place. The flen is round and thick, branching at the top chicfly, where it forms a leafy head. The leaves are alteruate, ftalked, pliable and downy, of feven fhallow crenate lobes. Flawers numerous, axillary, purple, very like thofe of the common Malva fyvefris, but rather more handfome.
L. triloba. Three-lobed Tree-Mallow. Linn. Sp. Pl. 972. Jacq. Hort. Vind. v. I. 30. t. 74.-Stem fhrubby. Leaves rounded, crenatc, fomewhat heart-fhaped, firghtly threelobed. Stipulas heart-fhaped. Flower-thalks aggregate, fingle-flowered.-Found on the coatts of Spain and France. With us it is a greenhoufe plant, not eafily kept nor much valued, being far more beatuful on its native rocks, where the light hoary green of its copicus foliage, is prettily contralted with the large, very delicate, rufe-coloured foskers. The broad fipulas are remarkable.
L. maritima. Soft Sinsle-flowered Tree-Mallow. Gouan. Illuftr. 46. t. 2x. f. 2. (Althæa frutes Clufii; Ger.em. 933*) -Stem flirubby. Leaves rounded, crenate, bluntly angular, foft and downy. Stalks axiliary, folitary, fingle-flowered.Native of Spain and the fouth of France. Linnæus did not diltinguifh its fynonyms from the latt, though it differs abundantly in the rruch greater foftnefs of the liaves, want of fipulas, and the folitary fower-foulks. The flowers are large and elegant, of a light.purple with dark claws. We have feen this fpecies bloffoming in Mr. Angeritcin's fine confervatory at Blackleath, but it finds no place in the Iftedition of Hort. Kew. or the 5 th of Hort. Cant.
Of the fecond fection are
L: thuringiaca. Great-flowered Lavatera. Linn. Sp . Pl. 973. Jacq. Auftr, t. 311. Curt. Mag. t. 517. -Stem herbaceous, downy. Leaves fomewhat downy ; the lower ones angular ; the upper three-lobed. Flower-4talks axillary? fingle-flowered.-Native of Hungary, 'Tartary, Germany, \&c. about hedges; a hardy perennial in our gardens, flowering from July to Septenber, and propagated exher by root or by feed; yet as Curtis obferves "it is rarely met, with in any of our collections;" poflibly becaufe the trimefris is preferred. The flems are fews ereet, three or
four feet high, clothed with fhort foft hairs. Laaves falked, dependent, but flightly downy. Flowers on long folitary ftalks, with large, pink, veiny petals, inverfely heart-flaped, their linufes "puckered" as Curtis fays ; but this is not reprefented by Jacquin in his wild plaut, and is perlaps an in. dication of luxuriance only.
L. cretica. Small-flowered Lavatera. Linn. Sp. P1. 973. Jacq. Hort. Vind. v 1. 15. t. 4 I , -Sten herbaceous, rather hairy. Leaves acutely five-lobed. Flower-talks axillary, aggregate.-Native of Crete, cultivated by Miller in 1768, and we believe ftill preferved in Chelfea garden, coming up fpontaneoully from feed, the root being annual. There is nothing to recommend it to gencral admiration, the flowers being far lefs ornamental than the wild Malva fylvefris, which the plant refembles in herbage. We have a fipecimen from the Goettingen garden named Lavatera fylveffis of Link.
L. trimefris. Spanilh Annual Lavatera. Linn. Sp. Pl. 974. Jacq. Hort. Vind. v. 1. 29. t. 72. Curt. Mag.t. 109 Stem herbaccous, rough with deflexed hairs. Leaves fmocthith, heart-fhaped, angular ; the lower ones rounded. Flower-ftalks folitary, fhorter than the leaves.- Native of Spain, France, and the Levant, a hardy annual in our gardens, where it is raifed without trouble, producing abundance of large, pink or white, very fhowy bloffoms, all fummer long. The fem is branched, two feet high, rough in the upper part efpecially, with fimple deflexed Jairs. The leaves are nearly fimooth on the upper fide, more or lefs downy beneath, all heart-fhaped; the upper ones molt angular, the lower more sounded, but ttill rather lobed. Flower-falks hairy, fhorter than the leaves.
L. punciaht. Dotted-flalked Lavatera. Allion. Auctuar. 26. Willd. n. 11. (Malva folio varie; Bauh. Prodr. 137. 2. 137.)-Stem herbaceous, rough with ftarry points. Lecaves downy; the lower ones rounded, the upper hattate. Flower-talks folitary, elongated.-Native of the country about Nice, according to Allioni, who firft, among modern botanifts, determined this very diftinct fpecies, but did not advert to Bauhin's fynonym, which Linnæus had referred to the preceding, but which, from the excellent figure and defcription, we have no hefitation in applying to this. $L$. pungala is an annual, diftinguifhed from the lat by its ftarry pubefcence, much more downy foliage, and much finaller purple flowers, on longer and more flender ftalks. The leaves alfo grow on long foottalks, and differ greatly in fhape, the lower ones being heart-fhaped, fhort and rounded, fightly lobed; fome higher up deeply and fharply five-lobed; but molt of the upper ones haltate; all are crenate. The caly $x$ is foft and downy.

Lavatera, in Gurdening, comprehends plants of the herbaceous perennial kinds, of which the fpecies moft generally cultivated are the Cretan lavatera (L. cretica); the common annual lavatera (L. trimeftris) ; the great-flowered lavatera (L. thuringiaca); the tree lavatera or mallow (L. arborea) ; the downy-leaved lavatera (L. olbia); the three-lobed lavatera (L. triloba); and the Portuguefe lavatera. (L, lufitanica.)

The firtt fort varies with red flowers, with white flowers, and with purple flowers.

The fecond kind has likewife feveral varieties.
Method of Culture.-The firt two, or annual forts, are readily increafed, by fowing the feeds in a light foil in the places where the plants are to remain, or in pots, in the foring feafon, as about the latter end of March, in patches of four or five in each, giving them water occafionally when the weather is dry. When the plants have attained a little growth, they mould be thinued out to one or two of the ftrongelt plants. When any are to be removed to other
places, it fhould be done at this period, and with a little carth about the roots, due water and fhade being given; but they fellom fucceed well by tranfplanting.

All the other fhrubby peremial forts may likewife be increaled by fowing the feeds, and managing the plants in the fame mamer. Molt of thefe forts will not laft more than two years in this climate, unlefs the foil be dry, when they contime three or four.

They in general require a warm dry fituation, or to have their roots covered by old tan, or the protection of the greenhoufe during the feverity of the winter feafon.

Thefe plants are highly ornamental in different parts of pleafurc-grounds. The annual forts have great beauty, in their flowers being large, numerous, and conficuous, and are proper where large thowy flowering plants are required. The peremnial kinds are alfo fuitable for large borders and firubbery compartments, having large, ftraight, upright, durable flems, terminated by branchy bulhy heads, and very large foft foliage; that form a variety in affemblage with other plants, though their flowers are often hidden by their large leaves.

LAVATION, in Antiquity, a fealt of the Romans, in honour of the mother of the gods, inftituted in memory of the day when the worfhip of Cybele was transferred from Phrygia to Rome, and celebrated on the twenty-fifth of March.

LAVATORY, or Lavadeno, a name given to certain places in Chili afd Peru, where gold is got cut of earth by wafhing.
M. Frezier gives us the following defcription of the lavatories of Chili: they dig deep into the earth, in fuch places as they have reafon to expect gold in ; and, in order to facilitate this digging, they turn a flream of water upon the fpot, loofening the earth as much as poffible all the time, that the current may have the greater effect, and tear up the earth more ftrongly. When they are got to the earth they want, they turn off the ftream, and dig dry-
The earth that they now get is carried on mules, and difcharged into a bafon, made fomewhat in the manner of a fmith's bellows, into which a little rivulet of water runs with a great deal of rapidity, diffolving the paris of the earth, and carrying every thing away with, it, excepting the particles of gold, which, by their great weight, precipitate to the bottom of the bafon, and mix with a fine black fand, where they are alnoft as much hidden as they were before in the earth. See Hifory of Gold.

Sometimes they ind very confiderable pieces in lavatories, particularly fome pieces of 24 ounces oach. There are feveral lavatories where they find thefe pepitas, or pieces of virgin gold, of a prodigious fize. Among others, they tell of one that weighed $5: 2$ ounces, bought by the couns de la Moncloa, viceroy of Peru.

Nine or ten leagues to the ealt of Coquimbo are the lavatories of Ardacoll; the gold of which is 23 carats fine. Their work here always turns to great probit, excepting when the water fails them. The natives maintain that the earth is creative (creatrix); that is, it produces gold continually; becaufe, after having been wathed fixty or eighty years, they find it impregnated afrem, and draw almoft as much out of it as at firft.

LAVATRIS, in Ancient Gecgraply, a piace of Great Britain, mentioncd in Antonine's 5 th Iter, fituated between Cataractoni or Cataract, and Verteris or Bough, and fuppofed to be Bowes in YorkRhire.

LAUD, Whliam, in Biggraply, archbifhop of Canterbury, the fon of a clothier of Reading, in Berkfhire, was born in October 1572, and having received his grammar learning at the fchool of that town, he was fent to the univerfity of Oxford in $\times 589$, where he was entered of St. John's college. Of this college he was admitted a fellow, and at the proper perinds he took his degrees. In early life he was efteemed by all who knew him as a very forward, conlident, zealous perfon. He was ordained deacon in 1600 , and in the following year he took prien's orders, and read a divinity lecture in the college. It was about this time that he maintained the conftant and perpetual vifibility of the church of Chrit, derived from the apoltles to the church of Rome, and continued in that church till the reformation. In $160{ }_{3}$, he was chofen proctor of the univerlity, and in the fame year he was appointed chaplain to Charles Blount, earl of Devonihire. In 1604, he took lis degree of bachelor of divinity, and in the exercife which he performed on this occafion he maintained the necoffity of baptifm; and that there could be no true church without diocelan bifhops. From the drift of his difcourfe he was fuppofed to be frongly inclined to popery. Dr. Abbot had already been his antagonilt, and on this nccafion he mgde no fcruple of charging him with being a Papitt in the molt public manner, fo that it was fcarcely fafe to be confidered his friend and companion. In the fear $1605, \mathrm{Mr}$. Iand married the carl of Devonfhire, his patron, to Penelope, the late wife of lord Rich, who had been divorced from him for adultery. In juftification of himfelf, he contended that the innocent and guilty might lawfully marry again, after a divorce had been obtained. The part which 3ie took in this affair expofed him to much cenfure from the public, gave great offence to the fovereign, and made fo deep an impreflion on the mind of Laud, that he ever afterwards obferved the anniverfary of the marriage as a day of falting and humbliation. His firl preferment in the church was to the vicarage of Stamford, in Northamptonfirice, in the year $x 60 \%$, which led to other lituations of more value and importance. In I6ri, he was elected prefident of St. John's college, and very foon after was appointed one of lis majelty's chaplains. He had now great hopes of riling with rapidity to the higheft honours, but his expectations were fo completely difappointed, that in the year 16 r a he had determined to withdraw from the court. By the perfuafion of Dr. Neile, bifhop of Lincoln, he was induced to semain there another year; to keep up his feirits the pre-

VoL. XX.

Late gave him a prebend in the church of lineoln, and, in the following year, the archdeaconry of Huntingdon. In 16,56, the king prefented 1)r. Laud to the deanery af Gloucelter, and at the fame time required hiun to reform and fet in order whatever was amifs in that cathedral. He was diligent in obeying the royal mandate, and made great alterations in the church, which being effected, he recommended, that the members of that church fhould make their humble reverence to God not only at their firlt entrance into the choir, but at their approaches to the holy table, which he had removed from the middle of the church to the ealt end of the choir. Thefe changes gave great offence to many perfions on account of their fuperfliticus tendency, particularly to Dr. Mites Sniith, biflop of Glouceiter, who from that moment would never enter the church again fo long as lie lived. Laud now began to take an active past againt the Puritans; and he was a;fo very defirous to bring the church of Scotland to an uniformity with that of England: with this view lie attended the king in a journery to Scotland, but nothing was grained by the expentive tour, excepting that the king faw his commands neglected, and his authority contemned. Unon his return he was made a prebend of "Weftmintter, and in the following year he was nominated to the bifhopric of St. David's, chiefly through the interelt of the lord-keeper Williame, at the inftigation of the favourite Buckingham, to whom Laud had recommended himfelf. In the year $\mathbf{1 6 2 2}$, bifhop Lauid held a conference with Fifher, a Jefuit, before the marquis of Buckingham and his mother, in order to confirm them both in the Proteflant religion, with refpect to which they were then wavering. From this time a clofe in: timacy fubfilted between Laud and Buckingham, who made the bifhop his confeflor and counfellor ; and when he went with prince Charles into Spain, left him as his agent at court, with whom he maintained a frequent correfpendence. In the courfe of this, he mfinuated fome heavy charges agraind his friend, the lord-keeper Williams. This circumftance occafioned a fertled enmity between the two bihops, Williams accufing Laud of the deepelt ingratitude on that account. Laud correfponded with the duke of Buckingham during his journey to France, to bring about a merriage between the princefs Henrietta-ilaria and king Charles I. Supported by Buckingham's favoar, to whom he is charged with having rendered himfelf too fubfervient. bilhop Latud gained the confiduce of the new king, and it was baid that thefe two men flopped up both the king's cars from any other doctrines in clurch or ftate, but what was infufed by them. Laud was defired by king Charles to make out a lilt of the eminent divines with their principles and qualifications, that from this lift he might delect his chaplains, and others fur proxnotion in the church. Land quickly gave in his lift, of whom his friends had the mark O againt their names, for " orthodos," but thofe whom he did not delight to henour, he branded with a 1 , fignifying, that they were Puritans, and, as fuch, ought not to be trulted with any power whatever. At the coronation in 1626, Laud officiated as dean of Weftmintter, by the king's appointment, in the room of billop Williams, who was in difgrace. In the fame year he was tranlated from St. David's to the bifropric of Dath and Wells, and was alfo appoinsed dean of the chapel royal. In 1627 he was fiworn a member of the privy council, and, in 1628 , tranflated to the fee of London. By the advice of Laud all ecclefiaftical"preferments were given away, and the whole country was almoft entirely governed. Upoa the affaffination of the duke of Buckingham he prerailed on the king to fend to the judges for their opinion,

313
" whether,

## LA U D.

"whether, by law, Felton might not be racked :" they returned a decided opinion, "t that he could not be racked by the laws of England." Bihop Laud was the molt active and leading member of the high-commifion court, the arbitrary and fevere proceedings of which were juftly odious to the nation. For an initance of the extreme rigour and cruelty of their proceedings, we refer to the article Leighton, a learned Scotch prelate, who was fentenced to itand in the pillory, and to have his cars cut off, and his nofe flit, and then to be imprifoned for life, on account of a book which he had written. No fooner was the favage fentence paffed, than bifhop Laud pulled off his cap, and gave God thanks for it. In the year $163^{\circ}$, bifhop Laud was elected chancellor of the univerfity of Oxford, to which he was a great benefactor. He adorned it with many noble buildings, and enriched it with books and curious MSS. in almoft all the known languages of the world, procured at an immenfe expence. In 1631, bifhop Laud undertook to repair and beautify St. Paul's cathedral, which he accomplilhed in a very magnificent ftyle; but to raife the money which was expended, he reforted to fo many oppreffive and unjuftifiable methods, that ii became the common proverb, that St. Paul's was repaired with the fins of the people. Laud thewed great zeal in obtaining the utmolt deference to all the external rites and ceremonies of the church, and he caufed the feveral churches, in which he took in intereft, to be adorned with all kinds of pictures, images, and altar-pieces, all which circumitances led the people to fufpect, that he was too much inclined to the papal religion, if he were not already a Papilt in his heart. This fufpicion was thill ftrengthened by his declaration, that in the difpofal of all ecclefialtical preferments, he thou'd give a moft decided preference to fingle men, fuppoling the abilities of the fingle and married to be otherwife equal. In 1633, he attended the king in a journey to Scotland, and was prefent at his coronation for that country, which ceremony was performed in the abbey church of Holyrood-houfe. While in Scotland, he took every opportunity of urging the clergy to conformity with the church of England, but in this he was completely unfucceffful. Almolt immediately after his return, Abbot, the archbifhop of Canterbury, died, and Laud was initantly appointed his fuccefior. He was, almoft at the fame moment, offered a cardinal's hat, which he declinec', but upon what grounds he refufed the honour is not known, though various motives have been affigned. He now carried matters very high, drove many of the French and Dutch Proteftants, to whole anceltors Edward VI. had given an afylum, out of the kingdon: and either imprifoned or filenced many worthy clergymen, who refufed to read the king's declaration for allow. ing lawful fports on Sundays after divine fervice. He was itill more fevere againft thofe who were any ways fufpected of puritanical principles. Some of them, by an exertion of arbitrary power, were fined, imprifoned, and even whipped, and kept to hard labour. Laud was, in 1635 , nominated to other high offices, among which was the office of a comminfioner of the treafury. He now procured the lord treafurer's Itaff for his friend Dr. Juxon, the bilhop of London, which gave great offence to the people. (See Juxon.) We cannot give any thing like a detail of the many profecutions in which the archbifiop was almoft conftantly engaged, they will be found in other articles of this work. (See BAstwick, Prynve, $\hat{S N C}^{\text {.) }}$ It is fufficient to fay in this place, that thefe profecutions were cruel, illegal, and tyranuical; but they were not borne by the people without deep, though filent, complaints. Never was man more hated, or more defervedly 10: there till exifted in the country the printing prefs, by meand of which his proceedings and charater, and the arbi-
trary meafures of the court, were expoled to the whole nation, in a fecret manner. He accordingly procured a decree to be made in the flar-chamber, which ordained, that the number of printers fhould be limited; and thofe who were allowed to follow the profeffion, fhould not be allowed to print any books of divinity, law, phyfic, philofophy, or poetry, till they had been licenfed by the archbimop of Canterbury, or the bifhop of London for the time being; upon pain of very grievous penalties. Thefe proceedings, though they might be ufeful to the court for a fhort time, created fo many enemies to the exifting flate of things, that there was great danger of fome fudden convulfion. Many of the beft men in the country, to avoid perfecution, retired to America for an afylum, and a multitude of others would have followed their example, had not the archbihop obtained an edict to prevent any one from leaving the kingdom without a licence for that purpofe. This was a degree of feverity fcarcely paralleled in the Chriftian world, but it anfwered no good end, for the people took a general difguft, and almolt the whole of England was filled with Puritans. Laud did not confine his arbitrary meafures to England, but was equally violent in his plans with regard to Scotland, fo that he drew upon his head the hatred of that kingdom, and provoked the refiltance which led to the renewal of the folemn league and covenant, fubfcribed by king James, and the whole nation in the year 1590. The attempt made in $\mathbf{3} 637$, to force on the Scotch the new liturgy, was the firl ftep which called forth the open oppofition of all ranks. The king at firlt raifed a powerful army to reduce the covenanters to fubmilion, but when he had marched to the borders of Scotland, he found the preparations made to receive him fo ferious, and he knew that his Proteftant nobility and foldiers were not zealounly affected in his caufe, that he found himfelf compelled to feek for a general pacification. It was foon difcovered that the idea of war was not abandoned, but only deferred, and that the Englifh court were refolved to fubdue the fpirit of the people in Scotland. Laud and Strafford were the advifers of this refolution, and to raife fupplies, application was made to the Englifh parliament, which, after an interval of twelve years, was fummoned to meet at Weftminfter for that purpofe. The commons not only refufed to comply with the defires of the crown, but appointed committees to confider the grievances under which they laboured. The king wifhed them to commence with a fublidy bill, which they refufed; he at length diffoled the parliament, in great anger, before a fingle act was paffed. All the engines of arbitrary power were fet to work to raife money for the war, and thofe who refufed to comply with the demands made upon them were fined and imprifoned. The greater part of the odium of thefe oppreffions fell upon the archbifhop, of whom the populace exprefied their deteftation in the molt open way that they dared. On one occafion, viz. on May gth, 1640, a paper was pofted up, exhorting the London apprentices to attack the palace at Lambeth, but the archbihhop having had timely notice of their intentions, fruftrated their defigns, and difperfed the multitude, amounting to the number of 500 perfons. One, of them was taken in the act of breaking the windows, and was cruelly put to death as a traitor, but this extreme feverity only ferved to inflame the mob ftill more againft the archbifhop. Another circumftance which contributed to encreare the number of the archbimop's enemies, was his, continuing the convocation of the clergy after the diffolution of the parliament, by which he obtained feveral fubfidies granted by the clergy, which the Commons had refufed till. their grievances were redreffed. At length the neceffities of the ftate obliged the king to call a new parliament, and,
as foon as it met, the canons and conflitutions of the late convocation came before the houfe of commons. Thefe, being difcuffed, were declared " to contain many matters contrary to the king's prerogative, to the fundamental laws and flatutes of the realm, to the rights of parliament, to the property and liberty of the fubject, and matters tending to fedition, and of dangerous confequence." In the courfe of the debates the archbifhop's character was warmly attacked, and in fome of the fpecches he was charged with the treafonable defign of fubverting the religion and laws of the country. On the next day articles againft the archbifhop, prefented by the Scotch commiffioners, were read in the houfe of lords, and then reported to the houfe of commons, in a conference between the two houles. The refentment of parliament broke out into a flame, and a motion was made and carried that he had been guilty of high treafon. Upon this, Denzil Hollis, fon of the earl of Clare, was immediately lent up to the bar of the houfe of lords, to impeach him in the name of the Commons of England, to inform their lordhips, that, in convenient time, they would bring up the particulars of their charge, and to sequeft, that in the mean time he might be committed to fafe cuftody. His grace being now commanded to withdraw, he requefted leave to fay "that he was heartily forry fur the offence taken againft him, but humbly defired their lordhips to look upon the whole courfe of his life, which was fuch, that he was very fure not one man in the houfe of commons did believe, in his heart, that he was a traitor." He was now committed to the cuftody of the gentleman ufher of the black rod; and on the 26th of February, fourteen articles were brought up from the Commons by fir Henry Vane, the younger. Hie was then committed to the T'ower, and in his paflage thither he had to undergo the loud and deep curfes of an enraged populace. One of the firft fteps taken againft him was levying upon his property a fine of twenty thoufand pounds, for his proceedings in the convocation held in 1640. In June 1641, he refigned the chancellorthip of the univerfity of Oxford, and in the following October, the houfe of lords fequeftered his archiepifcopal jurifdiction. His confinement in the Tower was very fevere, and he began to feel in his own perfon fuch fufferings as muft bring to his recollection what he, in the day of his power, had inflicted upon others. After an imprifonment of nearly three years, he was brought to trial upon the fourteen articles already mentioned, and upon ten additional ones, which were now, for the firft time, brought forward. Many of the charges were ill fupported, and much of the evidence was trifing and irrelevant. It fufficiently appeared, hovever, that he had laboured to extend the royal prerogative and the ecclefiatical power, to a degree that was utterly inconfiftent with the liberties of the people; that he had been zealous in enforcing the illegal claim of flipmoney; that he had committed perfons to prifon, and punifhed them without law; and that he had been guilty of many arbitrary, illegal, and cruel actions. Archbifhop Laud defended himfelf with uncommon fpirit, eloquence, and acutenefs, and with extraordinary prefence of mind. His counfel in their defence endeavoured to thew, that if the charges were true, they did not amount to treafon by any ctablifhed law of the kingdom. This juflification had its weight, and the lords, who were flaggered with the plea, deferred giving judgment, till the Commons thought fit to bring in a bill of attainder, which was, after much delay, paffed. To ftop the confequence of this, the archbifhop prefented the king's pardon under the great feal, but it was over-ruled by both houfes. By this bill the archbifhop was condemned to fuffer death, as in cafes of high treafor, and
all the favour he could obtain was to have lis fentence altered from hanging to decapitation. He met his death with great firmnefs on 'lower hill, on the roth of January. being then in the feventy-fecond year of his age. Mr. Hume, in fpeaking of the learning and morals of archbiftop Laud, fays" he was virtuous, if feverity of manners, and abltinence from pleafure, could deferve that name. He was learned, if polemical knowledge could entitle him to thar praife." In his government of the church, it has been juftly obferved, he difplayed a total want of charity toward; thofe who made the lealt oppofition to the ductrines and ceremonies eftablifhed by authority ; and under his countenance, the ftar-chamber wore all the horrors, and exercifed all the cruelties, of an inquifition. In ftate affairs his counfels were high and arbitrary, and he was very active in pro. moting thofe meafures which ultimately proved his own ruia. and that of the king. He was in fome cafes generous and munificent: befides what he did for Oxford in her buildings and library, he founded an Arabic lecture, which began to be read in 1636, and he invefted the univerfity with many: new privileges. He procured a charter for the town of Reading, founded in it an hofpital, and endowed it with a revenue of zool. per annum. The archbifiop publifhed fome fingle fermons, which have been reprinted fince in an oetavo volume. He printed a conference between himfelf and the Jefuit Fifher. His diary has been printed fince his death; and in the year 1700, was publifhed "An hiftorical Ac. count of all the material Tranfaetions relating to the Univerfity of Oxford, from Archbifhop Laud's being elected Chancellor, to his Refignation of that Office;" written by himfelf. His letters to Gerard John Voffius were printed in London in 1690 , and fome others may be found at the end of Dr. Parr's Life of archbifhop Uther. Biog. Brit. Toulmin's Edit. of Neal. Hume.
LAUDA, in Geograpby, a town of the duchy of Wurzburg, on the Tauber; 28 miles S.S.W. of Wurzburg. Alfo, a town of the duchy of Warfaw; 20 miles S.E. of Gnefna. It is called Laudica.

LAUDAMNAT, a town of Bengal; 12 miles S. of Nattore.
LAUDANUM, a name given by the chemifts to certain preparations, chiefly extracts of opium, on account of their excellent qualities; the word being derived from laudare to praife.
The "laudanum liquidum" of Sydenham, Thebaica tinctura, or wine of opium of the London Pharmacopeia of 1809, is prepared by macerating for eight days 1 oz. of extract of opium, bruifed cinnamon bark and bruifed cloves, of each a dram, in a pint of wine, and ftraining. It is obferved, that the degree of narcotic power of this preparation is nearly the fame as that of the ordinary tincture of opium, from which it differs, in having the extract for its balis, ia the addition of aromatics, and in the vehicle employed. The extract of opium, it is fuppofed, produces lefs confequent affeation of the brain and nervous fyttem than crude opium, and the fame effect feems to be further obviated by the atomatics which are joined to it. This is a compofition of the fame articles, in different proportions, as the Tinctura thebaica of P. L. 1745, and as the celebrated liquid laudanum of Sydenham. This is ftill in ufe, and it poffeffes fuch advantages by the modification of opium it affords, as to jultify being reftored to the Plarmacopcia. See Opient.
LAUDAVA, in Geography, a town of Pruffia, in the palatinate of Culm ; 20 miles N.E. of Thorn.

LAUDER, a royal borough, in Berwickfhire, Scotland, is fituated on a river of the fame name, about 22 miles to the fouth of Edinburgh, and 24 from Berwick. It is

## L A U

## L A U

now only a place of a mean appearance, and entirely dentitute of trade. Formerly, however, it was a place of very coifiderable note. It was conitituted a royal borough at a very early period, and for many years was dittinguithed as the refidence of royalty, and the feat of the Scottiin parliament. In the reign of king James III., when the parliament was convened to confuit upon the means of repelling the Englin invafion, the nobility were fo enraged at the conduct of the favourite mininiter, tir Robert Coclirance, that they hung him and his alfociates over Lauder bridge, in prefence of the king and his army. This town has five f.irs during the year. It joins with Haddington, Salburgh, Dunhar, and North Berwick, in fending a reprefentative to parliament. Near the town, on the filde of the river, is Laviderfort, built hy Edward I. of England, and now the principal feat of the earl of Latiderdale. In this mantion are feveral noble apartments, rich in ftucco work. One of them is very carefully preferved, as a curious example of the tailt of the age in which it was made. Many veltices of ancient Pititinc camps can fill he diftinctly traced in this neigh. bourliood. Several tumuli, alfo, are vilible on Lauder-Mwir, which has probably been the fcene of fome battles in ancient times, as many fragments of fwords, bows and arrows, \&c. have been dug up from this place. On a riling ground, not far from the town, are the remains of a Roman flation, in which a number of coms of that people have been found at different periods. Some ancient Spankli, Englifh, and Scottilh coins have likewife been diforered in different fields in this vicinity. The foil in the parifl of Lauder is light and fandy, and in a high ftate of cultivation. The country rifes gradually from the river, on both fides, to hills of a moderate height, which afford excellent pallure for sheep. Copper ore las been difcovered in different fpots, but is not rich enough to admit of being wrought with any. profpect of advantage. Slate is allo in plenty, but of an inferior quality. Adderlones and arrowpoints of fint, commonly called elf, or fairy arrosus, and feveral other itones of the moft fanciful thapes, are found here after hcavy rains. The whole parith, according to the parliamentary returns in 1800 , contained $3+9$ houifes, inhabited by ${ }_{7} 750$ perfous. Sinclair's Account of Scotland, vol. i. by the Rev. Dr. James Ford.

LAUDI Spinituall, Ital. the molk ancient melodies that can be found in Italy, fet to Italian words. It was the opinion of Father Meneitrier (furr les Drames en Mutique) that hymns, canticles, and mytteries, in the vulgar tongues of Europe, had their origin from the pilgrims who weit to the Holy Land. St. Francis d'Affife, born 1 182, is mentioned by Creccimbeni, and other Italian writers, among the firlt pious perfons of that country wlo exercifed their genius in compofing hymns and fpiritual fongs, called Lauuli, in the form of canzonets. Le Laudf, which were likevife Ealled lalde, lodi, cantici, or canticles, are compofitions in praife of God, the Virgin Mary, or the faints and martyrs. They refemble hymns as to the fubject, but not the characier and verificiction : hymns having been originally conttrusted on Greek and Roman models; but the laudi, or fpiritual fongs, are entirely of Italian invention.

A fociety for the performance of thefe religious poems was inftituted at Florence fo early as the year $\mathrm{I}_{3} 10$, the members of which were called laudgh, and lisudifit. In the fifteenth century this fpecies of facred poetry was very much eltemed and practifed, as is manifelt by the various collections that were made of them, one of which was printed 14 $4^{4} 5$. It the next century feveral volumes of them were publifhed, among which there are many poetical compolitions on facred fubjects by Politian, Bembo, Lodovico Martelli, and other eminent poets. (Quadrio, Storia d'Ogni Poef
rol. ii. p: 466.) In the spth century, though their favour was fomewhat diminihed, jet, befides a large volune compofed by Serafno Razzi, and publifhed by the nuthor, 1608 , there were many collections of thefe fpiritual fongs printed.

Crefcimbeni tells us that the company of laudfifi of St. Benedict, at Florerce, went to Rome during the time of the grand jubilee, in the year 1700, and fung through the ftreets in proceflion feveral laudi that were swritten by the celebrated Filicaia. In molt of the ancient collections, the melodies were prefixed to each of thefe fongs. They were at firlt little more than chants, and without bafe. However, according to the commentary on lwacaccio, by Sanfovino, publifhed at Venice, $15+6$, they were afterwards fung in many different parts. "There are in Florence," fays hee, "feveral Ichools of artizans and mechanics, among which are thole of Orfanmichele, and Santa Maria Novella. Every Saturday after nine v'clock thefe affemble in the church, and there ling five or fix laudi, in four parts, the words of which are by Lorenzo de Medici, Pulci, and Giambellari ; and at every laud they change the fingers, and to the found of the organ difcover a madonna, which tinimes the fettival. And thefe fingers, who are called laudef, have a preceptor, whom they denominate their captain or leader."

This company flill fublifted in 1770, when we frequently heard them ling their hymas, through the theets, in three parts, and likewife in their church, accompanied by an organ. Of the antiquity of this intitution, as a MS, volume of Laudi Spirituali, which we found in the Magliabecchi library at Florence, is an indifputable proof, the preface, and a fpecimen of thofe ancient melodics, bearing date MCCCXXXVI. have been inferted in the General Hiltory of Mufic, vol. ii. p. $32 \%$.

LAUDICOENI, among the Romans, formed of laus, praife, and cana, fupper or entertainment, applauders, or perfons who, for a reward, attended the rehearfal of plays and urations, in order to raife, or join in the acclamation. See Acclamation and Applause.

LaUDON, Gidmox Envest, baron, in Biograply, was delcended from a refpectable family, origimally from Scotland, a branch of which fettled in Livonia, and there purchafed aneftate at 'lotzen, where the fubject of the following article was born in 1716. He difplayed, at an early age, a Itrong inclination for a military life, and being inftructed with this view, he entered, at the are of fifteen, into the Ruffian army as a cadet, and, in 1733, he was at the taking of Dantaic, where the king of Poand had fought refuge, in confequence of the diturbances which then prevailed in that country. He ferved three campaigns under count Munich againtt the Turks, and was prefent at the taking of Azof, Oczakow, and Chotzim. On the relloration of peace, he faid fome time at Peterfburgh, in hopes of higher promotion, but being difappointed in his expectations, he went to Vienna, and was appointed by the emprefs queen to a command in the corps of Pandours, then raifed by haron Trenk, and with thefe he proceeded to Bavaria. While he belonged to this corps he was feverely wounded, and taken priloner by the French, but was refcued by his own corps before his wound was healed. After this he was engaged much in active fervice, but he employed every leifure moment in the ftudy of the military art, and in preparing himfelf for the active fituation in which he was afterwards placed in the feven years' war. In 1754, he was employed to reduce to obedience the rebellious Croats, which he did rather by his judicious conduct than by force of arms. During the feveu years' war, which commenced in 1756 , he performed the molt noble exploits, which we cannot in this place give in detail. Towards the close of that war, he de-

## L A U

## I. A V

termined to make an attack on Schweidnitz. The night ap. pointed for the execution of this plan was the 3 oth of Scptember. Every preparation being made, Laudun barangued his foldiers, forbade them, under the feverelt penalties, to plunder the town, and promifed, in cafe of their obedience, to diltribute among them the fum of 100,000 rix-dollars. The guards exclaimed with one voice, "No, gencral, lead us on to glory, we do not want money." At two in the morning the fignal was given, and the firlt aflault made, and in four hours laudon was in poffeflion of the whole fortrefs. Although this achievement had been undertaken without the order of the Aulic council, the emprefs congratulated the victor in a letter written by her own hand, and fent him her pieture fet round with diamonds. On the conclution of peace in 1763 , the gencral retired to his eftates in Bohemia, but in 1760 the emprefs appointed him a member of the Aulic council of war, and in the following year he was elected a member of the equeltrian order of the empire, and in 1769 he was made commander-in-chief in Moravis. In 1770, when Frederic the Great paid a vilit to the emperor Jofeph at Neuftadt, the principal officers were invited to dine with the two monarchs. As the company were about to place themfelves at table, his Pruffian majelty faid to Laudon, "come general, and fit near me, I would rather have you by my fide than oppolite to me." In the war of Bavaria, in 1778 , he was promoted by the emperor to be field-marfhal, and entrutted to the command of the Auftrian army, which anounted to 50,000 men. The plans which he formed to wounteract the defigns of the enemy were worthy the reputation which he had before acquired. After the peace, Laudon again retired to his ettates, from whence he was again called, on the breaking out of the Turkith war, in $1 \% \$ 8$. He had the command of the grand army when it was refolved to reduce Belgrade; the archduke Francis was to be prefent at the liege, and the emperor, in a letter to Laudon, faid, that "his nephew could not be in a better fchool than under his Gideou." The attack commenced on the 15 th of September, and on the 3 oth it was determined that the place fhould be carried by florm. The affault began about nine in the morning, and at one the outworks were in poffefinon of the befiegers. The fortrefs till refufed to capitulate ; but, after a dreadful bombardment, by which moft of the enemy's canuon were filenced, the place furrendered. In confequence of this achievement, he was appointed generaliffimo of the whole Auttrian army, an office which had been conforred on no perfon fince the time of prince Eugene, and which gave him an unlimited controul over all the Auffrian generals, and even oyer the Aulic council of war. On his rezurn to Vienna, he was received with every mark of diftinction that his fovereign and the people, by whom he was idolized, could beltow. After the death of the emperor Jofeph, he was confirmed in all his appointments by his fucceffor Leopold, who continued the war; foon after this he was taken ill of a fever, of which he recovered, but having imprudently rode out, contrary to the advice of his phyficians, he was feized with a fuppreffion of urine, which put an end to his life in the month of June following. This great general was beloved by his troops, who, under his command, believed themfelves to be invincible. The molt flriking feature in the character of Laudon was that dauntlefs prefence of mind, combined with daring intrepidity, fo eflential to the hero, and which can turn to the belt advantage any unexpected opportunity that occurs. Jofeph II. had a bult made of him, to be erected in the hall of the Aulic council of war, with the following infeription, "Gideunis Laudoni, fummi calfrorum prefecti, femper itrenui, fortis, felicis militis, et civis optimi exemplum, quad duces militefque imitantur, Jofephus II. Ange in ejus effigie proponi
voluit, anno $1-83 .{ }^{-1}$ After the capture of Betgrade, the cmpror took frum the lanily repofitory of the houfe of Aultria the large ftar of the Therefan order, and fent it to Laudon, with permiflion for him to wear it on his breaft; though by the llatutes it could only be worn by the grand matter of the order. Gen. Liog.
1.AUDS, Launes, the fecond part of the ordinary office of the breviary, faid after matins, though, heretofore, it ended the office of the night.

The laudes confitt principally of pfalms, hyonns, \& $\mathbf{c}$. whence they took their mame, from laus, laudis, praife.

LAVELANET, in Gcograply, a town of France, in the department of the Arricge, and chief place of a canton, in the diftrict of Foix ; 12 zniles N.E. of Tarafcon. The place contains 1200 , and the canton 12,83 I inhabitants, on a territory of $32-\frac{1}{2}$ kiliometres, in feven communes. N. lat. $42^{\circ} 56^{\prime}$. E. long. $1^{\circ} 55^{\prime}$.
LAVELLO, a town of Naples, in Daflilicata, the fee of a biflop, fuffragan of Bari; fix miles N . of Venofa.

LAVEN, a fmall ifland near the E. coatt of Luçon. N. lat.-14 12'. E. long. $124^{\circ} 6^{\prime}$.

LAUENAU, a town of Weitphalia, in the principality of Calenberg ; 15 miles N. of Hameln.

LAUENBURG, a town of Hinder Pomerania, and chief town of a lordhip of the farre name, fituated on the Lehe; $3^{6}$ miles W. of Dantaic, N. lat. $54^{\prime \prime} 32^{\prime \prime}$. E. long. $174^{2}$.-Alfo, a town of Germany, in the duchy of Saxc Lauenburg, on the right coalt of the Elbe, built by Henry the Lion. Here is a toll on the Elbe; 30 miles S.E. of Hamburgh. N. lat. $53^{\circ} 22^{\circ}$. E. long. $104^{\prime} 8^{\prime}$. See Sixe-Lavembergo.

LAVENDER, in Agriculture, a fmall fhrubby plant, fometimes cultivated in fields near large towns for the fpikes of flowers, which are either fold in fmall buadles, or diftilled for lavender-water, and the eflential oil of the plant.

The common fpike lavender is molkly employed with this intention. According to fome the method of cultivating it is by planting the flips or cuttings of the young fhoots, after being itruck, in rich fhady borders or nurferies the preceding fpring, about September or October, in rows, two, three, or more feet diltance from each other, and about the fame diftance apart in the rows, the ground being kept clean by digging or hoeing in the fpring or autum, and the plants retained in order by proper pruning. And as they decay from age or other accidents, they are replaced from the nurfcries; the nips of fuch plants as are wearing out being made ufe of for the purpofe. The fyikes of flowers begin to get ripe and ready for gathering about the end of June or July, when it is collected by women and children by cutting off the heads and tying them up in bundles, fo as to be fent to the Atill-houfe, or other places, in proper bafkets. When, for didiliing, the lower parts of the ftems are then cut off and the heads put into the 1till.

But this plant, when cultivated in the feld, fould, ac-cording to others, lave the ground well prepared by digging, or repeated ploughing and harrowing; after which, in the fpring feafon, as about March or beginning of April, a proper quantity of dips or cuttings of the young thoots or branches fhould be provided, and planted at once by means of a dibble, in rows of not mure than two and a half or three feet apart, and one and a half or two feet diftant in the rows, cloting the moull well about them. 'They afterwards require to be kept clean by means of the hue, and to have the monld brought up to them occationally, particularly in the auturn, and the dead atems or leaves cleared away.

They will moftly afford foikes of flowers in plenty in the fecond fummer, after being thus planted out.

Lavender fuceeds bef where the foil is rather of a dry quality, and not too lliff. In fome parts of the fouthern diftricts near London, it is grown in the fields with much profit.

In the Agricultural Survey of Berkflire, it is flated, that the late field-marfhal Conway, about twenty years ago, formed a large lavender plantation, and erected proper apparatus for its management at Park-place, near Henley. " There are about twenty acres planted with lavender, on the fide, and at the bottom of a chalky hill, with a fouthweftern afpect. The land at the bottom is very good, but that on the flope has only a thin covering of mould over the chalk, and the difference of foil is ftrongly marked by the luxuriance of the plants they refpectively bear."

It is of fuch importance to keep crops of this fort perfectly clean, that three men are conttantly employed in weeding this plantation; who, occafionally, ufe fmall hand-hoes, but not much, as they are liable, without great care, to break and injure the plants. When the flate of the weather will not admit of this fort of butinefs being done, they go over the plantation with large fhears, and clip off all the ftalks which were left by the lavender cutters.

Hot fummers are very favourable to the productivenefs of plantations of this kind.

Lavender, in Botany. See Lavandula.
Lavender Cotton. See Santolina.
Lavender, French. See Cassidony.
Lavender, Sea, Limonium. See Statice.
Lavender, Hollow-leaved Sea, or Side-faddle Flower. See Sarracena.

LAUENFRED, in Geography, a town of Wettphalia, in Calenberg, on the Wefer; 15 miles N.W. of Gottingen.

LAVENHAM, a market-town and parifh in the hundred of Babong, and county of Suffolk, England, was formerly coniderable for its manufacture of woollen cloths and calimancoes. The making of yarn from wool is now, however, the principal employment of the inhabitants. The market is held here on Tuefday, and there are two fairs during the year ; one for butter and cheefe on the 1oth of October, and another for horfes on Shrove Tuefday. Six capital burgeffes, chofen for life, conflitute the governors of the town, and by them all the inferior officers are appoisted. The land here is of that fort called Borough-Englifh, whereby all heritable property defcends to the youngelt fon, or, in default of iffue, to the youngelt brother. The town itfelf is agreeably fituated on the banks of the river Brell, from which it rifes in a gentle acclivity, and confifts of nine freets or divifions, and a market-place, with a ftone crofs in the centre. At the fouth end flands the parih-church, one of the fineft fpecimens of ancient ecclefiaftical architecture in the county. This noble building was probably founded towards the clofe of the fifteenth century. Its walls are built of freeftone, interfperfed with very curious decorations of fint-work. On every fide they exhibit a variety of arms of noble perfona es, who probably obtained that diftinction by their benefactions towards the erection of the church. The inner roof is very finely wrought in carved work; and there are two pews of fuch exquifite workmanfhip, as to vie with any in Henry Vlith's chapel. This town has, likewife, a meeting-houfe for Diffenters, two charity-fchools, and two Sunday-fchools, one of which is fupported by the Diffenters. In the parliamentary returns for 1800, the houfes are ftated to amount to 339 in number, and the inhabitants to 1776 perfons.

LAVENI., in Botany, a genus formed by the late Dr. Solander, and adopted from his manufcripts by profeffor Swartz, of the Cotula Verbefina, and Verbefina Lavenia of
their common preceptor Linnæus. The name is of unknown origin, and fulpected by profeffor Martyn to be vernacular in Ceylon. It firft appears in the fupplement to Ray's EFifloria Planlarum, v. 3. 217 , on the authority of Sherard, for the fpecies latt mentioned, for which it was adopted by Linnæus as the trivial name. Whatever the derivation or meaning of this word may be, its cuphony may uphold it, though, according to found principle, Swartz ought to have preferred Adcnofemma, given to the fame plant by the claffical Fortter, and contructed of $\alpha d \eta y$, a gland, and $\varsigma \varepsilon \mu \mu \alpha$, a crown, the feed being crowned with three glands inftead of the feather, hair or membrane appropriated to other genera of this family. Swartz. Prod. 112. Schreb. 544. Willd. Sp. Pl. v. 3. 1724. Mart. Mill. Dict. v. 3. (Adenoftemma; Forft. Gen. t. 45: Juff. 184.)-Clafs and order, Syngenefia Poly-gamia-equalis. Nat. Ord. Compofite difooidea, Linn. Corymbifera, Jull:

Gen. Ch. Commion Calyx ovate, fomewhat imbricated, confiting of from 10 to it lanceolate, equal, permanent fcales. Cor. compound, uniform, of from 15 to 20 equal hernaphrodite florets, which are funnel-fhaped, dilated at the bafe, the limb in five regular fpreading fegments. Stam. Filaments five, thread-fhaped, fhorter than the tube; anthers oblong, flattifh, didymous, flightly cohering laterally. Pjf. Germen oblong; ftyle thread-fhaped, longer than its own corolla, deeply divided; ftigmas flattifh, club-hhaped. Peric. none, except the permanent fpreading calyx. Seeds rather club-fhaped, flightly rugged, vifcid with glands. Crown of three awl-fhaped brifles, glandular at the tips. Recept. naked.

Eff. Ch. Receptacle naked. Seed-down of three briftles, glandular at their tips. Calyx ovate, flightly imbricated. Style divided.

Obf. Forter defcribes the florets as bearded or downy on their upper or inner furface.
I. L. decumbens. Decumbent Lavenia. (Cotula Verbefina; Linn. Sp. Pl. 1258. Mant. 473. Chryfanthemum fylvaticum repens minus, chamrdryos folio, flore luteo nudo, femine roftrato; Sloane Jam. v 1. 262. t. 155. f. 2. Tanacetum herbaceum erectum, foliis cordatis crenatis oppofitis, capitulis paucioribus remotis terminalibus; Browne Jam. 316. Herb. Linn.) -Stem decumbent. Leaves heartfhaped, obtufe, obtufely ferrated.-Native of the inland cool and fhady woods of Jamaica. Root annual. Stem dew cumbent or proftrate, from nine to eighteen inches long, throwing out roots from the lower joints, fimple, except now and then a fhort axillary fhoot or two, leafy, nearly fmooth, bluntly quadrangular. Leaves oppofite, ftalked, an inch or more in length and almoft as broad, heart-fhaped, nearly fmooth, blunt, unequally and bluntly ferrated, threeribbed, often cut away clofe to the lateral ribs at the bafe. Flowers few, terminal, convex, yellow, fcarcely fo large as a pea, on long, flender, in fome degree panicled, talks.
2. L. ereila. Upright Lavenia. (Adenoftemma vifcofa; Forft. Prodr. 54. Verbefina Lavenia ; Linn. Sp. Pl. 1271. Swartz. Obf. 312. Eupatoriophalacron ferophularix aquaticx foliis oppolitis ; Burm. Zeyl. 95. t. 42. Yu-tumba ; Rheede Hort. Mal, v. 10. 125.t.63.)-Stem erect. Leaves elliptical, pointed, fharply ferrated; tapering and entire at the bafe.-Native of Ceylon, the coalt of Malabar in fandy ground, and the Society ines. Root annual, of many pale fibres. Stem a foot high, erect, fomewhat branched, leafy, fquare, rough with afcending briftles. Lesaves ftalked, oppofite, the uppermoft lefs exactly fo ; all of a broad elliptical figure, tapering much at each end, three-ribbed, rough, two or three inches long, entire at the bafe, broadly and acutely ferrated upwards. Flowers on fhortifh, hifpid, hoary; axillary ftalks, accompanied by linear braiteas, and

## LA U

confifing of fewer florets than the preceding, of a palifh blue colour, and externally downy.

LaVENSAR, in Geography. See Lavansars.
LAVENSTEIN, or Loewenstein, a town of Germany, in the principality of Culmbach, near which is a coppermine ; 12 miles S. of Saalfeld.-Alfo, a town of Wettphalia, in Calenberg ; nime miles E. of Hamelno-Alfo, a town of Saxony, in the margravate of Meiffen; iS miles S. of Drefden. N. lat. $50^{\circ} 42$. E. long. $13^{\circ}+6^{\prime}$.

N. lat. $47^{\circ} 36^{\prime \prime}$. E long. $8^{\prime \prime} 4^{\prime}$.

LAUFFON, a town of France, in the department of the Upper Rhine, and chief place of a cauton, in the diftrict of Délémont, feated on the Barfch; 16 miles N. of Soleure. The place contains 740 , and the canton 7513 inbabitants, on a territory of $172 \frac{1}{2}$ kiliometres, in 21 communes. N. lat. $47^{\circ} 32^{\prime}$. E. long. $7^{\circ} 20^{\prime}$.

LAUGEON, a Lown of Meckley; 42 miles W. of Munnypour.

LAUGERIA, in Botany, named by Jacquin, in honour of Robert Laugier, profefor of botany and chemiftry in the univerfity of Vienaa, whot the botanic garden there was

## L A U

firn eftablifhed. Jacq. Amer. G4. t. 177. f. 21. Linn. Gen. 102. Schreb 140 . Willd. Sp. Pl. v. I. roSi. Mart. Mill. Dict. v. 3. Juff. 20G. Clafs and order, Pentandria AIomagnis. Nat. Ord. Rubiaces, Juff.

Gen. Ch. Cal. Perianth fuperior, of one leaf, tubular, finall, deciduous, unequal at the orifice. C'or of one petal, falver-fhaped; tube very long; limb in fie obovate fegments. Stam. Filaments five, very fhort; anthers linear, long, within the tube. Pijl. Germen nearly ovate, inferior; Ayle thread-fhaped, rather longer than the tube; fligma capitatc. Peric. Drupa roundifh, umbilicated with a finail depreflion. Sect. Nut roundifh, with five furrows, and from two to five cells.
Eff. Ch. Corolla falver-fhaped, five-cleft. Sitamens within the tube. Drupa inferior. Nut of five cells.

Obf. Vahl fuggelts that this genus might with propriety perhaps be united to Guetharda; fee that article.
I. L. odorata. Linn. Sp. Pl. 276. Jacq. Amer. 64. (Edcchi; Loef. It. 259.271. 306.)-Leaves elliptic-lanceolate, pointed, nearly fmooth. Stem fomewhat fpinous. Clufters panicled. Nut with five cells. - Native of South America: obferved by Jacquin in expofed buhhy places on the fea flore, about the Havanah and Carthagena. T'he flom is fhrubby, ten feet high, erect, branching, the brancles oppofite and widely fpreading. Leaves opjofite, on fhort ftalks, from one to two inches, or more, in length, ellipticlanceolate inclining to obovate, pointed, entire, veiny, defcribed by Jacquin as fmooth, but a young branch fént by him to Linnæus, from the Vienna garden, has zumerous hairs on the leaves, efpecially at the rib and edges, and its fooffalks, like the twig itfelf, are very hairy. Stipulas axillary, oppofite, lanceolate, recurved. Cluffers axillary, panicled, lax, as lung as the leaves." Flowers dirty red, very fragrant at night. Fruit copious, larger than a pea, very black, foft, when ripe falling off on the flighteft hak. ing of the bufh.
2. L. lucida. Swartz Ind. Occ. v. r. 475. Vahl. Symb. v. 3. 40. t. 57.-Leaves oblong, obtufe, membranous, fhining. Clufters forked. Nut with two cells.-Native of bufly places, in the warmer parts of Jamaica, as well as in St. Lucia and Santa Cruz. A jerub with round, fmootb, fpreading branches. Leaves two or three inches in length, oblong, with a blunt point, fhi:ing, firooth on both fides. Stipulas axillary, orate, acute, deciduous. Clufers from the bofoms of the upper leaves, fo as to appear terminal, folitary, rarcly oppofite, the leng:h of the leaves, eitter timply forked, or twice divided, widely fpreading. Ficzers neariy feffile in a fimple row on each branch of the clufter, with $\mathbf{3}$. folitary intermediate one, whitifh, fragrant. Frait black, its nut of two unequal cells. Dr. Swartz thinks this may be the Ipstaraguapin of Loef. It. 270, with the defription of. which it agrees in many refpects, but he never obferved any fpines on his L. lucilla. We have, neverthelefs, no doubt of their being one and the fame fpecies.
3. L. cortiacea. Vahl. Eclog. v. 1. 26.- ".Leaves ellipticovate, rather coriaceous, fmooth on both fides, bluntifin. Spikes twice divided. Flowers tetrandrous." - Found on. the fummits of mountains in the ifland of Monterrat, where it was probably found by Von Ruhr. A /brub.or tree, but we know nothing further concerning it.
4. L. refinofa. Vahl Eclog. v. 1. 27.-"Leaves breadlanceolate, fmooth; glaucous beneath. Spikes axillary, cloven. Branches refinous at the fummit." - Native of lofty mountains in Montferrat.
5. L. tomempofa. Swartz Inç. Occ. v. 1. 477." Leaves ovate, acute; downy beneath. Clulters forked. Nut of two cells." - Native of flrubby places in the weftern part of Jamaica, A fmali tres, thrise the height of a man, with fubdivided.

fubdivided downy brancles. Leaves fhining and fmooth above, filky and foft beneath. Flower's whitifh. It bloffoms in autunn, and refembles a Tournefortia in habit and inflorefcence. Swartz.

LAUGHER, a name given to a particular fpecics of pigeon, callied by Moore the columba ridens. It is about the fize of the common pigeon, and much of the fame make ; but it has a very bright pearl-colonred eye, almoft white, and is a mottled red, or blue. They are faid to be brought from Jerufalem, and the country thereabouts. When the cock of this fpecies courts the hen, he has a guttural cooing, not unlike the guggling of a bottle of water, when poured out haltily; and after this he always makes a noife not unlike laughing, from the fingularity of which he has obtained his name.

LAUGHI, Lis, in Geograply, a fief of Piedmont, which takes its name from a mountain; formerly held immediately of the empire, ceded, in $17+6$, to the king of Sardinia, or duke of Savoy, and now amexed to France.

LAUGHTER, an action or paffion peculiar to man.
Authors attribute lqughter to the fifth pair of nerves, which lending branches to the eye, ear, lips, tongue, palate, and mufcles of the cheek, parts of the mouth, precordia, \&c. there hence arifes a fympathy, or confent, between all thefe parts; fo that when one of them is acted upon, the others are proportionably afected.

Hence a favoury thing feen or fmelt, affects the glands and parts of the mouth, a thing feen or heard, that is thameful, affects the check with blahtes; on the contrary, if it pleafe and tickle the fancy, it affects the precordia and mufcles of the mouth and face with laughter; if it caufes fadnefs and melancholy, it likewife affects the precordia, and demonitrates itfelf by cauting the glands of the eyes to cmit tears.
Laughter, according to Hobbes, is "a fudden glory, arifing fron a fudden conception of fome eminency in ourfelves, by comparifon with the infirmity of others, or with our own formerly." Dr. Campbell, on the contrary, maintains, that this emotion doth not refult from the contempt, but folely from the perception of oddity, with which the paffion is occafionally, not neceffarily, combined. See Ridicule.

L'AUGIER, Mowsigxor, in Biography, principal phyfician to the imperial court at Vienna in 1772; the molt intelligent and beit informed critic, among mufical dilettinti, with whom we ever converfed. He had been in France, Spain, Portugal, Italy, and Conltantinople, and was perfectly well acquainced with national ityles of mufic, and the peculiar merits and defects of individual compofers throughout Europe. This gentleman, in defpite of uncommon corpulency, poffefed a mott active and cultivated mind. His houfe was the rendezvous of the firlt people of Vienna, both for rank and genius, and his converfation was as entertaining as his knowledge was extentive and profound. Among his other acquirements he had arrived at great ikill in practical mufic, had a moft refined difcriminating tafte, and could give, vocally, fpecimens of the national melody, which he had heard swith philofophical ears wherever he had been; in fine, he was a living hiftory of mufic. In Spain he had been intimately acquainted with Dominico Scarlatti, who, at fevents ${ }^{-}$three, compofed for him a great number of harplichord leffons, the chief of which had never been printed. The book in which they had been tranfcribed contained forty-two pieces, among which were feveral /losv movements, with which, for want of foltinuto and expreffion, in the old harpfichords, he feldom enriched his works. Thefe leffons were compofed in 1756 , when Scarlatti was too fat to crofs his hands, as he ufed to do; fo that thefe are not fo diffecult
a, his more jurenile works, which were made for his pupil and patronefs, the late queen of Spain, while the was infanta of Portugal. M. L'Augicr ufed to relate, that the emprefs queen Therefa had been a very notable mufician, and that fome years ago he had heard lier fing very well. In the year 1739 , when fhe was only twenty-two ycars of age, and very handfome, the fung a duo, with old Scnetino, at Florence, fo well, that by her voice, which was then a very fine one, and graceful and itceady manner, the fo much captivated the old man, that he could not procced without faedding tears of fatisfaction. Her imperial majefty had fo long been a performer, that fhe one day, in pleafantry, told the old Faultina, the wife of Haffe, who was then upwards of feventy, that the thought herfelf the firlt (meaning the oldeft) virtuofa in Europe; for her father, at a rehearfal, brought her on the court ttage at Vienna, when fhe was only five years old, and made her fing a fong.

Metaftalio, in a letter to Farinelli, calls M. L'Augier Monfignore; the phyfician of the pope, and we fuppofe the imperial phyfician is qualified with the title of Monfignore, my lord. The imperial Laurrat tells Farinelli, that Monfignor L'Augier is charmed with him, with his heart, and with his conduct. And fporting with his rotundity, he fays, "he often vilits me, in fpite of his immeafurable corpulency, and mounts to the altitude where I relide, with the lightnefs of the molt fim dancer. I thall, for your fake, embrace as much as puffible of his majeltic circumference." This extraordinary perfonage, with a mind proportioned to his body, died at Vienna in 1774, to the great lofs of fociety in that city, and of found criticifm and good tafte.

LAVLANO, in Geography, a town of Naples, in Principato Citra; 27 miles E. of Salerno.

LAUJAR, a town of Spain, in Grenadas is miles N.W. of Almeria.

LAVIGEN, a town of Norway, in the diocefe of Dron-theim; 24 miles N. of Drontheim.

LAVIGNON, a name which the fifhermen of the vicinity of Rochelle give to a fhell-fifh, which is ufed for food in that place, and is probably a fpecies of Solen. It is common on the ceaft of Poitou, and has a very thin pair of thells for its covering, and which never can fhut clofe, in the manner of the cifter or mufcle, or other common bivalve fhells: the filh, therefore, always buries itfelf in the mud by way of fecurity. The fhells are very fmooth and polifhed, efpecially on the infide, and they are naturally white. This colour they always retain within, though their outer furface is often inged black by the mud.

They are often baried five or fix inches deep in the mud, but it is always eafy to know where they are, beeaufe they mult keep a frice communication with the water above; by means of a round aperture, of about a tenth of an inch diameter, which opens from the furface of the mud to every fhell-fith. When the thells of this filh are opered to their utmoft width, it is eafy to fee a fort of arm with which each is furnifhed, in the manner of the common mufele, for its progreflive motion. This part ferves them to bury themfelves in the mud, and to raife themfelves out of it again, when they are inclined to feek a new habitation; into which they make their way in a more fpeedy manner than would eafily be thought.
When the creature is plunged to its proper depth under ground, it receives the benefit of the water abore, by means of two pipes, or probofcides, which have each a double aperture at their ends. Thefe take in water, and throw it out again, alternately, for the ufes of the animal, and either of the two is indifferently qualified to anfwer either purpoife. The fin has a power of leagthening, or fhortening thefe

pipes at picafure, and, when it pleafes, takes them wholly iuto the fhell. Mem. Acad. Par. 1710.

LoAVIN, in Ornithology, a name given by the people of the lhilippine illands to a fpecies of hawk, a bird of great beauty, being variegated all over with yellow, black, and white. They call it alfo ficub.
LAUINGEN, in Gcography, a town of 13avaria, in the principality of Neuburg, on the Danube, fuppofed to have been a Roman colony; lix miles above Hocktlett. N. lat. $4^{8^{\circ}} 3^{32^{2}}$. E. long, $10^{2} 22$.
LAVINGTON, East, or Murkel Leavington, a markettown and parifh in the hundred of Swanborough, and county of Wilts, England, is fituated at the northern termination of Salifbury plain. It was formerly called Steeple, or Staple, Lavington, and was a confiderable town; having acquired the nane of Cheaping, or Market Lavington, from its great corn market, which was eftablinhed early in the fifteenth century, but is now much decreafed, as the chief refort of the dealers is to Devizes. Eaft Lavington is $89^{\circ}$ miles from London; the markets were on Monday and Wednefday. The population, as recturned to parliament in 1800 , was 918 ; the number of houfes $16 \%$. Bihop Tanner, the celebrated author of "Notitia Monaltica," was born in this town in $167+$.
$W_{f} f$, or lBilhop's Lavingion, is a parih within two miles of the foregoing, but is fituate in the hundred of Whorlfdon; it was returned, in 1800, as containing 21+ houfes, and 998 inhabitants. Britton's Beauties of Wilthire, 8 vo.

LAVINIUM, in Ancient Geography, a fmall town of Latium, exactly S. of Rome, and eight miles S.E. of Lanrentum, near the fea-coalt, on the rivulet Numicus, between the mouth of which, and the J'iber, 压neas is fuppofed to have landed. According to Strabo, he built this town after the defeat of Turnus, king of Ardea; thus perpetuating his victory and the name of liis wife Lavinia, daughter of king Latinus. According to the fame author, he erected here a temple of Venus, the care of which he committed to the Ardeates. But as this city was not ftrong enough to refilt the affaults of his enemies, who were jealous of his power, he built another on an eminence, E. of the firft. See Lanuvius.
LAVINO, in Geography, a town of Italy, in the Milanefe; 18 miles W.N.IW. of Como-Alfio, a town of Naples, in the Molife; 24 miles N.E. of Molife.

LAVIS, a town of Tyrn, at the cunion of the rivers Lavis and Adige; cight miles $N$. of Trent.

LAVIT de Lomigne, a town of France, in the department of the Gers, and chicf place of a canton, in the diltrict of Lectoure; 12 miles E. of Lectoure. The place contains 1330 , and the canton 7695 inhabitants, on a territory of $193^{\prime}$ kiliometres, in 15 communes. N. lat. $43^{\prime 2} 57^{\prime}$. E. long $1^{\circ}$.

LAUKAS, a town of Sweden, in the government of Wafa; 124 miles E.S.E. of Wrafa,

LAUKOWITZ, a town of Bohemia, in the circle of Bolella:\% ; 10 miles N.N.E. of Junr-Buntzel.

LAUNAY, Peteh, in Biography, was born at Blois in the year 1573, and having conliderable family interelt, he obtained, in early life, a poof under goveroment, and was made fecretary to the king.. Thefe honours he willingly renounced, in order that he might devote his time to the ftudy of the facred writings. His works prove how diligently he followed his new profeffion. He acquired the refpect and efteem of the French Proteftants, and he was chofen deputy to all the fynods of his province, and to almoft every national fynod which was held in his time. He died in 3662, at the age of eighty-nine years. His works are paraphrafes on the Vol, XX.
books of Proverbs, Ecelefiaftes, the prophet Danich, all the epirtles of St. Paul, and the Apocalypfe, which were publifhed at different periods. He publifhed likewife "Remarks on the liable, or an Explanation of the different Words, Phrafes, and Figures of the facted Writings:" and "A Treatife on the Lord's Supper."

LAUNCE, in Jchlbyology, se Ammonver.
LAUNCEGAYS, in our Old Writars, a kind of offenfive weapons now difufed, and prolibited by the ftatute 7 Rich. II. cap. 13. Many of the commentators on our ancient laws profefo themfelves unable to explain what kind of weapoons thefe were. Grofe fuggells, that the term launcegay may be a corruption of the words lance afigue, is tharp or pointed lance; and if the intention of the acts be conlidered, it will jultify, in adegree, this fuppofition; as they were evidently framed to prevent thofe violent affrays that frequently arofe among the gentry of that time, commonly attended by a numerons fuite, who, if armed with mifchievous weapons, might have filt much blood. A lance fit for war was, perhaps, termed fharp, or pointed, in oppofition to a blunt or tilting lance. See Lavice.

LAUNCESTON, in Geography, a populous borough and market-town in the hundred of Eart, and county of Cornwall, England, is fituated on an eminence, at the diftance of one mile from the river Tamer, near the central part of the ealtern fide of the county. Its ancient name was Dunheved, the Swelling Hill ; but the prefent appellation, according to Burlafe, figuifies the "Church of the Cafle." The cafle is the moft important object in the town, to which, in all probability, it gave origin. Its mouldering walls furround and cover a confiderable extent of ground, and prove it to have been a fortrefs of great ftrength. and importance. The principal entrance was from the fouth-weit, through a fortified paffage upwards of an hundred fect in length, and ten in breadth. At the end of this flood the great gate, the arch of which was pointed, but is now in ruins. This led to a fmaller gate, with a round arch, opening into the bafe court, which formed a fquare of 136 yards, furrounded by thick walls and fortified with a deep ditch. At the fouthowelt angle was a very ftrong round. tower, whence a terrace extended to the keep or citadel at the fouth-eaft angle of the court. This confifted of an immenfe artificial hill, nearly ninety feet in perpendicular height, about 300 feet diameter at its bafe, and 93 at its fummit. The afcent to this keep originally commenced at a femi-circular tower, and continued to the top through a covered way, feven feet wide, now in ruins. The keep confilts of three wards, and is furrounded by a circular wall. The thicknefs of the outer wall, or parapet, is about three feet; the fecond wall is fix feet from the former, nearly four times the thicknefs, and confiderably higher. About eight feet within this wall is another, ten feit thick, and thirtytwo feet high from the floor of the inclofed area, the diameter of which is about eighteen feet. In the bafe court formerly Itood the county gaol, a fpacious affize court, a chapel, and other buildings; but thefe haveall been taken down, except the gaol, which retains its fituation near the bottom of the hill. The building of this cafte has been generally attributed to William, earl of Moreton and Cornwall, in the time of William the Conqueror; but this opinion is probably erroncous, as the fyle of workmanfhip exhibited in feveral parts of the remains, is apparently of a much earlier date.. The walls of the kecp, in particular, have every appearance of. being confiderably more ancient; and from a retrofpective view of events that have occurred in this county, the conjecture appears to be fully warranted that the foundation of the cafle is as remote as the time of the Britons... The er:

## LA U

in which the town was founded, or, at leaf, began to afo fume a regular form, is better determined; this was about the year 900 . No remains of the original buildings are now cxtant. On the north fide of the town was a priory of Auguttinc monks, faid to have been eftablifhed by Warlewalt, bifhop of Exeter. As stlis town was a principal refidence of the carls of Corawall for many years after its foundation, its confequence contiaually increafed, and many liberties and privileges were granted to its inhabitants. Soon after the conquelt a weekly market was eftablifhed op Sunday; in the reign of king John, the towninecn paid five marks for the removal of the ruarket to Thurfday, but it has fince been changed to Sturday. In the reign of Henry III. Launcellon was made a free borough by the king's brother, Richard, earl of Poietiers and Cornwall; he alfo granted the inlhabitants fome additional immunities, which were confirmed by feveral fubbequent charters; and in the reign of R*hard 11. the affizes were ordered to be held at Launcelton, and "no where elfc." This regulation was obferved till the firt year of George I. when an act was paffed empowering the lord chancellor to appoint any other place in the county. Since that period the winter allizes only have been hicd here; thofe of the fummer having been removed to Bodmin. By a charter of Philip and Mary, granted in 155 , which enumerates and confirms the various prior clarters, the government is velled in a mayoor, recorder, and eight aldermen, who, with the free burgeffes, have the right of electing the parliamentary reprefentatives. The whole number of voters is about twenty. This borough made its firlt return in the twenty-third of Edxard I. and had a may yor as early as the time of Edward IV. Near the centre of the town is the church of St. Mary Magdalen, a handfome fabric, built with fquare blocks of granite, moft of which are enriched with carved ornaments, esecuted in a very fingular manner. At the welt end is a lofty tower; and a figure of the Magdalen, in a recumbent poffure, is placed in a niche at the ealt end. This church was originally only a chantry chapel; in the reign of Henry IV. it was re-edified and confiderably enlarged; in Henry VI.th's reign it was conflituted a parifh church, and was again rebuilt in the time of Henry VIII. The town was formerly furrounded by a wall, of which fome parts filll remain. The flreets are narrow; but the houfes are well built ; on the fouth fide is a fortified gateway, containing an apartment ufed as the town gaol. The children of the poor are educated in two charity-fchools maintained by voluntary fub. fcription; and a frec-.chool founded and endowed by queen Elizabeth. Launcefton is diftant from London 213 miles; has a.weekly market on Wednefday, belides that on Saturday already mentioned, and fix annual fairs ; the return to parliament in the year 1801 flated the population to be 1483 , the number of houres 226 . The houfes of this town are connected with thofe of Newport, which is a burough, though apparently only part of Launceiton. See NewP)

About two miles north of this town is Werrington, a feat of the duke of Northumberland. Polwhele's Hillory of Co.n.xall, to. Beauties of England and Wales, vol. ii.

LaUNCH, in Ship Building, is the nip or defcent wherenn the flip is built, alfo the whole machinery ufed in bunching.

To facilitate the operation of 1aunching, the fhip, when fle is firft built, is fupported by ftrong plafforms, laid with a gradual inclination to the water, on the oppofite fides of hier keel, to which they are parallel. Upon the furface of this decliviey are placed two correfponding ranges of plarks, which compofe the bafe of a frame, called the cradle, whofe
upper part envelops the flip's bottom, to which it is fecurely attached. Thus, the lower furface of the crade, conformiug exactly to that of the frame below, lies fat upon it, lengthways, under the oppofite fides of the fhip's bottom; and as the former is intended to fide downwards upon the latter, carrying the fhip along with it, the planes or faces of both are well daubed with foap and tallow. The neceflary preparations for the launch being made, all the blocks and wedges by which the flip was formerly fupported. are driven out from under her keel, till the whole weight gradually fubfides upon the platforms, which ate accerdingly called the ways. The fhores and flanchions, by which he is retained upon the flocks till the time of launching, are at length cut away, and the fcrews applied to move her, if necefliary. The motion ufually begins at the inftant when the fhores are cut, and the fhip flides downward along the ways, which are generally prolonged under the furf face of the water to a fufficient depth, to foat her as foon as fhe arrives at the farthelt end thereof. When a fhip is to be launched, the enfign, jack, and pendant, are always boitted, the laft being difplayed from a faff ereled in the middle of the fhip. Ships of the firlt rate are commonly conltruted in dry docks, and afterwards floated out, by throwing open the flood-gates; and fuffering the tide to enter, as foon as they are fiwinhed. Falconer.
LAUNCHING, the att of conveying the fip into the water after fhe is built.
Lauxcuiso-Draft of Water, the depreffion of the flip. when firft launched below the water's furface.
Lavecruxg-Planks, form the upper furface of the platform on each fide the fhip, wherevn the buldgeways fide in the aet of launching the thip.

LAUNDER, in Mineralogy, a name given in Devosfhire, and other places, to a long and hallow trough, which receives the powdered ore, after it comes out of the box, or coficer, which is a fort of mortar, in which it is powdered with iron pefles.

The powdered ore, which is wafhed into the launder by the water from the coffer, is always fineft neareft the grate; and coarfer all the way down. See Bupple and Drefing of Ore.
LAUNDRY, as if Lavanlerrie, Fr. the room in which clothes are walhed; or, in a more reftricted and appropriate fenfe, as the term is ufed in the fubfequent article, it denotes the place where clothes are mangled, dried, and ironed. Under this head we flall include the suyfb-bonfe, as it is neceffarily connected with the laundry. Wafling and getting up linen are employments of great importance in moff families, and they have engaged the attention of many ingenious mechanics, who have contrived various waflhing-machines for the abridgment of labour and expence in this department of domeltic economy. Moft of the machines hiitherto ufed are objectionable on many accounts, but principally becaufe they operate by frizion, inltead of preffiure. When the linen is properly prepared for walhing, it may be thoroughly cleanfed by preffure only. Rubbing it with the hands, or by any machine that operates by friction, injures it more than the wear it fultains in aetual ufe. Hence it follows that the beft method of cleanling foul linen is, firtt, to prepare it for the operation by foaping it where neceflary, and putting it into foak for at leat twelve hours. This will loofen the filth, and decompofe the greafe and other matter with which it is foiled, and it will then be readily removed by alternately foaking, and fquezezing or preffing. The defideratum, therefore, is, to conltruct a macline that would, by a rotative motion, or an up-and-down froke, (like pumping) alternately prefs and faturate the lisen with

## I. $A \cup N D R Y$.

the fuds, and lattly with clear water. The niachine that comes neareft to this, of any that has fallen under our notice, is oñe invented by Mr. Gould.

We fhatl now deferibe a waflothoufe and laundry, confruped upon fcientilic principles by Joln Bentley, efq. the pref:nt polfeffor of Highbury Houle, near London, being the completelt of the kind we have met with.

The wallh-houfe is 24 feet long, nine feet broad, and eirht feet high. It is furnithed with a filtering machine, a ciftern for filtered water, tivo coppers, a copper cullender, a jack with pullies, fix wafling tubs, a fone fonk, a table; a wringing machinc, and a pump of hard water.

The floor is rouzh Yorkflaire-fone, laid upon a fliarp current. Over twothirds of the roof is a lead cikern containing 40 hogtheads of rain water, fupplied from the adjoining buildings. The other third of the roof is conical, furmounted with a cylinder for a fleam-vent, which opens and fhuts at pleafure. When open, befides emitting the iteam, it adnuits both light and air. The ciflern for filtered water holds 200 gallons, and fupplies, by pipes and cocks, the copper tubs and link.

The firft copper is fixed fo that the top of it is level with the bottom of the ciftern, and the bottom of it is level with the top of the other copper, and the tops of the tubs and fink, all which it fupplies with hot water. The tubs, coppers, and fink, are fupplied with cold water from the ciltern. Each of the tubs lias a brafs plug at bottom, to difcharge the foul water. A ninc-inch board runs along the front of the tubs and fink on the ground, to prevent the fplafhing of the water when difcharged. Each tub is furnifhed with a fmall wooden ftrainer for foap.

The fecond copper-is for boiling the linen, and has a copper cullender to hold the linen, which is drawn up by the jack and pullies. The jack has a paul and ratchet wheel to keep the cullender fufpended over the copper till the water is drained from the linen into the copper, which can then be turned out altogether into the rinfing-tub. By this contrivance, the ufual mode of poking the linen out with a ftick (which frequently damages it) is avoided. At the bottom of this copper is a large brafs cock for difcharging the fuds when they are done with.

Though the fix tubs are fupplied with both hot and cold water, there are only fix cocks to the whole, one cock fupplying two tubs, by means of a fcrew-joint in the nozzle, which turns at pleafure to either tub. There is alfo a fcrewjoint between the key and pipe in each cock, by which means it can at any time be repaired without the affiltance of the plumber.

The filtering machine performs its operation by afcent. It has three cocks in one pipe: The uppermoft is for regulating the quantity of water to be filtered, which can be varied at pleafure from 50 to 500 gallons in a day. The other is for cleanfing the machine when faturated with filth, which is accomplifhed by only turning the cock, and will, in a few minutes, be as clean as it was at firit, the mud, \&c. being difcharged at the third or middle cock, which alfo ferves to draw unliltered water when required. Under the ciltern is a receptacle for coals, and under the filtering machine a place for pails and mops. Both cilterns have a furplus wa-ter-pipe to prevent running over, and in which are allo plugs to difcharge all the water when needful.
The table hangs to the wall, and may be put up and down at pleafure. It is for forting and foaping the foul Inen, \&c.

The laundry adjoining the wafh-houfe is is feet fquare, and II feet in higight. It has two windows in front. The foor is level, of rubbed Yorkthire-ltone, laid upon brick pie:s,
to keep it perfeetly free from damp. It is furnified with one of Baker's harge mangles; an ironing board 12 feet by three fret, with four large drawers for the ironing-ckoth, iron-kolders, \&c. with room for the clothes-bafkets underneath; a ftove or drying-clofet, eight fect by fix feet; a furnince for heating the clofet and the irons, and a place for coals under the ffoor, clofe by the furnace. The clofet contains four wooden horfes, cach with five rails or bars. Each horfe runs in and out of the clofet upon two fmall iron wheels, upon an iron rail-way. One horfe holds fix flirtz, or a proportionable quantity of other linen, and the whols will dry off as much and as fpecdily as fix women can walh in fucceffion. It hardens the linen after being irned, and is alfo ufeful for airing feather beds, \&ec. The linen, whiltt drying, is kept free from froke and duit, and there never can be any fleam in the room.
The furnace for heating it is fimilar to thofe under coppers or in a hot-houfe, immediately over which, before it enters the flue to the clofet, is an iron oven for heating the irons. The flue is continned round the bottom of the clofet, and carried up the end of the building. The top of the horizontal part of the flue is of calt-iron plates; iron being a good, and brick a bad conductor of heat. A few incles above thefe iron plates, the iron rail-way before mentioned is laid, between which and the flue there is a flooring of wire work. This prevents any accideut from the cafual falling of linen upon the flues, but does not impede the afcent of warm air. Level with the rail-way, infide the clofet, there is an opening 15 inches fquare, communica:ing with the external air. The cieling of the clofet is in the form of a hopper, termirating in a funnel of the fame diameter ( 15 inches) as the external air-vent. Both thefe vents are furnithed with a fliding door, which opens and fhuts, as required, by pulley cords.

The primciple upon which it acts is by heating it to a वंegree fufficient to excite a Itrong evaporation from the wet linet, and carrying off the moilture by means of the two vents. During the time of its acquiring this heat, both the vents, and alfo the horfes, are lept clotely fhut, fo that the clofet is nearly air-tight. As foon as the proper degree of heat is obtained, both the vents are to be opened, when a ftrong current of air rufhes in at the lowelt, carrying up all the vapour from the linen through the upper vent or funnel, when the dryi ig will be vary fpeedily completed. The linen is then removed, a fref fupply put in, and the opera* tion repeated as before, beginning by clofely thutting all up.
Befides the difpatch and economy attending this wafh-houle and laundry, the health and comfurt of thofe employed in them are greatly promoted, by being entirely free from the pernicious effects of damp vapour, and in not being incommoded by any extra heat in hot weather.
Since this article was written, the gentleman above mentioned has made a coniderable improvement in the wafhhoufe. He has conftrutted an apparatus for performing the operation by fleam. Although it is not yet (December ISII) quite completed, it is fufficiently fo to have afcertained by experiment, that cvery feccies of awbite linen may be better cleanfed this way than it is poflible to do it by the hands, or any machine hitherto invented. - We fay cuzbite linen, becaufe the operation proves to be fo powerful, that it difcharges the colour from all dyed and printed articles that have been tried with it.

At the end of the walh-houfe a frong iron-boiler is fixed, three feet dix inches long, one foot eight inches wide, and two feet nine inches dep, with fittings up the fame as thofe for ftc an--ngines, viz. a feeding-pipe with regulator, a 3 C 2
mercury
mereury gauge-tube, a three-inch fteam-tube, two obfervation cocks, a fafety valve, and a difcharging pipe. From the Iteam-tube, a pipe of $1 \frac{1}{2}$ inch bore is continued the whole length of the building; and from this main Itean-pipe, others of fmaller dimenfions, from $\frac{3}{8}$ to $\frac{3}{4}$ inch diameter, are laid on the different theaming veffels. Thefe may be either of wood, tin, or copper; but the latter is certainly belt, for the action of Itean is fo powerful, that it will foon render both wood and tin uflefs. They mult be fitted with a loofe grating infide, about two inches from the bottom; a cock at one end, to admit the fleam; and another at the other end, quite at the bottom, to difcharge the foul water. The procefs is as follows: Soap the linen where it is very dirty, and pitt it to foak; then place the linen upon the grating in the itean veffel; cover it up, and turn on the theam. The difcharging cock mult be occafionally opened, to draw off the condenfed ftean; and when it is found to conie off perfectly clear, which it will do in half an hour, or lef's, the operation is finifhed, and the articles will come out perfectly clean, and mott beautifully white.

By this fimple and eafy procefs, the drudgery of wafhing is entirely done away; and the faving in time, foap, and other expences, is greater than can well be conceived. The faving of water in many fituations is a matter of confequence; but what is of Itill more importance, the linen will lalt double the time it otherwife would do: for as there is neither preffure nor friction, it cannot be injured in this procefs.

Wafhing by fleam has been practifed, but never before by this method. The way it has been dose has been by fleaming the linen in the fuls. Hence it is evident that the filth that is forced out of the linen is mixed with the fuds, and is again difperfed equally all through the linen; fo that repeated changes of foap and water mult be had recourfe to, before the liner is made thoroughly clean. But by this new procefs, the linen being put into the fteaming velfels, without any other liquur than it retains on being taken out of the foaking tubs, every particle of matter which is diflodgced from it intlantly fubfides to the bottom of the veffel, and never can again come in contact with the linen. Our readers mult excufe the prolixity of this article, on account of its great innportance and ufefulnefs in domeflic economy to every fanily.

Note- -The boiler above defcribed alfo heats an hot-loufe in an adjoining garden, befides boiling a copper, and thus does the work of fix fires.

LAUNOY, Joun de, in Biography, was born at Valdefie, a village of Lower Normandy, in 1603 . He received the early part of his education at Conftance, whence he was fent to the univerfity of Paris, where he purfued his Itudies -with great diligence for live or fix years. In 1636 he was ordained prielt, and foon after was admitted to the degree -of doctor of divinity at the college of Navarre. For the fake of improvement he travelled to Rome, and became acquainted with the moft eminent characters ; but on his return to Paris, he applied with great intcufenefs to his ftudies, and compofed a valt variety of works on fubjects relating to hiltory, criticifm, and eccletiaftical difcipline. At his own houfe he formed a kind of literary fchool, for the difculfion of topics that tended to the improvement of the mind. He was an able defender of the rights of the -Gallican church, in oppofition to the pretentions of Rome. He attacked feveral falle traditions with great intrepidity; and he contended fo forcibly for expunging the names of feveral falfe faints from the calendar, that he was called the banifher of faints. It was faid of him, that "he was a terxible critic, formidable both to heaven and earth; that he
had expelled a greater number of faints from paradife than ten popes have canonized. He fufpected the whole martyrology; and he examined all the faints one after another, in the fame manner as they do the nolility in lrance:" By the freedom which he exercifed in his writings, he provoked againtt him an hoft of enemies; and he was obliged, at the intimation of the king, to difcontinue his affemblies, which were held at his own apartments. He met with an excellent friend in the abbe d'Ellrees, who prefented him with a very valuable prefernent in the clurch, which he foon religned, chooling to live contented on a fmall income rather than endure the cares of bufinefs. He faid that it was nuch more difficult for a Chriftian to make a right ufe of riches, than to live without them. He died in his $75^{\text {th }}$ year, in 1678 . His works are very numerous, and have been collected and publifhed in ten volumes, folio. Of one of his pieces, viz. "De Auctoritate negantis Argumenti," Bayle fays, had he publifhed nothing elfe, he would have eftablifhed his fame as a benefactor to the republic of letters, by a thoufand fine hints which it contains for dillinguifhing truth from falfehood in hiftorical matters. He was a perfon of great fimplicity, a good friend, difinterelted, and laborious; an enemy to vice, void of ambition, charitable and beneficent, and ever obferving the fame tenor of life. Bayle. Moreri.

LAUNY, or Laux, in Geography, a town of Bohemia, in the circle of Saat\%, on the Egra, on the road from Leipfic to Prague; 9 miles E.N.L.. of Saatz. N. lat. $50^{\circ}$ $20^{\prime}$. E. long. $13^{\circ} 54^{\prime}$.

Lavoisier, Anthony Lawrence, in Biggrapey, a diftinguilhed clemical philofopher, was born at Paris, on the 13 th of Augult $17+3$. His father, who was a man of opulence, fpared no expence in bettowing upon him the advantages of a liberal education; and he difplayed very early proofs of the extent and fuccefs of his studies, efpecially in the circle of the phytical fciences. In the year 1764, the French government propofed a prize queftion, relative to the belt method of lighting the ftrects of a large city. Lavoilier prefented a differtation on the fubject, which he difcuffed upon the molt enlarged and philofophical views. This was not only highly approved, and printed at the expence of the Academy of Sciences, but obtained for him the prefent of a gold medal from the king, which was delivered to him by the prefident of the Academy, at a public fitting, in April 1766. 'Two years afterwards, he was admitted a member of that learned body, of which he was conflantly one of the molt active and ufeful aflociates. A bout the fame time, he was occupied in experimental refearches on a variety of fubjues: fuch as the analy fis of the gypfum found in the neighbourhood of Paris; the cryflallization of falt ; the properties of water; and in explorings the phenomena of thunder, and of the aurora borealis: and he dittinguifhed himfelf by feveral differiations on thefe and other topics, practical and fpeculative, which appeared in different periodical works. In the Memoirs of the Academy for $1 \%{ }^{2} 0$ were publifhed his obfervations on the nature of water, and on the experiments which had béen fuppofed to prove the poffibility of its converfion into earth. He proved, by a careful repetition of thefe experiments, that the earthy depolit, left after repeated diftillations of water, procceded folely from an abrafion of the veffels employed. Lavoifier performed feveral journies into various parts of France, in company with M. Guettard; in the courfe of which he collected a fore of materials for a lithological and mineralogical hiltory of that kingdom, which he ingeniouny arranged in the form of a chart. Thefe materials were the bafis of a great work on the revolutions of the globe, and on the formation of the ftrata of the earth : two interefting iketches of which were printed

## IA VOISIER.

printed in the Memoirs of the Academy for the years $17 \neq 2$ and $1787^{\circ}$

In fact, M. Lavoifier devoted his whole time and fortune to the cultivation of the feiences, the boundarics of which he feemed, by fuch an union of zeal, talent, and wealth, deflined to extend. About this period, a new mine of experimental refearch, which promifed the molt curious and interelling refults, had been opened out by the genius of 1)r. Black, and already purfucd with much fagacity and induftey by Dr. Priettley.-We allude to the difcovery of the properties of certain acriform fubitances, gafes, or (as they have been called) factitious airs, which had hitherto efcaped the attention of chemical inquirers. M. Lavoilier, ttruck with the beauty and importance of thefe difcoveries, entered into the fame field of refearch with all the feientific ardour by which he was characterized: and here the advantage of his ample wealth was manifelt; for he conducted his experiments upon a large fcale, with coflly iultruments of the molt improved conltraction. The refult of this courfe of experimental inquiry he gave to the world in 1574, in his "Opufcules Chymiques," which contained not only a clear and elegant view of all that had hitherto been done, in regard to gafeous or aëriform fluids, but alfo feveral original experiments, remarkable for their indrenuity and accuraey.

The exiltence of a gafeous body, in a fised or folid itate, in the mild alkaties and alkaline earths, which, when expelled from thefe fubitances, aflumed an aërial form, and left them in a caultic tate, as well as its production during the combuttion of fuel, had been demonitrated by Dr. Black; and Bergman had thewn that this air poffefied acid properties. Dr. Prielley had allo fubmitted it to various experiments in the year ${ }^{1} 767$; but no progrefs had been made in afcertaining the real conltituent parts of this acid gas, or fixable air. 'The honour of this difcovery was left for Lavoilier; who, in 1772 , by expofing a piece of charcoal, inclofed in a glafs veffel, to the action of a lens, difcovered that part of the charcoal was confuned, that a diminution of air had taken place in the receiver, and that the refidue poffeffed the properties of the lixable air:-whence he concluded that charcoal was one of the conftituent parts of this gas. The combutible rature of the diamond having been alrendy proved by Macquer, d'Arcet, and others, Lavoifier was induced to fubmit this fubitance to the fame treatment as the charcoal in the former experime:.t; and he found that precifely the fame refults took place: whence he inferred, that there cxifted a great analugy between charcoal and diamond. Both thefe conclufions have been amply confirmed by fubfequent experiments: ther were in every refpect important; and feen, together with the facts previoufly known, of the production of acids by the combultion of fulphur and phofuhorus, to have given the firlt hint to Lavoifier of his fubfequent general theory of the formation of acids.

Lavoifier now turned his experimental refearches to the fubject of the calcination (as it was then termed, from its apparent fimilarity to the procefs of making lime) of metals. It had already been fhewn by Rey and Humberg, that metals acquire an augmentation of weight during calcmation. This additional weight was attrisuted by the latter to the fixation of heat and light ; but was fuppofed by the former to proceed from the fixation of a part of the air. M. Laveitier publifhed the refilt of his inveltigation of this curious fubject in ry74, in a memoir on the calcination of tin in clofe veffels, th which he demonitrated the following very important facts. He fhewed, 1 , that a given quantity of air was requilite for the calcination of a given quantity of tin; 2 , that a part of the air is abforbed during this pro.
cofs, by which net only the Dutk, isut the wergite of the air is diminithed; 3, that the weight of the tin is increafed during the fame procefs; and, A, that the weight acquired by the tin is exactly equal to that which is loft by the air.

Thus by a few limple, accurate, and well-chofen experiments, Lavoilier had apparently arrived at the legritimate inference, that during the procefo of the formation of acid, whetler with carbonaceous matter, fulphur, or phofiphorus, and alfo during that of the calcination of metals, an abforption and hixation of air take place, and thus he gained a glimple of principles, in tho viev of which his fingular fagacity in deviling experiments, and his accuracy in exceuting them, would in all probability have alone colfucted him (1) thafe brilliant refults, to which the active genies of 1) r . Prictley fo materially contributcd. The fy yelhetic proof. only of this union of air with the bafe had been as yet afcertained: but Dr. P'riefley firt furnifhed the analytic proof, by diftevering the combination; a difcovery which at once advanced the natcent theory of Lavoilier, and, in his hands, became the fource of more than one important conclufion. In Alegult 1774, Dr. Priellee difcovered, that by heating certain metallic calces, efpecially the calcined mercury, (the precipitate per fe. as it was then called, a quantity of air was feparated, while the mercury refumed its metallic form; and this air, which he found was much purer than that of the atmofphere, he called, from the theory of the time, dephlogijficated air. The fucceeding winter he spent at Paris, and communicated to Lavoilier, and the other philofophers there, his recent difeovery: and the importanse of this intelligence to the views of Lavoilier was manifett in a memoir pubilithed by him in the following year, 1775, on the nature of the principle which combines wihh metals during their calcination. In this paper he fhewed, in conformity with the experiments of Dr. Priefley, that the mercurial precipitate per fe, by being heated in a retort, gives our a highly refpirable air, ( (ince called ooyycon, ) and is itfelf reduced to the metallic fate; that combultible bodies burn in this air with increafed brilliancy; and that the fame mercurial calx. if heated with charcoal, gives out not the pure air, but fixed air:-whence he concluded that fixed air is compofed of charcoal and the pure air. It has, therefore, fince been called carbonic acil.
A fecond very important confequence of Dr. Prieftley's difcovery of the pure or vital air, was the amalyfis of the air of the atmofphere: which was accomplifhed by Lavoificer in the following manner. He included fome mercury in a clofe veffel, together with a known quantity of atmolpheric air, and kept it for fome days in a builing flate: by degrees a fmall quantity of the red cals was formed upon the furface of the netal; and when this ceafed tu be projuced, the contents of the veffel were examined. The air was found to be diminifhed both in bulk and weight, and to have been rendered altogether incapable of fupporting combuftion or animal life: part of the mercury was found converted into the red calx, or precipitate per. $\sqrt{c}$; and, which was extremely fatisfactory, the united weight of the mercury and the precipitate exceeded the weight of the original mercury, by precifely the fame amount as the air had loit. To complete the demonfration, the precipitate was then heated, according to Dr. Priellley's firt experiment, and decompofed into fluid mercury and an air, which had all the properties of vital air ; and this air, when mixed with the unrefpirable relidue of the original air of the receiver, compofed an elaitic fluid poffelfing the fame properties as atmof pherical air. The vital air was afterwards made the fubject of various experiments in refpect to the calcination of metals, to the combultion and converlion of fulphur and phofphorus into

## LA $\begin{gathered}\text { OISIER. }\end{gathered}$

acids, sec. in which proceffes it ivas found to be the chief agent. Hence it was named by lavoifier oxyyen (or generator of acids), and the unrefpirable refidue of the atmoPphere was called $a \approx o t$, (i. e. incapable of fupporting life.)

The new theory thus acquired farther fupport and confiftency: oxygen appeared to be one of the moll active and inportant agents of chemiftry and of nature; combultion, acidification, and calcination, (or, as it was now called, oxydation, the calces being alfo termed oxyds, i. e. fonething approaching to, or refembling acids, were proved to be procefies ftrikingly analogous to each other; all according in thefe points, that they produced a decompofition of the atmofpheric air, and a fixation of the oxygenous portion in the fubilance aciditied or calcined.

Time alone feemed now requilite to ellablifh thefe decerines, by exemplifying them in other departments of chemisal refearch. In the year $1 / 7,7$, fix menoirs were communicated to the Academy of Sciences by Lavoifier, in which his former experiments were comfirmed, and new advances were made to a confiderable extent. Our countrymen, Black and Crawford, in their refearches refpecting latent heat, and the different capacities of bodies under different circumitances, had laid a folid foundation, on which the doctrines of combultion, refulting from the foregoing experiments, might be perfected, and the caufe of the light and heat connected with it might be explained. The firft mentioned philofurther, Dr. Black, had hiewn, that a folid, when it is made to affume a liquid form, and a liquid, when it affumes the form of vapour, abforls or combines with, and renders latent, a large portion of heat, which is again parted with, becomes free and cognizable by the fenfe of feeling, and by the thermometer, when the vapour is again condenfed into a liquid, and the liquid becomes folid. In like manner, it was now faid by Lavoilier, during the procefs of -ombuftion, the oxygen, which was previoufly in a gafeous ftate, is fuddenly combined with the fubtance burnt into a liquid or folid. Hence all the latent heat, which was efential to its gafeous flate, being inftantaneoufly liberated in Jarge quantity, produces flame, which is nothing more than very condenfed frec heat. About the fame time, the analogy of the operation and necefiity of oxygen in the function of refpiration, with the preceding lyyputhefis of combuftion, was pointed out by Lavoilier. In the proce?s of refpiration, it was found that, although atmofpheric air is inhaled, carbosc acid and azot are expired. This animal operation, faid Lavoifier, is a fpecies of flow combuttion: the oxygen of the air unites with the fuperfluous carbon of the venous blood, and produces carbonic acid, while the latent or combined caloric (the matter of heat) is fet free, and thus fupplies the animal heat. Ingenious and beautiful, however, as this extenfion of the analogy appeared, the fubject of animal temperature is till under many obfcurities and difficulties.

The phenomena of chemiftry, however, were now explicable upon principies more fimple, confittent, and fatisfactory than by the aid of any former theory; and the Lavoifierian doctrines were every where gaining ground. But there yet romained a formidable objection to them, which was derived from a circumitance attending the folution of metals in acids; to wit, the production of a conliderab'c quantily of inflammable air. If fulphuric acid (formerly called vitriolic acid, or oil of vitriol) cumffis only of fulphur and oxygen, it was faid, and bar iron is nothing more than this metal in a fimple fate, how dues it happen, that when thefetwo fubtances, with a little vater, come in contaft, they flould produce a large quantity of inflammale air during their re-action? This objection was unanfwerable, and appeared to be fatal
to the whole theory: But it was mof opportunely converted into an argument in its farour, by the great difcovery of the decormpolition of water, made by Mr. Cavendifh ; who refolved that clement, as it was formerly efteemed, into exygen and inflammable air. The latter has fince, therefore, been called bydrogen, or generator of water. This experiment was repeated with full fuccefs by Lavoifier and his aftociates in 1783; and the difcovery was farther eltablified by a fuccefsful experiment of the fame chemitts, carried on upor a grand fcale, in which, by combining the oxygen with hydrogen, they produced water, and thus adding fynthefis to analyfis, brought the fact to demonftration.

This new view of chemical phenomena, together with the immenfe accelfen of new compounds and fubitances, which the labours of modern experimentalifts had brought to light, appeared to demand a correfpondent alteration in the nomenclature. Accordingly, a committee of fome of the ableft of the French chemitts, of whom Lavoifier was the moft confpicuous, undertook the arduous tafk, and produced a regular fyitem of nomenclature, derived from the Greck language, which, although far from being faultlefs; and notwithlanding much oppofition with which it was at firft treated, has become the univerfal language of chemical fcience, and has been adopted even in pharmacy and medicine. His work, entitled "Elemens de Chymie," which was publihed in 1789 , was a model of fcientific compofition.

We have hutherto viewed M. Lavoifier principally as a chemical philofopher, in which character he has tounded his great claims to the refpect and admiration of pollerity. But the other arts and fciences are indehted to him for confiderable fervices which lie rendered them, both in a public and private capacity. In Frasce, more than in any other country, men of fcience have been confuited in matters of public concern; and the reputation of Lavoinier caufed him to be applied to, in $I_{7} 76$, to fuperintend the manufacture of gunpowder, by the enlightened minitler Thurgot. By the application of his chemical knowledge to this manufacture, he was enabled to increafe the explofive force of the powder by one fourth; and while he fuppreffed the troublefome regulations for the collection of its materials from private houfes, previoully adopted, he quintupled the produce. The Academy o! Sciences received many fervices from his hands. In addition to the communication of furty papers, relative to many of the molt importent fubjects of philofophical chemiltry, which were printed in the twenty volumes of Memoirs, from 1772 to 1793, he moll actively promoted all its ufeful plans and refearches, being a member of its board of confultation, and, when appointed to the office of treafurer, he introduced order into its accounts, and economy into its expenditure. When the new fyttem of meafures was propofed, he contributed fome new and accurate experiments on the expanfion of metals. The national convention confulted him with advantage concerning the beft method of manufacturing affignats, and of fecuring them againft forgery. Agriculture carly engaged his attention, and he allotted a confiderable tract of land on his eftate in the Vendome, for the purpofe of experimental farming. The committee of the conitituent affembly of 179 I , appointed to form an improved fyftem of taxation, claimed the alfiflance of his extenfive knowledge; and he drew up, for their information, an extract of a large work on the different productions of the country and their confumption, for which he had been long collecting materials. This was printed by order of the affembly, under the title of "Richefies Territoriales de la France," and was eftcemed the molt valuable memoir on the fubject. In the fame year, he was appointed one of the commifioners of the national treafury; and be introduced

## L A V

Into that department fuch order and regularity, that the yroportion between the income and the expenditure, in all the branches of government, could be feen at a fingle view every evening. Thlis fpirit of fyltematic and lucid arrangement was, indeed, the quality by which he was pecularly dillinguifhed, and its happy influence appearcd in every fubjeet which occupsed his attention.

The prisate life of this diftinguifhed perfon was equally eftimable with his public and phlofophical character. He was extremely liberal in lis patronage of the arts, and encouraged young men of talents in the purfuit of fcience. His houfe became a vafl laboratory, where philofophical experiments were inceffantly carrying on, and where he held converfaziones twice a week, at which all the votaries of learning and fcience, foreigners as well as Frenchmen, affembled. In his manners M. Lavoifier was mild, affable, and obliging ; a faithful friend and hufoand, a kind relation, and charitable to the poor upon his eftates; in a word equally claiming efteem for his moral qualities, as for thofe of his underitanding.

The time was arrived, however, when diftinetion even by his talents and worth was fo far from fecuring public refpect, amid the tumults of the revolution, that it became a fource of danger, and, when joined with wealth, was a'moft certainly fatal. All thofe efpecially, who had held any fituation under the old adminiftration, particularly in the financial departments, were facrificed during the murderous reign of Robefpierre, to the popular odium. Lavoifier was icized and thrown into prifon, upon fome charges fabricated againit himfelf and twenty-feven other farmers-general. During his confinement he forefaw that he fhould be ftripped of all his property; but confoled himfelf with the expectation that he would be able to maintain himfelf by the practice of pharmacy. But a more fevere fait awaited him: he was capitally condemned, and dragged to the guillotine, on the 8 th of May, 5794.

The name of Lavoifier will always be ranked among the moft illultrions chemitts of the prefent age, when it is confidered what an extenfive and beneficial influence his labours have had over the whole fcience. It has been faid, indeed, that if he be effimated on the fcore of his actual difcoveries, not only Scheele and Prieftley, and Cavendifh, but many more, will itand before him. But he pofferted in a high degree that rare talent of difcernment, by which he detected analogies, which others overlooked, even in their own difcoseries, and a fagacity in devifing and an accuracy in completing his experiments, for the purpofe of elucidating every fuggeftion which he thus acquired, fuch as few philofophers \&ure poffefled, No one who did fo much, probably ever made fo few unfucceffful or random experiments. It was the fingular perficuity, fimplicity and order to which he reduced the phenomena of chemiltry, that claimed for his theory the general reception which it met with, and occafioned the abandonment of thofe doctrines which prejudice and habit confpired to fupport. Subfequent difcoveries, however, and wnore efpecially thofe numerous facts which the genius of Mr. Davy has lately brought to light, through the medium of that moft powerful agent of decompolition, galvanifm, have rendered feveral modifications of the Lavoifierian theory neceffary, and bid fair to produce a more general revalution in the language and docirines of chemiftry.
M. Lavoifier married, in 177 I , the daughter of a farmergeneral, a lady of pleafing manners and confiderable talents, who partook of ber hurband's zeal for philofophical inquiry, and cultivated chemittry with much fuccefs. She engraved with her own hand the copper plates for his laft work. Mad. Lavoifier has fince given her hand to another eminent philo.

fopher, count Rumford. Gen. Biog. IIutchinfon"s Bioz. Med.
LAVONIA, in Georrafhy, a town of Naples, in Calabria Citra; 8 miles W.S.W. of Roffano.-Alfu, a quwn of Calabria Ultra; 14 miles W. of Squillace.

Lavora, or Thrma in Lavora, a fertile and delightful province of Naples, diverfified with hills and plains, lying between $40^{\circ} 36^{\prime}$ ald $41^{\circ} 45^{\prime} \mathrm{N}$. lat. ; anciently 'Terre Laboria, Campania, and Campus Laboricus, and in the midude ages the Caftellany of Capua. It received its prefent name in rons from Richard II., prince of Capua, on account of the fitnefs of the foil for every kind of culkivation. This province is populous, and abounds in corn, wine, oil, and other productions of Italy. It is bounded o: the N.IV. by Campagna di Roma, on the N. and IE. by Abruzzo Citra and Contado di Molife, on the S.E. and S. by Principato Ultra and l'rincipato Citra, and on the IV. by the Mediterranean ; being 90 miles from N.W. to S.E. and $30-45$ in breadth; and in 1779 it contained $1,210,089$ inhabitants. It is watered by the rivers Garigliano and Voiturno; the former, which is a placid ftream, rifes in Abruzzo Ultra, and falls into the fea below Trajetto; the latter defcends from the A penninss, pafies by Capua, and lofes itfelf in the gulf of Grota. The capital of this province is Naples.
LAUPEN, a town of Switzerland, in the canton of Berne, and chief place of a bailiwick: it is fituated at the conflux of the Sannen and Senfe; 5 miles S.W. of Berne. It was once imperial.

LAUQUEN, called Villarica by the Spaniards, a lake of Chili, about 72 miles in circuit, with a beautiful conic hill in the centre. From this hill fprings the river Tolten, which joins the Pacific ocean.
LAUR, a town of Perfia, in, Chufittan; 50 miles E. of Toltar.

LAURA, a town of Ruffia, in the government of Mofcow; 36 miles N.E. of Mofcow.
Laura, a town of Hindooltan, in the circar of Nagore ; 20 miles W. of Catchwana,

Laura, Azvpz, primarily fignifying village, fireef, or hamlet, a name given to the refidence of the ancient monks. Authors cannot agree about the difference between a laura and a monaftery : fome pretend, that a laura was a monaftery, wherein there lived at leaft a thoufand monks; but this is nowife credible. The more natural opinion is, that the ancient monatteries were the fame with the modern, confifting of large buildings divided into halls, chapels, and cells, poffeffed by the monks, each of whom had his apurtment; but the laure were a kind of villages, whereof each houfe was inhabited by one or two monns at the molt ; fo that the houfes of the Chartreux feem, in fome meafure, to reprefent the ancient laure, and thofe of the other monks proper monafteries., The term laura was only underttood of the religious places in Egypt, and the Eaft, where their houfes ftood apart from each other, and were not joined by any common cloitter, the monks that inlabited them only meeting in public once a week.

LAURADIO, in Geography, a town of Portugal, in the province of Eftramadura, on the S. Fide of the Tagus, 6 miles S.S.E. of Libbon.

LAURAGAIS, the name, before the revolution, of a fmall country of Fravec, in Upper Langredoc, of which Caltelnaudary was the capital.
LAURANA, a fea-port of Iftria, with a finall harbour. in the gulf of Quarnero; 8 miles S of Caftua. N. lat. $45^{\circ} 28^{\circ}$ E. Elong. $14^{\circ}{ }^{17}$.

LAURE,

## I. A U

LAURE, a town of Portugal, in the provinee of Alantejo; 30 miles W. N.W. of Evora.

LAUREAT, POET, is a well known office in the king's houfhold. Sir toln Hawkins obferves, that there are no records which afcertain the origin of the inftitution of tise office in this kingdom, though there are many that recognize it. It appears that as early as the reign of Henry III. there was a court poet, mamed Henry de Avranches, who is fuppofed to have lad an appointment of a hundred fhillings a year, by way of falary or ttipend. In 1341 Petrarch was crowned with laurel in the Capitol by the fenate of Rome; afterwards lirederic ILI. emperor of Germany, gave the laurel to Conradus Celtes; and ever fince the counts palatine of the empire have claimed the privilege of folemnly invelting poets with the bays. Chaucer, who was contemporary with Petrarch, and acquanted with him, when abroad, affumed the title of poet-laureat on his return to England; and in the 12th year of Richard II. obtained a grant of an anmual allowance of wine. We read of perfons under the fame title in the reigns of Edward IV. Henry V'II. and VIIl. and of James I. who, in 1655 , granted to his laureat an annual penfin of 100 marks. In the year 1630, this penfion was augmented, by letters patent of Charies I. to $100 \%$ per ammm, with an additioual grams of one terfe of Canary Spanilh wine, to be taken out of the king's thore of wines yearly. Hawkin's Hilk. of Mulic, vol. iv. p. 13.

LAUREATION, a term in the Scottifh univerfitics, ufed for the act of taking up the degree of a malter of arts, to which the fludents are admitted after four years' ftudy in the univerfites.

LAUREL, in Butany and Gardring. Sce Lacres and Prexles.
Laurel, Common or Cher"., Ptanus laurocerafus, in the Materia Medica, is a native of the Levant, and has been long cultivated in Britain. The leaves have a bitter Ityptic tafte, accompanied with a flavour relembling that of bitter almonds. The fiowers alfo have a dimilar flavour. The powdered leaves, appliid to the nottrils, excite fineering, but lefs powerfully than tobaceo. Whe kerncl-like flavour of the leaves has caufed them to be ufed for culinary purpofes, efpecially in cuftards, pudings, blanc-mange, $\mathcal{E c}$. and as the proportion to the quantity of milk is inconliderable, this has been done withont any noxious effect. However, as the poifonous quality of this laurel is now indubitably proved, the public fhoild be cautioned againlt its interal ufe. The firit and principal proofs of the deleterious effects of this veretable upon mankind were communicated to the Royal Society by Dr. Madden of Dublin, in a " letter giving an account of two women being poifoned by the limple ditilled water of laurel-leaves, and of feveral experiments upon dogs, by which it appears that this laurel is one of the moit dangerons poifuns litherto known." He mentions alfo the cafe of a genteman, who by milake drank a quantity of this laurel walcr, and died in a few minutes, complaining of a viulent difurder in his ftomach. (See Phil. Trand. $N^{0}$ q18. 426 , vol. $x 2 x$ vii.) The cafe of tir Theodofius Boughton is more recent. His death in 1780 was afcribed by an Egylifh jury to this poifon. In this cafe the active principle of the lauroceraifs was concentrated by repcated diftillations, and given to the quantity of an ounce. It has been found by the experiments of Mad. den, Mortimer, Nicholle, Langrifh, Vâter, Fontana, and others, that to brute animals this poifon is almoft intiantaneoufly mortal. Thefe experiments alfo thew, that the laurelwater is deftructive to animal life, not only when taken sato the komach, but atfo on being injected into the inter-
tines, or applied externally to different organs of the body. The mont volatile is the moft active part of the laurocerafus; and from jts fenfible qualitits we may be led to judgu, that an analogrous principle feems to porvade many wther vegetable fubitances, efpecially the kernels of drupaceous fruits; and in various fpecies of the Amygdalus, this fapid principle extends to the flowers and leaves. It is obfervable, that it is much lefs powerful in its action upon human fubjects than upon dogs, rabbits, pigeons, and reptiks. To poifon man, the effential oil of the lauroccrafus muit be feparated by dillillation, as in the fpirituous or common lauret water; and unlefs this is flrongly imbued with the oil, or given in a large dofe, it proves innocent. Dr. Cullen remarks, that the fedative power of the laurocerafus ads upon the nerrous fyltem in a different manner from opium and other narcotic fubilances, whofe primary action is upon the animal functions; for the lantocerafus does not occafion fleep, nor dues it produce local inflimmation, but feems to act directly upon the vital powers. "Although this vegetable feems to have occupied the notice of Stoerck, its medicinal ufe has its adrocates. From Limareus we learn, that in Switzerland it is commonly and fuccefsfully ufed in pulmonary complaints. Langrifh mentions its efficacy in agues; and as Bergiens found bitter almonds to have this effect, we may from analogy conclorde, that this power of the laurocerafus is well ellablifhed. Baylies found that it pofteffed a remarkable power of diluting the blood, and from experience, recommended it in all cales of difeafe fuppofed to proceed from too denfe a flate of that fluid; adducing particular inftances of its efficacy in rheumatifm, athnia, and in fchirrous affections. Nor does this author feem to have been much afraid of the deleterious quality of the laurocerafus, as he orders a pound of its leaves to be macerated in a pint of water, of which he gives from $3^{\circ}$ to +0 drops three or four times a day." Woodville's. Med. loot.

Latidel, Alevandrian, in Botany. See Ruscus.
Laulel, Druaff, of America. See Kapma.
Lauliel, Seafide. See Pintllantitus.
Lautil, Spruce, or Spurge. Sce Dipine.
Lacral Mountains, in (ieoryaphy, a range of mountains: W. of the Alleghany ridge, and part of the Alleghany mountains ; extending frorv Pennfylvania to North Carolina, and giving rife to feveral branches of the Ohio river. The: Great Kanhaway breaks through the Laurel ridge in its way to the Ohio. N. lat. $38^{\prime} 30^{\prime}$. W. long. $81^{\circ} 19^{\prime}$. About lat. 36 , in a fpur of this mountain, is a fpring of water 50 feet dcep, very cold, and, as it is faid, blue as indigo. The lands, within a fmall diftance of the Laureli momtains, through which the Youghiogang river runs, are in many places broken and flony, but rich and well timbered; and in fome places, and particularly on Laurel creels.: they are rockj and mometainons. From the Laurel mountain to Monongatela, the lands for the firt feven miles are good, level, and fit for farming, interfperfed with finc meadows : the timber', white-oak, clefnut, hickory, Sic. Morfe.

Latiel Rizer, a rivery of Kenticky, which runs intothe Cumberland, $N$. lat. $3.6^{\circ} 34^{\prime}$. W. Iong. $83^{\circ} 50^{\prime}$.

LAERELS, pieces of gold coined in the year 1619, with. the king's bead laureated, which gave them the name of: laurcls ; the twerty-hilling pieces of which were marked: with XX , the ten 1hillings X , and the five flilling pieces. with V .

LAUREMBERG, Peter, in Biograply, a learnedphyfician, was born at Rollock, where his father was profeffor of medicine and miathematics. Peter took the degree of doctor in the univerlity of his native place, and afterwards
travelled into France, and fettled for fome time at Montauban, where he taught philofophy in r6in. In 1614, however, he was at Hamburgh, and was profeffor of natural philofophy there until 1620 ; when he returned to Roftock, and was appointed profeffor of poctry in 1624. He died in this city on the 13th of May, 1639, at the age of 54. He left feveral works; thofe on anatomy, however, were efteemed by Riolan as of very indifferent worth. They are, "Difputationes Phyficx," Roftock, 16ı6. "Ifagoges Anatomicæ Grecx Interpretatio," Hamburgh, 1616. "Proceftria Anatomica," ibid. 1619. "Laurus Delphica, fen, Confilium quo defcribitur Methodus perfacilis ad Medicinam," Leyden, 1621. "In Synopfin Aphorifmorum Chymiatricorum Angeli Salx, Vicentini, Notre et Animadverfiones." Roftock, 1624. "Porticus Efculapii, feu, geralis Artis Medice Conlfitutio," ibid. 1630. "Apparatus Plantarius primus, \&c." Francfort, 1632. "Paficompfe nova, id eft, delineatio Pulchritudinis," Leipfic, $1634^{\circ}$ "Anatomia corporis humani, five Collegium Anatomicum duodecim difputationibus comprehenfum," Roft. 1636.

William Lauremberg, the father of the preceding, who died in 1612 , left an "Effay on the malignant, petechial Fever," Roftock, 1605 ; and the following polthumous works: "De Curatione Calculi," Leyden, 16i9. "Botanotheca, five Modus conficiendi Herbarium vivum," 1626 : and "Hitoria Defcriptionis Aelitis, five Lapidis Aquilx," 1627. His younger fon, John Lauremberg, likewife was a phyfician, and author of feveral works, on the antiquities of Greece, algebra, and arithmetic, \&c. Eloy. Dict. Hift. de la Méd.

LAUREMBERGIA, in Botany, fo named by Bergius in honour of Peter Lauremberg, formerly an excellent gardener, who publifhed a work on horticulture at Francfort in 1632 , which is faid to have led the way to the modern improvements in that art. Berg. Cap. 350. t. 5. f. Io. See Serpicula, to which the fynonym of Bergius undoubtedly belongs, though cited with hefitation in Schreb. Gen. 628. Lamarck's figure of Serpicula, t. 758, is in fact a copy of that of Bergius.

LAURENCE, Canons of St., an order of regular canons, fo called from the monaftery of St . Laurence d'Oulx, in Dauphiné.

This congregation is faid to have been founded by St, Benedict. It was deftroyed by the Vandals, and continued uninhabited till the middle of the inth century. In 105\%, Odo, count of Savoy, gave it to one Gerard, and his canons. This donation was confi:med in Ic65; by Cunibert, bifhop of 'Turin, who added to it above forty other churches; by which means a very confiderable congregation was formed. to whom the fucceeding popes, and counts of Savoy, granted a great many privileges.
It had thirty priories; the chief, who is. the prior of the congregation, bears the title of provoit, and exercifes a fpiritual jurifdiction throughout his provofthip.
Laurence, Bay of St., in Geograpby, a bay on the E. coaft of Ruffia, at the entrance of Beering's ftraits. N. lat. $63^{\circ} 47^{\prime}$. E. long. $188^{\circ} 15^{\prime}$.

Laurence Creek, a river of Kentucky, which runs into the Ohio, N. lat. $38^{\circ} 30^{\circ}$. W. long. $83^{\circ} 36^{\prime}$.

Liaurexce Ifland, a fmall ifland in the gulf of Florida, near the coaft of Eaft Florida. N. lat. $25^{\circ} 36^{\prime}$. W. long. $80^{\circ} 22^{\prime}$ 。

Laurence Ifland, an ifland in the Pacifio occan, on the coaft of Ruffia, near Tfchukotfloi Nofs; about three leagues in circuit. N. lat. $63^{\circ} 47^{\prime}$. E. long. $188^{2} 15^{\prime}$.

Laurence, Gulf of St., a part of the North Allantic osean, fituated between the illand of Newfoundland, Labra-

VoL, XX.
dor, Canada, Nova Scotia, and the ifland of Cape Breton; 个?O miles in length, and 150 in breadth. This is the eftuary of the river of the fame name, and is generally frozen froms December to A pril. 'This nobl- gulf is clofed by the ifland of Newfoundland, and by numerous fand-banks, particularly hy that which is called the Great Lank. N. lat. $47^{\circ} 51^{\prime}$. W. long. ' $57^{\circ}$ to $615^{\prime}$.

Laurence, Harbour of Sto, a bay on the S. coaft of Newfoundland, fituated N.W. of the entrance into liacentia bay.

Laurence Key, a fmall inand in the bay of Honduras, near the coaft of Mexico. N. lat. 16 . W. long. 89 ' $48^{\prime}$.

Laurence Kirk, a town of Scotland, in the county of Kincardine, in which have been lately ettablifhed manufactures of lawns, cambric, \&c. In 1790 it was crected into a burgh of barony, with the privilege of a markct. 'The population in 1801 was $1215 ; 7$ miles W. of Bervie.

Laurence, or Lawurence, Riter of St., the largeft, or at lealt the fecond, river in North America, being not lefs than 90 miles wide at its mouth, and navigable for flhips of the line as far as Quebec, a dittance of 400 miles from the fea. Near Quebec it is five miles wide ; at Montreal, 560 miles from its mouth, from two to four miles broad. To this place it is navigable with perfect fafety for fhips drawing fourteen feet water. During the whole of its courfe to King fton on lake Ontario, 743 miles from its mouth, it is navigable for batteaux of two tons burden, except merely at the rapids above Montreal, at the Fall of the Thicket, and at the Long Fall, where it is neceflary to lighten the batteaux, if heavily laden. Mr. Weld fuggefts, that at each of thefe places it is poffible to conitruct carals, fo as to prevent the trouble of unlading any part of the cargoes of the batteaux ; and that, at a future day, when the country becomes rich, fuch canals will, without doubt, be made. The fource of this river is not precifely afcertained; but the name is generally appropriated to the ftream that iffues from lake Ontario. From Ontario to Montreal it has the name of Iroquois, and afterwards it aflumes the name of St. Laurence. This river cannot, conformably to geographical ufage, be traced beyond lake Ontario, to lake Supcrior; much lefs, with Mr. Weld, to lake Winipic, which, according to the beft maps, has no communication with the fea of Canada, or the connected lakes Superior, Michigan, and Huron. The length of the St. Laurence may be reckoned about 700 Britifh miles, its chief characteriftic being its breadth. Mr. Weld has made feveral obfervations on the importance of this river to the commerce of North America. The time required to afeend this river, from Montreal to Kingfton, is commonly found to be feven days, but with a flrong and favourable wind the voyage may be performed in lefs time, and with an adverfe wind it will of courfe require longer time. The paffiage downwards is performed in four or five days, according to the wind. The current is fo ftrong, that a contrary wind feldom lengthens the paffage in this direction more than a day. The channel of this river, in ftead of having been impaired by time, like thofe of many others, and that of the Miffifippi in particular, is found to be confiderably better now than when it was firf difcovered; and there is reafon to imagine that it will improve ttill more in procefs of time, as the clear water from lake Ontario comes down with fuch impetuofity during the floods in the fpring of the year, as frequently to remore banks of ground and of loofe ftones in the river, and thus to deepen its leed. To this purpofe, it is obferved, that the channel on the N. fide of the ifland of Orleans, immediately below Qnébec, which, in the year 1720 , was not deep enough to admit a

## L $A$ U

Pallop of fmall fize, except at the time of high tides, is at prefent of fufficient depth for the largett veffels, and is the channel moft generally ufed. This river, in its courfe, forms a great variety of bays, harbours, and iflands, which are not only fertile and pleafant, but favourable for the purpofes of commerce. It appears by a comparifon of the St . Laurence with other rivers, connecting the lakes with the Atlantic ocean, that this river opens a fhorter paffage than any of the others, and that the portages are fhorter than in any of the other routes; they are allo fewer, and goods may be tranfported in the fame boats the whole way from Montreal to the lakes. Befides, the St. Laurence witl, on another account, be found a more commodious channel than any other for the carrying on of trade between the ocean and the lakes. Being conftantly fupplied from that immenfe refervoir of water, lake Ontario, it is never fo low, even in the drief feafon, as not to be fufficiently deep to float laden batteaux.

The fcenery along various parts of this river is very fine, as it winds for bundreds of miles through a rich country, diverfified with rifing grounds, woodlands, and cultivated plains. The attention, in going down the river, is particularly attracted by the beautiful difpofition of the towns and villages on its banks. All the houfes have a neat appearance at a diftance; and in each village, however fmall, there is a church: the churches are kept in good repair, and moit of them are covered, according to the cuftom of the country, with tin, which, from the manner in which it is put on, never becomes rufty.

LaURens, Andrew du, or Laurentius, in Biosraphy, a French phyfician, was born at Arles. He was a difciple of Lewis Duret, at Paris; but after having taken his degree of doctor of medicine, he fettled in a provincial town. He was induced, however, to accompany a lady of quality to court, and through her interef was appointed chancellor of the univerfity of Montpellier, phyfician to the queen, and ultimately (in 1606) firft phyfician to the king, Henry IV. He died in 1609 . He left feveral works, the principal of which were upon anatomical fubjects, and were more remarkable for elegance of ftyle, than correctnefs in the detail of facts. His "Hiftoria Humani Corporis et fingularum ejus partium anatomica," folio, 1600 , was often reprinted, and tranlated into French by Heliot, in 1741. The figures of this work are chiefly copied from Vefalius. He publifhed alfo "Difcours de la Vue, des Maladies melancholiques, des Catarrhes, et de la Vieilleffe," ${ }^{1596}$, which was tranflated both into Latin and Englifh. Gen. Biog. Hutchinfon Biog. Med.

Laurens, in Geography, a diftriat of South Carolina, lying between Enoree and Saluda rivers; about 31 miles long and 22 broad, containing 12,809 inhabitants, of whom 1919 are flaves.

Laurent de la Pluine, St, a town of France, in the department of the Mayne and Loire; three miles S.W. of Chalonne.

Laurent du Pont, St., a town of France, in the department of the Ifere, and chief place of a canton, in the diftrict of Grenoble; 12 miles N . of Grenoble. The place contains 3339, and the canton 11,551 inhabitants, on a territory of $1 \delta_{2 \frac{1}{2}}$ kiliometres, in eight conimunes.

Laúrent de Rividol, St., a town of France, in the dppartment of the Aveiron; nine miles N. of Severac.

Laurent de la Salaque, St., a town of France, in the department of the Eaitern Pyrenées; feven miles N.E. of Perpignan.

LAURENTALIA, or Larentalia, called alfo La: rentinalia, Laurentales, and Larentales, feafts celebrated among the Romans on the tenth of the calends of January, or twenty-third of December, in memory of Acca Laurentia, wife of the fhepherd Fauftulus, and nurfe of Romulus and Remus.

Acca Laurentia, from whom the folemnity took its name, is reprefented as no lefs remarkable for the beauty of her perfon, than her lafcivioufnefs; on account of which, the was nick-named by her neighbours', lupa, Jke-wolf; which is faid to have given rife to the tradition of Romulus and Remus being fuckled by a wolf. She afterwards married a very rich man, who brought her great wealth; which, at ber death, fhe left to the Roman people; in confideration of which they performed her thefe honours; though others reprefent the fealt as held ia honour of Jupiter Latiaris. See Larentinalia and Lares.

LAURENTEVA, in Geography, a bay or gulf of the Frozen fea, on the W. coaft of Nova Zembla. N. lat. $72^{\circ} \mathrm{I}^{-1}$ 。E. long. $53^{\circ} 14^{\prime}$.

LAURENTIA, in Botany, Mich. Gen. is.t. I4, received its appellation from Macheli, in compliment to Dr.

## L $\AA$ U

Mark Anthony Laurenti, a phyfician and profeflor at Bo. logna, whofe botanical merits have not been tranfmitted to poftecity, and the name is now funk in that of Lobeliu, to which article we refer the reader.

LAURENTUM, in Ancicnt Geography, a town of Italy, in Latium, of which it was for fome time the capital; and fuppofed to have been the relidence of king Latinus; fituated upon the fea-coatt, about eight miles S. of the capital.
LAUREOLA, in Botany, Spurge Laurel. Sce Dapine.

LAURI, Filippo, in Biography, painter of figures and landícapes. He was fon of Baldaflare Lauri of Antwerp, a landfcape-painter of note, who fettled at Rome, and died there in 164 .

Filippo was born in 1623; and became celebrated for cabinet pictures in the Flemith tyyle of colour, but with a much more correct and refined tafte of form than prevailed in that fchool; which molt probably he acquired by refiding with his father in Rome. His pictures are agreeably compofed, touched with great fpirit and freedom, of good colour and picturefque cffect. Claude Lorraine paid him the compliment to employ him frequently to put figures in the fore-grounds of his landfcapes; and in fome of his beft pictures, the hand of Lauri is difcernible in the better proportion and beauty of touch with which the figures are wrought than in thofe completed by Claude's own hand.

The fubjects he generally felected were thofe of nymphs, gods, and goddeffes, and the like; where he could, with propriety, introduce much of the nude. To thefe he gave great eafe in their actions, and compofed them in a very agreeable manner. He died in 169t, at the age of 71 .

Lavir, in Botany, a natural order of plants, to whtch Laurus, one of the number, gives its name; (the Laurine of Ventenat and Brown; fee Prodr. Nov. Holl. v. 1. 4or.) -This is the 27 th order of Juffieu's fyltem, the fourth of his fixth clafs. There is nothing equivalent to it among the Ordines Naturales of Linmeus.

The characters of Jufficu's fixth clafs are-Cotyledons two; petals none; ttamens inferted into the calyx. - The calyx is of one leaf, either fuperior or inferior, entire or divided. Corolla wanting, but there are fometimes little fcales, refembling petals, borne by the calyx. Stamens perigynous, or inferted into the calyx, definite or indefinite, both filaments and anthers diftinct. Germen fuperior or inferior, or only invefled with the calyx, fimple, or rarely feveral in a definite number; flyle either folitary, or feveral in a definite number, or wanting; figma fimple or manifold. Seed naked, fuperior, or pericarp fuperior or inferior; often containing a fingle feed, rarely feveral. The fituation of the embryo is various. Sometimes the flowers are of feparate fexes.-The orders of this clafs are fix; Elagni, Thymelaa, Protea, Lauri, Polygonea, and Atriplices. It is one of thofe in which botaniits differ moft with refpect to the application of the terms calyx and corolla. In the two firft orders Linnæan botanifts ufe the term calyx for what in the third and fourth is called corolla, and in the fifth and fixth again calyx. The analogy of one clals, if truly na. tural, ought certainly to prefcribe the ufe of the fame term throughont, for the fame part; but a queltion will but too frequently arife how far any clafs is really natural, or out of the reach of all exception; for, in every fytem, the leading fections, or claffes, mult be regulated by technical characters.

The order of Lauri is thus chatacterized:
Calyx divided into fix parts, permanent. Stamens fix, inferted into the lower part of each fegment, or couble that
number, fix of them being interior; anthers combined with the filament, opening from the bafe upwards. Germen fuperior; Tyle one; ftigma fimple or divided. Drupa or berry of one cell, containing a nut with one feed. Embryo deltitute of albnnen. Stemarborefcent or flrubby. Leavez alternate, rarely oppofite.

The gencra are Laurus, Poroflema, Schreb, and Dougluffit, Schreb. to which Mr. Brown has added Iindiandra, Ciryptocarya, Tet-antbera, and the Linnean genus CaljybaGencra fubjoined by Juffieu as allied to the Lauri are $M y=$ riflica, Virola of Aublet, which Schreber properly reduces to Myriflica, and Hernandia; to which lift Mr. Brown adds Gyrocarpus ; fee that article. The excellent author laft mentioned, accultomed, as has been faid of Jortin and Goldfmith, to enrich every fubject which he touches, has made the curious difcovery of the cotyledons of the Lauri being peltate near their bafe. He has alfo remarked a ftrange inadvertence of Gærtner, who takes the cotyledons of Caffytha for albumen, and the plumula for cotyledons. Thefe parts, being rightly underltood, admirably prove the truc affinity of the genus, notwithllandiug its paralitical and leaflefs habit.

Lauri, in Gcography, a town of Naples, in Lavora; two miles S.W. of Sezza.

LAURIA, a town of Naples, in Baflicata; 17 miles E. of Policaftro.

LAURICAUCHA, a mountain of Peru, abounding in filver ore; fix miles N. of Pafco.-Alfo, a lake of Peru; 80 miles N. of Lima.

LAURIERE, a town of France, in the department of the Upper Vienne, and chief place of a canton, in the diftrict of Bellac ; is miles E. of Bellac. The place con. tains $140 \%$, and the canton 6502 inhabitants, on a territory. of 145 kiliometres, in feven communes.

LAURINGEN, a town of the duchy of Wurzburg, on the Laur; 30 miles N.E. of Wurzburg. N. lat. $50^{\prime} 13^{\prime}$. E. long. $10^{\circ} 32^{\prime}$.

LAURINO, a town of Naples, in Principato Citra; 9 miles W.N.W. of Policaftro.

LAURINUM. See Daphineleon.
LAURISTAN, in Geogruphy, a town of Perfia, in the province of Irak, on the Zenderoud; 90 miles W. of Ifpahan.

LAURO, a town of Portugal, on a river of the fame name, in the province of $\dot{A l}$ lentejo ; 27 miles W.N.W. of Evora.

LAUROCERASUS, in Botany, the Cherry-laurel, fo called, from the laurel-like appearance of its leaves, as welf as from the fruit; which is truly a cherry, and, though not wholefome, eatable, notwithftanding the very dangerous qualities of the reft of the plant. See Prenus and Laurel.

LAUROTAXA, a name ufed by Columna, and fome other authors, for the narrow-leaved kind of rufous, or butcher's broom, called by others bifingrua.
LAUROW, in Geography, a town of Hindooftan, in Bahar ; 10 miles. S.S.W. of Gayah.
LAURUS, in Botany, the ancient Latin name of the Bay-tree, for which it is retained by modern botanifts, and along with which it now comprehends a great number of fpecies, contlituting one of the nobleft genera in the whole vegetable kingdom. The origin of the word is loft in the obicurity of antiquity; and whether etymologifts derive it from lavo, to wafh, or from laus, praife or honour, they give us little more fatisfaction in one cafe than the other.Linn. Gen, 200. Schreb. 27 C . Willd. Sp. Pl. v. 2. $47 \%$ Mart. Mill. Dict. ©. 3. Ait. Hort. Kev. ed 2. v. 2. $42 \%$ : Sm. Prodr. FI. Grec. Sibth. v. I. 268. Juff. So. Tuurn.

\&.367. Lamarck. Tlluftr t. $\mathbf{3 2 I}^{\text {² }}$. Grertn. t. 92.-( Borbonia; Plum. Gen. 3.t.2. Perfea; ibid. 44. t. 20.) Clafs and order, Enncandria Monogynia. Nat. Ord. Holvracea, Linn. Lauri, Juif.

Gea. Ch. Cal: none, unlefs the corolla be taken for fuch. Cor. in fix deep, ovate, pointed, concave, erect, alternately external fegments. Nectary confilting of three pointed coloured tubercles, each terminating in two brifles, furrounding the germen. Stam. Filaments ni:ne, fhorter than the coroila, compreffed, obtufe, three in each row ; anthers attached to the edges of each filament, in the upper part, at each fide. There are two globular glands, on a very fhort Italk, attached to every filament of the innermolt row, near its bafe. Pif. Germen fuperior, nearly ovate; ftyle fimple, of equal thicknefs throughout, the length of the ytamens; itigma obtufe, oblique. Peric. Drupa oval, pointed, of one cell, contained within the corolla. Secd. Nut ovate, pointed, with a kernel of the fame fhape.

Obf. Moft of the fpecies, including the Cinnamon and Camphor, have united, or hermaphrodite, flowers; fcveral are dioecious, as $L$. nobilis, the Sweet Bay, which has moftly from 8 to it ftamens, and a deeply four-cleft corolla. The glandular bodies attached to fome of the filaments, afford a difcriminating character.

Eff. Ch. Calyx none. Corolla calyx-like, in fix deep fegments. Nectary of three glands, bearing two brillles, and furrounding the germen. Innermoft filaments bearing glands. Drupa with one fecd.

Linnrus's itth edition of Sylt. Veg. has i6 fpecies, Willdenow has 34 , the increafe being chiefly from the works of Swartz and Thunberg. Several till nondefcript are in the hands of moft collectors of tropical plants. The genus is extremely interelting on account of feveral fine and valuable aromatic fpecies, as the Cinnamon, Caffia, Camphor, Saffafras, \&c. The habit of the whole is arborefcent. Leaves ftalked, almoft without exception alternate, undivided, entire, fmooth and evergreen, more or lefs ovate or elliptical. Florwers moftly panicled, fmall, pale or greenifh, not ornamental, but very curious in itructure. Fruit large in proportion to the bloffom. Mr. Brown expreffes an intention of feparating Cinnamomum, as a diftinct genus from Laurus, as indeed it originally ftood, till Linmxus united them. It is extremely probable that other fpecies require more accurate generic inveltigation than they have hitherto received, in which predicament we fufpect is the Saffafias of Norih America, a tree with deciduous and partly lobed leaves. There appears alfo to be an oriental Saflafras wood, of a much more permanent though fimilar flavour to the American, of which we formerly procured a fpecimen at Venice, but of the tree that produces it we know nothing.

The following may fuffice for examples of Laurus as the genus at prefent ftands.
L. Cinnamomum. Cinnamon-tree. Linn. Sp. Pl. 528. (Cimnanomum foliis latis ovatis frugiferum; Burm. Zeyl. 62. t. 27. Caffia cinnamomea, five Cinnamomum; Herm. Lug-duro-Bot; 129. i. 655,656 .) - Leaves triply-ribbed near the bafe, ovate; lateral ribs vanithing near the top. Panicles repeatedly compound. Native of Ceylon, where, as well as in Amboyna, its importance as an object of cultivation, for the fake of its precious bark, is univerfally known. (See Cinnamon.) Cuncerning the botanical determination of the prefent fpecies, there has always been fome doubt, Linnæus having defined it foliis trinerviis, that is, with three ribs diftinct ar the bafe, which is only fo far true, that they are united to the mid-rib at a much lefs diltance above the bafe, which is rounded, than thofe of $L$. Caffa. It feems moreover that this Cinnamon, like other cultivated plants,
is liable to many varieties, not only in qualiey, but in external configuration, and it may very poffibly have originated from the Caffa, like apples from the wild crab. For a long while the true Cinnamon was fcarcely to be feen in the herbariums of Europe, but we have a fpecimen from Amboyna, by favour of the late Mr. Chriflopher Smith, in which the panicles are copious, longer than the leaves, repeatedly fubdivided, and fomewhat umbellate. The flowers are filky externally, and rather fmall. Linnzeus fays they are dioe--cious. Another fpecimen, from the garden at the Mauritius, has narrower leaves, and much fmaller panicles. The true Cinnamon is now not rare in the floves of curious collectors. The bifhop of Winchefter, many years fince, raifed it from feeds ripened in his own garden.
L. Caffia. Caffia-bark-trec. Liun. Sp. PI. 528. (Carua; Rheede Hort. Mal. v. 1. 107. t. 57.) -Leaves triply.ribbed far above the elongated bafe, elliptic-lanceolate; lateral ribs ranifhing beyond the middle. Panicles corymbofe.-Native of Malabar, Sumatra, Java, \&c. The narrower leaves, tapering at each end, and the very different qualities of the bark, which is more mucilaginous and far lefs gratefully aromatic, diftinguif this from the preceding, whether it be a fpecies, or only a variety. Rheede fays, the bark of the root yields camphor.
L. Camplora. Japanefe Camphor-tree. Linn. Sp. Pl. 528. Jacq. Coll. v. 4. 22 I. t. 3. f. 2. Kæmpf. Amoen. 770. t. 771 . (Arbor camphorifera japonica; Commel. Hort. Amit. v. I. 185. t. 95.)-Leaves elliptical, pointed, triply-ribbed far above the elongated bafe. Clufters axillary, fomewhat compound, fhorter than the leaves. Native of Japan, often to be feen flowering in the Englifh ftoves. The curious ftructure of the Bloforms may be feen in Jacquin. The Japanefe camphor is believed to be obtained by diftillation from this tree, that of Borneo and Sumatra being the produce of one of a different fpecies, if not genus, of whofe botanical characters little is known. This latter is erroneoufly called Laurus Campbora in our article Campion, to which we refer the reader.
L. nobilis. Common Bay-tree. Linn. Sp. Pl. 529. (Laurus ; Camer. Epit. 60. Ger. em. 1407.)-Leaves lanceolate, veiny, finely reticulated, evergreen. Flowers fourcleft, dioecious, in fhort axillary clufters. Native of Italy and Greece, almoft perfectly hardy in our climate, being one of the moft defirable evergreens we have, though of flow growth. The leaves are of a rich deep green, highly and pleafantly aromatic. Flowers born by old trees only, pale yellow. Fruit black, the fize of an unripe olive, ftrongly aromatic, never, as far as we know, perfected in England, but plentiful in Italy. This is certainly the $\delta x$ pm of Diofcorides, and confequently the claffical laurel. It is ftill called by the fame name among the modern Greeks. There is a broad-leaved variety, called $\delta \alpha \not \rho_{m} \pi \lambda \alpha z v \pi \hbar \hbar$ in Diofcorides.
L. afivalis, Benzoin and Safafras, three North American fpecies, have deciduous leaves. The true Benjamin tree, or Gum Benzoin (fee thofe articles) is not, as Ray fuppofed, this Laurus Benzoin, but a fpecies of Styrax, as was firft fhown by the late Mr. Dryander in the Philofophical Tranfactions for 1787, p. 307 .t. 12 . See Styrax.

Laurus, in Gardening, comprifes plants of the evergreen and deciduous tree kinds, for borders, green-houfe, and ftove, of which the fpecies cultivated are the common fweet bay (L. nobilis) ; the willow-leaved bay (L. xeftivalis) ; the common benjamin-tree ( L . benzoin) ; the faffa-fras-tree (L. faffafras); the royal bay, or Indian laurel (L. indica) ; the broad-leaved Carolina bay, or red bay (L. borbonia) ; the camphor, or camphire-tree (L. cam-
phora) ; the cinnamon-tree (L. cinnamomum) ; the caffia, or wild cinnamon-tree (L. caffia) ; and the alligator pear (L. perfea).

The firl fort has feveral varieties, as the broad-leaved, which is almolt too tender for the open air in this climate, with leaves much broader and fmoother than thofe of the common fort : the common, which is feldom hurt in this climate, except in very fevere winters, of which there are two fubvarietics, one with plain leaves, the other with leaves waved on the edges: the narrow-leaved, with very long narrow leaves, not fo thick as thofe of the preceding two forts, and of a light green, the branches covered with a purplifh bark, and the male flowers come out in fmall clufters from the axils of the leaves, fitting clofe to the branches; of which there are fubvarieties in the nurferies with variegated leaves. What is now called bay, was formerly called laurel, which has introduced fome confufion.

It may be noticed, that the chief of the camphor ufed in Europe is prepared from this tree in Japan, by fplitting the wood into fmall pieces, and fubliming or diftilling it with water in an iron retort, covered with an earthen or wooden head, in the hollow of which they faiten hay or ftraw, to which the camphor, as it rifes, adheres. This camphor is brownifh or white, but in very fmall femi-pellucid grains. It is packed up in wooden calks, and thus fent to India and Europe, where it is purified by a fecond fublimation, and reduced into the folid mafs as found in the fhops. Native camphor, or the Capoor Baroos of the Malays, is a production obtained in Sumatra and Borneo, by cutting down the trees, and fplitting them with wedges into fmall pieces, the camphor being found in the interltices in the Itate of a concrete cryftallization. Some have afferted that it is from the old trees alone that this fubftance is procured, and that in the young trees, if it is in a fluid ftate, it is called Meenio Capoor, or camphor oil; but this is a miltake : the fame fort of tree that produces the fluid does not produce the dry, tranfparent, flaky fubftance, nor ever would. They are readily diftinguifhed by the natives. Many of the trees, however, produce neither the one nor the other. The traders ufually diftinguifh three degrees of quality, by the names of head, belly, and foot, according to ite purity and whitenefs. Some add a fourth fort, of extraordinary finenefs, of which a few pounds only are imported to Canton, and fell there at the rate of two thoufand dollars the pecul.

The common camphor will evaporate till it wholly difappears; while that of Sumatra and Borneo, called native camphör, though fubject to fome decreafe, does not appear to lofe much in quantity from being kept.

Camphor oil is obtained by the Sumatrans by making a tranfverfe incifion into the tree, to the depth of fome inches, and then cutting flopingly downwards from above the notch, till a flat horizontal furface be lefr. This they hollow out, till it is of a capacity to receive a quart : then put into the hollow a bit of lighted reed, and let it remain for about ten minutes, which aeting as a ftimulus, draws the fluid to that part. In the fpace of a night the liquor fills the receptacle previoully made. The trees are foon exhaufted.

The eighth fort has feveral varieties; but it is the Ceylon cinnamon that is chiefly ufed as a fpice.

Method of Culture--The firft fort may be increafed by feed, layers, and fuckers. The feed fhould be fown foon after the berries are ripe, or early in the fpring, either in beds, covering them with earth near an inch deep, or in drills half a foot afunder, the fame depth. When the plants are come up, they fhould be fupplied with frequent waterings during the fummer, and in winter defended from fevere froft by the
fhelter of mats, or fome other covering, being tender whlnle young; and after having two fummers' growth in the feed. bed, in the fpring following the ftrongelt thould be removed into nurfery rows, one or two fect afunder, and a foot apart in each row, giving water in dry weather, till they have taken good root, and keeping them clear from weeds. When they are half a yard, or two or three fect high, they are of proper growth for tranfplanting into the firubbery in autumn or fpring. 'I'he berries may alfo be fown in pots, and planged into a hot-bed in fpring, which brings the plants forwarder, being careful to inure them to the full air in the fummer feafon.

In the layer, fome of the lower branches that are well furnifhed with young fhoots, may be laid down in the early fpring, or in Auguft, but the latter is the beft feafon; each floot being flit-layed; they become rooted in one year, when in fpring following they may be taken ofl, and planted in the nurfery, in the manner directed for the feeelings.

Where fuckers are had rccourfe to, they fhould be taken up with good roots in autumn or fpring, and be planted in the nurfery like the feedlings and layers.

This fort is alfo capable of growing by cuttings, planted in the begiuning of April on a moderate hot-bed of tanners? bark covered eight inches deep with rich loofe frefh earth, five inches deep, and eight or nine afunder, rubbing off their leares, and watering them gently every evening while the bed continues warm, covering the glaffes with mats during the heat of the day. When the cuttings have fhot roots, they fhould receive all mild gentle fhowers, and the evening dews. In the beginning of Auguit, the glaffes may be taken off, being replaced when the weather begins to be frolty; keeping them open every mild day. In the beginning of the April following, or as foon as the weatherbecomes temperate, both glaffes and frames fhould be removed, continuing frequent and plentiful waterings during the fummer months, as the weather may require; and in the fucceeding April the plants will be ftrong, well rooted, and fit for planting out.
At the period when the plants raifed in thefe ways are removed to the nurfery, they fhould have their fuperfluous roots and branches cut away, encouraging the leading fhoots; planting them in a well fheltered quarter of light mould. The ground fhould be dug over in autumn and fpring, keeping it clean, loofe, and mellow in fummer, and the plants be annually pruned in April.

The gold-ftriped variety is tender, being commenly kept in pots, and houfed with hardy green-houfe plants. When it flands in the open ground, it is fometimes much injured in fevere winters. The method of increafing it is by budding it on the plain fort.

And the broad-leaved and narrow-leaved varieties are not fo hardy as the common fort, being fcarcely able to live abroad whilit young, in common winters, without fhelter. As in fevere winters the old trees are frequently killed, or at leaft the branches much injured, the plants are frequently kept in tubs, and houfed in the winter feafon.

The fecond, third, and fourth forts may be increafed by feed, by layers, and fometimes by fuckers and cuttings. The feeds or berries procured from America, and preferved in fand, fhould be fown, as foon after they arrive as poffible, in a bed of light earth an inch deep, or in largifh pots the fame depth, plunging them in mould, in an eaftern border, up to their rims, till the fpring following; when they fhould be placed in a hor-bed, which greatly forwards the germination of the feed, and foon brings up the plants. They mult be timely inured to the full air. The plants raifed by either method fhould, while young, be watered during fummer,
and fheltered from the frof in winter, and when two years old be planted out in nurfery rows, as directed for the other plants. They may alfo be increafcd by layers and fuckers in the fame manner as directed for the firll fort ; but it is fometimes long before the layers are rooted.

They are likewife fometimes capable of being increafed by cuttings, by the aid of a good hot-bed.
And the fifih, fixth, and feventh forts may be increafed by layers, but they are fometimes two ycars before they are fufficiently rooted. They may alfo be raifed from feeds, procured from the places of their natural growth, fowing them in pots, and plunging them in a hot or bark-bed; but without this aid they do not always grow freely the frit feafon; in which cafe they flould be placed in the open air in fummer, and in a frame, or in the green-houfe, near the windows, in winter : and in fpring the pots be plunged in a lot-bed, which will bring up the plants, giving air daily, and frequent waterings, and inuring them by degrees to the open air as the fummer advances; placing them in fhelter in winter, and in the following fpring planting them out in feparate fmall pots, managing them as other green-houfe fhrubs.
The eighth, ninth, and tenth forts are alfo raifed by layers and feed, fown and managed as above, generally affitited by the bark-bed of the flove; the plants being planted off into feparate pots, and managed afterwards as other hot-houfe plants.

It may be noticed that the firit, fecond, third, and fourth forts are lighly ornamental in the borders and clumps of pleafure grounds; the three following in green-houfe collections; and the three laft among other thove plants.

LAU RUSTINE, a name often given to a fine evergreen flowering fhrub. See Viburnum Tinus.
LAUS, in Ancient Geography, a town of Italy, in the territory of the Laconians; founded by the Sybarites, but afterwards taken poffeffion of by the Lycaonians, a colony of the Samnites.
Lavs Pompeia, a town of Gallia Tranfpadana towards the S.E.; founded by the Boii, and afterwards belonging to the Infubrians. It was a Roman colony and municipal.
Laus Kaurens, in Geograpby, a peninfula of Finmark, in the Frozen fea. N. lat. $70^{\circ} 45^{\circ}$. E. long. $30^{\circ} 24^{\prime}$.
LAUSANNE, a city of Switzerland, in the canton of Berne, and the largett town in the Pays de Vaud, and by the French divifion of 1798 the capital of the department and canton of Leman, is beautifully fituated on the declivities of three hills, and in the intermediate vallies, environed by an old wall, and diitant two miles from the lake of Geneva, and 37 miles N.E. from Geneva irfelf. The diftrict to which it gives name was once a republic itfelf, but afterwards annexed to the canton of Berne, and is a confiderable tract, lying below the border of Vevay and Venoge, about 13 miles in length and five in breadth. The afcent upon which the town is built is fo fteep, that in fome places the horfes cannot, without great difficulty, draw up a carriage, and foot paffengers afcend to the upper part of the town by tleps. Thefe inconveniences, however, are amply compenfated by the fublimeft views in nature, commanding the lake of Geneva, the Pays de Vaud, and the rugged coalt of Chablais. The church is a magnificent Gothic building, having been formerly a cathedral, while the Pays de Vaud was fubject to the houfe of Savoy. It ttands on the mott elevated part of the town ; and contains, among many other fepulchres, the tomb of Amadeus VIII. duke of Savoy, tylyed the Solo. smon of his age, but more knowa by the name of the antipope Felix V., who exhibited a fingular inttance in the anBals of Europe of a perfonage twice abdicating the pomp of
fovercignty, and $\begin{aligned} & \text { zevice retiring to a private flation. The }\end{aligned}$ number of inhabitants, acoording to Coxe, is about 7000 ; Pinkerten flates them at 9000 . In the year 1536 , when part of the Pays de Vaud was conquered from the houfe of Savoy, the bifiop of Laufame retircd from the town, and the inhabitants put themfelves under the direction and fovereignty of the canton of Berne, which granted to it new privileges, in addition to thofe which it had formerly polfeffed. The reformation was introduced by Pierre du Viret in the fame ycar. The bihhop's diocefe formerly comprelended the greater part of the cantors of Berne, Soleure, and Friburg, the Pays de Vaud, the principality of Neufchâtel, Bienne and its territory, and the country of Erguel, and extended almoff to Franche Comté. Since the reformation, it has been reduced to little more than the cantor of Triburg and a part of that of Soleure. Laufanne choofes its owr magitracy, which confitits of a burgomalter, five bannerets, the town council, the council of fixteen, and the great council. An academy was eltablifhed here in 1537 , and a college in 1540. Profeffors in every fcience are appointed by government, and there is a tolerable library for the ufe of the public. The bailiwick of Laufanne is extesfive ; the bailif,, who is chofen every. fix years, fucceeded to the bifhop, and has equal jurifdiction. The air of Laufanne is very pure and healthy; and it has plenty of excellent water, with every neceflary of life in the greatelt abundance. Laufanne is nat only governed by its own magittrates, and has its own courts of juttice; but the burghers, who polfefs houfes in the principal freet, enioy the right of pronouncing fentence in criminal caufes. The criminal is tried by the civil power; if he is found, and acknowledges himfelf guilty, one of the magittrates pleads in defence of the prifoner, and another againft him ; the court of juftice gives an opinion upon the point of lave, and the majority of the burghers above-mentioned determine the penalty. If the punifhment is capital, there is, according to the letter of the law, no pardon, unlefs obtained within twenty-four hours from the fovereign council of Berne, although it. generally happens that eight days are granted for that purpofe. When the criminal is feized within the juridiction of the town, the fact is tried, and the burghers pronounce fentence in the town-hall ; in this cafe there is no appeal. But when he is taken within the diftrict of the bailiff, they affemble in his houre, and an appeal lies from their determination to Berne. Laufanne is 41 miles S.W. of Berne. N. lat. $46^{\circ} 33^{\circ}$. E. long. $6^{\circ}$ 28.' Coxe's Travels in Switzerland, vol, ii.
LAUSSIG, a town of Saxony, in the circle of Leipfic; 14 miles S.E. of Leipfic. N. lat. $51^{\circ} 7^{\prime}$. E. long. $12^{\circ} 36^{\circ}$.
LAUSSNITZ, a town of Saxony, in the margravate of Meififen; 13 miles N. of Drefden.
LAUSZA, a town of Samogitia; 44 miles N.W. of Miedniki.
LaUT. See Pulo Laut.
LAUTAKARI, a fmall infand in the $N$. part of the gulf of Bothnia. N. lat. $65^{\circ} 35^{\prime}$. E. long. $24^{\circ} 34^{\prime}$.
LaUTENBURG, a town of Pruffia, in the territory of Culm ; 48 miles E. of Culm.
LAUTER, a town of Germany, in the county of Henneberg; 11 miles N.E. of Meinungen.
LAUTERBACH, a town of Bohemia, in the circle of Saatz ; 65 miles W. of Prague. N. lat. $50^{\circ} 2^{\prime}$. E. long. $12^{2} 45^{\prime}$ - Alfo, a town of UPper Hefle; 13 miles N.W. of Fulda.-Alfo, a town of Saxony, in the circle of Errgebirg; five miles N.W. of Z wickau.
LAUTERBERG, a town of Wefthalia, in the Hartz

## LA U

Haxtz forett, near which are mines and forges of copper and iron; 14 miles S. of Goflar.

LAUTERBOURG, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diltrict of Wiffembourg, fituated on the Lauter. The place contains 1941, and the canton 9782 inhabitants, on a territory of 1 So kiliometres, in 10 communes; 29 miles N.N.E. of Strafburg. N. lat. $49^{\circ}$. E. long. $8^{2}$ I4..

LAUTERBRUENNEN, a valley of Switzerland, in the canton of Berne; fix miles S. of Interlachen, and about 15 miles in circuit, embofomed in the midit of the Alps, and celcbrated for its picturefque and romantic fcenery. The weftern boundary, from which the Staubbach falls, forming a catara\{t, would, in any other country, be called an errormous mountain; it here appears only a trifing hill, in comparifon with the oppofite chain, of which the highelt point is the beautiful Jung frau-horn, that flretches in a femicircular dircction, and, towering above the adjacent peaks, rifes to a ftupendous height. At the extremity of the vale, there are fome noble points of view, and glaciers which ftretch from the foot of the Breithorn and Grofs-horn. In this delightful valley, many ftreams of the cleareft water gulh from the earth like fmall rivers, and numberlefs torrents precipitate themfelves from the mountain. From this circumftance the valley derives its name; Lauterbruennen fignifying, in German, many /prings. One of the peaks, adjoining to this valley, which is called the Grols-horn, is of a pyramidal Thape, and capped with frozen fnow; another, the Breithorn, is conical, and feems crowned with an enormous mafs of tranfparent ice, from which the reflection of the fun-beams is inexpreffibly beautiful. But the molt elevated and the moot majeftic of the whole group, is the Jungfrau-horn. (See Jungrrau.) The hollows between the mountains are filled with large vallies of ice, broken into various fhapes, and feveral torrents, burting from the fnow, and uniting in their courfe, form the Weits-Lutchine, a river which rolls rapidly through the valley of Lauterbruennen, joins the Schwartz-Lutchine, which flows from Grindewald. and fwells the Aar. This valley is bordered by calcareous rocks to its furtheft extremity. Wengenalp is the laft of a group of calcareous and fchiftous mountains between, Lauterbruennen and Grindewald, which there joins the Jungfrau, the fummits of which appear to be of granite. Coxe's Travels, vols. i. and ii.

LAUTEREKEN, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the diftrict of Kaiferflautern; 24 miles N. of Deux Ponts. The place contains 627 , and the canton 4594, inhabitants, in 21 . communes. N. lat. $49^{\circ} 39^{\prime}$. E. long. $7^{\prime} 35^{\prime \prime}$.

LAUZES, a town of France, in the department of the Lot, and chief place of a canton, in the diltrict of Cahorn. The place contains 444 , and the canton 7139 inhabitants, on a territory of $237 \frac{1}{2}$ kiliometres, in 11 communes.

LAUZET, Le, a town of France, in the department of the Lower Alps, and chief place of a canton, in the diltrict of Barcelonnette; ro miles W. of Barcelonnette. The place contains 857 , and the canton 5038 inhabitants, on a territory of 295 kiliometres, in feven communes.
LAUZUN, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the dutrict of Marmande; 14 miles N.E. of Marmande. The place contains 10S9, and the canton 12,852 inhabitants, on a territory of 220 kiliometres, in 17 communes, N. lat. $44^{\circ}$ $3^{8}$. E. long. $0^{-3} 3^{\prime \prime}$.

LAW, Edmund, in Biography, a learned Englifh prelate, the fon of a clergyman, in the neighbourhood of Cartmel, in Lancafhire, was born in the year $170 \%$. He received the greater part of his claffical learning at the free grammar fchool of Kendal, from which place he was fent to $S t$, John's college, Cambridge. He was admitted to the degree of B. A. in 1723, and foon afterwards was elected fio low of Chrift's college. During his refidence in this coiles', he became known to the public by a tranflation of azcluitt ? King's "E(fay upon the Origin of Evil," with note ${ }^{\text { }}$ To this work was prefixed "A preliminary difertation," by the Rev. Mr. Gay of Sidney college. In the controverfy which took place in confequence of Dr. Clarke's "Demonitration of the Being and Attributes of God," Mr. Lav took a part, and among other things publihhed his "Enquiry into the Ideas of Space, Time, \&c.". In the year 1735 , a new and improved edition of Robert Stephens" "Thefaurus Lingur Latinæ" was given to the public, and in the preparation of this valuable work, Mr. Lav had a confiderable fhare. In 1737, he was prefented by the univerfity to the living of Graytock, in the county of Cumberland, worth about 300 l . per annum. In 1743, he was promoted by fir George Flemming, bifhop of Carlifle, to the archdeaconry of that diocefe, and, in 1746 , went from Graytock to refide at Salkeld, a pleafant village upon the basks of the river Eden, the rectory of which is annexed to the archdeaconry. During his refidence at this place, he publifhed his "Confiderations on the Theory of Religion ;" to which he fubjoined "Reflections on the Life and Character of Chritt;" and an appendix concerning the ufe of the words "Soul and Spirit." In 1749, Mr. Law proceeded doctor of divinity; in his public exercife for which degree, he defended the doctrine of what is ufually denominated "The feep of the foul." In 1754, he was elected mafter of Peter-houfe, in Cambridge, and in the following year appointed head librarian of the univerfity; a finecure place, with a falary of fifty pounds a-year. He received almolt every year fome additional preferments, which were rather honourable expreffions of regard from his friends, than of much advantage to himfelf: in 1767 , he obtained a ftall in the church of Durham, and in ${ }_{17} \mathrm{G}_{9}$, on the recommendation of the duke of Grafton, he was nominated bifhop of Carlifle, and was permitted to hold, in connection with the bifhopric, the malterfhip of Peter-houfe, and the rectory of Graytock. In 1574, he publificd a very valuable tract, entitled "Confiderations oa the Theory of

## L. A W

Religion," which has paffed through at leait eight editions. The object of this work was to fhew that arts and fciences, natural and revealed religion, have upon the whole been progreffive, from the creation of the world to the prefent time; as alfo that they have been fuited to each other, as well as to the circumttances of mankind, during each eminent period of this their progreffion. In 1777, Dr. Law gave the public a handfome edition, in four vols. 4to. of the works of Mr. Locke, with a life of the author, and a preface. In the edition of the "Confiderations," publifhed at Carlifle in 1784, he made fuch alterations as thewed that he had given up the doctrine of the pre-exiftence of Chritt, a fact which he noticed to a friend in pretty ftrong language. Dr. Law died in Auguft 1787, in the 84th year of his age. The life of Dr. Law was a life of inceffant reading and thought, almolt entirely devoted to metaphyfical and religious enquiries. The leading peculiarity of his religious fentiments is, that "Jefus Chrilt will, at his fecond coning, by an act of his power, reftore to life and confcioufnefs the dead of the human fpecies, who, by their own nature, and without his interpofition, would remain in the Itate of infenlibility, to which the death, brought on mankind by the fin of Adam, had reduced them." Dr. Law pubilihed, befides the articles already mentioned, fome fingle fermons; a tract on "The Nature and Neceflity of Catechiling ;" "A Defence of Mr. Locke's Opinion concerning perfonal Identity;" and "Obfervations occafioned by the Contelt about literary Property." See life prefixed to an edition of his Reflections printed by Johnfon in 1803.

Law, Joun, a famous projector, the fon of a goldfmith in Edinburgh, was born about the year 1681. It appears that he was not brought up to any profeffion, but having a turn for calculation, he made himfalf a proficient in numbers, and in the fpeculations depending upon them. He obtained, while very young, the confidence of the king's minifters for Scotland, and was employed by them to arrange the revenue accounts, which were at that time in great diforder. To remedy the want of a circulating medium he propofed the eftablifhment of a bank, which, according to his plan, might iffue paper-money to the amount of the value of all the lands in the kingdom. This was not adopted. At the death of his father he fucceeded to a fmall eftate, and commenced the fine gentleman, fupplying the deficiency of his income by gaming. In confequence of a duel, in which he killed his antagonit, he was obliged to leave the country. He vifited Venice and Genoa, from which cities he was banifhed as a fharper; be wandered through Italy, fupporting himfelf by his wits, chiefly by the fuccefis of fingular wagers, in which, by his fkill in calculation, he always took care that the chances fhould be in his favour. He propofed his financial fcheme to Louis XIV, who liftened to his plans. A bank was eftablifhed, compofed of 1200 flares of 3000 livres each; to this was annexed a Miffifippi company, who had grants of land in Louifiana, and was expected to realize an immenfe fum by planting and commece. To this were afterwards joined the trade of Senegal, and the privilege of the old Eaft India company. In 17 IS, it was declared a royal bank; and by a number of advantages arbitrarily conferred upon it, fuch were the extent of its bufinefs, and the magnitude of its funds, that its fhares rofe to twenty times their original value. All France was feized with the rage of gambling in the funds. Money and valuables of all kinds were brought to the market and invetted in bank paper, and thofe thought themfelves truly happy who could ifrip themfelves of every thing for a participation in this imaginary wealth. In 1720 , Law was made comptroller-general of the finances. Regarded as the Plutus of the kingdom, he faw
at his levee dukes, peers, and marfhals of France. At length the bafelefs fabric of this profperity began to give way: the fhares funk daily in value, and the ruin of the fyltem feemed to be inevitable. He was obliged to refigu his poft, after holding it only five menths; and loaded with the public execrations, retired firft to an eftate in the country, and then, for further fafety, quitted the kingdom. He now palted the remainder of his days in obfcurity, occupied, however, with his projects, fully convinced of the folidity of his fyftem, the failure of which he attributed to the oppofition it met with. He died at Venice in 1729.

Law, William, a learned and pious divine of the church of England, was born at King's-Cliffe, Northamptonfhire, in 1686, and educated at Oxford, where he took his degrees. He entered into holy orders, but it does not appear that he ever had the sure of fouls, owing probably to his adherence to non-juring principles, which he maintained to the clofe of his life. He was fome time a private tutor in a gentleman's family at Putney, after which he chiefly refided in a very retired way at the houfe of Mrs. Hefter Gibbon, aunt of the celebrated hiltorian, in Northamptonfhire, where he died in 1761. He was author of a great many theological publications, of which the moft important is "The lerious Call to a devout and holy Life, adapted to the State and Condition of all Orders of Chriftians." His "Practical Treatife on Chriftian Perfection" was likewife very much elteemed. He entered the lifts againft bihop Hoadley; and was a zealous difciple of the doctrines of Jacob Behmen, whofe works he publifhed.
Law, in its moft general and comprehenfive fenfe, fignifies a rule of action; and is applied indifcriminately to all kinds of action; whether animate or inanimate, rational or irrational ; in which fenfe it is ufed when we fay, the laws of motion, of gravitation, of optics, or mechanics, as well as the laws of nature and of nations. Accordingly law is a command or precept, conflituting a rule of action, and coming from fome fuperior authority, which an inferior is obliged to obey; or, according to forme, law is a command, or mandate of fome perfon, or power, whofe precept carries with it the reafon of obedience: or, it is a rule of action, that obliges by virtue of its being the will of a fuperior. See Obligation.

The word is formed from the Saxon lah, laga, which figo nifies the fame.

Thus, the commands of God with relpect to men, of a city with refpect to the citizens, and univerfally of all powerful beings in refpest to thofe who cannot refilt, are called their laws.

The nature of a law will be mot clearly difcovered by Thewing wherein it differs from covenant, counfel, and right or equity; with all which it is frequently confounded.

Law is confounded with covenant, or compact, by thofe who take laws to be nothing elfe but opoiornuzix, or forms of living determined by the confent of mankind : among whom is Aritotle, who defines a law, "a declaration determined by the common confent of a city, fhewing in what manner things are to be done :" which is not fo much the definition of a law, as of a civil law; nor yet properly of a civil law ; for this common confent is ne more than a mutual covenant, which does not oblige any perfon, and confequently is not any law, till fome fupreme power be conflituted with a power to compel, and to make it penal to tranfgrefs it. Here then the covenant is confounded with the law, which leads into abfurditiẹ; for a covenant or compact is a promife proçeding from us; a law, a command directed to us.

## L A W.

The difference between a counfel and a law is this:
A counfel is a precept, wherein the reafon of obedience is taken from the thing itfelf prefcribed; a command is a precept, wherein the reafon of obedience depends on the will of the prefcriber; for we cannot properly fay, fic wolo, fic jubeo, unlefs Aet pro ratione voluntas. A law comes from a perfon who has a pawer over thofe whom he commands; a counfel, from him who has no fuch power. To do what is enjoined by a law, is an att of duty; what by a counfel, an act of choice, or freewill. Counfel is only matter of perfuafion, law is matter of injunction; counfel acts only upon the willing, law upon the unwilling alfo.

Law is confounded with right or equity, by thofe who perfift in doing what is permitted by the divine law, though prohibited by the laws of the country. What is prohibited by the divine law, cannot be permited by the civil law; nor what is commanded by the divine law, be prohibited by the civillaw; but what is permitted by the divine law, may, notwithitanding, be prohibited by the civil law: for the inferior laws have a power of reftraining the liberty left by the fuperior laws, though they cannot enlarge it. Now right or equity is a natural liberty, not conflituted by laws, but free of them; for take away laws and liberty is complete.

This liberty is firt reftrained by the natural and the divine law, the reft reltrained by the civil laws; and what remains unreftrained by the civil law, may be again reftrained by the conflitution of particular cities and focieties. There is a great difference, therefore, between law and right, lex $\mathcal{J}$ jus ; for law is a chain ; but right a liberty; and they dif. fer as two contraries. See Civil or Municipal Law, infra.

Law may be divided, with refpect to its different original, inte divine and buman.

Law, Divine, may be confidered as twofold, with refpect to the two different manners in which God notifies or announces his will to man ; viz. natural (or moral), and pofitive.

Law, Natural, is that which he has made known to all mankind, by an innate light, called natural reafon.

Natural law may be divided into that natural law of men, which, in a peculiar fenfe, is called the Law of nature; and the nafural lav of countries, commonly called the Law of nations. (See each of thefe articles.) The precepts are the fame in both thefe; but becaufe, when focieties are once inftituted, certain perfonal properties become velted in men; that law, which, when we fpeak of the duties of men feverally, we call the natural laws, when transferred to citieg or countries, we call the lawe of nations.
M. Regis fays, that the laws of nature are the dictates of right realon, which teach every man how he is to ufe his natural right; and the laws of nations, the diAtates, in like manner, of right reafon, which teach every ftate how to att and belhave themfelves toward others.

Law, Poffitive, is that which God has revealed by his prophets, or by perfons fupernaturally commiffioned and infpired and found only in the holy fcriptures: fuch are thofe laws delivered to the Jews, relating to the divine worfhip and polity, which may be called divine civil laws, as being peculiarly directed to that people. As the natter of natural laws is fomething in its own nature good and neceffary, thefe laws are founded in the immutable natures and relations of things, carry with them their own recommendation, and if it were not for the depravity of mankind, would not need a fupernatural light for the difcovery of their reafonableneis and obligation. Whereas pofitive laws differ from the former, both with regard to the matter of them, as well as the manner of their publication. Thefe may be diftinguifhed into fuch as are purely pofitive, or partly fo. The matter of Vor. XX.
purely pofitive laws is indifferent; fo that the pofitive decree of the legilator alone makes them to be laws, mere reafon being then filent. Such were the cercmonial laws of the Jews, and fuch are the facraments of the Chrittian religion. Neverthelefs, every pofitive law is founded in reafon, though reafon may not be able, antecedently to their promulgation, to difcover their fitnefs and utility. But the reafons that recommend them, when they are actually promulged, would not give them the authority and fanction if a law, without the exprefs inftitution of the fupreme lawgiver. Laws that are partly politive may be refolved into the law of nature, or the moral law as revived, improved, and enforced by revelation. Several particulars of this law derive a greater degree of evidence from this new mode of promulgation, and alfo a flronger enforcement. The law concerning the fabbath is in a peculiar fenfe a law of this kind, the matter of it being of a mixed nature. That fome part of our time fhou'd be confecrated to the worhip of our creator, the light of nature dietates; but that it fhould be a ferenth part rather than any other, or the laft ferenth rather than the firft, or the third, is not natural but poffive.

Law of Naiure, as it refpects intelligent, moral, and accountable beings, is the will of God, relating to humar aetions, grounded in the moral differences of things; and becaufe it is, in fome meafure, difcoverable by natural right, it is obligatory upon all mankind. It is thus defined by Cisero (De Legibus, lib. i.) "Lex ef ratio fumma infita in natura que jubet ea qux facienda funt, prohibetque contraria." It is called the law of nature, on account of the manner of its promulgation, which is by natural reafon; on account alfo of its fource or foundation, this law refulting from the refpective natures of beings and things, of beings, as God and man, and of things or actions, as morally good or evil, and having different phyfical effects; and, moreorer, becaufe it is the law of God. Nature is but a fictitious perfen; and all that is faid of the wifdom of her deligns and operations, of her power, or of her laws, is to be afcribed to him who is the author of nature. "Quid enim eft aliud natura, quam Deus et divina Ratio, totii mundo, et partibus ejus inferta?" Seneca de Benef. 1. vi. c. 7. The demonfration of this law of nature has been attempted by feveral learned men, who commonly urge the confent of the more civilized nations, as a good argument for the exiftence of this law. "Omni autem in re confenfio omnium gentium lex natura putanda eft,", fays Cicero; i.eo "as to any point, the agreement of all nations in it is to be efteemed a law of nature." Others have erroneount alleged, as a proof of the law of nature, innate ideas or praetical principles, impreffed on the foul of man by its creator: but of fuch ideas and principles we have no evidence. A. more direct and conclufive demonfration of the law of nature may be deduced from the confideration both of the divine and human nature; which beheld in one siew and in the relation they bear to each other fupply unequivocal eridence of the exittence and obligation of this law. To this purpofe we thall avail ourfelves of fome appropriate reflections and reafonings of the learned judge Blackftone in immediate connection with this fubject. "As God," fays this learned writer, "when he created matter, and endued it with a principle of mobility, eftablifhed certain rules for the perpetual direction of that motion; fo, when he created man, (and endued him with freewill to conduct himfelf in all parts of life, he laid down certain immutable laws of human nature, whereby that freewill is in fome degree regulated and reftrained, and gave him alio the faculty of reafon to difcover the purport of thofe laws:"

Confidering the Creator only as a being of infaite power, ${ }_{3} \mathrm{E}$
ht
he was able unqueftionably to have prefcribed whatever laws he pleated to his creature, man, however unjuft or fevere. But as he is alfo a being of infinite wifdom, he has laid down only fuch laws as were founded in thofe relations of juftice, that exifted in the nature of things antecedent to any pofitive precept. Thefe are the eternal, immutable laws of good and evil, to which the Creator himfelf in all his difpenfations conforms; and which he has enabled human reafon to difcover, fo far as they are neceffary for the conduct of human actions. Such among others are thefe principles: that we fhould live honefly, fhould hurt nobody, and fhould render to every one his due; to which three general precepts Juftinian has reduced the whole doctrine of law.

But if the difcovery of thefe firlt principles of the law of nature depended only upon the due exertion of right reafon, and could not otherwife be obtained than by a chain of metaphyfical difquifitions, mankind would have wanted fome inducement to have quickened their inquiries, and the greater part of the world would have refted content in mental indolence, and ignorance its infeparable companion. As therefore the Creator is a being, not only of infinite pozver, and wiflom, but alfo of infinite goodnefs, he has been pleafed fo to contrive the conftitution and frame of humanity, that we fhould want no other prompter to inquire after and purfue the rule of right, fut only our own felf-love, that univerfal principle of action. For he has fo intimately connected, fo infeparably interwoven the laws of eternal juftice with the happinefs of each individual, that the latter cannot be attained but by obferving the former; and, if the former be punctually obeyed, it cannot but induce the latter. In confequence of which mutual connection of jultice and human felicity, he has not perplexed the law of nature with a multitude of abtracted rules and precepts, referring merely to the fitnefs or unfitnefs of things, as fome have vainly furmifed; but has gracioully reduced the rule of obedience to this one paternal precept, "that man fhould purfue his own true and fubftantial happinefs." This is the foundation of what we call ethics, or natural law. For the feveral articles into which it is branched in our fyftems, amount to no more than demonftrating, that this or that action tends to man's real happinefs, and therefore very jultly concluding that the performance of it is a part of the law of nature; or, on the other hand, that this or that action is deftructive of man's real happinefs, and therefore that the law of nature forbids it.

This law of nature, being coeval with mankind and dietated by God himfelf, is of courfe fuperior in obligation to any other. It is binding over all the globe in all countries, and at all times : no human laws are of any validity, if contrary to this; and fuch of them as are valid derive all their force, and all their authority, mediately or immediately, from this original.

But in order to apply this to the particular exigencies of each individual, it is itill neceflary to have recourfe to reafon: whofe office it is to difcover, as was before obferved, what the law of nature directs in every circumitance of life; by confidering, what method will tend the moft effectually to our own fubtantial happinefs. And if our reafon were always, as in our firft anceftor before his tranfgreffion, clear and perfect, unruffled by paffions, urclouded by prejudice, unimpaired by difeafe or intemperance, the tafk would be pleafant and eafy; we fhould need no other guide but this. But every man now finds the contrary in his own experience; that his reafon is corrupt, and his undertanding full of ignorance and ervor.

This has given manifold occafion for the benign interpofi-
tion of divine providence; which, in compaffion to the frailty, the imperfection, and the blindnefs of human reafon, hath been pleafed, at fundry times and in divers manners, to difcover and enforce its laws by an immediate and direet revelation. The doctrines thus delivered we call the revealed or divine law, and they are to be found only in the holy fcriptures. Thefe precepts, when revealed, are found upon comparifon to be really a part of the original law of nature, as they tend in all their confequences to man's felicity. But we are not from thence to conclude that the knowledge of thefe truths was attainable by reafon, in its prefent corrupted ftate; fince we find that, until they were revealed, they were hid from the wifdom of ages. As then the moral precepts of this law are indeed of the fame original with thofe of the law of nature, fo their intrinfic obligation is of equal ftrength and perpetuity. Yet undoubtedly the revealed law is of infinitely more authenticity than that moral fyftem, which is framed by ethical writers, and denominated the natural law. Becaufe one is the law of nature, exprefsly declared fo to be by God himfelf; the other is only what, by the affiftance of human reafon, we imagine to be that law. If we could be as certain of the latter as we are of the former, both would have an equal authority: but, till then, they can never be put in any competition together.

Upon thefe two foundations, the law of nature and the law of revelation, depend all human laws; that is to fay, ne human laws fhould be fuffered to contradict thefe. There are, it is true, a great number of indifferent points, in which both the divine law and the natural leave a man at his own liberty; but which are found neceffary for the benefit of fociety to be reftrained within certain limits. And herein it is that human laws have their greatelt force and efficacy: for, with regard to fuch points as are not indifferent, human laws are only declaratory of, and act in fubordination to, the former. To inftance in the cafe of murder : this is exprefsly forbidden by the divine, and demonftrably by the natural law ; and from thefe prohibitions arifes the true unlawfulnefs of this crime. Thofe human laws that annex a punifhment to it, do not at all increafe its moral guilt, or fuperadd any frefh obligation in foro confcientia to abftain from its perpetration. Nay, if any human law fhould allow or injoin us to commit it, we are bound to tranfgrefs that human law, or elfe we mutt offend both the natural and the divine. But with regard to matters that are in themfelves indifferent, and are not commanded or forbidden by thofe fuperior laws; fuch, for inftance, as exporting of wool into foreign countries; here the inferior legillature has fcope and opportunity to interpofe, and to make that action unlawful which before was not fo.

We might further add, that, as there is a natural and neceffary difference between virtue and vice, and the feveral actions and difpofitions which are denoted by thefe two oppofite terms, natural reafon difcovers it to be the will of God, that every man fhould look upon this difference in the nature of things and actions, as a law or rule, which he is religiounly to obferve, under pain of his Maker's difpleafure. Among thofe writers who have alleged arguments in proof of the law of nature, fome have founded it upon the reafon and fitnefs of things, others, on our moral fenfe, and focial affections; and others, again, on the good effects of virtue, and evil effects and confequences of vice; but, however they may differ in the principles upon which they have founded their reafoning, they have ultimately arrived at the fame conclufion. Thefe principles are illutrated under their proper heads in the courfe of this work. The names and works of the different writers are cited by Grove,
in his "SyAtem of Moral Philofophy," vol. II. p. ii. n. 5. The law of nature, fays the author laft cited, is eternal and neceflary ; fo that it always did, and always could not but exif. It is univerfal, infomuch that all mankind are born the fubjects and objects of this law, notwithflanding the difference of climate, of government, of language, and of opinions and cuitoms that have prevailed in different parts of the world. Moreover, the law of nature is immutable, for the divine nature is immutable. The firft principle, or law of nature, according to Hobbes, is felf-prefervation. Thomafius will have in to be our own happinefs, which falls in at laft with the fentiment of Hobbes. Puffendorf maintains it to be fociality. Valentine Alberti, the belief that we are the image of God. Henry and Samuel Cocceius, the will of God. Grotius, right reafon. Velthemius, the intrific decency or turpitude of actions. Strimefius and Janus, that we are to love God, ourfelves, and our neighbour.

Laws, Human, comprehend all thofe rules of conduct, which originate in the wifdom of man, individually or collectively confidered, and which are defigned to regulate their behaviour to one another in more limited or more enlarged focieties, and which are enforced by human authority and worldly fanctions. Human laws are neceffary as a remedy, partly to the generality, and partly to the inefficacy of the divine. The laws of God are too general to afcertain all the duties of fociety, without fome additional interpretations of men. That no man by fraud or violence injure another, and take his property, is a divine law; which notwithftanding, human laws are in many cafes needful to fettle the bounds of property, and affign every member of the community his rights and duties; what he may expect from others, and what he is to do to them. "Salus populi fuprema lex efto." "To fecure the welfare of the fociety be the fupreme law" is really a divine precept; but the geniufes and interefts of nations are fo various, yea, fo liable to change are the interefts and circumftances of the fame people, that different laws are neceffary to fuit this diverfity of tempers, occafions, and emergencies. Nor is it any reproach to the divine law that it is no more particular ; fince it mult be infinite to reach all the particular circumftances of mankind: and God hath given men reafon, by which they may build upon the foundation that he hath laid fuch further laws and conflitutions, as the courfe and pofture of human affairs fhall require. Nor is the inefficacy of the law of God, which is the other thing that makes human laws neceffary, any more a difhonour to it. For what is the caufe of this inefficacy, but the wilful corruption of men? It was moft fit, that the chief rewards and punifhments annexed to the divine laws fhould be unfeen and future; that the trial of human virtue might be more confpicuous. And were not mankind furk into an extreme degeneracy, the profpect of an eternal werld would make all other confiderations ufzlefs. But as it is now, the torments of an after-life are not a bridle ftrong enough upon the lufts and paffions of men. It is therefore neceflary, that every fociety, to fecure its own peace, fhould infert as much of the divine law into their refpeltive conftitutions, as concerns the welfare of the body politic; and inforce thefe laws, not as divine, but as laws of the fate, with civil fanctions; that they who will not be made honeft by the fear of God, may be fo by the fear of the laws of their country. The difference between the phi-

 that honefly and virtue, which others obferved through fear of the laws;" agreeably to that of the apofle, "that the law is not made for a righteous man, but for the lawlefs and
difobedient." All human laws are of the nature of thofe called civil; and thefe, with regard to the difference of their fubject matter, may be fub-divided into the law of nations, civil law, and canon law.

Law of Nations, Jus Gentium, is that rule, or meafure, which all or feveral nations, either by a tacit or expre?s agreement, are obliged to obferve towards one another, whether in peace or war. If, indeed, men were to live in a flate of nature, unconnected with other individuals, there would be no occafion for any other laws, than the law of nature, and the law of God. Neither could any other law polibly exift: for a law always fuppofes fome fuperior who is to make it; and in a ftate of nature we are all equal, without any other fuperior but him who is the author of our being But man was formed for fociety ; and, as is demonftrated by the writers on this fubject, is neither capable of living alone, nor indeed has the courage to do it. However, as it is impoffible for the whole race of mankind to be united in one great fociety, they muft neceffarily divide into many; and form feparate flates, conimonwealths, and nations, entirely independent of each other, and yet liable to a mutual intercourfe. Hence arifes a third kind of law, to regulate this mutual intercourfe, called "the law of nations:" which, as none of thefe ftates will acknowledge a fuperiority in the other, cannot be dictated by any; but depends entirely upon the rules of natural law, or upon mutual compacts, treaties, leagues, and agreements between thefe feveral communities: in the confruction alfo of which compacts we have no other rule to refort to, but the law of nature; being the only one to which all the communities are equally fubject : and therefore the civil law very jufly obferves, that "quod naturalis ratio inter omnes homines confituit, vocatur jus gentium."
Law, Civil or Municipal, is the rule by which particular diftricts, communities, or nations are governed; being thus defined by Juftinian, (Inft. 1. 2. 1.) "Jus civile eft quod quifque fibi populus conftituit." Judge Blackitone calls it " municipal" law, in compliance with common fpeech; for though, frietly fpeaking, that expreffion denotes the particular cuftoms of one fingle municipium, or free town, yet it may with fufficient propriety be applied to any one fate or nation, which is governed by the fame laws and cuftoms. Accordingly, municipal law, thus underfood, is properly defined to be "a rule of conduct prefcribed by the fupreme power in a ftate, commanding what is right and prohibiting what is wrong." It is a "rule;" not a tranfient order from a fuperior to or concerning a particular perfon, but fomething permanent, uniform, and univerfal. It is thus diftinguihed from advice or counfel, and alfo from a compact or agreement. (See the beginning of the article Lawr.) It is a rule of "civil conduct," by which it is diftinguifhed from the natural or revealed law. (See Law of Nature.) The municipal or civil law regards man as a citizen, and bound to other duties towards his neighbour than thofe of mere nature and religion; duties in which he has engaged, in confequence of enjoying the benefits of the common union ; and which amount to no more than that he do contribute, on his part, to the fubfiltence and peace of the fociety. It is likewife a rule "prefcribed," becaufe a bare refolution, confined in the breait of the legiflator, without manifelting itfelf by fome external fign, can never be properly a law. This refolution muft be notified to the people who are to obey it. This may be done by univerfal tradition and long practice, which fuppofe a previous publication, and is the cafe of the common law of England. It may be notified, viva voce, by officers appointed for that purpofe, as is done with regard to proclamations, and fuch acts of ${ }_{3}$ E 2
parliament
parliament as are appointed to be publicly read in churches and other affemblies. And, lattly, it nay be notified by writing, printing, or the like; which is the general courfe taken with all our aets of parliament. This notification, however, fhould be made in the moft public and perfíicuous manner; and not like the mafk of Caligula, who (according to Dion Caffus) wrote his laws in a very fmall character, and hung them up upon high pillars, the more effectually to enfnare the people. That, without doubt, can never be a rule to any perfon, which is not liable to his engnizance, or which he neither does nor can know. Agretably to this circumflance, fome have derived "lex" a legendo; becaufe the law was to be publicly read, that it might be known to all and oblerved by all. The matter of divine laws being ufually of great importance, and the author a fovereign who bas an abfolute propriety in us, and on that ground an unqueftionable right to the moft entire devotednefs, and zealous concern to pleafe him; we ought to ufe all the means in our power to come at the knowledge of his will. But as human laws proceed from the will of thofe who, by nature, are upon a level with the relt of mankind, and have the confent of others to govern them purely for their temporal or political good, fuch a provifion ought to be made for their publication, that by an ordinary care, and without taking up much of their time and thoughts, which are to be fpent in their private callings, people may be able to know the pleafure of their governors. There is another circumitance, which is worfe than the non-promulgation of a law; and that is the making of laws "ex poft facto:" when after an action (indifferent in itfelf) is committed, the legiflator then for the firlt time declares it to have been a crime, and inflicts a punifhment upon the perfon who has committed it. All laws fhould be made to commence " in futuro," and be notificd before their commencement. When the laws or rules of conduct are properly notified or prefcribed, it is the bufinefs of the fubject to be thoroughly acquainted with them: for if ignorance, of what he might know, were admitted as a legitimate excufe, the laws would be of no effect, but might always be eluded with impunity. On this head we fhall only add, that it is requifite to the very effence of a law, that it be made by the fupreme power. Sovereignty and legilature are convertible terms; one cannot fubfilt without the other. That the law may anfwer the purpofe of a complete rule, "commanding what is right and prohibiting what is wrong," it is neceffary that the boundaries of right and wrong be eftablifhed and afcertained by law: and it is then the bufinefs of the law, confidered as a rule of civil conduct, to enforce thefe rights, and to redrefs thefe prongs. For this purpofe every law may be faid to confift of Ceveral parts: one, declaratory, whereby the rights to be obferved, and the wrongs to be efchewed, are clearly' defrined and laid down ; another, dircIory, whereby the fubject is inftructed and enjoined to obferve thofe rights, and to abftain from the commiffion of thofe wrongs; a third, remedial, whereby a method is pointed out to recover a man's private rightc, or redrefs his private wrongs ; to which may he added a fourth, ufually termed the fanation, or rindicatory branch of the law, whereby it is fignified what evil or penalty fhall be incurred by fuch as commit any public wrongs, and tranfgrefs or neglect their duty. (Blackit. Comm. book i.) For the interpretation of the law, fee Interpretation.

Civil haws, confidered with regard to the two offices of the legiflator, viz. to judge and to compel, may be divided into two branches; the one difributive, the other vindiative and peral.

Law, Difributive, is that by which every man has his
right; or, it is that which conllitutes the rules and meafures of things, whereby we know what belongs to us, and what to others; fo as we may not difturb or interrupt others in the enjoyment of their own, nor be interrupted by them; and what each man may lawfully do or not do.

Law, Vindizive, is that branch by which the punifhments to be inflicted on thofe who violate the laws, are determined.
The diffributive and vindictive are not two fpecies of laws, but two parts of the fame law. For if a law fay no more than "Whatever you catch in your net, in the fea, fhall be your's," it is in vain ; for though another take from you what you have caught, it is ftill your's; in regard, in the ftate of nature, where all things are common, your's and another's are the fame thing. So that what the law defines to be your's, was your's before that law, and will be your's after it, though poffeffed by another.-A law, therefore, is but an empty found, unlefs it determisie the thing to be your's in fuch a fenfe as to forbid every body elfe from difturbing you in the poffeffion of it. But fuch prohibition will be vain, unlefs there be a penalty annexed to it. A law, thercfore, muft contain both thefe parts, that which prohibits, and that which punifhes. The firt whereof, which is called difributive, is prohibitory, and fpeaks to all; the latter, called vindizive or penal, is mandatory, and fpeaks only to the public officers. Whence it follows, that to all civil laws there is annexed a penalty, either implicitly or explicitly ; and where that punifhment is not afcertained, either by writing or by example, it is fuppofed to be arbitrary, and to depend on the pleafure of the legillator: for that is no law, which may be violated impunè.

Civil laws, confidered with regard to the different manners of promulgating them, are of two kinds; fripte and non fcripta, or written and unwritten.

Laws, Written, are thofe which require either the voice, or fome other fign of the legillator's will to become laws. The written laws of England confirt of ftatutes, acts, or edicts, made by the king's majefty, by and with the advice and confent of the lords fpiritual and temporal, and commons, in parliament affembled. The oldeft of thefe now extant is the famous "magna charta," as contained in parliament 9 Hen. III. See-Magna Cbarta and Statuths.

Laws, Unwritten, are fuc, as need no other promulgation befides the voice of nature, or natural reafon; of which kind are all natural laws.

Hence it appears, that though the natural laws be defcribed in the writings of the philofophers, they are not therefore to be called zuritten laws; nor are the writings of lawyers, laws, for want of the fupreme authority; nor the refponfa prudentum, or opinions of judges, laws, excepting fo far as they are allowed by the fupreme power to pafs into ufe; and then they are called leges fcripte, written laws; not becaufe of their ufe, but becaufe of the will of the fupreme power, which is argued from their paling into ufe.

The unwritten law of England includes not only "general cuftoms," as the common laww, properly fo called; but alfo the "particular cuftoms" of certain parts of the kingdom; and likewife thofe "particular laws," that are by cufom obferved only in certain courts and juridictions. When thefe parts of the municipal law of England are called "leges non icripte," we are not to underfland that thefe laws are at prefent merely oral, or communicated from the former ages to the prefent folely by word of mouth. Indeed, during an age of profound ignorance of letters, all laws were entirely traditional, becaufe the nations among which they prevailed had but little idea of writing. Thus the Britifn

## L A W

as well as the Gallic Druids committed all their laws, as well as learning, to memory; and it is faid of the primitive Saxons here, as well as their brethren on the continent, that "leges fola memoria et ufu retinebant." But with us, at prefent, the monuments and evidences of our legal cuftoms are contained in the records of the feveral courts of juttice, in books of reports and judicial decifions, and in the treatifes of the learned fages of the profeffion, preferved and handed down to us from the times of higheft antiquity. But thefe parts of our law may be fitly Atyled "leges non fcriptx," becaufe their original inflitution and authority are not fet down in writing, as acts of parlizment are, but they receive their binding power, and the furce of laws, by long and immemorial ufage, and by their univerfal reception throughout the kingdom. In like manner as Aulus Gellius defines the " jus non fcriptum" to be that, which is "tacito et illitcrato hominum confenfu ct moribus exprefium." See Consmon Laze and Custom.

Having confidered the civil law in its more general acceptation, as denoting the ftatutes and ordinances of every flate for its own good government, we fhall refer for the flatement of its more fecial acceptation to the article Civil Lazu.
Laws, Canon or Ecclefiafical, in a more extenfive fenfe, denote laws relating to the workhip, difcipline, and government of the church. For an account of that which is by way of eminence called cinnon law, fee Canon Lazv.

There is another divifion of the law of England befides that which we have above ftated, more large and particular ; as into the prerogative or crown law; the law and cuftom of parliament; the common law; the ftatute law; reafonable cuftoms; the lav of arms, war, and chivalry; ecclefiaftical or canon law ; civil law, in certain courts and cafes; fore? law ; the law of marque and reprifal ; the law of merchants; the law and privilege of the fannaries, \&c. But this large divifion may be reduced to the common divifion; and all is founded on the law of nature or reafon, and the revealed law of God, as all other laws ought to be. I Co. Inf. II.

Law is alfo applied to the feveral policies of ftates and people, or the maxims and rules they have agreed upon, or received from their magitrates, whereby to live in peace and mutual fociety.

The laws of the twelve tables were the ancient laws of the Romans, for which the Decemviri were fent into Greece, and which ferved them for the ground-work of all their jurifprudence.

The celebrated laws of the more modern days, are thofe of the Angli, the Werini, or Thuringi; of the Boii, or Bavarians ; thofe of the Burgundi, Germans, Danes, and Norwegians; of the Franks, the Frifons, the Lombards, the Gothic laws, the Martina, or Mercian law; the laws of the Saxons, Scots, Sicilians, Vifigoths; the laws of Oleron, the Molmu:in law, and the Salic law.

Law, Lex, among the firit Romans properly fignified an ordinance of the people, made at the requeft of a magiftrate, particularly a conful.

Thefe ordinances differed from the plebifcita and fenatus confulta, and even from other ordinances made at the requeft of any other magittrate befide a conful, though thofe to0 bore the name of laws.
Thus, though Aquilius and Falcidius were only tribunes when they made their requelt, yet we fill fay, the Aquilian Law, the Falcidian law, \&c.
The feveral laws of the Romans are diftinguifhed, 1. By the name of him at whofe requeft they were paffed; as the Cornelian Eaw, the Julian law, \&c. 2. By the matter or
fubject of the law; and hence came the terms, teflumentary laws, as the Furian, Voconian, \&c. judiciary laws, Agrarian laws, \&c.
3. Sometimes by the crimes againlt which they were made. For inttance : the laws tou diug poifoning, parricides, \&c. the laws of concufion, preculate, \&c.

The Codex and Authenzicx are the laws and conftitutions of the Roman emperors; and the Digeft is a compilation, made by the emperor Jultimian's order, of the feveral opinions and judgments of the mof learned in the Roman law ; to which he gave the fanction of laws, as appears by the epiftle prefixed to the work; and it is this that properly coniftitutes the lloman law. See Civir Law.

The lex talionis, or law of like for like, is the moft ancient and equitable law in the world. It was obferved by the Hebrews.

Law has alfo a more fpecial fignification, wherein it is taken for that which is lawful with us, and not elfewhere : as "tenant, by the courtefy of England."

Thus we alfo fay, to evage lasw (vadiare legem), and to make or do laze (facere legem). See Wager, and Make.

Law of Arms, is that law which gives precep:s how rightly to proclaim war, to make and obferve leagues, to attack the enemy, and to punifh offenders in the camp.
Common things concerning arms and war are under the cognizance of the conitable and marihal of England. ${ }_{13}$ R. II.

Law, Foreft. See Forest.

## Law, Frank. See Frank.

Law of Honour, denotes a fyftem of rules, conftructed by people of fafhion, and calculated to facilitate their intercourfe with one another; and for no other purpofe. No. thing is adverted to by the law of honour but what tends to incommode this intercourfe; and hence it only preferibes and regulates the duties betwixt equals, omitting fuch as relate to the Supreme Being, as well as thofe which we owe to our inferiors. For which reafon, profanenefs, negleat of public worlhip or private devotion, cruelty to fervants, rigorous treatment of tenants or other dependants, want of charity to the poor, injuries done to tradefmen by infolvency or delay of payment, with numberlefs examples of the fame kind, are accounted no breaches of honour ; becaufe a man is not a lefs agreeable companion for thefe vices, nor the worfe to deal with, in thofe concerns which are ufually tranfacted between one gentleman and another. Again, the law of honour, being conllituted by men occupied in the purfuit of pleafure, and for the mutual conveniency of fuch men, wivil be found, as might be expected from the character and defign of the law-makers, to be, in moft inItances, favourable to the licentious indulgence of the natural paflions. Thus it allows of fornication, adultery, drunkennefs, prodigality, duelling, and of revenge in the extreme; and lays no itreis upon the virtues oppofite to thefe. Paley's Principles of Moral and Political Philofophy, vol. i.
Law, Infurance of. See lnsurance.
Law, Intendment of. See Intendsents.
Law Language was formerly, in this kingdom, Norman or law French ; and in this barbarous dialect were all public proceedings written and recorded. Nothing could be a more humifating and ignominious badge of tyranny and foreign fervitude; being introduced under the aufpices of William the Norman, and his fons; and thus the ironical obfervation of the Roman fatiriat came to be literally verified, that "Gallia
"Gallia caufidicos docuit facunda Britannos." (Juven. xrv. 118.) This continued till the reiga of Edward III., when by flat. 36 Ed. III. c. 15 , it was enacted, that for the future all pleas, \&c. Mould be conducted in the Englifh tongue ; but entered and enrolled in Latin. The practifers, how* ever, being ufed to the Norman language, which was more familiar to them, continued to take their notes in law French ; and when thefe notes were publifhed, under the denomination of reports, they were printed in that barbarous dialect ; which, joined to the additional terror of a Gothic black letter, has occafioned many ftudents to throw away their Plowden and Littleton, without venturing to attack a page of them. But in reality, fays Blackitone, on a nearer acquaintance, they would have found nothing formidable in the language ; which differs in its grammar and orthography as much from the modern French, as the dietion of Chaucer and Gower does from that of Addifon and Pope: Befides, as the Englifh and Norman languages were concurrently ufed by our anceftors for feveral centuries, the two idioms have naturally affimilated, and actually borrowed from each other; for which reafon the grammatical conftruction of each is fo very much the fame, that an Englifhman (with a week's preparation) would underftand the laws of Normandy, collected in their "grand couftumier," as well, if not better, than a Frenchman bred within the walls of Paris.

The Latin, which fucceeded the French for the entry and enrolment of pleas, and which continued in ufe for four centuries, anfwers fo nearly to the Engliih, that it has been generally imagined to be totally fabricated at home, with little more art or trouble than by adding Roman terminations to Englifh words. Whereas, in reality, it is a very univerfal dialect fpread throughout all Europe at the irruption of the northern nations, and particularly accommodated and moulded to anfwer all the purpofes of the lawyers with a peculiar exactnefs and precifion. Thefe northern nations, or rather their legiflators, though they refolved to promulge their laws in the Latin tongue, have frequently intermixed in it fome words of a Gothic original ; which is more or lefs the cafe in every country of Europe, and ought not, therefore, to be imputed as any peculiar blemifh in our Englifh legal Latinity. The truth is, that which is generally denominated law Latin, is in reality a mere technical language, calculated for eternal duration, and eafy to be comprehended both in prefent and future times ; and on thofe accounts beft fuited to preferve thofe memorials which are intended for perpetual rules of action. As to the objection of locking up the law in a ftrange and unknown tongue, this is of little weight with regard to records, which few have occation to read, but fuch as do, or ought to, underftand the rudiments of Latin. The learned Blackfone fuggeits, that the terms of the "law are not more numerous, more uncouth, or more difficult to be explained by a teacher, than thofe of logic, phyfics, and the whole circle of Arittotle's philofophy, nay even of the politer arts of architecture and its kindred fudies, or the fcience of rhetoric itfelf." The technical Latin continued in ufe from the time of its firft introduction till the time of the fubverfion of our ancient conftitution under Cromwell, when, among many other innovations in the law, the language of our records was dltered and turned into Englỉh. But, at the rettoration of king Charles, this novelty was no longer continued; the practifers finding it very difficult to exprefs themfelves fo concifely or fignificantly in any other language but the Latin. Thus it cortinued without any fenfible inconvenience tiil about the year 1.730 , when it was again thought proper that the proceedings at law fhould be done into Englifh; and it was accordingly fo ordered
by fatute 4 Geo. II. c. 26. This provifion was made, according to the preamble of the flature, that the common people might know and underfland what was alleged or done for and againft them, in the procefs and pleadings, the judgment and entries in a caufe. Several inconveniences arofe from this alteration; fo that in two years it was found neceffary to make a new aet, 6 Geo. II. c. 14 , which allows all technical words to continue in the ufual language, and has thereby almoft defeated every beneficial purpofe of the former ftatute. Blackft. Com. b. iii.
Law, Marine, denotes that law which ferves to regulate the interefts of navigation and maritime commerce. (See Navigation, and Commerce.) This law has undergone various alterations and improvements, in confequence of the extenfion of naval intercourfe between different nations for the purpofes of commerce. Several codes have been formed by different ftates primarily for the regulations of navigation, and for defining the authority of the mafters and other officers of hhips, and the duty and rights of the feamen; and afterwards for the regulation of maritime contracts. The earlieft fyftem of marine law, which hittory records, was that compiled by the Rhodians, after they had, by their commerce and naval vietories, obtained the fovereignty of the fea, about 900 years before the Chriftian era. Thefe laws exift at prefent only in a detached and imperfeet ftate, as they have been preferved and incorporated in other fubfequent inflitutions of a fimilar nature. It has been fuppofed by fome that the Rhodian laws were adopted by the Romans during the firft Punic war, when they firft became a naval power ; but others affirm that they were incorporated with the Roman law by Juftinian and others. As for the Phoenicians, Carthaginians, Athenians, Corinthians, and other maritime fates of antiquity, it does not appear whether they had any marine laws of their own inftitution. If they had any, they have not been tranfmitted to our times. The firtt code of modern fea-laws was compiled, fays ferjeant Marfhall, about the time of the firlt crufade, towards the end of the irth century, by the people of Amalf, who had then become confiderable for their commerce and maritime power. It is not improbable that the code confifted principally of the Rhodian inftitutions, which were found ftill in force in the countries bordering upon the Mediterranean; and being collected into one regular fyltem, were generally received, for a confiderable time, as law in thofe countries. In procefs of time, other ftates, as they acquired importance and diftinction, formed new collections of marine laws, in which the old inflitutions were altered and modified to fuit the improvements of the times, or their own particular interelt. But when inconveniences were found to arife from a diverfity of rules pertaining to a fubject that had been long regulated by one general fyftem, which was regarded as part of the law of nations, it became neceffary for the different maritime flates to form a new code out of all thefe difcordant materials, which was done, as Grotius informs us, (De Jure Bell. 1. iii. c. 1. § 5. n. 6.), by the authority of almoft all the fovereigns of Europe. This new digeft was denominated "Confolato del Mare." It was firft publifhed, by order of the ancient kings of Aragon, in the Catalan tongue, and therefore probably compofed at Barcelona, the capital of Aragon. In the $1^{\text {th }}$ th century this code was revived as law in Italy, the Greek empire, France, and Germany; and Vinnius fays, that moft of the marine laws in Spain, Italy, France, and England are borrowed from it. It feems to have been confidered as a branch of the public law, and its regulations are ftill of very high authority in every maritime ftate of Europe. The next colleciion of feap laws in point of time, as well as of celebrity, is that of Oleron.

L A W
Oleron. (See Oreron.) This was fucceeded by a collection of the ordinances made by the "Merchants and mafters of the magnificent city of Wibuy, in the ifland of Gothland, formerly very famous for its commerce, but now reduced to an obfcure and inconfiderable town." Many of 'the regulations contained in this code of lawa are precifely "the fame with thofe of Oleron. Thefe laws were for fome ages, and indeed ftill remain, in great authority in the north'crn parts of Europe. In 1597, the deputies of the Hanfeatic league, in a general affembly at Lubeck, drew up a fyftem of laws relating to navigation, for the ufe of their confederacy, to which, in i614, they added feveral new ordinances. But the molt complete and comprehenfive fyltem of this kind is the famous ordinance of the marine of -Louis XIV. publifhed in 168 I . This excellent code was̀ compiled and arranged by a very malterly hand, under the infpection of Colbert, the celebrated minifter of that prince, upon an attentive revifion of all the ancient fea-laws of France and other countries, with the affiltance of the moft learned men of the time, and upon confultation with the different parliaments, the courts of admiralty, and the chambers of commerce in France. It forms a fyftem of whatever experience and the wifdom of ages had pronounced to be molt jult and convenient in the marine inflitutions of the maritime Itates of Europe. Notwi:hftanding new regulations, fuggelted by motives of national intereft, it has hitherto been efteemed a code of great authority upon all queftions of maritime law. From this ordinance, and from the elaborate and ufeful commentary of Valin, lord Mansfield is faid to have derived much of his extenfive and accurate acquaintance with the principles of marine. Marfhall's Law of Infurance, vol. i. See Insurance.

Law of Marque, a law by which thofe who are driven to make ufe of it, take the goods, or fhipping of the party that has done them wrong, and of whom they cannot get ordinary juftice, whenever they can take him within their own bounds or precincts. 27 Edw. III. cap. 17 .

Law, Martial. . See Martial.
Law AIerchant, a fummary fort of law, originally differing from the common law, though now adopted, and become a part of the laws of the kingdom. This decides the caufes of merchants on the general rules which obtain in all commercial countries; and that often, in matters relating to domeftic trade, as, for inftance, with regard to the drawing, the acceptance, and the transfer, of inland bills of exchange. (Co. Litt. 172. Lord Raym. 181. 1562.) One point of it confifts in this, that if there be two joint merchants of wares, and one of them dies, his executor fhall have the moiety; which is not allowed in the cafe of others, not merchants. See Custom.

The law of merchants not being founded in the particular inftitutions, or local cuftoms of any particular country, but confilting of certain principles which general convenience has eftablifhed to regulate the dealings of merchants with each other in all countries, may be confidered as a branch of public law.

LAWEND, in the military language of the Ottoman empire, the appellation of cavalry, called alfo Delibaches. (See Delibacies.) From Lawend we have formed Laventi. Their arms are fhort fabres, piftols, mufkets, and lances. They wear a kind of cap, which is a long cylinder of black felt, nine or ten inches high, and without any projecting rim. Their faddles are made in the Englifh manner, of a fingle fkin, ftretched upon a wooden tree; in the reft of their accontrements and clothing, they refemble the Mamlouks. Their ragged clothes, their rufty arms, and their horfes of different fizes, give them the appearance of banditti more than of foldiers; and, in reality, they have firft diftin. guifhed themfelves under the former character, nor have they much changed their habits by adopting their fecond occupation. Almoft all the cavalry in Syria are Turkmans, Curds, or Caramanians ; who, after exercifing the trade of robbers in their own country, feek employment, as well as an afylum, near the perfon of the pacha. Throughout the empire, their troops are, in like manner, formed of plunderers, who roam from place to place. From want of difcipline, they retain their former manners, and are the fcourge of the country, which they lay walte, and of the peafants, whom they often pillage by open force. Volney's Travels, vol. ii.

LAWER KIRK, in Geography, a town of Scotland, in the county of Perth; 15 miles S.E. of George Town.

LaWES, William, in Biography, the eldeft fon of Thomas Lawes, a vicar-choral of the cathedral church of Salifury, and a native of that city, was placed early in life under Coperario, for bis mulical education, at the expence of the earl of Hertford. His firlt preferment was in the choir of Chichelter, but he was foon called to London, where, in 1602 , he was fworn a gentleman of the chapel royal; which place, however, herefigned in 1611 , and became one of the private, or chamber-muficians, to Charles, then prince, and afterwards king. Fuller fays, "he was refpected and beloved of all fuch perfons as calt any looks towards virtue and honour ;" and he feems well entitled to this praife. He manifeited his gratitude and loyalty to his royal mafter by taking up arms in his caufe againft the par-
liament.

## L A W ES.

liament. And though, to exempt him from danger, lord Gerrard, the king's general, made him a commiflary in the royal army, yet the activity of his fpirit difdaining this intended fecurity, at the fiege of Chefter, $16+5$, he loft his life by an accidental fhot. The king is faid, by Fuller, to have been fo affected at his lofs, that though he was already in mourning for his kinfman lord Dernard Stuart, killed at the fame fiege, his majcly put "on particular mourning for his dear fervant Willian Lawes, whom he commonly called the father of nufic."

His clief compofitions were fantafias for viols, and fongs and fymphonies for mafques. Though his brother Henry, in the preface to the Choice Pfalmines for three voices, which they publiflied jointly, boalts that "he compofed more than thirty feveral forts of mufic for voices and inftruments, and that there was not any initrument in ufe in his time but he compofed for it as aptly as if he had only fudied that.". In D.. Aldrich's Collection, Chrif-church, Oxon, there is a work of his cailed Mr. William Lawes's Great Confort, "wherein are fix fetts of muficke, fix books." His Royal Confurt for two treble viols, two viol da gambas, and a thorough-bafe, which was always mentioned with reverence by his admirers in the 17 th century, is one of the mott dry, aukward, and unmeaning compofitions we ever remember to have had the trouble of fcoring. It mult, however, have been produced early in his life, as there are no bars, and the pałfages are chiefly fuch as were ufed in queen Elizabeth's time. In the mulic--fchool at Oxford are two large manufcript volumes of his works in fcore, for various inftruments; one of which includes his original compofitions for mafques, perforined before the king, and at the inns of court.
His authem for four voices, in Dr. Boyce's fecond volume, is the beft and moft folid compofition that we have feen of this author ; though it is thin and confufed in many places, with little melody, and a harmony in the chorus, P. 201, which we are as unable to underfland, or reconcile to rule, or to our own ears. He nuft have been confiderably older than his brother Henry, though they frequently compofed in conjunctions: We are, however, unable to clear up this point of prinogenenture : Henry's name is placed firtt in the fitle to Choice Palmes, publifhed in 164S, in the preface to which he fays, "as to that, which is my part in this compofition, it takes precedence of order only, not of worth." And yet he fays of his own tunes jult before, "they had their birth at the fame timee as his." Befides the pfalms at the end of fir William Davenant's mafque, called " The Triumphs of the Prince d'Amour," 1635 , it is faid, that "the mufick of the fongs and fymphonics, were excellently compofed by Mr. William and Mr. Henry Lawes, his majefty's fervants."
Several of the fongs of William Lawes occur in the collections of the time, particularly in John Playford's Mufical Companion, part the fecond, confilting of dialogues, glees, ballads, and airs, the words of which are in general coarfe and licentions. The dialogue part, which he furnihed to this book, is a fpecies of recitative, wholly without accom. paniment : and the duet at laft, which is called a chorus, is infipid in melody, and ordinary in counterpoint. His boated canons, publifhed by his brother Henry at the end of their pfalms, as proofs of his great abilities in harmony, when fcored, appear fo tar from finihed compofitions, that there is not one of them totally free from objections, or that bears the flamp of a great mafter.

Lawes, He\ry, the brother of William, was likewife a difciple of Coperario. By the cheque-book of the clapel royal, it appears that he was fivorn in Pifteller, in January, 2625 , and, in November followigg, gentleman of the ehapel;
after this, he was appointed clerk of the cheque, and one of the public and private muficians to Charles I. William and Henry Lawes were at this time in fuch general favour, that though the kingdom was divided into factions, and were not only varied more in their principles, but difputed them with more violence than at any other period of our hiftory, there was but one opinion concerning the abiities of theie muficians. Yet as the reputation of Heary was \&ill higher, and more firmly eftablifhed than that of his brother, it feems to require more ample difcuffion. We have examined with care and candour all the works which we cosild find of this compofer, which are fill very numerous, and are obliged to own ourfelves unable, by their excellence, to account for the great reputation which he acquired, and the numerous panegyrics beftowed on him by the greateft poets and muficians of his time. His temper and converfation mulf certainly have endeared him to his acquaintance, and rendered them partial to his productions : and the praife of fuch writers as Milton and Waller is durable fame. Tallis, Bird, or Gibbons, who were all infinitely fuperior to Lawes, never had their abilities blazoned by contemporary poets or hiftorians of eminence. Fenton, the editor of Waller's works, tells us, that "the belt poets of his time were ambitious of having their verfes fet to mufic by this admirable artit ;" and, indeed, he not ouly fet fome of the works of almoft every poct of eminence in Charles I.'s reign, but of young noblemen and gentlemen who feem only to have tried their frength on the lyre for his ufe, and of whofe talents for poctry no other evidence remains than what is to be found in Lawes's publications.
Waller has more than once bettowed his fragrant incenfe on this mufician. Peck fays, that " Milton wrote his Mafque at the requeft of Lawes ;" but whether Milton chofe Lawes, or Lawes Milton for a colleague in Comus, it equally maniferts the ligh rank in which he thood with the greatelt puets of his time. It would be illiberal to cherifh fuch an idea; but it dooss fometimes feem as if the twinfifters, Poetry and Muric, were mutually jealous of each other's glory: "t the lefs interefting my lifter's offspring may be," fays Poetry, "t the more admiration will my own obtain?" Upon afking fome years ago, why a certain great prince continued to honour with fuch peculiar marks of favour an old performer on the flute, when he had fo many muficians of fuperior abilities about him? We were anfwered, "becaule he plays worfe than himfelf." And who knows whether Milton and Waller were not fecretly influenced by fome fuch confideration? and were not more pleafed with Lawes for not pretending to embellifh or enforce the fentiments of their fongs, but fetting them to founds lefs captivating than the fenfe.

But burd as the mufic of Lawes appears to us, it feems to have been fincerely admired by his contemporaries in general. It is not meant to infinuate that it was pleafing to poets cnly, but that it was more praifed by them than any other mulic of the fame time. Though that of Laniere, Hiltcn, Simon Ives, Dr. Child, and others, feems preferable ; :nd the poets, whofe praife is fame, perhaps taught others to admire.

The time was now conie for fimplifying harmony and purifying melody in England, as weil as in Italy; and the beginning of this enterprize was not fortunate here any more than in that country : harmony and contrivance were relinquifhed without a compenfation. Simplicity, indeed, was attained; but devoid of accent, grace, or invention. And this accounts for the fuperiority of church mutic over fecular at this period in every part of Europe, where canon, fugue, rich harmony, and contrivance, were ftill cultivated; while the firt attempts at air and recitative were auk ward, and the bafes thin and unmeaning. Indeed, the compofers of this
kind of mufic liad the fingle merit to boaft of affording the tinger an opportunity of Jetting the words be perfectly well undertood; as their melodies, in general, confitted of no more notes than fyllables, while the treble accompaniment, if it fubfitted, beinis in unifon with the voice-part, could occafion no embarrallinent or confution.

But there feems as little reafon for facrificing mufic to poetry, as poetry to mufic ; and when the fentiments of the poem are neither enforced nor embellifhed by the melody, it feems as if the words might be ttill belter articulated and underltood by being, read or declaimed, than when drawled out in fuch pfalmodic ayres as thofe of Henry Lawes and his contemporaries. It has, however, been afked "whoever reads the words of a fong but the author ?", And there are certainly many favourite fongs, which nothing but good mufic and good finging could ever bring into notice. There are, however, poems, we will not call them fongs, on fubjeets of wit and fcience, which mult ever be enfeebled by mufic ; while others, truly lyric, and confined to paffion and fentiment, travel quicker to the heart, and penetrate more deeply to the foul by the vehicle of melody, than by that of declamation. But we want not to fet up one art againft another, or to give a preference to finging over declamation ; but to affign to each its due place and praife. There are palages in our beft plays which could never be fung by the fineft performer that ever exilted, to fo much effect as they have been Spoken by a Garrick or a Siddons; while in Mctaftafio's charming dramas, there are lines and flanzas, by which an audience has been often more comoletely enrapt, when well fet and well fung by a mellifluous and touching voice, than by the moft exquilite declamation of the greateit actors that ever exilted. Though Henry Lawes feverely cenfures the admirers of Italian mufic in his preface, yet his firft cantata, "Thefeus and Ariadne," is both in poetry and mufic, an imitation of the famous fcene in Monteverde's opera of "Arianna," which was afterwards formed into a fingle heroic fong, entirely like this, in ftilo recitativo, without any, air from beginning to end. After the operas of Rinuccini, which had been fet by Jacopo Peri, Giulio Caccini, and Monteverde, in that manner, at the beginning of the 17 th century, had met with fuch univerfal applaufe in Italy, from the lovers of poetry and fimplicity, and enemies to madrigals and mufic of many parts, this kind of compofition had many imitators, not only in Italy, but throughout Europe. All the melodies of Henry Lawes remind us of recilative or pfalmody, and fearec any thing like an air can: be found in his whole book of Ayres. As to his knowledge and refources in counterpoint, we are certain that they were neither great nor profound. His vorks were chiefly publifhed under the title of "Ayres and Dialugues," of which he printed three feveral books, the firlit in 1653; the fecond in 1655 ; and the third in $105 \%$. Befides thefe, many of his fongs and dialogues were publifhed by Playford in collections, entitled "Select Mufical Ayres and Dialogues," by Dr. Willon, Dr. Charles Colman, Nicholas Laniere, and others. Though moft of the productions of this celebrated mufician are languid and infipid, and equally devoid of learning and genius, we fhall point out one or two of them that feem the molt meritorious.

Book the Firf, p. Ir.

Vol. XX.
is one of the moft pleafing airs that we have feen of thiak author. We fhould infert anotlier of his fongs cutire, in the mulical plates, had we roons; "A Lover once I did efpy;" not fo much on account of the beauty of the melody and harmony, though it is one of the beft in thofe particulars, as for the fingularity of the meafure, which is fuch as feldom occurs. Harry Carey"s ballad "Of all the firls that are fo fmart, \&cc." which is a flower kind of hornpipe, refembles it the molt of any air which we can recollect. "Little lowe ferves my turn," p. 18. of the fame collection, is the gayeft air which we have feen of H. Lawes. Flis other moit. pleafing ballads are thofe beginning. "If v:hert the fun," p. I8, and Ben Johnfon's fong, "Still to be neat, ttill to be drefled ;" fee Play ford's Colicction. But the beft of all hus fonys feems "Come from the dungeon to the throne," p. 167. of Playfair's fecond part; and "Amidit the myrtles as I walk," is pleafing pralmody.

The tunes which he fet to Sandys's excellent verfion of the pfalms, as well as thof to the Chose Pfalmes of the fame paraphrafe, which were con pofed by Henry Lawes and his brother, in a kind of anthem or motet ityle, though afhered into the world, in $16+8$, by fuch imnumerable pancgyrics in shyme, are fo far from being fuperior to the fyllabic pfalmody of their predeceffors orho clothed Sternhold and Hopkins in Narcoties frains, that they feem to poffefs not only lefs pleafing melody, but lefs learned harmony, than may be found in anterior publications of the fame kiod. And this feems to be the opinion of the public: as they were never adopted by any vociferous fraternity, or admitted into the pale of a fingle country church, that we have been able to difcover, fince they were firlt printed. One of thefe, firit publifhed by Henry, to the feventy-fecond pfalm, has, indeed, long had the honour of being jingled by the chimes of St. Lawrence Jewry, fix times in the four-and-twenty hours, in a kind of Laus perpetua, fuch as was eftablithed in Pfalmody illand, mentioned in the General Hillory of Mufic, vol ii. p.g.

During the civil war, Henry Lawes fupported himfelf by teaching ladies to fing; however, he retained his place in the chapel royal, and, at the Reftoration, compofed the coronation anthem. Yet he did not long furvive this event, for, in October, 1662 , he died, and was buried in Weftmin. fter Abbey.

## LAWFUL. Sce Unlawful. <br> Lawful Nam. See Naam.

LAWING of Dogs, a phrafe ufed in our ancient law. writers. Thus, maftiffs murt be lawed every three years, Crompton Jurifd. fol. I 63 , that is, three claws of the forefoot fhall be cut off by the fkin, or the ball of the fore-foot cut out. Sce Expeditation.

LAWLESS Court, a court held on King's bill at Rochford in Effex, every Wednefday morning next after Michaelmas day, at cock-crowing; at which court they whifper, and have no candle, nor any pen and ink, but a coal. He that owes fuit of fervice there, forfeits double his rent every hour he is miffing.
This court is called lawlefs, becaufe held at an unlavful hour ; or, perhaps, quia diata fine lege; hecaufe opened without any form. It is mentioned by Camden ; who fays, this fervile attendance was impofed on the tenants, for conlpiring at the like unfeafonable time, to raife a commotion.

## Lawless Mar, ex-lex. See Outlaw.

LAWN, in Gardening, an open fpace of fhort grafs. ground, in the front of a refidence, or in a garden, park, or other pleafure-ground. Thefe, when extended in the principal fronts of habitations, add confiderably to the neatnefs and grandeur of their appearance, by laying them open, and admitting more extenfive profpects. Where there is a fulti-

## $\mathrm{L} \wedge \mathrm{W}$

cient Icope of ground, they thould be as large as the nature of the fituxtion will adnit, always being planned in the moft confpicuous parts immediately joining the: houfes, and extended outwaid as far as convenient, allowing width in proportion; having each fide or verge bounded by elegant flurubbery compartments in a varied order, feparated in some parts by intervening fpaces of grafs-ground, of yaried dimenfions, and ferpentine gravelowalks, gently winding between and through the plantations, for occafional hady, theltered, and priyate walking; or fimilar walks carried along the fronts of the boundary plantations, and immediately joining the lawns, for more open and airy walking in; and in fome concave fweeps of the plantations there may be receffes and open fpaces both of grafs and gravel, of different forms and dimenfions, made as places of retirement, fhade, $\$ \mathrm{sc}$.

Thorgh the ufual fituations of lawns are thofe juft mentioned; yet if the nature of the ground admit, or in cafes where there is a good fcope of ground, they may be continued more or lefs each way; but always the mott conliderable on the principal fronts, which, if they be to the fouth, or any of the foutherly points, they are the moft defirable for the purpofe.

With refpect to the dimenfions, they may be from a quarter of an acre, or kefs, to fix or eight acres, or more, according to the extent and fituation of the ground. Sometimes lawns are extended over ha-has, to ten, twenty, or even to fifty or fisty acres, or more. But in thefe cafes they are not kept mown, but caten down by live flock.

The form mult be directed by the nature of the fituation; but it is commonly oblong, 〔quare, oval, or circular. But in whatever figure they are deligned, they thould widen gradually from the houfe outward to the furtheft extremity, to have the greater advantage of profpect ; and by having that part of them within the limits of the pleafure-ground, bounded on each fide by plantations of ornamental trees and frubs, they may be continued gradually near towards each wing of the habitation, in order to be fooner in the walks of the plantations, under fhade, fhelter, and retirement. The terminations at the farther ends may be either by ha-has to extend the profpect, or by a flrubbery or plantation of fately trees, arranged in fweeps and concave curves. But where they extend towards any great road, or diftant agreeable profpect, it is more in character to have the utmoft verge open, fo as to admit of a grand view from and to the main refidence.

But the fide-boundary verges fhould have the plantations rurally formed, airy, and elegant, by being planted with different forts of the molt ornamental trees and fhrubs, not in one continued clofe plantation, but in diftinct feparated compartments and clumps, varied larger or fmaller, and differently formed, in a fomewhat natural imitation, being fometimes feparated and detached lefs or more, by intorvening breaks, and open fpaces of fhort grafs, communicating buth with the lawns and interior diftricts; and generaily varied in moderate fweeps and curves, efpecially towards the lawns, to avoid ftiff, formal appearances, both in the figure of the lawns and plantations. In planting the trees and fhrubs, which fhould be both of the deciduous and evergreen kinds, where intended to plant in diftinet clumps, eisher introduce the deciduous and evergreens alternately in feparate parts, or have fome of both interfperfed in affemblage; in either method, placing the lower growth of fhrubs towards the front, and the taller backwards, in proportion to their feveral ftatures, fo as to exhibit a regular gradation of height, that the different forts may appear coufpicuous from the main Jawns. They may be continued backwards to a confiderable
depth, being backed with trees and flirubs of more lofty growth. The internal parts of the plantations may have gravel or fand walks, fome flady, cthers open; with here and there fome fpacious fhort grafs openings, of different dimealions and forms.

It is feldom that extenfive lawns in parks or paddocks, \&ec. have any boundary plantations clofe to what nay be consfidered as a continuation of them beyond the pleafare-ground, but are fometimes dotted with noble trees, difperfed in various parts, at great diftances, fo as not to obftruct the view; fome placed fingly, others in groups by twos, threes, fives, \&c. and fome placed irregularly, in triangles, fweeps, Itraight lines, and other aifferent figures, to caufe the greater variety and effect, each group being diverffied with different forts of trees, all fuffered to take their natural growth. Where frall, thefe kinds of openings fhould always be kept perfectly neat, by being often poled, rolled, and mown, but where they are of large extent, this is fcarcely ever the cafe. See Grass, Ground, and Turfing.
Lawns, in Commerce. See Cambric.
LAWOROW, in Geograthy, a town of Auftrian Poland, in Galicia; 24 miles W. of Lemberg.

LAWREACE, Peter Joseph, in Biography, an engineer, was born in Flanders in the year 1715. He difitiguilhed himfelf, when he was only eight years old, by a confiderable turn for mechanics. Cardinal Polignac being fhewn a machine that he had at that early age conftructed, predicted that he would one day arrive at eminence in the fcience of practical mathematics. Before he had attained to manhood, he had executed drains in different parts of Flanders and Hainault, which till that time had been deemed impracticable. He conftrueled many curious and very ingenious nuices and locks for rivers and canals; and he invented machines that were found of great utility in fortification, and a carriage on which the coloffal ftatue of Lewis XV. was brought to Paris with great eafe. He contrived engines, which at once cleared mines of their water, and, at the fame time, raifed the metallic ores. He formed a junction of the Scheldt and the Somme, which he effected by a fubterraneous canal, three leagaes in length, the level of which was 45 feet above the fource of the Scheldt, and 15 feet below the bed of the Somme. The various mechanical inventions and undertakings of M. Lawrence have been celebrated in a poem by Delille, intitled, "The Treafury of Parnaffus."

LAWSONIA, in Botany, dedicated by Linnæus to the honour of John Lawfon, a native of North Britain, who vifited Carolina, and publihed an account of his voyage, with much information concerning the plants of that country, at London in 1709, in quarto.-Linn. Gen. 191. Schreb. 257. Willd. Sp. Pl. v. 2. 344. Mart. Mill. Dict, v. 3. Air. Hort. Kew. ed. 2. v. 2. 354 . Juff. 33 I. Lamarck. Illuftr. t. 296. (Akanna; Gærtn. t. 110.)-Clafs. and order, OZandria Monogynia. Nat. Ord. Calycantbeme, Linn. Salicaria, Juff.

Gen. Ch. Cal. Perianth inferior, four-cleft, fmall, permanent. Cor. Petals fuur, ovato-lanceolate, flat, fpreading. Stam. Filaments eight, thread-fhaped, the length of the petals, and flanding in pairs between them; anthers roundifh. Pif. Germen fuperior, roundifh; ityle fimple, as long as the ftamens, permanent; fligma capitate. Peric. Berry dry, globofe, pointed, of four cells. Sceds numerous, ak. gular, with a fpongy coat.

Obf. Gærtner, who juftly efteems the fruit to be rather a dry berry than a capfule, chufes to call the genus Alcanna, a word corrupted from Al Henna, the Arabian appellation of the firt fpecies.

Eff. Ch. Calys fourocleft. Petals four, regular. Stamens approaching each other in four pairs. Berry dry, fuperior, of four cells, with many feeds.

1. L. inermis. Henna, or Smooth Lawfonia. Linn. Sp. Pl. 419. Suppl. 219. (L. alba; Lamarck. Dict. *. 3. 106. L. fpinofa; Haffelq. It. 464. Alhenna, five Henna Arabum; Walth. Hort. 3. t. 4. Rauwolf. It. Go. 1. 7.)-Thorns none. Leaves obovate, acute. Segnents of the calyx as long as its bafe. - Native of various parts of the Levant. Miller is faid in the Hortus Kewenfis to have cultivated it in 1759 , but it is never preferved long, even in a ftove, by our gardeners. The writer of this article obtained feeds in 1787 at Paris, from M. Desfontaines, who had brought them from Barbary. Thefe vegetated at Chelfea, and in fome other gardens, producing fhrubiay plants of a humble ftature, which in the enfuing autumn and winter were laden with flowers, whofe delicate afpect, and exquifite feent, attracted the admiration of all who faw them. The habit of this fpecies is not unlike Privet, but the laves are more obovate, and of a lighter green. The forvers are yellowifh-white, whith purplifh flamens, and grow in oppofite clufers about the tops of the branches. Haffelquift in his travels, Englifh edition 246, fays, "the leaves are pulverized, and made into a pafte with (hot) water. They (the Egyptians) bind this pafte on the nails of their hands and (foles of their) feet, keeping it on all night. This gives them a deep yellow, which is greatly admired by the eaftern nations. The colour lafts for three or four weeks, before there is occafion to renew it. The cuftom is fo ancient in Egypt, that I have feen the nails of the mummies dyed in this manner: The powder is exported in large quantities yearly, and may really be reckoned a valuable commodity. The Arabians call it Chenna. The dried flowers afford a fragrant fmell, which women who have conceived cannot bear."
2. L. Jpinofa. Prickly Lawfonia. Linn. Sp. Pl. 498. (Cyprus, Alcanna; Rumph. Amboin. v. 4. 42. t. 17. Mail-an「chì ; Rheede Hort. Mal. v. 1. 73. t. 40. Pluk. Phyt. t. 220.f. r.)-Branches becoming (pinous. Leaves obovate, with a fmall point. Segments of the calyx as long as its bafe.-Native of the Eaft Indies. It differs from the former, of which many have not unjufly thought it a variety, in having the permanent lateral branches hardened into a fpine at their extremities. The fruit anfwers to Gærtner's deicription of a dry berry rather than a valvular capfule. The leaves feem to vary in fhape. Rumphius fays they are ufed to dye the nails in the inland of Celebes, \&c., and that the Malay women are particularly fond of the flowers, with which they deck their perfons and ftrew their beds. Haffelquit's own fpecimen, called in his travels, by Linnæus, $L$. Jpinofa, proves not to be this plant but the former. Indeed, as we bave before hinted, they are moit probably but one fpecies.
3. L. coccinea. Scarlet Lawfonia. Branches becoming fpinous. Leaves elliptic-obovate, acute. Segments of the calyx twice as long as its bafe.-Sent from Banda by the late Mr. Chriltopher Smith, as "a Lazufonia with fcarlet flowers.". It is very nearly related to the lalt, and we find nothing to difcriminate this, our fpecimen being but imperfect, except a difference in the relative proportions of the parts of the calyx, of the certainty or conftancy of which we have fome doubt.

One might fuppofe this plant to be the L. purpurea, Lamarck. Dict. v. 3. 107, Willdenows's n. 2; but on turning to the Poutaletsje, Rheede Hort. Mal. v. 4. 117- t. 57, citcd for it, which Linnews very erroneoully quotes for $L$. inarmis, the plant of Rheede will be found widely different
from every Lawfonia, as Jufficu well obferves, p. 332. The flowess are monopetalous and tetrandrous, with an inferior germen, and this great French botanif fufpects it may be a Petfia, Of its belonging to his order of Ruliacta there can be little doubt. The 1. . purpurea, therefore, of which Lamarck had feen only leaves, and Willdenow nothing, falls to the ground.
4. L.? Acrongchia. Broad-leaved Lawfonia? Linn. Suppl. 219. Forftr. Prodr. 27. (Acronychia lx vis; Forit. Gen. 27. t. 27.) - Leaves obovate, on long falks. Petals inflexed at the point. Stamens fringed.-Gathered by the Forfters in New Caledonia. A fmooth /brub, with round Uranches. Leav's oppofite, an inch or two long, obovate, obtufe, broad, entire, תightly revolute, veiny, frooth. Footlalks half an inch long, fraight, channelled, fmooth, united to the leaf by a joint. Clufers axillary, forked, much florter than the leaves. Calyx with very fmall, rounded, pale-edged fegments. Petal's lincar-oblong, hooked inward at the point. Stamsons fringed at the bale, fcarcely fo long as the corolta. The fruit is pofitively defcribed by Foriter as " an inflated caprule of four vulues." This character, and the totally different form of the petals and calyx, perfuade us that the fpecies in quellion ought to ftand as a genus by itfelf, as Forter originally made it.

Lawsonia, in Gardening, contains plants of the exotic tree kind for the flove, of which the fpecies are the fmooth Lawfonia (L. inermis), and the prickly Lawfonia (L. (pinofa).

Metbod of Culture. - Thefe two plants may be raifed by fowing the feeds in pots of light mould, in the early fpring, and plunging them in the bark bed of the flove. When the plants have acquired a few inches growth, they fhould be removed into feparate fmall pots filled with light fandy earth, replunging them in the bark-bed, and giving a little water, with proper fhade. They afterwards may be placed fo as to have pretty free air, but be conftantly kept in the fore at all feafons.
They afford a variety among other fove plants.
LAWYER, (legjfa, legijperitus, jurijconfultus,) by the कaxons calted labman, is a counfellor, or one learned in the law; and lawyers, fuch as counfellors, attornies, \&c. are within the act 3 Jac. I. againit extortion; but it has beca held only to extend to officers. See Counselior, Attorney, \&c.
LAX, in Geograpby, a town of Switzerland, in the Valais; 33 miles E . of Sion.

LAXA, a town of the ifland of Lewis, fituated on a bay, on the eaft coaft; 9 miles S.S.W. of StornamayAlfo, a town of Peru, in the diocefe of La Paz; 20 miles S.W. of La Paz.

LAXATIVE Medicines, are thofe purgative or cathartic fubftances, which operate gently, without producing any confiderable difcharge from the mucous glands and exhalants of the inteftines; fuch as manna, magnefia, rhubarb, the neutral falts in fmall dofes, fulphur; electuary of fenna, \&c. For an account of the operation and ufe of thefe medicines, fee Cathartics.
LAXATOR, in Anatomy, a name applied to two mufcles of the officula auditus. The laxator tympani najor is the externus mallei of Albinus; the laxator minor is fimply laxator tympani of that anatomit. The exiftence of the latter mufcle is doubted by fome. See the article Ear, where they are defcribed by the names of Albinus.

LAXEMBURG, in Geography, a town of Auftria; 7 miles S. of Vienna.

LAXEX BAX, a bay on the ealt coaft of the Ifle of Man, in the Irin fea, which affords a fhelter from wefterly
winds, in about 7 to to fathom water. The cape at the fouthern extr-nity is called "Laxey Point."
layior Tócia. Sec Toma.
LAXMANNTA, in Botany, a mame originally given by Forlter, in his G.miza, $t .47$, to a fyngenelious tree of St. Helena, which Solander confidered as a Bidens, buis which George Forter in his Pluntie Allantice, 50, fubfequently reforred to Spilantlusus. We have not difonvered it in Will. denow, nor caas we afeertain what Schreber decided concerning this plant ; but the latter has adopted the name for ano her genus, of which we are now to fpeak. It is defigned to commemorate the Rev. Eric Laxinann, a native of Finland, Profeffor at Peterfburg, who made many botanical difcoveries in Silberia, and died in 1796.-Schreb. 800. Mart. Mill. Dict. v. 3 . (Cuminofima ; Grertn. t. 58.) Clafs and order, Heicandrici Monogynia. Nat. Ord. Aurantia ; Jufl.
Gen. Ch. Cal. Perianth inferior, very fmall, of one leaf, bell-haped, in four roundifh fegments, permanent. Cor. Petals four, longer than the calyx, linear, coriaceons, cqual, fpreading, inflesed at the point, marked on the upper fide with a triply villous line. Stam. Filaments fix, linear in their lower part, awl-fhaped upwards, ftraight, fpreading, rather fhorter than the corolla ; antliers roundifif, incumbent. Pijf. Germen fuperior, ronndinh, very bairy; ftyle fhorter than the flamens, thick, angular ; itigma limple, obtufe, furrowed. Peric. Berry nearly globofe, of four cells lined with a membranc. Seeds folitary, oblong, comprefifed.
Eff. Ch. Calyx four-cleft, inferior. Petals four, linear, downy on the upper fide. Berry with four cells. Seeds foltary.

1. L. Cuminofma. Globofe Ankrenda. (Cuminofma Ankænda; Gxatn. Sem. v. 28o. t. 58. f. a-H.) -Fruit globofe, ीlighty deprefled. Petals twice the length of the calyं.- Native of Ceylon. Of this we know nothing but from Gartner, who confounds its fynonyms with the following, though he dititinguifhes it as a fpecies by the fhape of the fruit, and relative proportions of the caly:v and pecals.
2. L. Ankenda. Pointed Ankrenda. (Cuminofma baccis ovato-acuninatis; Gartn. v. I. 281 . Jambolifera; Linn. Zeyl. 5 8, excluding the fynonyms. Ankenda; Herm. Muf. Zeyl. 23: Perin-Panel ; Rheede Hort. Mal. v. 5. 29. t. 15.)-Fruit ovate, pointed. Petals many times longer than the calyx. - Native of Ceylon and Malabar. A $\beta_{\text {brib }}$ about four feet high, with round, fmooth, leafy branches. Lezzes oppofite, without flipulas, ttalked, four or five inches long, znd nearly two in breadth, obovate, entire, veiny, fmooth and flinieg, full of pellucid dots. Panicles axillary, flalked, repeatedly three-cleft, corymbofe. Flowers greenih-white. Berry ovate, pointed, dark-green, with an aromatic flavnur of Cumin.
Mr. Dryander in Tr. of Limn. Soc. v. 2. 232, has well illuitrated the fynonymy of this plant, which Linnxus had confounded with the Jambolana, or Jamboloins of Acolla, a fpecies of Calyetrantbes; fee that article. This mittake is fuppofed to have arifen from the tickets of Madan and $A n$ Lerdiz in Hernann's herbarium having been changed.
LAY, Allampl, or Alampou, in Geography, a town of Africa, in the kingdonn of Niugo, on the Cold Coatt.

Lay, or $L a i$, the title of the mof ancient kind of fongs in the French language. It was not till the reign of Plilip Auguflus that longs became common in that country. Gautier de Coincy, an ecclefiatic of St. Medard de Soiffons, compofed a confiderable number, which are fill preferved in MS. among his other writings. "Lays were a kind of elegies," 'ays M. 1 'Eveque de la Ravaliere, (An-
cienté des Chanfons, tom. i. p. 225.) "filled with amorous complain:s. The origin of this fuecies of compofition is fuch as rendered it neceflarily plaintive: as the word lai is imagined to have been derived from $1 / . f$ fus, Latin, which fignifies complaints and lamentations. However there are fume lays which defribe moments of joy and pleafure more than forrow or pain; and others upon facred fubjects.

Chaucer, who frequently ufes the word lay, confines it. wholly to fongs of complaint and forrow:

> "A Ad in a lettre wrote he all his forwe In manere of a complaint or a lay, Unto his faire frefhe lady May," Cant. Tales, v. 9754* "He was difpeired, nothing dorft he fay, "Sauf in his fonges formhat wold he wray His wo, as in a general complaining; He faid, he loved, and was beloveu nothing. Of fwiche matere made he many layes, Songes, complaintes, roundels, virelays-",

Tran. t. 112550
"Thus end I this complaining or this lay."

## Ibid.

In. Spencer's time, however, its acceptation was more general, and as frequently applied to fongs of joy as forrow:
"To the maiden's founding timbrels fung
In well attuned notes, a joyous lay."
Fairy Queen.
Shakfpeare and Milton ufe it likewife indifcriminately for every kind of fong.

Lai feems a word purely Francic and Saxon: it is neither to be found in the Armoric language, nor in the dialect of Provence. The French poetefs Marie, who in the time of St. Louis, about the middle of the thirteenth century, tranflated feveral tales from the Armoric language of Bretagne, calls them lais; but the term is of much higher antiquity. After its adoption by the Englifh poets, it foon became a generical term in poetry for every fpecies of verfe, as fong is now: but both thefe words ftull retain their particular acceptation as well as generical; for by a fong is undertood a fhort poem fet to a tune, and this was the particular meaning of lay, in the lait century, among our mufical writers.

Tales and fongs, fays the editor of ancient Fabliaux et Contes François, were the molt common and ancient fpecies of poetry. The French, naturally gay, chearful, and fportive, were more attached to this fpecies of compofition than any other nation, and communicated this love for lyric poetry to their neighbours. They mult have been in poffeffion of a great number of thefe fongs and tales, becaufe in all focial meetings the cuftom was for every one prefent either to fung a fong or tell a fory, as appears by the end of the fable of the prielt, "qui ot Mere à force," where we. read thefe verfes:

> "A ceft mots fenift cis fabliaux Que nous avons en rime mis, Pour conter devant nos amis."

And according to John li Chapelain, in his ditty of the Sacriltain of Clugny, it was cuftomary for a bard to pay his reckoning with a flory or a fong.

> " Ufage eft en Normandie, Que qui hebergiez elt, qu'il die.

Fable ou chanfon a fon ofte Cefte coftume pas n'en ofle Sire Jehans li Chapelains."
"In Nurmandy a fong or tale Is current coin for wine or ale; Nor does the friendly holt require For bed and board a better hire."

In the thirtenth century the fongs in vogue were of various kinds i moral, merry, and amorous: and at that time, melody feems to have been little more than plain-fong, or chanting. The notes were fquare, and written on four lines only, like thofe of the Rumilh church, in the clef of C , without any marks for time. The movement and embellithments of the air depended on the abilitics of the finger. The compafs of modern mufic is much extended fince by the cultivation of the voice; for it was not till towards the end of St. Lewis's reign that the fifth line began to be added to the ftave. The finger always accompanied himfelf on an inftrument in unifon. Poefie du Roi de Navarre, tom. ii.
Lay, in Agriculture, a term applied to fuch land as is in the ftate of grafs, or fward. This fort of ground is frequently dittinguifhed into fuch as has been long in the ftate of fward, and fuch as is newly laid down to grafs, or into old and new lays. The proper method of managing the latter is of great importance to the farmer, and which, Mr. Young thinks, fould be by keeping them perfectly free from ail forts of fock for the following autumn and winter after their being laid down, when, in the fpring, they will afford a flow of young grafs highly valuable for fheep, with which they fhould only be well Itocked, and kept down then, and during the whole of the fumnier: "nothing," in his opinion, "being more pernicious than mowing a new lay, as directed by certain authors. They may," he fuppofes, " have fucceeded in fpite of fuch bad management, but never by it." The molt fuitable method of managing thefe new lays, under different circumftances, will be defcribed in fpeaking of laying lands down to the flate of fward or grafs. See Laxing down to Grafs.

It may be obferved, that the treatment neceffary for old lays muft vary much, according to their nature and the particular circumflances under which they are placed, as will be fhewn under the management of meadow and pafture lands, as well as in confidering the nature of grafs. See GrassGround, Meadow, and Pasture.

It has alfo been obferved, that, on many farms, there are often " tracts of barren lays, from mofs, poverty, neglect, and bad herbage, upon which a very great improvement may be made by a fingle ploughing in Auguft. For this purpofe, a ftrong four-horfe plough mult be ufed with a fkimcoulter; then going over it twice, in different directions, with the fcarifier, fo as not to dilturb the flag; harrowing it once, and immediately fowing a quarter of a peck of colefeed, two bufhels of cock's foot, and one bufhel of Yorkfhire white per acre; adding fome of whatever feeds may be procured at the moment cheaply." It is then advifed to be left " unfed and untouched till the March following; in which month, and through April, it fhould be loaded well with fheep: the ufe will then be very great. Keeping fheep feeding it heavily through the year, the cole will be killed, and you will have a palture worth treble what it was before. The expence is faid to be fmalt, and the improvement rapid." Various modes of improving land, in the ftates here defcribed, will be explained under the heads above mentioned.

And the fame writer alfo thinks, that, by December, old lays will be wet enough to begin to break them up: "a

## L A $Y$

work that fhoukd not be done while the land is dry; for it will not then turn up in clean well.cut furrows. Ploughing grafs-land is, it is faid, a very good piece of hufbandry, when they are worn out and over-run with mofs and other rubbifh, or hide-bound. To keep land under fuch unprofitable turf is bad management. It fhould, by all means, be broken up, and kept in a cburfe of tillage for three or four years, and then laid down again: by which conduct, four times the profit will arife that could be gained from keeping it in lay."
Lax-Brother, among the Romanifs, a pious, but illiterate perfon, who devotes himfelf, in fome convent, to the fervice of the religious.

The lay-brother wears a habit different from that of the religious, nor ever enters into the choir, or the chapter.
He is not in any enders He is not in any orders, nor does he make any vow, excepting of conftancy and obedience.
Thefe lay-brothers make the three vows of religion.
In the nunneries are alfo lay-filters, who never enter the choir, \&c. and who are only retained for the fervice of the convent.

The inftitution of lay-hrothers began in the eleventh century. The perfons on whom this title was conferred were fuch as were too ignorant to become clerks, and who therefore applied themtelves wholly to bodily Jabour.

It feems to have taken its rife from hence, that the laity in thofe days had not, for the generality, the leaft tincture of learning; whence alfo thofe came to be called clerks, by way of diltinction, who had fludied a little, and were able to read.
In fome orders they are only retained by a civil contract, which, however, binds them for life; in other orders they are to pafs through four years of probation, as among the Jacobins; or feven, as among the Feuillants. The Capuchins admit none before nineteen years of age. The
Jefuits call them coadjutors.

Lay-Canons. See Canon.
Lay-Communities. See Community.
Lay-Corporation. See Corporation.
Lay-Fee, feodum laicum, land held in fee from a lay-bord, by the common fervices to which military tenure was fubject, as diftinguifhed from the ecclefiaftical holding in frankalmoign, difcharged from thufe burdens.

LAYAU, in Geography, a town of the ifland of St. Vincent, on the W. coatt, in a bay at the mouth of a river, to both of which it gives name. N. lat. $13^{\circ} 8^{\prime}$. W. long. $61^{\circ} 18^{\prime}$.
LAYBACH, a town and capital of Carniola, on a navigable river of the fame name, dividing it in fuch a manner, that part of the town lies in Upper, and the other in Lower Carniola. The citadel is ancient and has a church; it is inhabited by a conftable, who has the title of burggrave, and 12 foldiers. Laybach is the fee of a bifhop, who is a prince of the empire. The town contains, befides the cathedral, feveral churches, and about 500 houfes; 28 miles N.E. of Triefte. N. lat. $46^{\circ} 12^{\prime}$. E. long.' $14^{\circ} 30^{\prime}$.

LAYCOCK, or LACOCK, a parifh, formerly a markettown of Wilthire, England, is feated in a fine, fertile valley, on the weftern bank of the river Avon, three miles from Chippenham, and 95 weft of London. In the year 1800 this place contained 147 houfes, and 1408 inhabitants.. Here was formerly an abbey of large extent, and rich endowment. A large pile of the cld buildings atill remains in their formes monaftic.

## L $\mathrm{A} Y$

monaftic flyle; particularly the cloifter, kitchen, cellars, gallery, \& $\mathbf{c}$. ; with the fith-ponds and terrace walk. At the S.E. angle of the building is a tower, which contains, among other records, an original copy of the Magna Charta. See Blackitone's "Differtation on Magna Charta," \&c. Some account of the abbey, with a view of the cloifters, is publifhed in "The Architectural Antiquities of Great Britain," vol. ii. ; and a full defcription of the place, and other objects in the vicinity, will be found in Britton's "Brauties of Wilthire."

LAYDE', a town of Africa, in the country of the Foulis, on the Senegal ; 4 miles S.E. of Goumel.

LAYER, in Buildug. See Cocrse.
Layli, in Gardening, the young fhoot or branch of fuch trees as are capable of being raifod by being laid into the ground. It is the part which is placed in the earth in order to ftrike root, and from the new plant layers are made from different kinds of fhoots and young branches, according to their natures and habits of growth.

LAYERING, the act of placing layers into the ground. This is performed in different ways, as may be feen under the proper head. See Layng.

LAYES, or Leyes, a termufed in many parts of Eng. Jand for fuch pafture ground as has been formerly tilled and fown.

LAYING, in Gardening, the procefs or operation of placing layers in the foil. It is a method adapted to molt forts of trees and fhrubs, and many herbaceous plants. It is effected by laying branches and young fhoots of trees and plants in the earth, from two or three to five or fix inches deep, leaving their tops out, that the part laid in the earth -may emit routs, and become a plant. The layers, when well sooted, fhould be feparated from the parent, and planted in the nurfery, or other proper place, to acquire due ftrength and fize, for the purpofes for which they are defigned. And they require different lengths of time for becoming rooted, from a few months to two or more years.

There are great numbers of flarubs and trees that are eapable of being increafed by layers, but the practice is more particularly applicable to the floubby kind; as their branches grow near the ground, convenient for being laid down. It may, however, be practifed with fuccefs on fruittrees and forelt-trees, when their branches are fituated low enough for being laid, though the varieties of many fruittrees are better propagated by grafting and inoculation. The vine and fig, however, often admit of being increafed by layers; and foreft-trees, for the continuance of varieties; as the plants raifed in this method continue exactly the fame as the parent plant from whence they were raifed. This is a certain method to continue any approved variety, as well as to increafe fuch fhrubs or trees as do not produce feeds here, and which cannot be eafily obtained. It is likewife an expeditious and eafy mode of propagation; as by it many new plants are often raifed in a few months, which would take two or three years to bring them to the fame fize from feed. In many forts it is fo eafy that all the fhoots of any branch fituated near the ground, or convenient for laying down, may be made diftinct plants.

It may be noticed that, for all forts of the tree or fhrub kinds, it is generally performed on the young fhoots of the preceding fummer, which fhould be laid down in fpring or autumn; but fometimes on fhoots of the fame year, in fummer, efpecially in the hard-wooded evergreen trees and Shrubs, that do not frike root readily in the older wood. Many forts of trees that have their wood of a loofe foft texEure often grow pretty freely by layers of them, of two or Several years growth.

## L. A Y

But in herbaceous plants capable of being propagated by layers, fuch as carnations, pinks, double fiveet-williams, \&c, the young thoots of the fame year, laid down in June and July, are commonly the moft fuccefsful.

In regard to the feafon for performing this fort of work, in moft forts of trees and fhrubs, it is autumn and fpring, though it may be performed at almolt any time of the year.

Many kinds of under-fhrubby and herbaceous plants alfo fucceed, if layed any time in fpring or fummer till the end of June; though that and the following month are the moft fucceffful for the herbaccous tribe, as carnations and others ufually propagated by laying, as they then root the fame feafon in from three or four to five orfix weeks, fo as to be proper for tranflanting.

When it is intended to lay trees or fhrubs that naturally run up to ftems, without furnifing any confiderable quantity of lower branches for laying, a fufficient number of ftrong plants fhould be fet in the nurfery, at proper diftances, and headed down in the autumn or fpring after, within a feir inches of the ground, that they may throw out a good quantity of young fhoots the following fummer, ncar the earth, fo as to be convenient for laying down in the fucceeding autumn; or, by waiting another year many more fhoots for the purpofe of layers will be providcd, by the firlt fhoots throwing out many lateral ones, each of which when layed will form a plant. And on the layers being rooted, and all cleared away, the ftool remaining will furnifh another crop of fhoots for laying next year, and the fame in fucceffion for many years.

Where layers are wanted from trees that are grown up, and whofe branches are at a diftance from the ground, a temporary flage or fcaffold is erected, on which pots or tubs of mould are placed to receive the layers.

The general method of merely laying the branches or fhoots in the earth, is practifed for all forts; but previous to laying, they are often prepared in different ways to facilitate their rooting, according as the trees of different natures require; as by fimple laying, twiting, filting, cutting the bark, piercing the floot, wiring, and other modes.

Simple Laying.-This is merely layisg the fhoots in the earth, as directed below, without any previous preparation of twifting, flitting, \&cc. and is fufficient for a great number of trees and fhrubs of the foft-wooded kinds; but for fuch as do not readily roct by this fimple method, recourfe muft be had to fome of the following ways.
$T$ woifing the Layer.-By giving the fhoot a gentle twik in the part defigned to be laid in the ground, it greatly promotes and facilitates the emifion of fibres from the bruifed part.

Slitting or forguing the Layer.-This is the moft univerfal and fuccefsful mode, where any preparation of the fhoot is neceflary to promote its rooting ; it is performed by fitting the fhoot at a joint underneath, up the middle, half aninch or an inch or more long, according to the fize and nature of the layer, forming a fort of tongue nearly the fame as directed for carnation layers; laying that part in the earth, and raifing the top upright, or rather pointing inwards, fo as to feparate the tongue of the dit from the other part, and keeping the dit open, as directed below.

Cutting the Bark of the Layer. - This is performed by cutting the bark all round at a joint, taking out fmall chips all the way below the cut, and laying that part in the earth, by which it readily emits roots.

Piercing the Layer.-This is done, by thrufting an, awl through the fhoot, at a joint, in Several places, laying that

## £ AYING.

part in the ground, by which it will emit fibres from the wounds more readily.

Wiring the Laycr. -This is by twiting a picce of wire hard round the fhoot at a joint, and pricking it with an awl on each fide of the wirc in feveral places, laying it in the earth, by which it breaks out into roots at the confined and wounded parts; often proving fuccefsful in fuch trees and thrubs as do not readily emit fibres by the other methods.

It may be obferved that by fome of thefe methods almoft all forts of trees and Ghrubs may be propagated.

Metbod of Laying. - The general method of laying all forts of trees or plants, ether by fimple laying, or any of the other methods, is the following.

The ground about each plant muft be dug for the reception of the layers, making excavations in the earth to lay down all the thoots or branches properiy fituated for the purpofe, pegging each down with a booked ftick, laying alfo all the proper young fhoots on each branch or main fhoot, fixing each layer from about three or four to fix inches deep, according to their leagth, though fome fhorten their tops down to an eye or two only above the earth, raifing the top of each lajer fomewhat upright, efpecially the flit or tongued layers, to keep the fit part open. As all the layers of each plant or ftool are thus layed, all the mould fhould be levelled in equally in every part, clofe about every layer, leaving an even fmooth furface, with the top of each layer out.

It fometimes happens that the branches of trees are fo inflexible as not to be ealily brought down for laying ; in which cafe they mult be plafhed, making the gafh or cut on the upper fide; and when they are grown too large for plafh. ing, or the nature of the wood will not bear that operation, they may be thrown on their fides, by opening the earth about the roots, and loofening or cutting all thofe on one fide, that the plant may be brought to the ground to admit of the branches being laid down into the earth.

Where layers are to be made from green-houfe fhrubs, or other plants in pots, the work fhould generally be performed in pots, either in their own, or others placed for that purpofe.

After laying in either of the above methods, there is no particular culture neceflary, except in the heat of fummer giving occafional waterings to keep the earth moilt about the layers; which will greatly forward them, and promote a good fupply of roots againit autumn, when thofe that are properly rooted fhould be taken off and tranfplanted.

The layed branches or thoots fhould be examined at the proper feafon, October and November, and thofe that are rooted be cut from the mother plant, with all the root poffible, planting them out in nurfery rows a foot or two afunder, according to their nature of growth, there to remain till of due fize for their feveral purpofes; but thole of the tender kinds muft be potted, and placed among others of fimilar nature and growth.

When the layers are all cleared from the ftools or main plants, the head of each ftool, when to be continued for furnifhing layers, fhould be dreffed; cutting off all decayed and fcraggy parts, digging the ground about them, working fome freth mould clofe about their heads, to refrefh and encourage their producing a frefh fupply of thoots for the following year's laying down. This fort of care preferves them many years.

Lainng-down to Grafs, in Agriculture, the means of bringing fuch land as has heen under the plough into the ftate of grafs or fward. This is a part of hubandry which is of much importance to the farmer, and which requires much care and attention to accomplifh it in a proper manner,
under different circumfances of foil, climate, fituation, and preparation of the ground. It is well known by practical farmers that fome forts of foil are much more difficule to be brought into the thate of good grafs or fward than others, and that, when thes point has been accomplifhed, fome are much more profitable and advantageous than others, as affording a much better, and more latting herbage. In fome places, too, the bufinefs of bringing the land into the ftate of fward, after it has been in that of arable cultivation, is effected with the greateft eafe and facility: the ground, on being left in an unploughed condition, from its natural tendency to the production of herbage, returns to the ftate of fward, almoft without trouble, feed, or expence; whle in others, all the art of the moft careful agricultor is found infufficient for accomplithing the purpofe. It has been fated by Mr. Davis, that " after twenty years fruitlefs expectation and expence, the landholders have frequently been obliged to reftore the land again to a flate of tillage." Put befides this difpofition or tendency in foils for taking on the grow ha and eftablifhment of grafs crops, there are other circumftances to be attended to in Dringing them to the ftate of grafs or fward, after they have been under the plough; fuch as thofe of their poffeffing neither too much nor too little moilture, and that of their having a fufficient flaple or depth of mould for the full and fecure ellablifhment of the grafs plants. As where the foils are too wet, or too retentive of moifture, they will fuftain much injury, if not be wholly deftroyed, during the winter feafon, when there is much rain and frolt, as well as be quickly fuperfeded by plants of the coarfe aquatic kind, fuch as the rufh, \&c. And where they are too dry, the graffes will be liable to be deftroyed by heat during the fummer months, by the little moifture which they contain being thus carried away, and of courfe leave their places to be fupplied by other forts of coarfe plants, fuch as thofe of the mofs, fern, and'heath kinds, according to the nature of the ground. A good depth of mould or foil is likewife requifite, in order that the roots of the grafs plants may penetrate or run down to fuch a depth below the furface, as to be'in a great meafure out of danger from the effects of heat and evaporation in the fummer feafon. On thefe as well as other accounts, it is therefore better that the lands intended for grafs, efpecially where they are to be kept in a permanent ftate of fward, fhould ineline in fome meafure to a ftate of moisture, or be in fuch a degree retentive of it, as to preferve that ftate of humidity which is neceffary for the healthy and vigorous growth of the plants, withot endangering the deftruction of their roots by putrefaction, from its ftagnating in too large a proportion about them. It is chiefly on this principle, it is added, that the more light, thin, dry, defcriptions of foil are better fuited for the production of grain, or the occafional prac. tice of convertible hubandry, than for that of permanent grafs or fward.

And there are fill other circumltances connected with the nature of the foils, which are neceffary to be partioularly attended to in the laying of lands down to the fate of grafs, as thofe of properly adapting the grafs plants to their qualities, fome forts of graffes being much more impatient of wet than others, confequently more proper for the dries forts of lands; fome more capable of refilting the effects of heat and drought, and of courfe more fuitable for the thinner and more porous kinds of foil $\because$ while others delight in a moitt or wet foil, and are inoapable of being grown with any fuccefs, on fuch as are of a dry quality. They likewife differ much in refpect to their hardnefs; fome relifting the effects of cold much more effectually than others, and of courfe more adapted to high expofed fituations. Befides

## LAYING.

thefe, they vary in other refpects, fome fuccecding to the molt advantage in foils of the clayey kind, others in thofe of a loamy quality, while others delight in thofe of a $\int$.ndy nature, a few in thofe of the calcareous kind, and fome in thofe which partake much of the nature of peat.

In addition to thefe different natural propenfities, there are fome grafles that have the property of rifing to a great height in the ftem, and of courle affording a large coarfe produce, while others are more limited in this refpect, but fpread and extend themfelves more in a lateral direction, affording a lefs proportion of produce, but which is of a finer quality. The former, with certain reflrictions, would feem better adapted to the purpofe of hay, though the latter may be applied to.the fame ufe, where the finenefs of quality is preferred to quantity of produce. There are likewife fome forts of graffes that contain much larger proportions of faccharine matter in their compofitions than others, as well as more leaves and fewer flower ftems; and which, from the avidity with which they are fed upon by different forts of live flock, and the fuccefs that attends their being thus confumed in the improvement of fuch ftock, would appear to poffefs the largelt proportion of nourifhment; and of courfe to be the mott proper for being introduced where the lands are intended for the purpofe of grazing, or fattening animals by means of vegetable food in its graffy flate. And further, there is another property of graffes in which they differ confiderably; and which is of to much confequence as to require being regarded in the laying of lands to the fate of fward. This is that of early growth, which is a circumftance of valt importance in a grazing point of view, as there is in general a great deficiency of grafs for the fupport of tock in the early part of the fpring. See Praftical Agriculture.

It is the opinion of Mr. Curtis, that in the forming of good meadows, or other grafs-lands, there fhould be a combination of thefe different circumftances, as it is chiefly by the firlt, or the quantity of produce, that the cultivator is enabled to fupport his live flock, and pay his rent ; of courfe no expence in labour or manure is fpared to obtain it by the prudent farmer. It does not, however follow, that this fhould be folely regarded, or that to attain it the coarfeit forts of plants fhould be cultivated; nor will the graffes that are recommended merely for their being relifhed by cattle, or for the fweetnefs of their foliage, if they are found to be deficient in the quantity of produce, fully anfwer the views of the farmer or grazier, as, to conflitute a good meadow or pafture, an abundant produce is neceflary, And that, though animals prefer fome forts of food to others, it is not poffrble to indulge the live fock that is to be fupported conltantly with the fineft and moft delicate hay or herbage. Befides, it is not improbable but that the productive graffes may in fome cafes be highly nutritious, or that cattle may eat as eagerly the herbage or hay made from the coarfe as the fine graffes. And cattle are frequently known to thrive on food to which they are habituated by neceffity, though at firt they could fearcely be prevailed on to eat it. It is fuggefted, that in making experiments, perfons are apt to conclude too haftily from the appearance which a plant aflumes on its being firlt planted or fown; as the moft infignificant plant or vegetable will often make a great fhow, when its fibres have frefh earth to fhoot into: "but the trial comes when the object of the experiment has been in a meadow or pafture feveral years, when its fibres, from long growth, are matted together, and it meets with powerful neighbours, to difpute every inch of ground with it :" if " it then continue to be productive, it mult have merit." It is well known, that " lucern, when left to itfelf, is foon
overpowered ; and if broad-leaved clover, which is undoubeedly a perennial, the firtt year be fown, a great crop is produced; but let the field be left to itfelf, and the clover, like the lucern, will yearly diminim,-not becaufe it is a biennial, as has been often fuppofed, but becaufe plants hardier, or more congenial to the foil, ufurp its place : this flews, "that at the fame time that a good plant is introduced, it hoold be a powerful one, and fuch as is able to keep poffeffion, and contimue to be productive." Further, that "in refpect to the property of cattle's thriving on the food they eat, it is unqueftionably of great confequence; and it is to be regretted, that our knowledge of the molt nutritient kinds of herbage is fo confined: but of thofe plants which have been in cultivation, we are enabled to fpeak with fome certainty : it is well known, that "clover, lucern, faintfoin, tares, and feveral other fimilar plants, have a great tendency to fatten cattle; but what natural grafles, or other plants, which have not been fubjected to feparate culture, have this particular tendency, and in what degrees, remains to be afcertained by the teft of experiment." But, "that as leguminous plants are in general found to agree with cattle, it may be reafonably concluded, that a certain quantity of them may be proper and beneficial in paftures. It is well known that certain paftures are more difpofed to fatten animals than others: but how far this depends on fituation, and their particular produce, remains to be afcertained." With reipect to the property of early growth, it is fuggefted that the " want of early herbage in the fpring is the general complaint of farmers and graziers in all the beit grafs diftricts of the kingdom: thofe plants, therefore, which are found to hoot at an early period, and to put forth early foliage, efpecially when it is fuch as is grateful to cattle, muft be deferving of great attention. As far as graffes have to do in this bufinefs, thofe mentioned hereafter may effect all that can be expected in this way : much mult, however, depend on feafons; if the winter fhould be fevere, or north-eatterly winds prevail in the fpring months, grafly herbage will be backward, in fpite of all that can be done; but in order to counteract the bad effects of fuch feafons as much as poffible, paftures and grafs-lands fhould be warmly fituated, and not drenched too much with moiture, being theltered by thick hedges, and divided into fmall inclolures." But where early pafturage is the great object of the farmer, there are other plants that may deferve a place among them, fuch as thofe mentioned below. And that "though early herbage is highly valuable for pafturage, it is not lefs fo for the purpofes of hay; as by the middle of May at the lateft, a meadow of this fort would be fit for cutting; and the fecond hay-making begin by the time that hay-making ufually takes place in other cafes; and by this means the double advantage be obtained, of a larger produce, and lefs rifk in fecuring or making it."

It is fated in a late work on Practical Agriculture, that "on the principles that have been already explained, there can be little doubt but that by a judicious and due attention to the different circumftances and ufes for which grafslands are intended, as well as to the felecting and mixing of the beft and moft proper grafs-feeds, and adapting them to the particular nature and circumftances of the Ioils, after they have been brought into a fuitable condition for receiving them, thofe grounds which have been in a ftate of tillage may be laid down to the fate of fward, in a much better and more beneficial manner than has been the cafe under the indifcriminate ufe of fuch as were in, or which have fown thémfelves on the lands from the contiguous paftures." It has "been long fince remarked as extraordinary, by Mr. Stillingfleet, that cultivators fhould have neglected

## LA Y ING.

to make 2 proper adrantare of plants of fuch importance, and which, in moft fituations, conltitute the principal food of live ftock, from the want of properly dittinguifhing and felecting fuch as are the moft adrantageous and ufeful under different circumflances of the land." Some have likewife contorded, that " the beft grafs-feeds cannot be collected at too high a rate; as it is poffible, by fuch means, to render lands, which are fuited for the production of grals, much wore valuable than can be done by the common modes of laying them down."

It cannot, however, but be confeffed that much difficulty has "been thrown in the way of introducing the molt proper forts of graffes, in laying lands down to fward, from their near refemblance to each other, in many inflances, requiring the niceft difcernment to diftinguifh them, and from the want of other means of procuring them."

It has been Itated by Mr. Curtis, in his tract on Graffes, that "if graifs-lands, fuch as downs, pallures, and meadows, be carefully examined, they will all, except fuch as have been recently laid down with rye-grafs or clover, be found much in a fate of nature, replete with an indifcriminate mixture of plants, fome of which produce cattle food of a good kind, others fuch as is of a very indifferent defcription ; fome affording good crops, while others fcarcely yield any thing at all." And in the fyftem of Practical Agriculture it is fuggefted as fufficiently obvious, "that by a careful attention to the procuring of the beft and molt fuitable forts of grafs-feeds, and applying them according to the principles which have been given above, much fuperiority may be attained in the forming of palture, or other forts of grafs-lands." See Grass.

Method of Preparation of the Land.-The proper preparation of land for grafs-feeds is a part of management, according to the fame writer," that is of valt importance to the fuccefs of furming good grafs-lands, but which has been much negle eted in the practice of laying them down. From the fmalnefs of the feeds, and the fibrous nature of the roots of the grafs-plants in moft cafes, it is evident that lands which are intended for being laid down to the ftate of frard, whatever their quality may be in refpect to foil, fhould conftantly be brought into as fine a ftate of pulverization and mellownefs as poflible, before the feeds are put in: as where the contrary is the cafe, from the lumpinefs of the furface mould, the feeds can neither be fown with fo much regularity, vegetate in fo equal a manner, or extend their roots, and eftablifh themfelves at firft fo perfectly in the land, they are of courfe more liable to be deltroyed by hot feafons coming on afterwards. It is probable that in this sway much new laid down grafs-land is greatly injured the firit fummer, efpecially when it turns out to be hot and dry. The neceffary finenefs of mould may be obtained in different modes, according to the nature of the lands. In the more niff and heary ones, by ploughing before winter, and leaving them to be expofed to the action of frofts and other caufes during that feafon; having recourfe to fevere harcowing, and occafional rolling, in the early fpring months; and by the frequent interpofition of fuch forts of crops, in the courfes that precede thofe of grafs, as have a tendency, from the peculiar nature of their roots, to loofen and render the foils fine, fuch as thofe of the bean, cabbage, rape, and clover kinds. The lighter forts of land may be brought into a proper condition for the reception of grafs-feeds, by repeated pioughing and harrowing, or fcufting, and the frequent introduction, in the previous crops, of fuch forts of green fallow crops as have a power, by the great degree of fhade and flagnation which they afford, as well as by the culture which they require whle growing, of bringing the
foil into a fine friable nate. Thefe ate turnips, potatoss, tares, faintfoin, and cothers of a fimilar defcription." It has been contended by Mr. Clofe, "that where the grafs feeds are to be put into the ground with grain crops in the fpring, the tillage fhould be performed with more th: $n$ ordinary attention; which, in the cafe of turnips, will d: p nd greatly upon their being confumed at fuch an early period as will admit of the ground being thoroughly broken down and reduced; for if there be much delay, and the feafon prove unfavourable, a bed of mould, fufficiently loofe and mellow, will not be procured for the reception of the feeds: and when grown with fpring corn, the lands fhould be ploughed over three times; and where the firft of thefe earths can be given early cnough to be influenced by the vernal froits, it will be found to be much more beneficial." The ufe of the harrow and the roller will be occafionally neceffary, after the diferent ploughings, according to the nature and fate of the land. "But when the fowing is executed in Augulf, the fame degree of attention is not believed by the Xev. Mr. Young to be fo neceflary, as the time and feafon afford fo full an opportunity of bringing the ground into fuitable order, that the moft inattentive caltivator can fcarcely experience any other difficulty than what originates from an unufual wetrefs of feafon."
In the Syltem of Practical Agriculture noticed above, it is mentioned that, "befides this finenefs of preparation in the foils, it is neceflary that the method of cropping and application of manure in the preceding courfes be fuch as to leave them in a ftate of high fertility and richnefs; as no good grafs-land can be fuppoled to be produced, where the lands have been worn out and exhaufted by the previous crops:a praftice which has, howeter, been too general in the returning of arable lands to the condition of grafs. Mr. Marfhall has, he fays, indeed very juftly obferved, that the want of proper condition in the lands at the time of their being laid down to fward, added to thofe of improper fort of grafles and bad feeds, is the chief caufe of their not fucceeding." According to fome cultivators, "manure ought to be applied with every other crop, and always with that which immediately precedes the grafs. This is," he fays, "a practice that thould be adopted as mutch as poffible." And " in order to have grafs-lands of the beft kind, it is likewife of great utility to have them fo managed in the preparation, as to be rendered perfectly clean and free from all forts of weeds ; as by their rifing with greater rapidity than the fown grafs-plants, they are often liable to fhade and deAtroy them, or greatly injure their growth."

And it has been advifed by Mr. Billing\{ey, "in reftoring old worn out lands to the ftate of good patture, to clear the land from injurious weede by means of a full winter and fummer fallowing; or, inftead of the latter, by a crop of potatoes, well manured for, and kept in a perfectly clean itate by attentive culture while growing, fucceeded by winter vetches fed off in the early Cpring." And "in all the more light forts of foil, it is unque!tionably the moft beneficial practice to bring the ground into that fort of fine tilth, which is proper for the reception of grafs-feeds, by a judicious mixture of green crops of different forts with thofe of the corn kind, according to the nature of the foil." The moft appropriate methods of combining and intermixing thefe with each other are fully explained in confidering the modes of cropping different forts of ground. See Courfe of Crops, and Rotation of Crops.

Further: "when the lands have been, by thefe methods, brought into a good ftate of fertility, and reduced into z fufficiently mellow and friable condition of mould, the furface fhould be made as fine, loofe, and even as poffible "'

Azd

## LAYING.

And that "where the grounds are much inclined to moifture, the ridges may be preferved, which fhould be of confiderable breadth, with very flight furrows; but in the more light and porous defcriptions of land, the whole fhould be laid as even as poffible, without any ridges or furrows. In the former cafes, in fome diftricts, they prefer making the ridges fix, eight, or more yards in breadth; which, when the land is to be under the fcythe, is in a much better ftate for being mown; and if for patture, there will be lefs danger of the animals being injured by being caft in the furrows. But in the latter, the furface will not only be more agreeable in its appearance, but be more advantagcous for all the purpofes of grafs management," when thus laid down.

Moft proper natural Graffes. -In refpect to the kinds of natural graffes, the circumitances that have been obferved above render it fufficiently plain, that the proper choice and application of grafes mult be a matter of great confequence, in the laying down lands to the flate of fward or herbage.

In fact, it is, according to the author of Practical Agriculture, "a bufinefs attended with uncommon difficulty, from the number of trials that have been yet made being very inadequate for affording the means of fully deciding
upon their properties, advantages, and ufes, in many cafes, as well as from their habits, and the foils to which they are the beft fuited, being often very imperfectly known; and alfo from the great trouble and inconvenience of obtaining their feeds genuine, and in a proper ftate of healthy vegetation."

But it is fuggefted that the plants of the natural grafs kind, which have been found by experienced cultivators most ufeful in the different intentions already mentioned, are "the fweet-fcented vernal grafs, meadow fox-tail grafs, fmooth-ftalked meadow grafs, rough-ftalked meadow grals, meadow fefcue grafs, hard fefcue grafs, tall fefcue grafs, crefted dog's-tail grafs, ray or rye grafs, Yorkfhire white, cock's-foot grafs, tall oat grafs, timothy grafs, yarrow, burnet, white clover, trefoil, cow grafs, rib grafs, and a few others;" moft of which will be found ufeful in laying lands to grals, under different circumftances of foil, fituation, moilture, and drynefs. See Grass, and thefe feveral heads.

The Rev. Mr. Young, in the third volume of Communications to the Board of Agriculture, advifes the varying of grals-feeds, according to the nature of the feil, in this way:

Soils and Seeds.

| Clay. | Loam. | Sand. | Chalk. | Pest. |
| :---: | :---: | :---: | :---: | :---: |
| "Cow-grafs. | White clover. | White clover. | Yarrow. | White clover. |
| Cock's-foot. | Ray. | Ray. | Burnet. | Dog's-tail. |
| Dog's-tail. | York white. | York white | Trefoil. | Cock's-foot |
| Fefcue. | Fefcue. | Yarrow. | White clover. | Rib. |
| Fox-tail. | Fox-tail. | Burnet. | Saintfoin. | York white. |
| Oat-grais. | Dog's-tail. | Trefoil. |  | Ray. |
| Trefoil. | Poa. | Rib. |  | Fox-tail. |
| York-white. | Timothy. Yarrow. |  |  | Felcne. Timothy. |

With regard to the proportions or quantities which are neceffary per acre, it is hinted, that " in fituations where women and childres are fully employed, it may be difficult to procure large quantities gathered by hand: in fuch places a man muft be content with what can be bought. Crefted dog's-tail is fo very generally to be thus procured, that he eannot but fuppofe it in a good meafure at command.

However, without adverting to this point, he may remark, that from the lands which he has laid down to grafs to a confiderable extent, and in which he has ufed every one of thefe plants largely except the poa, and that on a fmaller fcale, he is inclined to think that the quantities fated below. may be fafely employed."

Mrethod of fowing Grafs-feeds.-In refpect to the time and manner of fowing grafs-feeds, they are different in practice according to the preparation and the particular circumftances of the land. The molt ufual period of putting in grafsfeeds has been the fpring, at the time the grain crops are fown: but where the land has been brought to a fuitable ftate of preparation by means of green and other fallow crops, the latter end of the fummer, as about Auguft, has been the more general time. In the former cafe they are moft commonly put in with the grain crops; but in the latter without any other fort of crop. The author of the Syftem of Practical Agriculture remarks, that "there has been much diverfity of opinion among agricultural writers with regard to the fuperior utility of thefe different feafons of introducing the feeds, as well as with regard to their being fown with or without other forts of crops. The adrantages of the auturmal over thofe of the vernal fowings are contended to be, thofe of the grafs-plants being lefs expofed to danger frum the fhade, clofenefs, and choking, that muft neceflarily occur at the latter feafon, there being lefs rifk of ftocking the ground with noxious weeds in cafe of the feeds of hay-chambers being indiferiminately fown; their being put in upon a better preparation and more mellow and fertile ftate of the land; their growth being more Atrong and vigorous from their not being robbed of their proper nourifhment by other exhaufting crops, and the great fuperiority of the hay produce: while, on the contrary, it is maintained in fupport of the vernal fowings, that befides their being lefs precarious, fhade is neceffary in the early growth of the grafs-plants to protect them from the effeets of heat; the moifture is better preferved in the foil for their fupport; fmall annual weeds niore effectually prevent it from rifing to injure them; and the lofs the farmer muft fuftain from the want of grain crop guarded againft."

But in regard to the objection on the ground of weeds being produced, Mr. Clole has remarked, that "fowing rubbin in Auguft is not of fo great importance as in the fpring. In the former feafon all the annual feeds vegetate, and if the beginning of the winter be mild, they will bloffom; but they cannot perfect their feeds, and thus ftock the land with noxious weeds.

Upon which the firlt of thefe writers obferves, that " though fome of the arguments urged on both fides of this controverted point may be objected to, the autumnal fowings not preventing the perennial weeds from rifing and fiedding their feeds in the following fummer, nor the great clofenefs of grain crops being without injury to the growth of the young grafs-plants; there are facts which render it probable that each method may have advantages under particular circumftances. In the more fouthern diftricts, where the feverity of the winter feafon is later in its approach, the autamnal feafon may frequently be made ufe of with advantage, after fallow crops, for fowing grafs-feeds, efpecially in cafes where the lands are in too rich a condition Sor the fucceffful growth of corn. But in the more northern
parts of the kingdom, and expofed fituations, where the froft fets in at an early period, it may be in general the moft advifable practice to put the feeds in, in the vernal months, with fuitable crops of the grain kind." And the Rev. Mr. Young has obferved, that "grafs-feeds anfwer almoft equally well in either method: he prefers, however, the Augult fowing without corn, though the fuccefs of his trials in the different feafons has not juttified any decifive conclufion." It is even admitted, that "in moory and mountainous fituations, where the fnows come early, autumnal fowings are not advifable, or to be performed later than the very early part of Augult; the vernal feafon with oats, for being cut young for foiling or hay, is conftantly to be preferred." Mr. Dalton, in Yorkfhire, after trying othicr methods, alfo recommends the autumnal feafon withouc corn as the molt advifable. And the Rev. Mr. Clofe ftates, that "a friend of his, wihing to procure good meadow or palture around his houfe, fallowed the land for barley; but the fpring proving wet, and the foil being a ftrong loam, he could only put half of it in order for that crop, which was fown and laid with clover and rye grafs. The other part was fallowed and fown in Augult with the fweepings of hay-chambers. The barley was a good crop, and the clover and rye-grafs were probably equal to the firft year's cut of hay. The fecond year the artificial graffes began to fail ; worfe the third, fourth, and fifth; the fixth year, after haping received two dreflings, the fpontaneous product of the foil began to give a fleece over the furface of the land. About ten years after thefe lands were fown, Mr. Clofe faw this field, when the part fown in Augult was worth at leaft fifteen fhillings per acre more than the part which had been fown with artificial graffes in the barley. Thus from actual experiments, numbers of which he could adduce, he concludes that fowing the fiveepings of hay-chambers in Auguft, is preferable to fowing any artificial grafles in the fpring with any crop of corn. Suppofe the corn worth five pounds per acre, the difference in the produce of hay or feed in the fecond, third, fourth, and fifth years, would more than counterbalance this; and the proprietor would find a permanent improvement in his land of from fifteen to twenty fhillings per acre." Mr. Young thinks, the beft feafon in the whole year for this purpofe is Augult, and the only one bdmiffible for it on Atrong, wet, and heavy foils, in forty years' experience having never failed at that period. It is flated in the Syftem of Practical Agriculture already noticed, that " $\mathbf{~ о ~}$ comparative experiments being made with corn in the fpring months, and without it in Augult, the latter was found by much the beft mode by different cultivators." But that in the experiment of an accurate agricultor, mentioned by the Rev. Mr. Young, in his paper in the communication to the board, "in comparing different methods of vernal fowings, in which four acres were fown with feeds alone, on peafe and buck-wheat ploughed in the preceding autumn; five acres with barley, and five more with the feeds put in alone without corn or manure: the portions fown alone were over-run with weeds, and only preferved from being fmothered and deftroyed, by being eaten down by $a$ dairy of cows." And others, after repeatedly trying the experiment of fowing in the fpring with corn, and the autumn without, and from long and extenfive practice, conclude, "that, even if we were to have no regard to any other circumftance, except the grafs crop alone, it would be always beft to fow it with fome kind of grain; but when we confider likewife the lofs that the farmer thus fuftains for want of a crop of grain, the practice of fowing alone muft be looked upon as highly perucious to the farmer."

## LAYING.

And he fappofes, that it is probably in this laft refpect that the greatet difudvantage of the practice confite, as without it the farnuer can derive no inmediate recompenfe for his great expence of tillage and preparation of the land."

In cafes where the vernal fowing with other forts of crops is had recourfe to, barley is that, according to Mr. Cartwright, which is molt ufually recommended, and "there feems to be no queltion that barley is in general the fitteft grain to be fown with grafs-feeds. The fame tilth which anfwers for the one is requifite for the other. Barley has a difpontion to loofen the texture of the ground in which it grows; a circumftance highly favourable to the vegetation of grais-feeds, which require a free and open foil to extend their roots in; the tender and delicate fibres of which have much difficulty in contending with the reliftance of a fubborn foil. And this points out the reafon why grafs-feeds fo frequently fail on ftrong land not in a proper flate of cultivation. In the choice of barley, that fort fhould be preferred which runs leait to flraw, and which is the foonett ripe." But the writer of the Syttem of Practical Agriculture obferves, that as from the grafly nature of the ftem, and the large fize of the ear in this fort of grain, a confiderable degree of clofenefs and fhade muft conttantly be kept up, it flould never be fown fo thickly as in other cafes where there are no grafs-feeds. Some object to fowing grafs-feeds with barley on other principles, as thofe' of its Grawing its nourifhment from the furface, which is alfo the cafe with the grafs-plants, and that in confequence they muft be greatly retarded in their growth from the want of due fupport. Where the land is in a proper flate of preparation and tillage, if fown with oats, they will be apt to become fo luxuriant as to greatly injure, if not wholly deftroy, the young grafs-plants by the clofenefs of their made. In fome cafes they, however, fucceed tolerably with this fort of crop. On the ftronger kinds of land the fowing of grafs-feeds has been found to anfwer well with thin crops of beans. In an experiment of this kind, it is ftated that Mr. Dalton found that the beans did not "rob, but fheltered and nourifhed the grafs-plants, the plan anfwering beyond expectation."

It is fuggefted, that in order to effe? the purpofes of diltribution and perfect vegetation in the moit complete manner, the feedifman fhould " be accuftomed to the bufinefs, and the feeds, as being of different weights, $i$. as little mixed with each other as poffible. It is much better to have more cafts than to blend the feeds together for the fake of difpatch. For all the fmaller forts of feeds, it has been fuppofed by the Rev. Mr. Young, preferable to deliver them by means of the Norfolk turnip trough, which bas lately been adapted to clover and ray-grafs. And this operation flould always be performed as foon after the land has been ploughed as poffible, as under fuch circumftances the feeds vegetate in a much more quick and vigorous manner. But it fhould never be attempted in fuch a wet ftate of the land as produces any great degree of tenacity or adhefivenefs in the mould, as in fuch circumftances the feeds would be apt to come up in a tufty unequal manner. Nor for the fame reafon fhould the lighter forts of grafs-feeds ever be fown in windy weather; as the delivering them in an equal and regular manner is a point of confequence to the forming of good grafs-land. In the covering in of the feeds, the author juit mentioned obferves, that care thould be taken that none are left in an expofed ftate on the furface of the ground, as where that is the cafe many of them will be deflroyed or picked up by birds, and the fward appear patchy. This bufinefs is execused in the moft complete
manner by a pair of light fhort-tined harrows at one tining. The practice of employing bulh-harrows is improper, as in that way the feeds are liable to be drawn into lumps. In all the lighter and more fpongy deferiptions of land, it may be advantageous to pafs a light roller over the furface immediately after the feeds have been well harrowed in." And " in cafes where the tenants and not the proprietors of the land are to lay them down to grafs, it may be the moft advifable practice for the latter to procure the feeds, but at the expence of the former, efpecially where they have a fufficient intereft in fuch laids; as, without this precaution, from their general propenfity to keep the ground under the plough, and their indifference in refpect to the obtaining of the moft proper forts of feeds, there may be danger of the bufinefs being improperly performed."
Proper Management after being laid down.-It may be remarked, that the proper conducting of this bufinefs is a matter of confiderable importance, and a point upon which much of the fuccefs of forming good grafs-land mult in moft circumftances depend. It is advifed by fome, as foon as the crop with which the feeds have been fown has been removed, to have recourfe to rolling the land with a moderately heave roller, when it is in fuch a flate of drynefs as jull to admit the impreffion of the implement; as by this procefs, from the mould being preffed clofely about the roots of the plants, their early growth may be much benefited, and the danger of drought in fome meafure obviated. The practice is, however, in the opinion of others, the moft neceffary in the more light and porous defcriptions of land. There are fill others, likewife, who recommend the application of manure at this period, in order to promote the growth and fupport of the young grafs-plants; a point which would feem quite unneceffary where the above mode of preparation has been had recourfe to. The writer of the Syitem of Practical Agriculture, however, ftates that " as the furface of fuch grounds as have been newly laid down to the ftate of fward is, from the previous tillage which they require, extremely tender, and readily broken into holes for fome time even in the drier defcriptions of land, the turning in of the cattle with the view of feeding them down muft, in moft cafes, be highly prejudicial by the treading which they caufe. The bell practice is, therefore, probably to fuffer no fort of fock to be put upon fuch lands till the fpring after their being laid down; or where the farmer finds it abfolutely neceflary to turn upon the lands, the lighteft fort of tock fhould conftantly be felected for the purpofe." And "it has been obferved by the Rev. Mr . Young, that the advantage of feeding fuch lands during the autumn and winter feafons, is fcarcely matter of any confequence, as the fpring feed for fheep, where it is omitted, is of fo much greater utility, a very early pafturage being in this way afforded for ewes and lambs." Mr. A. Young is allo decidedly of the fame opinion in his Farmer's Calendar.

There are much diverfity and contradiction in the opinions of experienced cultivators as to the future management in different flates and circumftances of the lands, fome fupporting the fuperiority of keeping the ground clofely fed down by theep or neat cattle, while others confider mowing or feeding as preferable. "There feems little reafon to doubt but that feeding by fome fort of flock is a much better practice than thofe of either mowing or feeding; the chief difficulty is in refpect to the fort of ftock that is the moft proper. On the dry and more firm forts of ground, a mixed flock may be the moft advantageous, as neat cattle and fheep, as in that way the new pafture may be fed down in the moft regular manner; but oan thofe that are of a more

## LAYING。

open, porouc, and lefs firm quality, fheep, by their eating fo clofely, may do much harm, efpecially in the firlt years of the new lay, by pulling up the young and imperfectly eftablifaed grafs-plants. Several inftances of this kind have been noticed in fuch foils. In lands that are more inclined to moilture, the confuming of the produce by neat catt'e muft conftantly be liable to do mifchief, except in very dry feafons; they mult of courfe be principally fed down by Theep. And in all cales where the new lay is chiefly ecnftituted of the more coarfe fort of graftes, theep would feem to be the molt proper kind of lock, as the graftes are thereby conitantly becoming more fine and fweet. Many fagt of this nature have been noticed by cultivators. The fweetnefs of the palturage on many fheep-downs has been remarked to depend more on their being kept clofely fed down than any other circumflances, as on being neglected in this refpect it becomes coarfe, and is rejected."

Syferm of Pradical Agriculture.-It has been well obferved by the Rev. Mr. Young, in a valuable paper, in the third volume of Communications to the Board, that " heepfeeding not only ameliorates by enriching the foil, and fining the herbage, but alfo by deftroying weeds." And Dr. Dickfon has "been affured by a very extenfive and experienced cultivator in Somerfethhire, that under this fort of management, not only many coarle graffes, but other forts of plants become fine, and eagerly fed upon by animals:" It is ftill farther ftated, that " Dr. Wilkinfon, who has been much in the habit of comparing different practices, advifes the grazing conftantly with fheep, and for the firlt fix jears never to permit the fcythe to touch the lays;" but this is certainly longer than is neceflary to preclude the foythe in many forts of foil. And the Rev. Mr. Young has remarked in. addition, "that it is not merely the firt jear that feeding with fheep is the beft practice on new lays, but it may he to managed the fecond, and if it extend to the third it is the better: and though there is not any neceffity for adhering to it any longer, it has been found to anfwer well in bis practice, four, five, or even fix years; and in general it may be concluded, that the more the land is fed with fheep, the greater the improvement will be. But in this management the impoverifhing abfurd fyitern of removing the animals to be folded in other places, is not to form any part of the practice."

In the Agricultural Report of the North Riding of Yorkfire it is fuggefted, that "it has been long the pracrice in that ditriet, with the molt improved cultivators, to have recourfe to the method of fheep-feeding for fome time after laying the lands down to grafs, as two years or more. Where ray grafs and white closer are intended to remain fome years, it is found by fome advantageous to eat them the firt.jear by the fheep, in clofing, thickening, and rendering them more permanent." Thele facts are all in evidence of the great propriety and utility of the practice of feeding new grafs-lands. It muft, ho:vever, be obferved, that in order to render the practice perfectly fafe and beneficial, the new lays fhould not be fed during the autumn, or the flock turned into them at too early a period in the fpring. "Nor fhould they be too hearily ftocked, or the ftock kept in the paftures too long, efpecially when it confilts principally of theep, as they may do much harm by paring and eating the plants fo clofely down as immediately to kiil them, or expofe their roots too much to the deftructive effects of drought. And in cafes where the graffes bave run up much to tlem, if the lands be fufficiently ftoeked with plants, it may be an ufeful method to cut them over, by means of a Aroug fcythe, before their feeds are formed, as
by this means they will become more frong, and vigorous; but, in the contrary circumilances, they are better left for the purpofe of providing a more abundant fupply of young graffes, as the benefit obtained in this way wi.l more than counterbalance the injury fuftained by the running up of the old plants." But the author of the Syftem of Practical Agriculture ftates, that "though the practice of feeding new laid graffes in the firt years appears to be the molt adyantageous and proper mode of managenent, efpecially for lands intended for pafture, there are many cafes in which they may be mown with great fuccefs. This pracice is perhaps always the moft beneficial and proper, and indeed the only one that can be adopted, in fuch foils as pofers any great degrec of moitture; as, under fuch circurallinces, ti.e feeding them down with any fort of live flock muft, in moft feafons, be injurious to she fward. And, befdes, where the object and intention of the farmer is chiefly hay, the grafs-plants, by being kept clofely eaten down by live flock for a confiderable length of time before the fcythe is applied, may, from their becoming thereby difpofed to a low and lateral fpreading growth, be aferwards more unfit for the production of hay crops. Several facts of this nature are related by writers on hufbandry. In one cafe, where different divifions of land of the fame kind were laid down in the fame manner, on one of them being kept in the flate of pafture, and the other alternately mown and paltured; after fome years, both being thut up for hay, that which had been paftured afforded a much inferior produce to the other. The fame thing has happened in other cafes of old pattures being converted into hay lands, even when the molt favourable feafon prevailed." It is confequently concluded, that "on thefe principles, it may be a more judicious practice to manage lands detigned for hay, without havicg them for any great length of time, previoully to their being mown, fed down clofely with foock; as in this way a larger produce of hay may be afforded." And it is fuppoled, that "where the new lays are mown the firt year after being laid down, which is not a method to be recommended, ith is an excellent practice to apply a moderate coat of manure over them in the autumn, efpecially when the fate of the land and the feafon is fuch, in refpect to drynefs, as to admit of its being done without injuring the furface fiward; as by this means the grafs-plants not only become more ftrong and vigorous, but better eftablified in the foil, and of courfe bear cutting with much lefs injury."'

But as it may be the cafe fometimes, though feldom, where thefe modes are fuliy attended to, that the farmer may fail either in part or wholly of producing a good lay; it has been obferved, that, "in the firlt cafe, it is the beft practice to have recourfe to fowing frefh feeds, which flould be performed in the early part of the fpring, when the weather is in a moilt fate; the feeds being adviifed by fome to be trodden in by putting fheep upon the land; either indifcriminately, or by very open folding, as the ufe of the roller will not be effectual, and that of harrowing canuot be practifed without injury." It is flated that a large cultivator at Enfield fourd advantage from puttirg the feeds in before the manure was applied in the new lays, which are fometimes too hatily plonghed up. By either method, the fward of fuch lays may often be much thickened, as well as benefited in other refpects. And that, in cafes uhere the grafies have run up much to ftem, if the lands be fuffieiently ftocked with plants, it may be beneficial to cut them over, by means of a fharp fcythe, before their feeds are formed; as by this means they will be more ftrong and vigorous, and the lands be lefe injured:- but, under the coatrary circum-

## IAYING。

fances, they are better left for the purpofe of providing a more abundant fupply of young graffes, as the benetic obtained in this way more than counterbalances the injury futtained by the old plants being left upon the land. But that where there is a complete failure from particular caufes, the moft advifable method is, where the feeds have been put in, in the fpring, with grain crops, to take off thefe crops as foon as they admit of it; and, after giving the land one ploughing, to harrow in directly frefh feeds, which fhould be accomplifhed as carly in the beginning of Augult as it can be performed; and a roller may be applied over the land, when in a fuitably dry condition, about October. But that where the latter end of fummer has been the time of fowing, it is advifed "that the land fhould have three ploughings performed upon it in the early fpring months, when the weather is fufficiently dry, and the grafs-feeds be again put in with the crop of buck-wheat in May, which, though it is not a fuitable crop for the heavy wet forts of land, fometimes anfivers well in dry feafons; and in wet ones, as affording but little feed, may be mown when in blofom as green food for the cows." From the land not being much robbed of its fertility in this way, it may be a beneficial practice.

The application of manure to new laid down grafs lands is feldom abfolutely neceflary: yet where they have not been returned to the ftate of fward under that degree of fertility and preparation which has been inculcated, it may, in many intlances, be had recourfe to with great advantage and improvement; as it is perhaps one of the belt methods of preferving a good clofe ftate of grafs or fward, when properly employed. Mr. Maxwell dtates, in the third volume of Comnunications to the Board, that "though in general no manure will be wanted till the land has been mown for hay, there caa be no doubt but that great additional improvement will be produced, where manure of any fort can be applied ;" and that " the oftener the land is manured, the greater will be the improvement." Where lands have been laid to fward or grafs with grain crops, the application of dlight dreflings of manure in the following autumn may be of much utility in fixing and encouraging the growth of the young grafsplants, as has been feen; but in other cafes, the latter end of the fummer following, or very early in the autumn, are fuppofed by fome to be the molt beneficial and proper periuds for the purpofe: "but as at thefe times, in many infeances, much lofs of manure may be fultained both by evaporation and the wafhing of heavy rains and fnows, it may be a better and more advifable practice to perform the bufinefs in the early fpring months, efpecially where the lands are to be conducted under the feythe; as in this way the enriching material will be ready to exert its influence at -the moment the young plants begin to fend forth their new - Shoots, and thus not only afford more affiltance in thickening and invigorating the new fward, but be lefs in danger of being ufelefsly diflipated and wafted." But "where manure cannot be fpared for repeatedly dreffing new grafs lands, as the gralfes are ofter, efpecially on lands not fuited to their growth, liable to decline and become thin, in fome inftances, it is fuppofed, from the fown graffes difappearing before the fpontaneous ones have attained fufficient vigour and Itrength; but more generally, probably, from the grounds not having been in a proper ttate of fertility, or finenefs of furface mould, at the time the feeds were put in; or the particular unfavourablenefs of the feafon, about the clofe of the third fummer after their being fown. It is believed by the Rev. Mr. Young, to be a better practice to edefer the ufe of manure till that time, on fuch lays as are
paftured; and when they are under the feythe, till the hay crop has been taken from the ground. We have no doubt of the fuccefs of the application of dung top dreflings at thefe periods, though they muft evidently be made ufe of in a lefs economical manner than at a later feafon in the autumn, or an earlier one in the fpring. And it is the molt common opinion, that all the finer and more foluble kinds of top dreflings are applied with the greateft benefits in the very early fpring months, as about the latter end of February, or the beginning of the following month. The differences in the effects of thefe forts of manure have perhaps not yet been fully afcertained, under different circumitances of application."

With the view of encouraging and fupporting the growth of the natural graffes, when the fown ones decline, as about the third year, an experienced cultivator at Enfield, who feems to favour the opinion of manure being the moft ufefully laid on land early in the autumn, or on hay lands immediately after the crops have been taken off, Itates that " he has ufed coal-afhes with great fuccefs, to the amount of three chaldrons per acre. He has laid of this manure on grafs land above fifty chaldrons in a year. About eight years ago, he laid down a field of twelve acres with broad clover principally, intending it to ftand only for two years. In the fummer it was mown twice; next year it was grazed: the clover was but weak. As he had particular reafons for altering his mind, and for wifhing to continue it in grafs, he refolved to ary the effects of grazing it with theep. On the fourth year it looked fo very bad, the clover almoft entirely difappearing, that he was tempted to plough it up. He, however, refolved to continue the grazing, and to give it a drefling of three chaldrons per acre of coal-a\{hes. The next year he obferved the white clover and natural graffes beginning to form a clofe turf; and the field is now an excellent piece of fward, without the aid of any hay-feeds." And it appears from the further trials of the fame cultivator, that the following fubllances have much effect, not only in promoting the growth and rendering the herbage more fine and fweet, but in renovating the fward:-the fcrapings of the road, fand drift, fold-yard liquor, and watering; and that the effects of other manures would feem to be chiefly in promoting the luxuriance of the graffes, and of courfe to be principally advantageous in increafing the quantity of produce; fuch as "tallow-chandlers" graves, when ufed in proportion of a ton an acre; and night-foil, when laid on to about three horfe cart loads the acre. And that in fixing, producing, and rendering the white clover more permanent, marle, or ftrong cold land, and coal-afhes, on wet foils, have been highly beneficial. On the drier clayey lands in Cornwall, " fea-fand has been found to mellow the clay, and make them hold the gra\{es." And on what are termed ftone brafh lands, the ufe of marle is often found of great utility, when applied in the latter part of the fummer of the firft year of the lay. But it is neceflary, to the fuccefs of this fort of application, that the ground be well covered with grafs before it is applied; as where the furface is much expofed, the marle is liatrle to plaitter and cake together, and the young grafs-plants to be, in confequence, expofed to much injury from the heat of the fummer. This fubftance feems to bring up the belf fort of natural graffes; but in time it finks below the reach of vegetation. About thirty cart-loads are fufficient for the acre. And chalk, on the deep loamy clays, was found by Mr. Davis an ufeful application the firft year on new lays, in the proportion of about twenty loads to the acre. On the more fandy forts, of land, clayey marle may be of great advantage in efta-
blifhing the grafs; and on peaty or moory lands, marlc and other fimilar materials will be found of advantage in rendering them more compact, and better fuited for preferving the grafles; as well as fand and road-ftuff, for fining the herbage, and rendering it more palatable to the flock.

Though " foot has been much ufed as a top-dreffing, it has not been found that its effects laft beyond the firt year. It has been tried to the amount of fixty bufhels per acre, at 8 d . per buthel; perhaps it fhould be ufed in larger quantity. Lime is nearly as dear, and of that 160 bufhels have been ufed per acre on arable land. Soot flhould perhaps be laid orr to that amount. Sugar-bakers' fcum has been ufed with great fuccefs to the amount of two loads an acre, at half a guinea per load, which has been found a ftrong warm manure, highly ferviceable on cold land, its effects being permanent. Lime is alfo found ufeful on the more friable red loamy foils, by fixing and rendering them more clofe, to kecp the vegetation more to the furface, as well as to promote the growth of the natural graffes, and prevent their roots from being injured by the heat of the fun. And woollen rags, though not generally ufed as manure on grafs-land, when chopped fmall, have been fpread with advantage on young clovers before winter, to the amount of about 10 cwt . per acre," being ufeful in protecting and nourifhing the young grafs-plants in their more tender growth, but they are flow in producing their beneficial effects.

On applying, in order to compenfate for an immediate crop of hay, and to thicken the fward or one part of a field, rotten dung about eight tons to the flatute acre, on another part woollen rags chepped at the rate of 1 vo flones to an acre $;$ and on a third a rich marle in the proportion of about 80 tpns to the flatute acre; Dr. Campbell found, on comparing their effects two years afterwards, that "the dung had produced the greater lusuriance. The woollen rags had a fuperior verdure, a deeper green: but as they had not yet been properly incorporated with the land, by the grafs growing over them, their ultimate produce could not be acertained." An acre of land may, it is fuppofed, "be manured by this means for about 3l. effectually, fhould they be found to anfwer the purpofe." The fame is the cafe with " the marle, which having covered the ground into which it is not yet carried down by the rains, and the grafs not having:grown through, it has at prefent rather done harm than good." On this account, he fuppoles that "marle is long in producing its beneficial effects, and the return of which cannot be looked for in lefs than two or three years:"

It is evident from thefe facts, that different effects may be produced on grafs-lands by the application of different forts of fubilances or materials to them in the manner of topdreffings after they have been laid down to grafs; and that "where fine herbage is the principal object in view, coal afhes and compofts of the earthy kind formed from fand, rud, fcrapings of roads, and other fimilar materials, intimately blended and incorporated with fuitable proportions of well rotted dung, may be the moft beneficial applications;": alfo that "the liquor of fold yards and watering may be ufeful in the fame intention as well as thofe of reftoring the grafs-plants or fwards, and promoting the luxuriance of the crops.". But that "where the increafe of produce is chiefly aimed at, good dung in a well reduced ftate, tal-low-chandlers' graves, night foil, chopped rags, foot, fcum of fugar, and other fubltances of the more animal kind, are the moft effectual and proper." While in the intention "of eftablifhing, preferving, rendering durable the different graffes, marle, lime, chalk, the folding of fheep, and other lubftances and practices of the fame fort, will be the moft proper for producing fuck effects.". And that in "render.
ing the lands more firm and folid, the three laft fubfances may perhaps be employed with the greateff fuccefs and ad: vantage." Sce Maxure and Grass Land.

LAZARUS，St．or Lazako，a military order，inft－ tuted at Jerufalcm by the Chrittians of the Weft，when they became matters of the Holy Land；whofe bufinefs was，to receive pilgrims under their care，guard them on the roads， and defend them from the infults of the Saracens．

Some fay，this order was inttizuted in ing．
The knights of this order，being driven out of the Holy Land in 1253 ，followed St．Lew：sinto France；who，in return for the fervices they liad done him in the Eaft，confirmed the donations made so them by his predeceffors，put them into poffeftion of feveral houfes，commanderies，and hofpitals， which he had built and endowed with ample privileges，and procured from Alexander IV．in 1255 a bull，confirming the order，and giving them permiffion to oblerve the rule of St． Augufline．In the year 1490 ，pope Innocent VIII．fup－ prefled their ordcr，and united them to the order of St．Juhn of Jerufalem；but the bull iffued for that purpofe was not received in France．In 1572，pope Gre ory XII．united thofe of the order in Italy with that of St．Maurice，（which Sce，）then newly inflituted by Emanuel Philibert，duke of Savoy．And，is 1608，this order was umited in France to that of our Lady of mount Carmel，which had been infti－ tuted by Henry IV．，and it obtained fome new advantages from Levis XIV．The knights of St．Lazarus，and thofe of our Lady of mount Carnel，are allowed to mary，and，
at the fame time, to poffefs penfions charged upon ceclefialtical livings. The badge of this order is a crofs (like that of Malta) of eight points, made of pure gold, edged with white enamel ; the middle, or nucleus, of the crofs is enamelled crimfon, and on it is the image of the bleffed virgin and child proper; the reverfe has the middle enamelled green, on which is the figure of St. Lazarus ; between the rays of the crofs are four fleurs-de-lis, and on each of the points a fmall gold ball. The crofs is faftened to a broad crimfon ribbon, and is worn either on the breatl or fcarfwife.

Lazanus, Fatbers of Sto, called alfo Lazarites, a name given to certain regular clerks of a congregation inftituted in France, in the feventeenth century, by M. Vincent.

They take the denomination from a houfe in the Fauxbourg St. Denis of. Paris; they have a feminary in Paris, called the feminary des bons anfans. The vows they make are fimple, and may be difpented with on occafion.
I.AZICA, in Ancient Geography, a country of Afia, S. of the Phafis, and N. of Armenia. This country was inhabited by a tribe of people called Lazi, who have to this day preferved their name, and are known among the Turks under the denomination of Lazas, and their country is called the country of the Lazas, or the province of Trebizond. In the time of Pliny, Arrian, and Ptolemy, the Lazi were a particular tribe on the northern fkirts of Colchos. In the age of Juftinian, they fpread, or at leaft reigned, over the whole country. At prefent they have migrated along the coalt towards Trebizond, and compofe a rude fea-faring people, with a peculiar language. As the ftrength of the Roman empire was gradually impaired, the Romans ftationed on the Phafis were gradually withdrawn or expelled about the beginning of the 2d century of the Chriftian era; and the tribe of the Lazi, whofe polterity (as we have faid) fpeak a foreign dialect, and inhabit the fea coalt of Trebizond, impofed their name and dominion on the ancient kincdom of Colchos. Their independence, however, was foon invaded by a formidable neighbour, who had acquired, by arms and treaties, the fovereignty of Iberia. The dependent king of Lazica received his fceptre from the Perfian monarch, and the fucceffors of Conttantine acquiefced in this injurious claim, whtch was proudly urged as a right of imememorial prefcription. In the begiuning of the fixth century (A.D. 522.) their influence was reftored by the introduction of Chrifianity. After the deceafe of his father, Zathus was exalted to the regal dignity by the favour of the great king; but the pious youth abhorred the ceremonies of the Magi, and fought, in the palace of Conftantinople, an orthodox baptifm, a noble wife, and the alliance of the emperor Jultin. The king of Lazica was folemnly invefted with the diadem, and his new patron foothed the jealoufy of the Perfian court, excufing the revolt of Colchos, by the venerable names of hofpitality and religion. The common intereft of both empires impofed on the Colchians the duty of guarding the paffes of mount Caucafus, where a wall of 60 miles is now defended by the monthly fervice of the mufqueteers of Mingrelia. But this honomerable connection was foon corrupted by the avarice and ambition of the Romans. Degraded from the rank of allies, the Lazi were incefliantly reminded, by words and actions, of their dependent Itate. At the dillance of a day's journey bejond the Apfarus, they beheld the rifing fortrefs of, Petra, which commanded the maritime country to the fouth of the Phalis. Inftead of being protected by the valour, Colchos was infulted by the licentioufnefs, of foreign mercenaries; the benefits of commerce were converted into bafe and vexatious monopoly: and Gubazes, the native prince, was reduced

Vol. XX.
to a pageant of royalty by the fuperior infucnce of the officers of Juftinian. Difappointed in their expectations of Chrittian virtue, the indignant Lazi repofed fome confidence in the juftice of an unbeliever, and after a private affurance that thicir ambafladors fhould not be delivered to the Romans, they publicly folicited the friendflip of Chofroes. The fagacious monarch difcerned the ufe and importance of Colchos, and meditated a plan of conqueft. His ambition was fired by the hope of launching a Perfian navy from the Phafis, of commanding the trade and navigation of the Euxinc fea, of defolating the coalt of Pontus and Bithynia, of diftreffing, perhaps of attacking, Conftantinople, and of perfuading the barbarians of Europe to fecond his arms and counfels againft the common enemy of mankind. Accordingly he led his troops to the fronticrs of Iberia; they were conducted by Colchian guides through the woods and along the precioices of mount Cuucafus; and a narrow path was formed into a fafe and fpacious highway, for the march of cavalry and even of elephants. Gubazes laid his perfon and diadem at the foot of the king of Perfia; his Colchians imitated the fubmifion of their prince, and after the walls of Petra had been thaken, the Roman garrifon prevented, by a capitulation, the impending fury of the lait affault. But the Lazi foon difcovered that their mopatience had urged them to choofe an evil more intolerable than the calamities which they ftrove to efcape. The monopoly of falt and corn was effectually removed by the lofs of thofe valuable commodities; the authority of a Roman legillator was fucceeded by the pride of an oriental defpot, who beheld, with equal difcain, the flaves whom he had exalted, and the kings whom he had humbled, before the footitool of his throne. The adoration of fire was introduced into Colchos by the zoal of the Magi ; their intolerant fpirit provoked the fervour of Chrittian people; and the prejudice of nature or education was wounded by the impious practice of expofing the dead bodies of their parents, or the fummit of a lofty tover, to the crows and vultures of the air. The Lazi were alfo apprized that Nufhervan had given fec:et orders for affaffinating their king, for tranfplanting them into fome diltant land, and for fixing a faithful and warlike colony on the banks of the Phafis. In thefe circumitances the Colchians, apprized of the ruin that awaited them, folicited the clemency and fuccour of Jultinian; who, from motives of policy, determined to expel the Perfians from the coaft of the Euxine. The fiege of Petra (which fee) was immediately undertaken. Thus commenced the Colchian or Lazic war, A.D. 549. Notwithfanding fome fplendid advantages obtained by the troops of Jultinian, the I'erfians occupied the paffes of Siberia; Colchos was enflaved by their forts and garrifons; they devoured the fcanty fuftenance of the people; and the prince of the Lazi fled into the mountains. At length, the prudence of Chofroes reInquifhed the profecution of the Colchian war, under a perfuation that it is impoflible to reduce, or at leait to hold a diftant country againtt the wifhes and efforts of its inhabitants. The fidelity of Gubazes fuftained trials of the moft rigorous kind; he patiently endured the hardnlips of a favarge life, and rejected, with difdain, the fpecious temptations of the Perfian court. The kiug of the Lazi had been educated in the Chriftian religion; his mother was the daughter of a femator; he had ferved 10 years a filentiary of the Byantine palace; and the arrears of an unpaid falary were a motive of attachment and of complaint. The lieutenants of Jultimian prejudiced the emperor againft him; perfuaded him that a fecond defection was meditated; an order was iffued to tend the king prifoner to Conftantinople, and a treacherous claufe was inferted in it, that he might be law3 H
full ${ }^{-}$
fully killed in cafe of refiftance; and Gubazcs, without arms, or fufpicion of danger, was thabbed in the fecurity of a friendly interview. In the firlt moment of rage and defpair, the Colchians would have facrificed their country and religion to the gratification of revenge; but the counfel of the wifer men among them prevailed; and the emperor, anxious to avoid the imputation of fo foul a murder, commiffioned a judge of fenatorial rank to enquire into the conduct and death of the king of the Lazi; and fome fatisfaction was granted to an injured people by the fentence and execution of the meaner criminals. After 20 years of defructive though feeble war, Chofroes was perfuaded to renounce his claim to the poffeffion or fovereignty of Colchos and its dependent ftates. Gibbon's Decl. \&c. of Rom. Emp. vol. vii. See Colchis, Mingrelia, and Tbebizond.

LAZISE, in Geography, a town of Italy, in the Veronefe, on the E. bank of lake Garde, with a harbour, a cuftom houfe, and a caftle; five miles W. of Verona.

LAZIVRAD, in Natural Hifory, one of the oldelt names by which we find the lapis lazuli expreffed in an!thors.

LaZULI Lapis, or Lapis Lazuli; Azure Stone, Jam.; Lafurfein, Wern.; Lazulite of Haüy and Delameth. (not of Werner); Pierre d'Azur, Broch.; Lazulite outremer, Brong. ; Lazurus orientalis, Linn.

The colour of this mineral is azure blue, generally perfect, but alfo paffing into Berlin blue and fmalt blue, feldom into flky blue: fome varieties fhew a flight tint of greenifhblue.

It occurs generally maffive, in rolled pieces and diffeminated ; alfo indiftinctly cryftallized. The regular cryftal form mentioned by Lhermina, and other French mineralogifts, is that of the garnet dodecahedron ; but whether this be the primitive or a fecondary form, or whether it belong at ail to the real azure ftone, is as yet undecided.

Its internal luftre is gliftening and glimmering. Fracture uneven, fine-grained.

Fragments indeterminately angular, more or lefs fharpedged, and flightly tranlucent on the edges.

It fcratches glafs, and is eafily frangible.
Specific gravity of the Perfian, (according to Briffon and Blumenbach,) 2.771; 2.896, (Kirwan); of the Siberian 2.945 , (Briflon).

It is infufible before the blowpipe; but at a ftill higher degree of heat its natural colour gives way to a bluifhgrey, and it runs into a whitifh enamel. Klaproth obtained a dark-coloured, femitranfparent, glaffy globule, covered with grains of iron. If previoully calcined it forms a jelly with acids. This latter obfervation was firt made by Marggraf, who, as early as the year 1788, publifhed an analy fis of the lapis lazuli, in which he fhewed that its colour is by no means produced by copper; his analyfis has been confirmed by Klaproth, who found alfo alumine as a conifituent part, which had been overlooked by his celebrated predeceffor. Its compolition, as determined by Klaproth, is the following:

## L A Z

The refuit of an analyfis given by M. M. Clement and Deformes, differs from the preceding: they obtained

| Silica | - | - | - | - | - | 34 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Alumine |  | - | - | - | - | 33 |
| Sulphur | - | - | - | - | - | 3 |
| Soda | - | - | - | - | - | 22 |
| Lors | - | - | - | - | - | 8 |

They confider thefe conftituents as effential, and look upon the 0.024 of lime, and the 0.015 of iron, which they have fometimes found, as accidental ingredients. Thefe chemifts have alfo obferved fome peculiarities in the characters of the earth, mentioned as pure filica in the above analyfis. This difcrepancy in the refults of the analyfes points out the necefficy of fubmitting the lapis lazuli to new chemical examination, which may throw light on the nature of the matter that produces the vivid and intenfe colour of this fubitance.

But little is known refpecting the geognoftic fituation of this mineral. We fee it diffeminated in, and mixed with, a fcaly cryftalline lime-ftone; alfo with quartz, and noft frequently with iron pyrites. The Siberian azure fone (which is diltinguifhed from that called the Perfian by its lefs vivid colour) is faid to be the production of a vein near the lake Baikal in Siberia, where it is accompapied with feldfpar, garnets, and pyrites.

The fineft azure-ftone is found in China, Great Bucharia, and Siberia. The true lapis lazuli has not yet been found in Europe, except buried under the ruins of Rome. That mentioned by Tournefort, as occurring near Ergeron in Armenia, is probably a blue copper-ore; and that which, as Mr . Pennant ftates, is found in great quantities in the ifland of Hainan, in the Chinefe fea, (whence it is fent to Canton, where they employ it in china painting,) may likewife turn out to be different from the true lapis lazuli.
M. Patrin was informed by a dealer in ftones, whom he met at Ekaterineburg in Siberia, and who had been in Bucharia, that the lapis lazuli occurred there in granite; not in veins, but diffeminated in all forts of proportion: but that it was extremely rare to find maffes, as thick as one's head, in which the blue generally predominated over the white and the grey. The blocks examined by Patrin had the appearance of being rolled: but he was informed they were taken from the quarry, and that their roundnefs was owing to their friction againlt each other in the carriage; though fometimes they were found by chance as boulders in torrents, and that thefe were of the moft vivid blue.
According to Laxmann, who refided feveral years in Eattern Siberia, rolled pieces of lapis lazuli are found on the fhore of the lake Baikal, in a kind of gulf to the fouthward, called the Koultouk ; but he fearched in vain for the mountains from which thefe blocks had been detached, and he could obtain no information on this fubject from the Buret Tartars who inhabit that favage country. Patrin.

We have omitted mentioning Perfia among the countries that furnifh this valuable fubftance, becaufe a traveller well verfed in the fludy of precious ftones denies its ever having been found there. "In the copper-mines of Perfia," fays Tavernier, "veins of lazur have been found ; which colour is much ufed in the country for painting flowers on the ceilings and roofs of apartments. Before thefe were difcovered, the Perfians had no other lazur than the real kind which comes from Tartary, and is exceedingly dear. The Perfian lazur is a fort of copper-ore, which, when pounded aed fifted, forms a fine paint, which appears very bright and pleafant.

## L. $\mathrm{A} \mathbf{Z}$

After this difcovery, the Perfians were no longer permitted to purchafe the Tartarian lapis lazuli; and Mahomet Beg iffued an order that painters fhould not ufe any but Perfian blue. This prohibition, however, did not long continue: for the Perfian pigment would not fland the effects of the atmofphere like the real kind, but, in the courfc of time, became dark and of a difreal colour. Sometimes it was full of fcales, and would not adhere to the end of a foft hair brufh; on which account it was foon neglected as a pigment, and the lapis lazuli of Tartary again introduced.

The lapis lazuli is fufceptible of taking a good polifh, and is therefore ufed for various ornamental and other purpofes, fuch as the engraving of gems: (See Gems.) The variety containing diffeminated pyrites, which the ignorant frequently miltake for gold, is preferred for mofaic and other inlaid work, \&cc. Moft profufely it was ufed for the lalt-mentioned purpofe, in the magnificent marble palace which Catherine II. built at Peterburg for Orlof, her favourite, and which has fome apartments completely lined with lapis lazuli brought from Great Bucharia.
Maffes that contain much quartz are lefs efteemed by the lapidaries, and particularly by thofe who prepare from it the ultramarine, a beautiful blue colour, fo called becaufe it was originally brought from the trading towns of the Levant. See Ultramarine.
Pliny ditinctly defcribes the lapis lazuli, but as a variety of fapphire.

The lapis lazuli was formerly reckoned of fome ufe in medicine : it was prepared by calcining and wafhing it feveral times; which done, it made an ingredient in the famous confection of alkermes.

The alchemical writers have given us procefles for magifteries, tinctures, and elixirs of lapis lazuli, but they are wholly out of ufe.

The method of making the Venetian counterfeit lapis lazuli is this; melt in a pot, in a glafs-houfe furnace, equal quantities of the faireft lattimo, and the whiteft cryftalline glafs; when this is in fufion, mix into it, by fmall parcels at a time, the blue fmalt ufed by the painters; make frequent proofs of the colour, and when it is right let the whole ftand twelve hours, and then work it. If the metal rife in the pot, put in a piece of leaf gold to keep it down. This makes a fine pale blue fubftance, reprefenting the plain blue parts of the natural lapis lazuli. Neri's Art of Glafs, p. 117.

A counterfeit lapis lazuli may be alfo made by fufing ten pounds of either of the compofitions for hard glafs (fee Colouring of Glass) with an ounce and a half of zaffer, and half an ounce of magnefia, till a very deep tranfparent blue glafs be produced. When the mafs is cold, powder it, and mix with it three quarters of a pound of calcined bones, horn, or ivory, by grinding them together: then fufe this mixture with a moderate heat, till the ingredients are thoroughly incorporated, and form the melted mafs into cakes by pouring it on a clean bright plate of copper or iron. In order to give it veins of gold, mix gold powder with an equal weight of calcined borax, and temper them with oil of Spike: let the cakes be painted with this mixture with frefh veins as are defired, and then put into a furnace of a moderate heat.

LaZULITE, or Lasulite of Werner (not that of Haïy, for which fee the preceding article) ; Azurite, Jamefon ; Siderite, Tromfdorff.

Colour indigo blue, from which it paffes into fmalt blue.
Is found maffive, diffeminated, and cryftallized, as it would appear, in four-fided and fix-fided prifms. Mr.

## L E A

Bernhardi obferved the fame forms in the variety from Salzburg, but alfo the regular octahedron with truncated edges, paffing into the regular rhomboidal dodecahedron. In general, the cryftals are very indittinct and fmall; and they occur always imbedded.

It is gliftening and thining, and of rather refinous luftre.
Longitudinal fracture imperfectly foliated, crofs fracture uneven. Fragments indeterminatcly angular. Its hardnefs is inferior to that of common feldfpar.

It is brittle, eafily frangible, and not particularly heavy.
The chemical characters of lazulite, which diftinguifh it from blue iron earth, are, according to Klaproth, firft, its crumbling before the blowpipe into a whitifh carthy mafs; fecondly, its giving a clear light wine yellow, glaffy pearl, with borax, and a tranfparent white pearl with falt of phofphor; and, laftly, its not being operated upon cither by acids, or caultic alkali.

Klaproth found the variety from Vorau, near Wienerifch Neuftadt, in Stiria, to be compoled of filex, alumine, and iron, but could not, from the fmellnefs of the quantity he operated upon, afcertain their proportions. An analyfis of the fane, by Heim, gave 0.6 ) alumine, and 0.30 iron.

Tromiderff's analy fis of the variety from Salzburg has given the following refults:

Mr. Tromfdorff thinks that alumine and magnefia mult be confidered as the effential parts of this mineral fubitance ; hence Mr . Bernhardi is inclined to refer it to the fpinelle ruby, with which Haïy has already united the cejlanite, or pleonaft, and which the lazulite refembles alfo with refpect to its cryftallization. But is not the hardnefs of the latter much inferior to that of finelle?

To the above two localities where the lazulite has been found, we may add that of Krieglach; for, indeed, the fubitance known by the name of blue feldfpar of Krieglach appears to agree in all its characters with thofe of Stiria and Salzburg. In all thefe places it is found in, azd grown together with, white quartz, imbedded in a kird of mica flate.

LAZZI, a denomination given by the Saxons to that rank of people who were born to labour, and being of a more fervile ftate than our fervants, becaufe they could not depart from their fervice without leave of the lord, but were fixed to the land where born and in the nature of flaves: hence the word lazzi, or lazy, fignifies thofe of a fervile condition. See Edhiling.
$\left.\begin{array}{l}\text { LE roy le veut, } \\ \text { Le roy s'advifera, }\end{array}\right\}$ See Le Ror.
LEA, in Ancient Geography, a fmall inand of the Ægean fea. Pliny.

Lea, in Geography, a river of England, which rifes in Bedfordhire, paffes by Hertford, Ware, \&c. and falls into the Thames a little below London.

Lea of Tarn, is ufed in fome parts of England for a certain quantity of yarn. At Kidderminfter it ought to contain, two hundred threads, on a reel four yards about. Stat. 22 \& 23 Car. 1 II .

LEACH.

## LE A

LEACH-Brine, a word ufed by the Englifh fatt-workers to exprefs the brine which runs out from the falt, when it fands in the bafket to drain, immediately after being taken out of the pan; and alfo the liquor left in the pan, when no more falt will fhoot. This is alfo called the noobere-brine, and bittern. In the German falt-works they ahways throw this liquor away. In our brine-falt works in Chefhire they alsays preferve it, and add it to the next boiling ; and in the Newcalte, and other fea-water falt-works, they fave it for the making the bitter purging falt, called Epfom fait.

LEAD, in Mineralogy', Plumbun, Lat.; Plomb, Fr.; Bley, Germ.; Saturnus, Alchem. The colour of lead is of a bluein-white; when tarnined, it becomes yellowifh.white, then blueifh, and at latt blueinh black. Luttre, when untarnifhed, 3 ; hardnefs, 5 ; and fpecific gravity fomewhere between It and I2. According to Briffon, it was $1 \times .35_{2}$; and a fecimen tried by Gellert, which was found at Freyburg, was eftimated at 11.44$)^{\circ}$. Next to gold, platina, and mercury, it is the heavielt metal, being upwards of eleven times heavier than an equal bulk of water. (See Specific Graviry.) The heavieft is reckoned the beft. It itains paper and the fingers. Next to tin, it is the molt fufible of all the metals. It is foluble in molt of the acids, though more readily fo in the nitrous diluted than the others. By expofure to the muilt atmofphere, it rufts or oxyds. It is mallealle and unelattic, and its oxyd is eafily fufible into a tranfparent yellow glafs. Having given this general defcription, we fhall now conlider the feveral combinations under which it is found in vature.

## Ores of Lead.

Sp. ro Lead Glance. Bleiglanz. This fpecies contains two fubfpecies: (I) Common lead-glance, the colour of which is of a lead-grey, of different kinds of intenfity; in fome varieties it inclines to a blackihh calt. The lead-grey

## LEA

frequently contains the greatel proportion of filver. It fometimes prefents fuperficially an iridefcent tarning. It occurs maflive, dificminated, in membranes, in angular pieces, and in grains ! fometimes it is met with reticulated, fpecular, corroded, and amorphons; feldom cylindrical, but often cryltallized. The crythaline furm exhibits feveral varieties : t, in the fhape of a cube, in which the planes are either flraight or fpherical convex; 2 , the cube having angles more or lefs deeply truncated; 3, the cube having its edges and angles truncated at the fame time, but of thefe the later the molt deeply; 4, octahedron, either perfect or truacated on all its angles; 5 , octahedrun having its angles and edges truncated at the fame time; 6 , rectangular four-fided prifms, acuminated on both extremities by four planes, which are fet on lateral edges; 7, fix-fided prifms, acuminated by four planes; 8, three-lided tables, in which the terminal planes are bevelled. The cryflals are ufually fmall, or at moft middle-lized, either grouped on one another, implanted, or folitary. The planes of the cryltals are fometi:nes fmooth, fometimes drufy, and fometimes rough. Internally it alternates from fpecular fplendent to glitening; on the external furface it is lefs bright, but its luitre is metallic. Its fracture is more or lefs perfect foliated, and its fragments are cubical. In mafs it is often compoled of granular, and rarely of lamellar dittinct concretions, which are much grown together, and whofe fracture has a radiated afpect. It is foft, perfectly fectile, eafily frangible, and the fpecific gravity is from 6.2 to 7.8 nearly. Before the blowpipe it fies to pieces, and emits a fulphureous odour. It is eafily tufible, and may be readily reduced on coal before the blowpipe. When it is alternately heated and cooled, it at length difappears entirely ; and if it contain filver, a globule of that metal remains behind. According to Vauquelin, lead-glance contains the following ingredients:

| From Kirfehsald, in Deux Ponts. |  | Kampfiein. | Ecalerberg. | Kantenlach. | Cologne. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Lead | 54 | 69 | 68.69 | 64 | 63.3 |
| Sulphur | S | 16 | 16.18 | 18 | 12. |
| Carbonated lime and filex | 38 | 15 | 16.13 | 18 | 19.67 |
| Oxyd of iron | - |  | - | - | 3.33 |
|  | 100 | 100 | 101 | 100 | 98.1 |

Dr. Thomfon gives the following as the refult of his experiments:

| Lead <br> Sulphur <br> Oxyd of iron |
| :--- |
| Lofs -85.13 <br> 13.02 <br> 0.5 |
| 98.65 <br> 1.35 |
| 100 |

Hence, as is erident from the above tables, the proportion of lead varies from 54 to rather more than $\delta j$ per cent. The proportion of filver varies confiderably alfo; and it appears to have an effect on the external afpect of the varieties. It fometimes alfo contains a fma-ll portion of iron; and gold has even been found in lead-glance. It is, next to pyrites, the molt common of metalitic ores, and is found in beds and veins in primitive, tranfition, and fecondary mountains. It occurs almolt always with biende and calamine, with which it appears to have a flrong geognoftic affinity. It is frequently
accompanied with filver ores, and fometimes with copper ores. To mention all the places in which it is found, would be to mention almolt all the known mineral diftricts in the world. It is very abundant in Germany, and alfo in many places in our own country. The lead-mines in Britain are fituated in Cornwall, Devonfhire, and Somerfethire, in Derbyhire, Durham, Lancahhire, Cumberland, and Weft. moreland ; in Shrophire, in Flinthhire, Denbighfhire, Merionethhire, and Montgomery@hire; at the lead-hills in Scotland, on the borders of Dumfriesfhire and Lanarkfhire, in Ayrfhire, and at Strontian in Argylefhire. Lead-glance is alfo found at Konigferg in Norway; in various parts of Lapland, and in Denmark and Sweden; in feveral diltricts of Saxony, Hungary, Tranfylvania; in France, Italy, and Spain. Molt of the lead of commerce is procured from this ore: it is alfo ufed without farther preparation in the potteries for coarfe work, and alfo in the fmelting of filver ores. Lead-glance is now generally ufed as a fcientific name, in preference to the lefs fignificant but common one salena, on account of its luftre, which forms a friking feature in the external afpect of this mineral. (2) The fecond fabferecies

## LEAD.

is compar lead-glanse. The colour of this is very fimilar to that of the common lead-glance. It occurs in mafs, diffeminated, and fpecular. The latter is externally fmooth, fhining, and fplendent; internally it is glimmering, and its luftre is metallic. Its fracture is even. It acquires a poliifh by friction; its ftreak is thining, almoft fplendent; not fo eafily frangible as the preceding fubfpecies; but agrees with it in the other charachers. Its fincific gravity is about $7 \cdot 4 \cdot$ It occurs in veins, and is ufually accompanied with the common lead-glance. When the two fubfpecies occur together, the compact always forms the fides of the vein, and this probably owing to its having been in a lefs perfect flate of folution. It is accompanied with black blende, common iron pyrites, copper pyrites, quartz, and heavy fpar. It is found in the lead-hills in Lanarkfhire, and in Derbyfhire; in divers parts of Germany, and in the valley of Chamouni in Switzerland.

Sp. 2. Blue lead ore. Blaubleyerz, Wern. Mine de plomb bleue, Broch. The colour of this fpecies is intermediate between dark indigo blue and lead-grey. It occurs maffive, and crytallized in perfect fix-fided prifms, which are ufually fmall, low, fometimes bulging, with a furface rough and dull. Internally it is feebly glimmering, and its luftre is metallic. The fracture is even, paffing into the fine-grained uneven and flat conchoidal. Its fragments are indeter. minately angular. It is opaque, gives a fhining metallic ftreak, is foft, fectile, and eafily frangible. Its fpecific gravity is 5 -46. It eafily melts before the blowpipe, burns with a weak blue flame, emits a ftrong fulphureous vapour, and is reduced to pure lead. It is conjectured to be a compound of lead, oxyd of lead, and fulphur; and is fuppofed by Werner to be intermediate between lead-glance and black lead ore. Klaproth difcovered in it phofphoric acid. It occurs in veins, accompanied with black lead ore, white lead ore, malachite, radiated copper azure quartz, fluorfpar, and heavy fpar. It is not often to be met with, and has hitherto been found only at Zfchoppau in Saxony, at Schemnitz in Hungary, and Brittany in France.

Sp. 3. Brown lead ore. Braun bleyerz, Wern. La mine de plomb brune, Broch. Its colour is hair-brown, of different degrees of intenfity, fometimes very pale, approaching to grey, and fometimes it paffes into a clovebrown. It occurs maffive, and is cryftallized in fix-fided prifms. The furface of the cryftals is blackifh and rough. Interually it is gliftening, and its luftre is refinous. The fracture is fmall and fine-grained uneven, and fometimes paffes into fplintery. It is foft, not very brittle, but eafily frangible. Its fpecific gravity between 6.60 and 6.98 . It melts eafily before the blowpipe, without being reduced; and, during the cooling, fhoots into acicular cryftals. It does not effervefce with acids. According to Klaproth, a fpecimen from Brittany contained,

| Oxyd of lead <br> Phofphoric acid <br> Muriatic acid |
| :--- |
|  |
| Lofs $\quad-\quad$78.58 <br> 19.73 <br> 1.65 |
| 99.96 <br> 4 |

It is found at Miefs in Bohemia; alfo in parts of Hungary, Sax̣ony, and Lower Brittany. In Bohemia it is ufually found accompanied with lead-glance, white, black, and green lead ores, copper pyrites, blende, quartz, heavy fpar, \&c. It occurs in veins.

Sp. 4. Black lead ore. Schroarz bleyerz, Wernu La nine de plomb-noire, Broch. The colour of this fpecies is greyifh-black, of different degrees of intenfity. It occurs in mafs, diffeminated or cellular, or cryftallized in fix-fided prifms. It is externally fplendent, and internally only thining. Fracture fmall. grained uneven, which fonetimes paffes into imperfect conchoidal and fiplintery. Fragments indeterninately angular; itreak greyifh white; rather brittle; cafily frangible, Specific gravity about 5.S. Before the blowpipe it decrepitates, and is quickly redeced to a metallic globule. According to Lampadius it confilts of,

It occurs in veins, and is almolt always accompanied with white lead ore and lead-glance, and ufually in the upper part of veins, and in new lead-glance formations. It very frequently encrufts lead-glance, and is covered with white lead ore, and fometimes by green lead ore. It is found in the lead-hills of Scotland ; in different parts of Bohernia, Saxony, Salzburg, Lower Brittany, and in Siberia. Previoufly to the analyfis of Lampadius, Haïy fuppofed it was a phofphate of lead; and Werner fufpected that it was a compound of lead, carbonic, and fulphuric acids.
Sp. 5. White lead ore. Wies-bleyerz, Wern. Mine de plomb blancle, Broch. This is a carbonate of lead: its colour is a greyih or yellowih-white, with very many different Thades. It occurs maffive, diffeminated, but moft frequently in a cryftallized ftate. The chief varieties are, 1 , the cunciform octahedron; 2 , the pyramidal dodecahedron; 3 , the preceding, with a fix-fided prifm interpofed between the pyramids ; 4, the fame as variety 3 , with fummits of the terminal pyramids replaced by a fix-fided plane; 5 , a fix-fided prifm, with fummits compofed of four planes; 6 , the fame, with fummits compofed of fix planes. The crytals are ufually fmall. Externally, it is fpecular fplendent, feldom gliftening: internally, it alternates from highly fplendent to glittening, and its luttre is adamantine, inclining fometimes to femi-metal ic, and fometimes to refinous. The fracture is commonly fmall conchoidal, but it frequently paffes into fine-grained uneven, and even into fine fplintery. Frag. ments indeterminately angular. It alternates from tranflucent to tranfparent, and is duplicating. It is foft, brittle, and eafily frangible. Its fpecific gravity is from 6 to 7.24 , according to the different fpecimens that have been analyfed. Before the blowpipe it flies to pieces, becomes red, yellow, and laftly melts into a globule of metallic lead. It makes a Itrong effervefcence with acids. Its furface becomes black, when expofed to the vapour of fulphuret of ammonia. Its conftituent parts are as follow :

From Siberia,
analyfed by Macquer.

But according to two other able chemilts, they are as follow:

It is almoft always accompanied with lead-glance, and occurs in a kind of repofitory. It occurs in veins that traverfe tranfition rocks; though it is found with different minerals, in different parts of the world. It is not a rare mineral, but is feldom found in fufficient quantities to make it worth while to feparate it from the adhering fpar, for the purpofe of fmelting. The fineft fpecimens of this ore that are found in Britain come from the mines of Derby hire, the Lead-hills in Scotland, and Minera in Denbighhire. It is allo found on many parts of the continent.
Sp. 6. Green lead-ore. Grün Blejerz, Wern. La mine de plomb verte, Broch. The colour of this fpecies is grafsgreen, which paffes on through the feveral fhades into green-inh-white. The olive and piftachio-green colours are the moft common. It occurs maffive, fometimes reniform, but moit commonly cryftallized. The varieties are, I. Six-fided prifms, having fometimes the lateral and terminal edges truncated. 2. When the lateral edges of the prifm converge towards their extremities, an acute, double, fix-fided pyramid is formed. The crytals are fmall; externally fmooth and fhining ; internally gliftening; the luftre is refinous. Fracture fmall-grained, uneven. Fragments angular and blunt-edged: it is foft, rather brittle, and eafily frangible. Specific gravity 6.27 to 6.94 . Before the blowpipe it does not fly to pieces: it brcomes white and melts eafly into a greyih-globule, but without being reduced even with charcoal. It diffolves in acids without effervefeence. Its conftituent parts are, according to

guifhed by the following characteritics: 1. The fracture in this fpecies is fine-grained, uneven, but in white lead-ore it is more or lefs conchoidal. 2. Its luftre is refinous, 3. It is harder than white lead-ore. 4. It is of a greater Ipecific gravity. 5. Its cryftals are often aggregated: and 6. Its prifms are generally fhorter than thofe of white lead-ore.

Sp. 7. Red lead ore. Roth Bleyerz, Werner. Red leadfpar, Kirwan. La mine de plomb rouge, Brochant. The colour of this mineral is of a hyacinth-red, fometimes inclining to aurora, or morning red. It occurs moft commonly cryftallized in broad four-fided prifms, and but rarely maffive, diffeminated, or in membranes. The cryftals are middle-fized : the furface of the cryftals is ufually fmaoth, fometimes longitudinally ftreaked. Both externally and internally it is fplendent, and its luftre is intermediate between adamantine and refinous. The fracture is foliated, and the fragments indeterminately angular. It fometimes inclines to tranfparency. It is foft, and in the intermediate fate between very brittle and fectile: eafily frangible, and its fpecific gravity is fomewhere between 5.6 and 60. It melts before the blowpipe into a blackifh fcoria, and may be partly reduced with borax. Specimens have been analyfed by

This mineral occurs in veins in gneifs and mica flate, where it is accompanied with lead-glance, green lead-ore, iron pyrites, brown iron-ftone, native gold and quartz" It is found in Siberia; at Annaberg, in Auftria; and at Upper Faucigny, in Savoy. It is much ufed as a pigment, on account of its beautiful colour, its durability in the atmofphere, and its mixing readily with oil.

Sp. 8. Yellow lead-ore. Gelbes Bleyerz, Werner. Yellow lead-fpar, Kirwan and Hatchett. Plomb molybdate, Haüy: La mine de plomb jaune, Brochant. In this fpecies, which has long been known to mineralogits, the lead is mineralized by a particular metallic acid, called the molybdic acid. It occurs fometimes maffive, more commonly cry ftallized in fmall cryftals; the forms of which are rectangular tables of four fides, or of eight fides, bevelled ; the cube, octahedron, equiangular eight-fided table, and double eight-fided pyramid. The tables are ufually broad and thin, and alternate from fmall to very fmall, but are feldom middle-fized.

They are fometimes united, frequently interfect one another, and form thus the cellular external fhape. Its colour is wax-yellow, and its luffre diftinetly waxy: it is tranflucent, foft, and cafily frangible. Its fpecific gravity is rather more than 5. It decrepitates before the blowpipe, then melts into a clobule of a grey colour, in which are diffeminated farticles of metallic lead. It gives a blueifh white colour to borax : it occafionally produces a glafs, which is greenifh-blue, and fometimes deep blue. Its conftituent parts are, according to

It occurs on compact lime-ftone which is much traverfed by veins of calc-spar, and is accompanied with molybdena and yellow lead-earth; fometimes, alfo, with lead-glance, white, black, and green lead-ore, calamine, blende, the calc and fluor fpars. It is found principally in Carinthia; though it is met with at Annaberg, in Auftria; alfo in Hungary, Silefia, Saxony, Burgundy, in France, and other places.
Sp. 9. Lead vitriol, or fulphate of lead. Blée vitriol, Werner. Native vilriol of lead, Kirw. Plomb fulphatè, Haïy: Le vitriol de plomb natif, Broch. The colour of this mineral is yellowifh grey, paffing to the greyif-white; the lighter varieties incline much to white. It occurs only in cryftals, the form of which is rectangular octahedrons with obtufe pyramids. The pyramids are often varioully truncated. Externally it is fhining; internally it ${ }^{5}$ is fplendent. The frature is compact; it is more or lefs tranfparent : is foftih, rather brittle, and its fpecific gravity is about 6.3. Ic is eafily reduced, when expofed to the flame of the blowpipe; and is infoluble in the nitrous acid. Specimens have been analyfed by Klaproth; the conftituent parts are as follow: viz. of that from

It occurs in lead-glance veins at Wanlock-head, and in brown iron-ftone in the ifland of Anglefea. It has alfo been found in lead-glance veins in Andalufia in Spain.

Sp. 10. Lead-arth. Bleyerde, Wern. is divided into two
fub-ipecies; 1, the cohcrent; and 2, the friable. 1. The coherent, or indurated, named Verbärstec bleierde by Werner, and Le plomb endurci by Brochant, is of a yellowifh or greenifh-grey colour. It is fomatimes of a fmoky-grey, and lometimes of a li,ht brownih-red. It occurs in mafs. Internally it is glimmering, pafling into gliftening, and its luftre is refinous. Its fracture is fine-grained, uneven, paffing into fine fplintery and earthy, alfo into flat conchoidal. It is opaque, or, at moft, fightly tranflucent on the edges. It gives a brownih Atreak, is loft, palfing into friable, not britile, but inclining to fectile, and heavy. It is eafily reduced before the blowpipe, effervefces with acids, and becomes black with fulphuret of ammonia. It does not appear to have been hitherto analyfed, but is fuppofed to be in intimate combination with white lead ore, alumine, and lime. It occurs with the other ores of lead, and is ufually accompanied by iron pyrites, malachite, and quartz. The yellow varieties are found in Derbythire, in fome parts of Germany, at La Croix in France, and at Nertichink in Siberia. The other varieties are to be met with at Wan-lock-head, in the Lead-hills in Scotland, in Saxony, Silefia, Poland, \&c. 2. Friable lead-earlh. Zerreibliche bleierde, Werner. Le plomb terreux friable, Brochant, is of a yel-lowifh-grey, approaching to fulphur-yellow. It occurs friable; fometimes mafive and diffeminated. It is compofed of dull dufty particles, which are more or lefs cohering, and foil a little. It has a roush feel, and is heavy. It occurs on the furface, or in the hoilows of other minerals, and is ufually accompanied with lead-glance, and other ores of lead, and is found at Wanlock-head, and the Leadhills of Scotland, at Zellerfeld in the Hartz, near Freyberg, in the electorate of Saxony, in the mountains of Cracow, Poland, at La Croix in France, and at Berefowfkoi in Siberia. It is in fome inftances obferved pafling into folid lead-earth, and is probably formed by the decompofition of lead-glance, as it is frequently met with as a cruft upon it.
Sp. 11. Another ipecies is denominated a triple fulphuret of lead. Its colour is dark-grey inclining to black. It occurs cryftallized. Its primitive figure is a rectangular tetrahedral prifm, befides which it prefents the following varieties. I. The primitive cryftal with folid angles replaced by triangular planes. 2. The fame with lateral edges replaced by rectangular planes. 3. The fame terminated by a very low and deeply truncated tetrahedral pyramid. 4. Four prifms with deeply truncated dibedral fummits joined together at their bafes, forming a rectangular crofs. The crytals are large and middle-fized, with a fplendent metallic luttre both externally and internally. Its fracture is coarfe-grained and uneven. It is brittle and eafily frangible. It leaves a faint black trace when rubbed on paper. Specific gravity 5.8 nearly. When fuddenly heated before the blowpipe it crackles and fplits; but if gradually heated it melts, and on cooling forms a giobule of a dull metallic grey colour. According to an analyfis made by Mr. Hatchett, it confiifts of

It is found in a mine at Huel-Boys in Cornwall.

The exiftence of native lead, which has been maintained by feveral mineralogitts, is extremely doubtful. What has been regarded as a native oxyd of the metal, appears to be rather an earthy carbonate.

Aflay and Analyfis of Leal Orcs.-The mont common lead ore, galena, is very eafily analyfed, fince it is in general compofed of fulphur and lead only. Thofe ores in which the lead is combined with other metals, fuch as filver, copper, antirrony, bifmuth, or arfenic, are attended with more difficulty in their analyfis. If the analyfis be made with a view to fmelt the ore, it will be proper to make the affay in the dry, as well as the humid way. The latter will not only give the proportion of lead, but its other conflituents, by which the fmelter is directed to ufe the molt proper fluxes. When, however, the analyfis is made for publication, it fhould be made by the humid procefs only, and with the greateft accuracy.

The common galena may be analyfed by diffolving 100 grains in dilute nitric acid: the lead will be diffolved, and the refiduum will be fulphur, which may be feparated by walhing. The folution of lead may now be treated with fulphat of foda. The lead will be precipitated, with the fulphuric acid in the ftate of fulphat of lead. The precipitate being collected, and dried at the temperature of 212, mult he weighed, allowing for every 100 grains of the fulphat 69.85 of lead. The lead may be precipitated from the nitric acid, in the metallic, by means of a plate of zinc. The metallic lead will adhere to the plate, and may be fcraped off and fqueezed into lumps, after being wafhed in clean water. The lead obtained by this procefs is fuppofed to contain a fmall portion of the zinc. It will, therefore, be proper to digeft the metallic precipitate, for a fhort time, in very dilate fulphuric acid, and then wafh the lead with warm diftilled water.

A feccimen of galena containing filex was analyfed by Vauquelin.

By flowly roafting a portion of this ore, he found it loft 12 per cent. of fulphur. Another portion was treated with dilute nitric acid, which diffolved the lead. The refiduun was heated to rednefs, by which the fulphur was volatilized, leaving behind 16.76 of fulphur. To the folution in nitric acid was now added fulphat of foda, when the lead was precipitated in the flate of fulphat. He obtained 63.1 per cent. of lead, allowing rco of fulphat to contain 75.72 of metallic lead. He then faturated the liquor with ammoniac, which threw down 3.3 per cens. of oxyd of iron, and obtained from the remaining liquor, by carbonat of putafh, 3 per cent. of carbonat of lime.
A fpecmen of lead ore from Cornwall, confifting of lead, filphur, antimony, and copper, was analyfed by Mr. Hatchet.

To 200 grains of the ore, in a matrafs, he added $20 z$. of muriatic acid. While the mixture was heated, he added, from-time to time, fmall quantities of nitric acid, juft to keep up an effervefcence, till the metals were oxydated and diffolvec. After being gently heated for an hour, the folution was complete, and of a green colour, owing to the prefence of the copper. The fulphur was feparated and floated on the liguid, which being collected was digelted in muriatic acid. When dricd it weighed 34 grains.

The above folution, and the muriatic acid in which the fulphur was digefted, were mixed together, and diluted with fix pints of diftilled water. The mixture became turbid and milky, and on being filtered while hot, the pure oxyd of antimony was left on the filter, which being wafhed with more boiling water, was dried, and found to weigh $\sigma_{3}$ grains.

When the liquid, which had paffed through the filter, including the wafhings, was cold, fome muriat of lead was depofited in cryltals, owing to the fparing folubility of that
falt. The whole was evaporated to a fmall quantity of liquid, fufficient to hold the copper in folution. This liquid, being feparated from the folid muriat of lead, contained a fmall portion of that falt. A few drops of fulphuric acid being added, however, feparated it in the flate of fulphat of lead. The mafs of muriat of lead left by cvaporation, was now re-diffolved in boiling water, and decompofed by fulphat of foda. The fulphat of lead here formed was added to that produced from the feparated liquid, which, on being wafhed and dried on a fand bath, weighed 120.2 grains. The green liquid containing the rentainder of the mineral was now faturated with ammonia and an excefs added, which rediffolved the oxyd of copper, forming a vivid blue folution. A quantity of oxyd of iron now fubfided, which, when feparated, weighed 2.4 grains.

The folution of copper was now evaporated nearly to drynefs, and boiled with pure potafh, when the black oxyd of copper was left at the bottom of the veffel, which being wafhed, feparated, and dried, weighed 32 grains.

In this analyfis the fulphur is the only fubfance feparated in a ftate of purity. The 63 grains of oxyd of antimony, allowing it to contain 23.08 per cent. of oxygen, would afford 48.46 of antimony. The 520.2 grains of fulphat of lead, allowing 70.9 to the 100 , will give 85.22 of metallic lead. The 32 grains of oxyd of copper, reckoning the black oxyd of that metal to contain 25 in the 100 , will yield 24 grains. If we reckon the 2.4 grains of iron at 1.2 of metal, the analy fis will fand as follows, when reduced to 100.

| Sulphur | - | - | - | 17 |
| :---: | :---: | :---: | :---: | :---: |
| Antimony | - | - | - | 24.46 |
| Lead | - | - | 6 | 42.61 |
| Copper | - | - | - | 12 |
| Iron | - | - | - | 1.2 |
| Lofs |  |  |  | 97.27 |
|  | - | - | - | 2.73 |
|  |  |  |  | 100 |

If filver had been a conflituent of the ore, the above procefs would have been a little varied. In the firft operation the ore would have been diffolved in dilute nitric acid, the antimony would bave been in part diflolved, and left at the bottom of the veffel in the tlate of ishite oxyd. When the fulphur and the antimony, by dilution with water, are feparated, muriatic acid muft be added. The lead will be in part, and the filver entirely precipitated. The muriat of lead may be feparated, by boiling water, from the muriat of filver. The weight of filver may be rated at 77.52 in the 100 of muriat. The other metals may be feparated as in the laft procefs. Arfeniated lead ore requires a itill different treatment. It was analyfed by Vanquelin as follows: 100 parts of ore were roafted for half an hour, occafionally adding a little tallow, which ferved to reduce the arfenic and facilitate its efcape. By this treatment it loft $3^{8}$ parts, which was prefumed to be oxyd of arfenic ; the remaining mafs was boiled with ftrong muriatic acid for an hour. A quantity of oxymuriatic acid efcaped, the liquid afumed a red colour, and white needle-formed cryftals of muriat of lead were depolited. The lead by this mears was converted into a meriat, which being diffolved in boiling water, and treated with fulphat of foda, affords fulphat of lead. This precipitate, being feparated and dried, weighed 25 parts, which gave 20.2. of lead, allowing 80.8 to the 100 of 1.1 phat. The liquid thus freed from lead being treated with pure ammonia, afforded a precipitate equal to 39 grains, confifting of oxyds of iron and arfenic. The circumttancs of oxymuriatic acid being given out, when the oxyd of lead was di-

## L. E A D.

gefted with muriatic, induced Vauquelin to conclude that it was in a ftate of peroxyd.
In this account the latt part of the procefs appears incomplete, in the circumftance of the oxyds of arfenic and iron being mixed together. The former of thefe may be feparated, boiling the two in nitromuriatic acid, which will convert the oxyd of arfenic into arfenic acid, and which may be feparated by walhing.
Carbonat of lead was analyfed by Klaproth by the following procefs. He introduced 100 grains of this ore into 200 grains of nitric acid, and diluted it with 300 of water. The carbonic acid efcaped in the form of gas, making a lofs of weight equal to 16 grains. Into this folution was fufpended a cylinder of zinc. In 24 hours the lead was precipitated in the metallic ftate, which weighed 77 grains, equal to 82 of oxyd.
Sulphat of lead has been analyfed by the fame chemift : roo grains of the ore were firft roatted at a red heat, and loft two grains, fuppofed to be water. The remainder was then heated to rednefs in a platina crucible, with 400 grains of carbonat of potafh. By this treatment a yellow reddifh mafs was obtained, which, on being digefted in water and filtered, afforded 72 grains of oxyd of lead. This was next diffolved in nitric acid, leaving a refiduum of one grain of oxyd of iron. A cylinder of zinc was introduced into the folution, which precipitated the lead in the metallic form, in quantity equal to $66 \frac{1}{2}$ grains.
The alkaline matter which paffed through the filter contained the fulphuric acid of the fulphat of lead, with excefs of alkali ; this excefs was faturated with nitric acid, and the liquid acetat of barytes was added, which caufed a precipitation of 73 grains of fulphat of barytes: this he allows to contain 25 grains of real fulphuric acid. Hence the refult is

| Oxyd of lead | 72 |
| :--- | ---: |
| Sulphuric acid | 25 |
| Oxyd of iron | 1 |
| Lofs by roafting | 2 |

## 100

We have alfo the analyfis of phofphat of lead by the fame ingenious experimenter.
One hundred grains of this native falt were diffolved in dilute nitri acid; into this folution nitrat of filver was dropped till it ceafed to precipitate : the infoluble fubftance, which was muriat of filver, weighed II grains, indicating 1.7 grains of muriatic acid. Sulphuric acid was now added to precipitate the lead. The fulphat of lead weighed 106 grains, which contained $7^{8.4}$ of oxyd of lead. The
excef3 excer( of fulphuric acid was feparated by adding nitrat of barytes, and then nearly neutralized with ammunia. On adding pitated, contad, 82 grains of phofphat of lead were preciwas now containing 18.37 of phofphoric acid : muriatic acid The dry mafs was digefted with alcohol, which diffolved the muriat of iron, the prefence of which was detected by pruffiat of potafh, and was found equal to $\frac{1}{\mathbf{T} 5}$ th of a grain of the oxyd.

Molybdat of lead was analyfed by Mr. Hatchett. He boiled a quantity of the ore in fulphuric acid, till it would diffolve no more. This formed fulphat of lead, while the molybdic acid was diffolved in the fulphuric acid. The fulphat of lead was boiled with carbonat of foda, and was afterwards wafhed: this appeared to be carbonat of lead. The nitric acid diffolved all but a fmall quantity, which was found to be filex. The lead was next precipitated by fulphuric acid. The folution of the molybdic acid in the ful.

Vot. XX.
phuric acid was diluted with 16 parts of water, and fatu. rated with ammonia; when a little oxyd of iron was precipitated. The folution was now evaporated to drynefs, and a frong heat given to fublime the fulphat of ammonia. The remaining mafs, when boiled with nitric acid to drynefs, afforded molybdic acid of a yellow colour.
Although the analyfis of the different ores may have pointed out general methods for the feparation of lead from other metals, fome hints may, neverthelefs, be neceffary for the analyfis of the alloys of lead. Lead is moit frequently alloyed with tin, filver, antimony, or bifmuth. The alloy of tin and lead may be diffolved in dilute nitric acid. .The lead will be entirely taken up. Moit of the tin will be precipitated in the flate of white oxyd, by the addition of water. If fulphuric acid be now dropped into the folution till the precipitation ceafes, the lead, in a flate of fulphat, will be obtained, while the remaining tin will be diffolved, which may afterwards be precipitated by an alkali. Lead may be feparated from filver, when both thofe bodies ape diffolved in pure nitric acid. The filver may be precipitated in the flate of muriat, by adding muriat of foda. The lead may be afterwards precipitated by fulphuric acid.
To feparate lead from bifmuth, diffolve the alloy in nitric acid, then add a large quantity of water, which will precipitate the greatelt part of the bifmuth in the ftate of white oxyd. The lead mult then be precipitated by fulphat of foda, and the remainder of the bifmuth by potah.

The feparation of lead from antimony may be performed by the fame procefs ufed for feparating tin.
It may be here noticed, that in all cafes where fulphur is prefent in the ore or fubftance to be analyfed, if the nitric acid be employed, it muft be very dilute, otherwife the fulphur will combine with its oxygen, forming fulphuric acid. In order to know when this takes place, the folution mult be telted with nitrat of barytes. If, however, lead be prefent, it will combine with the fulphuric acid as it is formed, and fall to the botiom of the veffel.
Reduation of the Ores, or fmelling of Lead.-Two proceffes are employed for the fmelting of lead, the one by means of a blaft furnace, called an ore-hearth, and the other by means of a reverberatory furnace. The latter is ufed throughout Derbyfhire and North Wales, and is undoubtedly the beft, where coal is not very fcarce. In the former of thefe methods the ore and the fuel are mixed together, and expofed to the blaft. The heat diffipates the fulphuret, the ore being the common fulphuret of lead or galena. A portion of the lead is oxydated, which facilitates the vitrification of the earthy parts of the ore, and of the fuel. Thefe together conititute the flag or fcoria. The metallic lead falls into the lower part of the hearth, and is defended from the oxygen of the blaft by the fcoria, which is fluid upon its furface. The liquid lead is let off from time to time, always retaining a portion for the fcorix to float upon. When the whole of the lead is to be drawn off, the blaft muit be flopped, and fome lime thrown upon the liquid fcoria, which renders it concrete, while the lead, being flill liquid, can be run off.

The reverberatory furnace employed for fmelting lead is made on the fame plan with thofe commonly ufed for puddling iron, differing in fize, and a few other particulars. The fire is made at one end, and the flame plays over the hearth, entering an oblique chimney at the end, which terlength of the hearth, from the place where the fire en-
ters, to the the fire conftitutes the throat of two feet of this length next the fame is four feet, and its depth about fix inches ; 3 I

## LEAD.

length of the fire-place is four feet, equal to the width of the throat; its width two fect, and depth three feet, from the grate up to the throat of the furnace. The rett of the hearth is a concave furface, nine feet long, four and a half feet wide at the throat of the furnace, feven feet four inches wide at the dillance of two feet from the throat, feven feet two inches in the middle of the hearth, five fect cleven inches at two feet diltance from the chimney, and two fect ten where the flame enters the chimney at two apcrtures, each ten inches §quare. Thefe apertures terminate in the oblique part of the chimney, the fection of which is 16 inches fquare, which communicates with the main chimney, the fection of which is twenty inches fquare, fuppofing a ftraight horizontal line, drawn from the lower plane of the throat of the chimney to the oppofite fide of the furnace; the lowelt part of the concave hearth, which is in the middle of this cavity, is nineteen inches below this line, the roof of the furnace being feventeen inches above the fame line: the reft of the hearth is co:sormably concave.

On each fide of the furnace are three openings, each about ten inches fquare, provided with iron doors, to be removed as occation may require. They are arranged at equal diftances from each other, between the commencement of the hollow hearth and the entrance into the chimney. The lower part of thefe apertures is on a level with the horizontal line above alluded to, being for the purpofe of ttirring and raking the ore, \&c. Befides the larger openings there are twa fmall apertures, one below the large middle opening, and nearly on a level with the bottom of the furnace; the other under that next to the chimney, at fome diftance above the firft aperture. The firft is a taphole for the lead, and the fecond for the fcoria. The ore is introduced by a veffel in the flape of a hopper, placed in the roof of the furnace.

Previous to the ore being fmelted, it requires to be feparated as much as poffible from the earthy matter in which it is imbedded. Although galena, which is the ore ufed for fmelting, is moft frequently accompanied by fulphat of barytes, fluats and carbonat of lime, it is found to exift in cryitallized diftinct maffes, and can be feparated from it by mechanical ineans to a tolerable extent. The whole of the ore, with the earthy matter, is pounded to a certain degree with hammers, and is chiefly performed by women. In fome places, however, it is broken down by paffing it through iron rollers preffed together by great weights. After the ore has been thus reduced, the earthy matter is feparated by wafhing. The powder to be wafhed is introduced into a fieve or riddle, and placed in a large tub full of water. By a certain motion given to the riddle, the lighter or earthy parts are thrown over the edge of the fame, while the galena, by its greater fpecific gravity, is retained. This procefs requires great dexterity, which can be acquired by experience only. There are, however, fome impurities which cannot be feparated by this mechanical procefs, and are generally fmelted with the ore. Thefe are blind, or blackjack, called by the fmelter mock ore; pyrites, or fulphuret of iron, named Brazil by the workmen. When the ore abounds much with thefe fubtlances, the procefs of fmelting is more dificult, and requires an extra affiftance of flux to reduce $1 t$.

In the ftate above defcribed, the ore is introduced at the hopper in the middie of the roof of the furnace, and fpread upon the concave hearth, to expofe it as much to the flame as poffible, in order to facilitate the efcape of the fulphur. This thould be performed by a long continued heat which is not virlent, in order that the fulphuret itfelf may not be volatilized, an effect which, more or lefs, always takes place. The moment the fulphur has left the bead it begins
to combine with oxygen. The oxyd of lead, thus formed, combines with the earthy matter, which it renders fo fulible as to become liquid upon the fulphur of the melted lead, and defends it from the future action of the oxygen. At this flage of the procefs the fire is raifed to feparate as quickly as poffible the melted lead from the liquid fcoria. The latter is now let of at the upper tap hole, leaving a fmall portion ftill upon the lead to preferve it from the air. The fire at this period is lowercd, and a quantity of coalflack thrown in upon the melted mafs. This ferses as well to facilitate the cooling, and to caufe the reduction of fome oxyd of lead, which alfo tends to tiffen the melted fcoria. This lait effect, however, is not produced fufficiently, till a quantity of powdered lime is thrown into the furnace. By this treatment the remaining fcoria becomes concrete, and is then broken to pieces and pufhed to the oppofite fide by means of a rake, and taken out of the furnace at the different operings on the fame lide. The liquid lead is now let out, at its proper aperture, into a large iron pan, or ciftern, from whicnce it is laded into moulds to caft into pigs. The furnace is now ready to be charged again. When the ore abounds with much impurity, the oxyd of lead is not fufficient to give the proper degree of liquidity to the fcoria. In this cafe a certain quantity of fluat of lime is added, which has the property of forming a very fufible compound with fulphat of barytes, an ingredient very common in the ore.
This flux has been ufed from time immemorial for the fame purpofe, and has no doubt derived its name from its properties as a flux. See Fluat of Lime.

The concrete fcoria, which is taken out of the furnace, is found to contain fome lead, independent of that in the thate of oxyd, and chemically combined. This is generally lodged in the cavities of the fpongy mafs. Thele maffes are taken to a kind of blaft furrace, called a flag-hearth. By this fecond fufion of the fcoria, the lead drops through the liquid mafs into the lower part of the hearth, where it is not acted upon by the blaft, and from thence is let off and caft into pigs. This lead is faid to be of an inferior quality. Some ores of lead contain filver. The great affinity of lead for that metal is fuch, that the whole of it is found in the lead (fee Silver), from whence it is afterwards feparated.

Pbyfical and chemical Properties of Lead.-Lead is of a bluinh-white colour, when made as bright as poffible. This is belt effected by fcraping and burnifing. This polifh it foon lofes by expofure to air.
Its foftnefs is fuch, that a cylinder of one inch in diameter and twelve inches long, may be eafily bent by a perfon of ordinary ftrength: indeed, it is the molt foft and flexible of the metals. Its fpecific gravity, according to Brifon, is 11.3523 , and io far from being increafed by the hammer, agreeably to that change in other metals by the fame effect, Mufchenbroeck afferts that it is diminifhed. It may be here proper to obferve, that thofe metals which are fufceptible of the moft perfect cryltallization, will undergo the greateft condenfation by the hammer, provided the metal be fufficiently malleable. Hence we find this property the mott confpicuous in brafs, and in blittered fteel. See Metal.
Lead, in cormon with its foftnefs, is the leaft elaftic of the metals; ro which alfo may be attributed its little tenacity. Its hardnef's is increafed by hammering, and its temacity in a proportionate degree.
Lead is exceedingly malleable, which connected with its exceflive foftnefs, admits of its being rolled into thin Gheets with little power. Its tenacity, according to. Dr.

## LEAD.

Thomfon, is fuch, that a wire of $\frac{1}{12.6}$ of an inch will fupport only 18.4 pounds. Lead fufes at about $600^{\circ}$ of Fahrenheit, and if raifed to a much higher temperature, will be found to diminifh by cvaporation. If lead be melted and poured into an iron mould, it will be found to concrete on the fides next the mould, while the middle part will be liquid for a fhort time. If this liquid part be poured off, or let out at a plug-hole at the bottom, the interior furface of the folid part will exhibit a crytalline form. The eryftals will be larger and more diftinct as the cooling is flower.

Lead is much employed in the axts, particularly for buildings and citterns. For the former of thefe purpofes it has many advartages. It is eafily worked into any fhape on account of its great foftnefs, and is fufficiently malleable to fold two edges over each other, fo as make it watertight without ioldering. This is a very great advantage, fince, when the pieces are foldered together, the expantion and contraction, by a change of temperature, foon breaks it to pieces.

Although it is at prefent in general ufe for water-cifterns, pumps, and pipes for conveying water, ferious objections have been made to it by different philofophers, particularly Dr. Lambe, fo far as regards its effects on the human economy.

A very ingenious paper was fome time ago publifhed by Morveau, in which he fhews that the water expofed to the leaden veffels would frequently be pernicious, if fome fulphuric acid were not prefent, which never fails to precipitate lead from any of its folutions. Thus we fee that lead is the leaft objectionable for mineral waters containing the fulphuric acid, which is very general in almoft all fprings.

Great mifchief has been produced by the ufe of lead in dairies; although we lament to fay that this practice is ftill followed up to a certain extent. If the milk runs into the flightet acidity, we muft expect fome lead to be diffolved, and its probable confequences if taken into the flomach.

The difeafe called the Devonflhire colic, was proved by fir George Baker, in feveral excellent papers written by him, and publifhed in the Philofophical Tranfactions of that time, to be occafioned by lead diffolved in the cyder, and which had been furnihed from the cyder prefles, which were lined with that metal; but was in confequence of this valuable difcovery laid afide.

We have heard of a fimilar difeafe in the Weft Indies, acquired by drinking new rum. The rum was found to contain lead, which had been taken from the leaden worm ufed for the condenfation of the firituous vapour. What, however, is very fingular, the rum loft its deleterious property by keeping about twelve months. This fact was not explained at the time, but it has lately been cleared up by a feries of experiments made by the writer of this article. The new ruin is generally put into oak cafks, from whence the liqour extracts a quantity of tan and gallic acid. Thefe fubltances combine with the lead in folution, forming a perfeatly infoluble fubltance, which falls to the bottom of the cafk. Thefe facts fhew that lead fhould not be ufed in any fituation where fermented liquors are prefent, fince in every ftage of their exiftence, they contain more or lefs acetic acid. And it mult not be forgotten, that all diftilled fpirits will contain the fame acid, from the circumftance of its being volatile and coming over with the fpirit.

We have, however, abundant fatisfaction in knowing that the exiltence of lead and gallic acid in fpirits, wines, or
other fermented liquors, are incompatible: and that all liquors which have been kept in oak cafks for a certain time muft be freed from lead. If we find the prefence of gallic acid by a folution of iron, we may pronounce fuch liquid free from lead.

Thefe obfervations, which may appear out of place, are given with a view 'to guide thofe who may be making or ufing veffels of lead, which, under fome circumftances, are attended with deplorable confequences.
Alloys of Lead formed wwith other Metals.- One part of tin and two of lead form an alloy, fufible at about $35^{\circ}$ of Fahrenheit, and ufed by tinmen and others under the name of foft folder. See Solmer.

Lead forms an imperfect alloy with copper. The metal ufed for common brafs-cocks is an alloy of thefe two metals. The lead is fo imperfectly combined with the copper, that when a piece of the metal is expofed to a certain heat, the lead feparates from the copper in bright globules of the former.

The alloy of antimony with lead is not uncommon. Sixteen of lead and one of antimony form the printers' type metal.

Lead cafily combines with mercury, forming an amalgam. This is effected either by putting mercury into melted lead, or by putting lead, in fmall particles, to the mercury. See Amalgam.

An alloy of filver and lead is eafily formed. Indeed lead is frequently ufed to take filver from plated iron, which is afterwards got from the lead by cupellation.

We are indebted to Mr. Hatchett for fome valuable facts relative to the alloys of lead and gold. One part of lead to eleven of gold forms a very brittle alloy, having a fracture of a pale brown colour, deflitute of metallic luftre.

The alloys in any proportion have the fingular property of being of lefs \{pecific gravity than the mean, the very contrary of which is obferved in moft other compounds of metals. The following is a table given by Mr. Hatchett exhibiting thefe facts.

| Metals. | Grains. | Specific Gravity of Alloy. | Bulk before Eninon. | $\begin{aligned} & \text { I. ulk } \\ & \text { a tier } \\ & \text { Union. } \end{aligned}$ | $\begin{aligned} & \text { Expan- } \\ & \text { fion. } \end{aligned}$ |

## LEAD.

When lead is expoled to the air for a little time, it foon appears of different colours, not unlike the prifmatic colours. By a longer expofure, affitted with moilture, it becomes covered with a white powder. This is the oxyd of lead combined with carbonic acid. This change is facilitated by heat, and ftill more by the fumes of acetic acid or vinegar. It is by this means that the white lead of commerce is made, of which we thall treat hereafter.

If melted lead be expefed to the oxygen of the atmofphere, a greyith-jellow powder begins to form upon the furface. By keeping it expofed for lome time, the powder becomes more yellow. In this fate it is called mafficot, or yellow oxyd of lead. It contains about 6.88 of oxygen.

This oxyd is made, in the large way, in a furnace not unlike a baker's oven. The middle of the hearth contains a recefs for expoling the melted lead. On each fide, and a little below the level of the hearth, is a fire, the flame of which paffes flowly over the hearth, giving fufficient heat to keep the lead melted, and paffes up a chimney near the mouth of the furnace. As foon as the lead is melted, a perfon is conflantly employed to agitate it, in order to expofe greater furface to the air. This manual operation is performed by a rake fufpended from a chain, fo that the perpendicular part of the rake dafhes through a portion of the inelted lead, by merely moving it backwards and forwards. By the fame motion, the oxyd which is formed is pufhed away from the furface of the lead, leaving it free to the action of frefh oxygen. This procefs being kept up, the lead is at length converted into a greenifh-yellow powder, mixed with lumps of metallic lead. This powder is ground in a mill and then wafhed, by which means the metallic lead is feparated, and the powder becomes of a more bright yellow. The green colour was therefore owing to a mixture of the blue particles of lead, mixed with the yellow oxyd. The yellow oxyd here produced is called mafficot; which fee.

This oxyd appears capable of combining with more oxygen by a lecond expofure. For this purpofe the yellow powder, after being wafhed and dried, is returned into the furnace above-mentioned, or one of limilar conftruction, kept for this fecond procefs only. The heat is kept uniform but not great, and the oxyd raked about to expofe as much fur$\mathrm{face}_{\text {as }}$ as poffible. It gradually changes colour, and ultinuately affumes a fplendid red. In this fate it is called minium ; which fee. Although during this procefs the oxyd appears gradually to pafs through all the fhades of orange colour from yellow to red, the two latter can only be conlidered as diftinct oxyds, the intermediate tints being mixtures of the two.

If we confider the yellow as the firft or protoxyd, the red will be the fecond, and the brown, yet to be treated of, the third and the peroxyd. Proult, however, has given fome reafon to believe that the yellow is not the firft. The oxyd which is precipitated from the nitric acid when heated to rednefs, to drive off the water and carbonic acid, is found to be the yellow oxyd in a very perfect ftate. The author above-mentioned informs us, that if cryftals of the common nitrat of lead be boiled with fome pieces of metallic lead, fcaly yellow cryftals are formed. This falt, decompofed by potafh, affords an oxyd which Prouft fuppofes to contain lefs oxygen than the yellow. Dr. Thomfon repeated his experiment ; he found the oxyd not to differ in appearance from the yellow, and makes it to confitt of lead, 91.5 lead, and 85 oxygen. This appears to be rather lefs oxygen than, according to his own analy tis, is contained in the yellow. But there is reafon to believc, that in Dr. Thomfon's analyfis of the yellow oxyd, the oxygen is rated too high. The
fame oxyd, according to Bucholz, is compofed of 100 lead and eight of oxygen, equal to 7.4 per cent. This analyfis appears to have been made under fuch circumftances as to entitle it to much credit. From the average of three analyfes of the yellow oxyd, obtained from acetat of lead, the writer of this article made the ox ygen 7.4 per cent. Hence we have abundant reafon to doubt the exittence of an oxyd below the yellow oxyd, fince it appears, from Dr. Thomfon's own account, that the oxyd, faid to confift of lefs oxygen than the yellow, contains 8.5 per cent., being 1.1 more than Bucholz makes the yellow oxyd.

If nitric acid in fufficient quantity be added to the red oxyd of lead, nearly the whole will be diffolved; $\frac{1}{1,}$ th of the oxyd will remain at the bottom of the veffel, which, when collected and dried, is of a dark brown colour, and is called the brown oxyd of lead. The following procefs is given by Vauquelin: Mix a quantity of the red oxyd of lead with water in a Woulff's apparatus, and let the oxymuriatic acid gas pafs through the mixture. The oxyd gradually becomes of a deeper colour, and is at laft diffolved. From this folution the brown oxyd is precipitated by potafh. From every 100 parts of the red oxyd 68 of the brown may be obtained. .

This oxyd is of a flea-brown colour, having no fmell or tafte. It is infoluble in any of the acids. It converts the muriatic into oxymuriatic acid, by giving up a portion of its oxygen. When rubbed brifkly in a mortar with powdered fulphur, the fulphur inflames, producing a ftrong fmell of fulphurous acid. According to the analyfis of Prouft, this oxyd is compored of 79 lead and 21 oxygen. Dr. Thomfon makes it 81.6 lead and 18.4 oxygen.

It appears highly probable that we have only three oxyds of lead, namely, the yellow, the red, and the brown. The firft, according to Prouft, contains 9 per cent.; Thomfon, 10.3; Bucholz, 7.4 ; the writer of this article, 7.4: the average of all thefe being 8.5 . The red oxyd, by Dr . Thomfon's analyfis, contains 12 per cent.: the brown, according to Prouft, contains in the 1c0, 25 oxygen; Dr. Thomion makes 18.4: the mean of thefe is 19.7.

Agreeable to the average refults of thefe different analyfes, we cannot help being forcibly ftruck with the beauty of Mr. Dalton's hypothefis relative to the limited proportions with which bodies combine. He makes the atom of lead to weigh 95, or to be 95 times heavier than an atom of hydrogen; the atom of oxygen being 7 times heavier. In referring to the doctrine advanced by this ingenious chemift, it will be feen that he holds the neceffity of bodies combining atom to atom, or in fome multiple of the fame; as, 2 to 1,3 to $1, \& c$. The firft oxyd of lead, agreeably to the above data, muft be 1 to 1 , or 9 ; to 7 ; the fecond oxyd, 95 to 14 ; and the third, 95 to 21 . Hence thefe proportions reduced to 100 , will fland as follows: $\frac{95+7}{7}$ $=\frac{100^{\circ}}{6.86}$, or 6.86 in the 100 , for the firft oxyd. Then, for the fecond, $\frac{95+14}{14}=\frac{100}{12.84}$, or 12.84 in the 100. Lafly, for the third or peroxyd, $\frac{95+21}{21}=\frac{100}{18.1}$, or 18.1 in the 100 . The proportions by analyfis give, for the firlt, 8.5; fecond, 12 ; and the third, 19.7: by theory, $6.86,12.88_{4}$, and 18.1 .

The fecond and third oxyds of lead give out oxygen, by expofure to heat in a crucible, and are reduced to the flate of the firft oxyd. If the heat be raifed a little above red-
nefs, the yelldw oxyd fufes into a glafs, in which ftate it is called the vitreous oxyd of lead. It becomes fo exceedingly fluid, as to run through the common crucibles. In this fate it has the power of oxydating, and combining with the oxyds of all the metals which are oxydatic, by expofure to air with heat: and hence is employed to great advantage in the cupellation of the nobler metals. Sec Silver.

When lead is oxydated at a high temperature, fuch as that employed in the feparation of filver from lead, the yellow oxyd fufes as it is formed, and is blown from the furface of the lead by bellows. In this ftate it is called litbarge; which fee. It confifts of the yellow oxyd, united to a portion of carbonic acid. For this part we are indebted to Dr. Thomfon.

Lead combines with fulphur and phofphorus.
Sulphuret of lead may be formed by projecting fulphur into melted lead, or by ftratifying thin plates of the metal with the fulphur. The compound is very brittle, of a dark grey colour. It may be cryttallized by flow cooling; under which form it exhibits a brilliant fracture, refembling the native fulphuret, or galena. This fulphuret, according to Dr. Thomfon, confilts of 86 lead and 14 fulphur. According to Dalton's hypothefis, it confifts of one atom of lead to one of fulphur: the former atom being 95, and the latter 13 , will give $\frac{95+13}{13}=\frac{100}{12}$, or 12 to 100; which agrees with feveral other analyfes very nearly.

Lead appears capable of combining with a fecond dofe of fulphur, conltituting a compound, which is more brilliant, and of a lighter colour. It may be eafily diftinguifhed from the common kind, by its burning in the flame of a candle.

It is called the fuper-fulphuret of lead, and, according to Dalton's hypothefis, muft confift of one atom of lead and two atems of fulphur, which would give $\frac{95+2 \times 13}{26}=$ $\frac{100}{21.5}$, or 21.5 per cent. Dr. Thomfon makes it 25 per cent. It is to this chemift we are indebted for our knowledge of this fubftance.
$P h o / p h u r e t$ of lead may be formed by mixing together equal parts of filings of lead and phofphoric glafs; the misture being fufed in a crucible. It is of a filvery blueih-white colour. It poffeffes flight malleability, and may be cut with a knife. It is compofed of 88 lead and 12 of phofphorus. Dalton makes the atom of phofphorus to weigh 9 : hence this compound of $I$ to $I$ will give $\frac{95+9}{9}=\frac{100}{8.6}$.

Salts of Lead.-Moft of the acids combine with the yellow oxyd of lead, forming peculiar compounds. By far the greatef proportion of thefe compounds is infoluble in water. All thofe which are foluble have a fweetifh tafte, attended with a roughnefs which it leaves on the tongue, fimilar to that of red port, and fome other wines. This property has caufed it to be ufed for the villainous purpofe of mixing with four wine, which does not only take up the acid, but adds a roughnefs and fweet vinous flavour, exceeding impofing upon the palate. Some have fufpended bags of fhot in the calks of wine; others have added common white lead.

Mankind are now fo well acquainted with the different tefts for lead, that it is very feldom found in thofe liquors. Water impregnated with fulphuretted bydrogen gas will
inflantly turn wine muddy and black, which contains lead. If a folution of iron be dropped into wine, and it turns black, the prefence of gallic is indicated: and from what we before obfezved, the exiftence of lead and that acid are incompatible in the fame liquid.

Sulpbat of Lecad.-Lcad is fearcely acted upon by the ful. phuric acid, in the cold. If the acid be boiled with the lead, fumes of fulphurous acid will be given out, and 2 portion of the lead oxydated, which combines with the acid, forming a whitifh palty compound. If the acid be in excefs, and the mafs wafhed in water, the fubftance becomes divided into two portions, namely, the fulphat of lead, which is inioluble, and the fuperfulphat, which is flightly foluble, and will be depofited in cryttals.

It is from the circumflance of the infolubility of the fulphat of lead, that the metal can be ufed with fuch advantage for the lead houfes, ufed in making fulphuric acid, and for making veffels which have to hold this acid. The fulphat which firft forms upon the furface defends the lead not only from the action of this acid, but from any other folvent of this pernicious metal. Sulphat of lead may be beft formed by adding fulphat of foda to the acetat of nitrat of lead. A denfe white precipitate is formed, which is fulphat of lead. This falt is produced in great abundance by the calico-printers, in making acetat alumine, with alum and acetat of lead. It forms an excellent paint with oil, for ftandiug the action of acids.

Kirwan gives the proportion of this falt at 23.37 acid, 75 acid yellow oxyd, 1.63 water in the 100; Bucholz, 24.72 acid, 75.28 oxyd; and Klaproth, 26.5 acid, and 73.5 oxyd : the mean of thefe is 24.86 acid, and 75.14 bafe. Calculated by Dalton's theory, the atom of fulphuric acid weighs 34 : therefore, $\frac{95+7}{34}+34=\frac{100}{25}$; or, the acid is 25 in the 100 : then, $100-25=75$ the bafe.

Sulphite of Lead.-The fulphurous acid has no action upon lead : but it combines with the yellow oxyd, forming an infoluble compound, having no remarkable properties. When expofed to a red heat, the acid is difengaged, in the form of gas.

When the fulphurous acid is added to the red oxyd of lead, the acid takes oxygen from the oxyd, reducing it to the ftate of yellow oxyd. The acid is converted into the fulphuric, and combines with the oxyd, forming the ful: phat of lead.
Dr. Thomfon gives the proportions at

Nitrat of Lead. - When the nitric acid is a little diluted, it acts with confiderable rapidity upon lead. If it be a little affifted by heat, the whole will become fpeedily diffolved, forming nitrat of lead: This confills of the yellow oxyd of the metal united to a portion of the acid. If the folution be evaporated, it affords cryltals of tin, in fix-fided pyramids of a dilvery white colour. This falt diffolves in $7 \frac{\pi}{2}$ of boiling water. When the cryftals are heated, they undergo a night detonation: the fame takes place when they are rubbed with fulphur in a hot mortar.

## According

## I. E A D.

Aocording to experiments of Dr. 'Thomfon, this falt confits of,

$$
66 \text { oxyd, }
$$

$$
3+\text { acid. }
$$

When the cryftals of the laft falt are boilcd with metallic lead, yellow fcaly cryitals are formed, condtituting, according to Dr. Thomfon, a fubnitrat, contifting of

> 81.5 oxyd,
> IS.5 acid,

## 100

By Dalton's theory the weight of an atom of nitric acid is 19 : in mof of the nitrats he fuppofes one atom of the bafe to unite with two atums of acid. The nitrat of lead, already defcribed, fhould, according to the above analyfis, confint of at lealt two atoms of acid to one of bafe, for $\frac{102+2 \times 19}{3^{8}}=\frac{100}{27.14}=27.14$ of acid, and 72.86 of bafe.

The acid here falls confiderably fhort of that in the ana1 yfis of Dr. Thomfon. The latter falt, which we have called the fubnitrat, fhould have one atom leifs of acid.
Hence $\frac{95+7+19}{19}=\frac{100}{15.7}$, which gives 15.7 acid, and $8_{+3} 3$ of oxyd $=100$.

Muriat of Lead.-Muriatie acid has a very feeble action on lead, but it readily diffolves the yellow oxyd, forming the muriat of lead. This falt may be alfo formed by adding muriat of foda to nitrat of lead. The precipitate which is formed is the falt in quettion. It diffolves in 22 parts of cold water. This is the fact only when no excefs of this acid, or when no other acid is prefent; fince the falt is foluble in molt acids to a greater extent than in water. When this falt is mixed with the fulphat of lead, it may be feparated from it by its folubility in the acetic acid. Muriat of lead is much more foluble in hot than in cold water. Hence, when a faturated hot folution is fuffered to cool, the falt is depofited in cryttals of a filvery-white colour. When heated they readily melt, and on cooling affume a flight tranfparency, from which it has been called Plumbum corneum.

On the application of greater heat fome of the falt eraporates in a white fmoke, leaving behind a fubftance, which is faid to be a fubmuriat of lead.

The compofition of muriat of lead is, according to Klaproth,

$$
\begin{aligned}
& \text { Acid } 13.5 \\
& \text { Oxyd } 86.5 \\
& \frac{100}{}
\end{aligned}
$$

By Kirwan's account,
$\begin{array}{ll}\text { Acid } & 17 \\ \text { Oxyd } & 83\end{array}$
100
The weight of the atom of muriatic acid being 22 , we Shall have by Dalton's theory $\frac{95+7+22}{22}=\frac{100}{17.74}$, by
which we have 17.74 acid, and 82.26 of oxyd, which comes very near to Kirwan. When the muriatic acid is poured on the red oxyd of lead, the lead gives up a part of its oxygen to the muriatic acid, conflituting the oxymuriatic acid. The muriatic acid then unites with the yellow oxyd thus formed, while the oxygen is returned to the remaining red oxyd, forming the brown oxyd.

The fubltance above-mentioned, faid to be a fubmuriat, appears rather ambiguous, and may, perhaps, be a mere mixture of the common muriat with the yellow oxyd of lead. There is, however, one argument in favour of its being a proper compound. It is faid not to be foluble in water, or that the excefs of oxyd is attached to the muriat, fo as to prevent its being feparated by the affinity of the water for the falt.

The common way of forming this fubftance is by adding to the muriat of foda a much larger quantity of litharge than would be neceffary to faturate the acid of the falt. We are indebted to Vauquelin for the beft account of the nature of this anomalous decompofition. At the fame time the muriat of lead is decompofed by foda. We have the fact before our eyes, that an oxyd of lead will completely decompofe the muriat of foda. If we flate the experiment of Vauquelin we fhall be better able to give an opinion. To one part of muriat of foda he added feven of litharge in fine powder, with as much water as made the mixture of the conliftency of thin foup. This was frequently ftirred for feveral hours. The litharge gradually loft its colour, and ultimately became white. It increafed in bulk, and fo much water was abforbed as to make it neceflary to add more. At the end of four days the chemical action had entirely fubfided, when the refult was examined. The liquid part, when feparated by the filtre, had a ftrong tafte of foda, with a tafte of muriat of lead, but no muriat of foda was prefent. The liquid afforded cryitals of carbonat of foda by evaporation. The fubllance from which the liquor had been feparated, when wafhed and dried, was of a dirty white colour, and was found to have increafed in weight $\frac{1}{8}$ th of the whole oxyd employed. When this fubttance was heated to a certain degree it affumed a fine yellow colour, by which it loft $\frac{1}{4}$ th of its weight. This was, perhaps, carbonic acid and water.

Some cauftic foda was added to a part of this fubftance, which changed its colour to that of a dirty yellow, and the refiduum was found to be a mafs of cryftals of muriat of lead. By the teft of an alkaline hydro-fulphuret, the foda appeared to hold a great quantity of the oxyd of lead in folution.

The one part of muriat of foda, ufed in this experiment, confifted of .44 of acid, and .56 of foda. The .44 acid would combine with 2.4 of the yellow oxyd to form 3.84 of muriat of lead, leaving $7-2.4=4.6$ of oxyd of lead. This is fuppofing the true muriat to be formed; but if a fubmuriat were formed, it muft confilt of more than one atom of lead united to one of acid. Suppofe it one of acid to two of oxyd, then $.44+2 \times 2.4=.4+4.8=$ 5.2 of fubmuriat, Atill there would be free oxyd left. But the author tells us that the yellow fubllance was infoluble in water, or that the water would not take the muriat from the excefs of oxyd, although the nitric acid, as well as the foda, was capable of that effect. If there were no free oxyd when two atoms of lead were to one of acid, Iet us fuppofe them three to one, we fhall then have $.44+3 \times 3.4=$ $.44 \times 7.2=7.64$ of a fecond fubmuriat. If, therefore, we are to rely upon the fact, that the muriat of lead could not be diffolved, leaving the excefs of oxyd, we mult regard

## I. E A D.

this yellow fubtance as a legitimate compound. If the contrary be the cafe, we mult regard it as a mixture of the true nuriat mixed with the yellow oxyd of lead. This fubitance has been manufactured under a patent by Mr . Turner, of Newealtle-upon-Tyne, and is deemed a valuable pigment for painting.

Phorpbat of Lead.-The phofphoric acid does not act upon lead in the cold, and but very feebly by heat. The refult of this action is the formation of an infoluble compound, which is the phofphat of lead.

This fait may be more eafily formed by adding together the folutions of phofphat of foda and the nitrat, or acetat of lead. A denfe white powder fubfides, which is the falt in queftion. This falt is infoluble in water, but it diffolves readily in nitric, and alfo, when affitted by heat, in the muriatic acid. On the latter folution cooling, cry fals of muriat of lead are depofited; a proof that a partial decompofition takes place. It is alfo decompofed by the fulphuric acid, by the affitance of heat.

When this fait is heated it melts, and on cooling affumes a cryffalline appearance.

It is from this falt that phofphorus is generally obtained; for when it is expofed to a great heat, in an earthen retort, with charcoal, both the lead and the phofphorus lofe their oxygen, the latter being diltilled over.

Mr. Dalton makes the atom of phofphoric acid to weigh 23 , then $\frac{95+7+23}{23}=\frac{100}{18.4}$; fo that this falt, from thefe data, confifts of 18.4 of acid, and 88.6 of oxyd, which is very near the proportions of the native falt.

Carbonat of Lead-Carbonic acid does not act upon lead, but it combines with the yellow oxyd of lead, forming an infoluble white powder, which is manufactured under the name of zwhite lead.

This falt may be formed by adding a carbonat of potafh to the acetat or nitrat of lead. The ptecipitate, being wathed and dried, is fnowy-white powder, appearing to the ese well calculated to make a much finer white paint than that made in the common way. Although the carbonat formed by precipitation is, no doubt, chemically the fame with the manufactured, their difference, in point of denfity, is very remarkable. The proportions of the conftituents of this falt are, according to Bergman, 16 acid, 84 oxyd; to Chenevix, 15 aci ${ }^{2}$, 85 oxyd; Proult, 16.15 acid, 83.85 oxyd ; and Klaproth, 16.33 acid, $\$ 3.67$ oxyd in the 100 .

The manufacture of white lead has been known long before any idea was entertained of its compofition, cr the theory of the procefs; and it is rather fingular that no more improvement has been made in the common procefs, which has long appeared to chemitts as clumfy and uneconomical.

The procefs confifts in expofing thin theets of lead to the fumes of vinegar at a certain temperature. The lead is calt into fheets about two feet long, five or fix inches broad, and about $\frac{1}{8}$ th of an inch thick. Thefe are coiled up, rather fpirally, into a cylindrical thape, about five or fix inches diameter. The yinegar is. placed in the bottom of earthen pots, which are different in fize at different manufactures; fome holding three pints and others five or fix. 'there is a ledge round the pot, in the infide, about an inch deep, for the purpofe of fupporting the cylindric coil of lead, which ftands upon it like a chimney. The pots thus fitted, with the lead and vinegar, are arranged in rows, upon a flratum of horfe-litter, or, what is now ufed as being cheaper, the refufe bark of tanners. The ends of all whe
cylinders of lead are covered with a plate of the fame metal, to confine the whole as much as pofible to the action of the vapour. The pots thus placed are covered over with liteer or bark, and a new Itratum of pota arranced in a fimilar way over them. Several tons of lead are fometimes expofed in this manner at one time. 'The heat arifing from the fermentation of the vegetable or animal matter keeps up a certain temperature, by which the vinegar is flowly evaporated. The vapour oxydates the lead, and the oxyd combines with carbonic acid. This latter fubllance was formerly thought to be furnifhed by the fermenting fubftance in which the pots wele imbedded : it is now, however, known, that the vinegar is decompofed, and furnithes the carbonic acid. White-lead works are at prefent carried on, both on the continent aod in this country, in which the heat is furnifhed by artilicial means only; and of cour'e the carbonic acid can come from no other fource than that of the vinegar.
After the lead has been expofed to the vapour of the vinegar for about fix weeks or two months, the pots are withdrawn, and the coils of lead are found corroded to a confiderable thicknefs. The white carbonat thus formed is very brittle and very hard. The fleets are now paffed through rollers for the purpofe of breaking the white lead from the uncorroded metallic lead. The powder is now taken to a pair of ftones, and ground in a manner fimilar to corn. After this it is levigated to get it of the greatelt poffible finenefs, and it is then gradually dried in ftoves for the purpofe.

Denfity and whitenefs are the molt valuable properties of white lead. Thefe properties do not depend upon the proportions of its elements, but upon the mechanical treatment. The denfity in all probability will be greater, as it has been longer forming, by the action of the vinegar being flower. Some of the pieces of white lead, as they are feparated from the fheet, are much harder than others, even in the fame bed. This hardnefs and denfity are fometimes fo great as to render the picces fonorous. In this ilate it is the molt valuable. Hence the whitelt and denfeft picces are felected. for making the beautiful fubfance called flake rubitte.

The value of white lead is eafily afcertained by the painters, from the quantity of oil required to give it proper confiltency. The greater the proportion of lead to the oil, the greater is faid to be the body of the paint, and the greater will be its whitenefs. The carbonat of lead made by precipitation, when in a dry ftate, is much whiter than the beft white lead, made in the common way. If, however, equal weights of the two be mixed with oil to make them fit for painting, the precipitated fpecimen will be found to take a much greater quantity of oil than the other, and its whitenefs much diminifhed. The common white lead will have loit fo little of its whitenefs, that the contraft will be very ftrikingly in favour of the latter. This fact is exceedingly apparent, on mixing together tranfparent media of different denfities. The whitenels of fnow depends upon the mixture of fmall particles of ice with air; for when the fame are mixed with water, the whitenefs difappears. All colourlefs traufparent bodies become white on being reduced to powder. This is obferved in pounded glafs and in falts which lofe their water of cryitallization. Whitenefs may therefore be faid to arife from a confufed refraction of light, rather than from reflection. See Ligilt.

Fluat of Lead. - Fluoric acid docs not oxydate lead ; but it is capable of combining with the yellow oxyd, forming this falt, which is an infoluble compound. It may be
formed

## LEAD.

formed better by adding the fluat of ammonia to nitrat or acetat of lead, the fluat of lead falling down in a ttate of powder.

Borat of Lead-Boracic acid does not act upon lead. This falt, however, may be formed by adding a folution of borat of foda to nitrat of lead. The borat of lead will be precipitated in the form of an infoluble white powder. This falt, from a vitreous !fate which the acid is capable of affuming, melts into a colourlefs glafs before the blowpipe.
Acetat of Lead.-Acetic acid has little or no action upon lead when the metal is immerfed in it; but the furncs of the acid in contact with air is capable of oxydating lead, as we have fhewn in the manufacture of white lead. The oxyd thus formed is eafily taken up by the acetic acid, forming a foluble compound of a fweetifh and aftringent tafte. If the folution be evaporated, an excefs of the acid being prefent, the falt is obtained in needle-formed cryltals, and of the luftre of fatin. It diffolves in about four times its weight of water at $60^{\circ}$. It is fingular that this falt is decompofed by the carbonic acid. It is from this circumftance that we always find it decompofed, in fome degree, by diffolving it in water, which generally contains more or lefs of that fubftance. This falt is ufed in medicine, uncryftallized, under the name of Goulard's extract.
The acetat of lead is an article of extenfive manufacture in England, France, and Holland.

Common diftilled vinegar is firlt faturated with the yellow oxyd of lead, which is fometimes from the carbonat or white lead, and frequently from litharge: the latter, however, is the cheapeft procefs. The folution fhould have a little excefs of acid, elfe it does not form the real falt. By flow evaporation this folution cryftallizes, in which itate it is ufed in abundance in the arts, particularly by the calico printers, for the purpofe of getting the acetat of alumine, by double decompofition with alum.

The analyfis of this falt, according to Dr. Thomfon, is 26 Acid 58 Yellow oxyd
16 Water

## 100

From the combinations of the acetic acid, the earths, and alkalies, it appears that the weight of its atom is about 36 . We have hence $\frac{102+36}{3^{6}}=\frac{100}{26}$, which gives 26 of acid and 74 of yellow oxyd $=100$.

Subacetat of Lead-When the laft falt is boiled for fome time with the yellow oxyd of lead, a peculiar falt is formed, confifting of two atoms of oxyd, and one of acid. It is lefs foluble in water than the acetat. It was firlt noticed by Thenard, to whom we are indebted for the following analyfis:

$$
\begin{aligned}
17 & \text { Acid } \\
78 & \text { Oxyd } \\
4 & \text { Water. }
\end{aligned}
$$

If it confilts of two atoms of bafe to one of acid, its analyfis, according to the data in the acetat, will be $\frac{2 \times 102+36}{3^{6}}$ $=\frac{100}{15}$, which gives 15 acid, and $850 x y d=100$.

Oxalat of Lead.-This falt is formed by diffolving the oxyd of lead in oxalic acid. In all probahility there are two falts of this fpecies. That given by Dr. Thomfon is formed
with the fecond oxyd, and an excefs of acid, and is the fiiperacetat. According to Bergman's analyfis it contains

| 41.2 | Acid <br> 58.8 <br> Red oxyd |
| :--- | :--- |
|  |  |

The weight of the atom of oxalic acid appears to be 39 , and an atom of the oxyd in this falt 95 lead +14 oxygen $=109$, therefore fuppofing it the fuper falt $\frac{95+14+39 \times 2}{39 \times 3}$ $=\frac{100}{41.7}$, which gives 41.7 acid, and 58.3 red oxyd $=$ 100.

The proper oxalat of lead may, no doubt, be formed by an alkaline oxalat being added to the nitrat of lead, the falt being precipitated in a ftate of infoluble powder. From the above data it ought to confift of 27.7 and 72.3 yellow oxyd.

Tartrat of Lead.-The tartaric acid does not act upon lead: but this falt may be formed by adding an alkaline tartrat to the acetat, or nitrat of lead. The tartrat of lead falls down in the form of white powder. Dr. Thomfon gives the analyfis of this falt at 37.44 acid, and 62.56 yellow oxyd.

Citrat of Lead. -This is an infoluble compound, formed by adding an alkaline citrat to a foluble falt of lead.

Malat of Lead.-Malic acid has no action on lead ; but the acid combines with the oxyd, forming a compound infoluble in water, but foluble in acetic acid. Cyder, which contains an abundance of malic acid, would never contain lead, but from the prefence of acetic acid. If acetat of lead be dropped into cyder, a copious precipitate falls down, but if free acetic acid be added, the precipitate is diffolved.

Arfeniat of Lead. The arfenic acid is capable of oxydating lead, and then combines with its oxyd, forming arfeniat of lead, which is sompletely an infoluble compound. It may alfo be formed by adding the arfeniat of potafh to a foluble falt of lead. From the analyfis of Chenevix it' confifts of 33 acid, 63 yellow oxyd, and 4 of water. According to Thenard, it is compoled of 35.7 acid, and 64.3 of oxyd. See the native arfeniat of lead under the mineralogical part of this article.
: Molybdat of Lead.-The artificial falt of this fpecies has been little examined. See the native falt.
Chromat of Lead. - This falt may be formed by adding an alkaline chromat to a foluble falt of lead. The falt is precipitated in the form of powder of a reddifh-yellow colour. It is foluble in potalh and foda, from which it may be precipitated without changing its properties. It is foluble in nitric acid, but it is decompofed by the muriatic and fulphuric acids. See naiive falt.

The cther feecies of the falts of lead are not of importance.

The alkalies and fome of the earths diffolve the oxyd of lead.
Potafh and foda, when pure, diffolve the greatelt proportion. By expofure to the air, however, the carbonic acid of the atmorphere combines with the oxyd of lead, as well as the potafh. The lead is precipitated in a fate of carbonat.

Thefe alkaline folutions of lead have the property of ftaining hair, wool, and horn. The tint commences with a light fawn colour, and ultimately becomes of a deep and beautiful reddifh-brown. Thefe colours are not permanent, being quickly faded by expofure to the light and the air.

Lime water, and probably folutions of barytes and fronrian, diffolve the oxyd of lead, but in fmaller quantity. A liquid formed by boiling lime and litharge in water, has alfo the property, of ftaining wool, but the colour is fomewhat different to that given by the alkaline folution. The brown colour has lefs of the red and more of the ycllow tint. A compofition of common pearl-afh, red lead, and quicl lime, is ufed to give horn the appearance of tortoife fhell. In effect, this compofition is a folution of the oxyd of lead in potafh.

Lead, as we have already feen in the preceding part of this article, is much ufed in building, particularly for covering, gutters, pipes, and in glafs windows. For which ufes, it is either calt inso theets in a mould, or milled; which latt, fome have pretended, is the leaft ferviceable, not only on account of its thinnefs, but alfo becaufe it is fo excecdingly ftretched in milling, and rendered fo porous and fpongy, that when it comes to lie in the hot fin, it is apt to fhrink and crack $*$ ad confequently will not keep out the water. Others have preferred the milled lead, or flatted metal, to the caft, becaufe it is more equal, fmooth, and folid.

The lead ufed by glaziers is fritt calt into fiender rods, twelve or fourtcen inches long, called canes ; and thefe, being afterwards drawn through their vice, come to have a groove on either fide for the panes of glafs; and this they call turned lead.

The method of paling or foldering lead for fitting on of imboffed figures, \&c. is by placing the part whereon the figure is to be paled horizontal, and ftrewing on it fome pulverized refin; under this they place a chafing-difh of coals till fuch time as the refin becomes reddifh, and rifes in pimples; they apply the figure, and rub fome foft folder into the jointing ; when this is done, the figure will be paled on, and as firm as if it had been caft on.

Lead is much ufed in varnihes and painting with oil, both as a colour and as a dryer. It is alfo ufed in the preparations of enamels and of porcelain as a flux, and makes the bafis of the.glazing of almof all pottery wares; and by means of lead the moft perfect metals are refined and aflayed.

Lead, in Medicine. This metal is celebrated by fome chemical writers for its great medical virtues; but after all it feems to be a metal which ought to be given internally with the greateit caution, and to be rather calculated for outward application. Its ore is fo poifonous, that the fleam arifing from the furnaces where it is worked, infects the grads of all the neighbouring places, and kills the animals which feed on it. The poifonous quality of this ore is fuch, that the people who live in the countries where it is dug, and near the places where it is walhed, can keep neither dog nor cat, nor any kind of fowl, but all die in a fhort time, and it has been known that a little houfe, in which lead ore had been kept for fome time, though afterwards made very clean, and bedded with fern, infected calves which were put into it, fo that all died in a very thort time; and it is a too melancholy obfervation, that children often die ftrangely and fuddenly about thefe places. Philofophical Collections, $\mathrm{N}^{2}$ 2. p. 6.

Its beft preparation is faccharum faturni, or the fuper-acetate of lead; which, though capable of doing great. good in hxmorrhages, and fome other cafes, is apt, however, to bring on colics of fo violent a kind, thát the remedy often proves worle than the difeafe.

The internal ufe of lead is dangerous, on account of the colics and palfies that are occafioned by it. Culinary veffels, lined with a mixture of tin and lead, which is the ufual Vol. XX.
timning, are apt to communicate to acid foods pernicious qualitics, and require to be ufed with great precaution. The fame thing has been alfo faid of liquors kept in glazed ware and of cyder made in veffels, where lead is ufed, and of wines adulterated with litharge, \&c. See the article Lead, fupra, and Colica Pictonum.
M. Navier has lately difcovered that the liver of fulphur, and particularly liver of fulphur of Mars, is an excellent antidote againft the poifon of lead; and he advifes patients labouring under its pernicious effects to drink larecly of acidulated liquors, to make afterwards the liver of fulphur the principal part of the cure, and to finif the cure with gentle purgatives.
The Dutch have been charged with correting the more offenfive expreffed oils, as that of rape feed, fo as to fubllitute them for oil olive or oil of alnoonds, by impregnating them with lead: in order to detect this abufe, nix a little of the fufpected oil with a folution of orpiment made in limewater: on fhaking them together, and fuffering them to reft, the oil, if it has any faturnine taint, will appear of an orange-red colour: if pure, of a palc yellowifh. The lead is difcovered in wines by the fame fulphureous folution, which changes the colour of wines impregrated with this metal to a brownifh red or a blackifh hue. However, the various preparations of lead are applied externally with fafety and great benefit, on account of its fedative, drying, and repellent qualities. The visegar and fugar of lead, and all the ointments and plafters which contain cerufs, minium, or litharge, eminently poffefs thefe qualities. See the following articles and references.

For the laws relating to lead, and the ftealing of it, fee ${ }_{27} \mathrm{Ed}$. III. ftat. 2. c. 1. 3. 15. 38 Edw. III. itat. I. c. 6. 4 Geo. II. c. 32. 29 Geo. II. c. 30 . See Larceny.

Lead, Black. See Plumbago.
Black lead in fine powder may be readily mixed with melted fulphur, and though the compound remains fluid enough to be poured into moulds, it looks nearly like the coarler forts of black lead itfelf. This was probably the method by which prince Rupert is faid to have made black lead run like a metal in á mould, fo as to ferve for black lead again. Birch's Hift. Royal Soc. vol. iii.

The German black-lead pencils, and thofe which are hawked about among us, are prepared in this manner : their melting or foftening, when held in a candle, or applied to a red-hot iron, and yielding a blueifh flame, with a ftrong fmell like that of brimitone, difcovers their compofition. Pencils of this kind are hard and brittie, and cut or fcratch the paper or wood inftead of marking them. The true Englifh pencils are formed of black lead alone, fawed into hlips, which are fitted into a groove made of the foftef wood, as cedar, and another 1lip of wood glued over them. Thefe pencils, however, are of different quality, on account of different forts of the mineral being fraudulently joined together in oue pencil, the fore-part being commonly pretty good, and the relt of an inferior kind. To avoid thefe inconveniences, fome take the finer pieces of black lead itfelf, which they faw into gips, and fix for ufe in port-crayons. Lewis's Commerce of Arts, p. 328.

By our laws, entering mines of black lead, with intent to fleal it, is made felony. See 25 Geo . II. c. 10. See Larceny.

Lead, for the manufalure of, fee Plumbery.
There are various preparations of lead, ferving for various purpofes, fome of which are now difufed, and others, under one form and name, or another, ftill continued.

Lead,

## LEA

Lead, Balfam of, an extemal medicine, formerly famed for its effects in old and flarp ulcers. It is made by mixing one ounce of fugar of lead with two of oil of turpentine, and ferting this mixture in a fand-heat till the falt is diffolved. By this means the oil acquires a red colour, and is called ballum of lead.

Lead, Burnt, plumbum ufum, is a chemical preparation ufed in mediciue, made of plates of lead, melted in a pot with fulphur, and reduced by fire into a brown powder.

Lead continued in fufion and firred, fo that frefh furfaces may be expofed to the air, will gradually change into a powdery dujky-coloured calx, bearing this name.

Burnt lead is only intended for exterual ufe. It has the farne virtues afcribed to it, in ointments and plafers, as litharge or minium. Mixed into an unguent with lard alone, it makes a grood ointment for the piles.

Lead, Bufter of, is a kind of liquid, anguent made of vinegar and lead, incorporated with rofeate oil, and commended for the curc of tetters. It is calied butyoum faturni.

Leid, Calcined, or calja of leud. Sce Calx, Cerusse, Grass of Leid, Lithaikee, Massicot, Mixium, Scc. and Alloys of Le.id, fupra.

Leid, Cafing of. Sec Castive.
Lead, Cerate of Super-acetate, Ceratum plumbi Juper-acetatis, the "Unguentum ceruflx acetatx" of P. L. I7 87 , is prepared in the following manner: Take of fuper-acetate of lead two drachms, white was, two ounces, and olive oil, half a pint. Diffolve the wax in feven fluid-ounces of oil, then gradially add to it the fuper-acetate of lead, feparately rubbed down with the remaining oil, and ftir the mixture with a wooden fice, until the whole has united.

Leid, Compound cerate of. See Ceratum lithargyri acetati comprofitum.

Lead, Cobefion of. See Conesion.
Lead $D_{u f /}$ is a preparation ufed by the potters; made by throwing charcoal duft into meted lead, and ftirring them a long time together: to feparate the coal again, they only walh it in water, and dry it afrefl. Its ufe is, to give a varnith and g!ofs to their works.

Lead, Entrat of, or Saturn, is prepared by fimmering together as many pounds of the litharge of gold as quarts of vinegar for an hour and a quarter, and often Atirring them; then taking it from the fire, and as foon as it is cool enough, pouring the clear liquor into bottles to be kept for ufe. If this liquor be made into the common ronfiftence of an extract, it muft boil yet Inger after its feparation from the mafs, and will acquire a reddifh colour. This is Goulard's extract (fee Lead, fupra), and the bafis of all his preparations of lead. It evidently differs in no refpect from fugar of lead, and vinegar of litharge, but in the degree of concentration. The only circumftance in which the extract feems to bave the advantage of fugar of Iead, appears to be in the greater quantity of the acetous acid contained in it, which proves an excellent affiftant in many cafes, and the fugar of lead, when once cryftallized, cannot be brought back to that flate of folution in vinegar in which it was before; yet where a large quantity of watery menftruum is added, as in Mr. Goulard's faturnine water, it is as well to make a Colution of fugar of lead in the water, and add the vinegar afterwards, as to mix them both together in the form of extract. Aikin's Obf. on the external Ufe of Preparations of Lead, \&c. p. 2. See Vinegar of Lead.

In the London Pharmacopeia of 1587 , this was denominated "A qua lithargyri acetati ;" and in the lait edition it is called "Liquor plumbi acetatis," or "folution of acetate
of lead," and it is directed to be prepared by mixing two pounds four ounces of fcmisvitreous oxyd of lead, with a gallon of acetic acid, and boiling down to fix pints, conftantly ttirring ; then fetting it by, that the feculencies may fublide, and Atraining. T'his is a denfe liquor, of a decep brown colour, and confifte of a faturated folution of fubace tate of lead. It was reltored in the laft Pharmacopeia, in confequence of the celcbrity it had obtained under the name of "Goulard's Extract." The "Aqua lithargyri acetati compofita" of P. L. 1787, called in the laft edition "Liquor plumbi acetatis dilus," or "diluted folution of acetate of lead," is prepared by mixing a drachm of folution of acetate of lead, a pint of ditilled water, and a flui-drachm of weak fopirit. When this mixture is made, even with diftilled water, fome precipitation takes place; and when, as is more common, ordinary water, containing any muriates or fulphates, is ufed, this is much more abundant from double decompofition, and gives the liquor a milky al surance when diffufed through it. To this it owes its common name of " white wafh."

## Liad, Glufs of. See Glass of Leid.

Lead, Magiflcry of, is the calx cf lead purified and fubtilized. It is made of lead diffolved in aquafortis, pouring filtrated falt water into it ; whence refults a magittery extremely white, which, when foftened by feveral lotions, is mixed with pomatums for the face and complexion.

Lead Mime. See Mining.
Lead, Mock, a name given to a glittering fubflance found in lead-mincs. See Galeva inariis, and Blinde.

Lead, Native. See Lead, fupra.
Lead, Ointments of, Preparalions of. See Unguent.
Lead Pluficr. See Emplastrum Commune.
Lead Pipes, Manufadure of. The common method ufed for making lead pipes, confilts in cafting the lead upon a fmooth fteel mandril placed in a mould, alfo of metal, to form the outfide. Thefe pieces are about 18 inches long. They are afterwards joined together by a procefs, called lining.

A very great improvement has been made in the manufacture of lead pipes, by drawing them in a manner fimilar to wirc. The lead to form the pipe is caft upun a mandril of the diameter of the infide the pipe, but of fuch a thicknefs as to equal the whole pipe in weight: it is then faftened upon one end of a cylindric fteel mandril, and the lead is pulled through different lized holes, till the pipe is of fufficient length and thicknefs. Thefe pipes can be drawn to the length of eight or ten feet. The power required, however, is very great, which is one objection to the method. They are alfo liable to flaws; for, if the cafting happen to be imperfect, the imperfection is much increafed and extended by the procefs of drawing.

This manufacture has been much improved by paffing the lead upon the mandril, through grooved rollers of different fizes, following each other in fucceffion. The power required is much lefs than that required for drawing; and the pipes are faid to be fuperior in other refpects. For a more particular account of this manufacture, fee Lead Pipes.

Lead, Red, a preparation of mineral lead calcined and rubified; ufed by painters, potters, and furgeons. See Minium, and Oxyds of Lead.
Lead, Salt or Sugar of, Saccbarum faturni, Superactat plumbi, fuperacetate of lead, is an effential falt of vinegar, incurporated with the proper fubltance of lead, or cerufs, diffolved in fpirit of vinegar. See Saccharum Satarni, and Lead, fupra.

L.EAF, (Forium, ) in Botany and $V_{\text {Cegetable Pby }}$ Pology, is a very general, but not univerial, organ of the herbage of plants, of the firlt importance to vegetable life, being, in many refpects, equivalent to the lungs of animals ; infomuch that when leaves are not prefent in the ufual manner, their office muft be performed by fome other part, which is generally the ftem. Leaves are, for the molt part, remarkable for their expanded form, in which the object of nature is manifeefly to prefent to the atmofphere as wide an extent of furface as poffible, greatly exceeding that of all the relt of the plant. "Their colour is almoft univerfally green, their internal fubftance pulpy and vafcular, fometimes very fucculent, and their upper and under furfaces co:nmonly differ in hue, as well as in kind or degree of roughnefs." "-How great a fhare the foliage of plants has in contributing to the beauty of the vegetable creation, and how widely their utility extends, in the fuftenance they afford to the animal world, not to mention their various economical ufes to mankind, is too evident to require much illuftration. Their curious functions, and their real ufe to the plant that bears them, has not till lately been properly underftood or juftly appreciated. The feience of chemitry was, for a long time, nut fufficiently advanced to throw the neceffary light upon this fubject; and even at the prefent day, when applied to the phyfiology of vegetables, it ferves rather to help us to conceive what may be, than to fee clearly what is, tranfacted in their apparently fimple, but truly elaborate, frame.

The firt who attempted to reafon upon the ufes and properties of leaves was Ciefalpinus, who merely fuppofed them a fort of clothing, or protection againt cold and heat. It is not worth flaying to confider his reafons, for an opinion which is fo inadequate to what it attempts to explain. This writer conceived the foliage of plants to originate from, or to be, a fort of expanf:on of, their bark.

Some of the firit practical obfervations that tended to difcover the importance of leaves, were made by garaeners, who, in their various treatment of fruit trees, foon found they were not to be flripped of their leaves, even partially, without caution, and that a general injury to the foliage infallibly ruined the fruit. They have alfo univerfally difovered, by experience alone, the benefit of removing decayed or fickly leaves; which all books on gardening have never failed to inculcate, though the writers had no idea of the manner in which the morbid fecretions, or corrupted exBalations, of thefe bodics, might injure the growing plant.-

When goofeberyy or currant but es are frijped of their leaves, by the voracity of caterpillars, every body knows that the fruit, if not withered, is altogether tallelefs. Wecansoot even yet precifely trace the mode in which this efie:t is produced, except that it evidently arifes from a great, thoun ha only temporary, injury to the conllitution of the flarub, caufed by its premature and violent defoliation. This injury is repaired in the enfuing feafon.

The abforption and perfiration of leaves could not lorg remain unobferved, when thefe organs came to be confidercid with any philofophical attenticn. Hales and Lonnct have made the beft and molt numerous experiments on this par: of their functions. The former firft fuggefted the probability of their imbiling air as well as morlure, nur did the action of light upon them efape his fagacity, though fubfequent chemitis and phyfiologifs have purfued thefe fubjects to a far greater cxtent. The fading of a leafy branclo of any plant when gathered, and its revival, on leeng immerfed fer a hort time in water, fufficiently evince the perfpiring and abforbing powers of the leaves. Dr. Hales firit determined the proportion of each, by experiments upon the great annual fun-flower, the vine, cabbage, \&c. On the firit-mentioned plant he beftowed particular attention, and the refult of his obfervation was that it loft Ilb .14 oz . weight in the courfe of a hot dry day, but in a dry night only three ounces. In a rainy night it gained two or three eunces by abforption. The furface of the plant, compared with that of its roots being, as nearly as could be calculated, in the proportion of five to two, it follows that the daily abforption by the roots was fo much the more rapid, in order to make up the lo ${ }_{5}$ which took place in the herbage. Compared with the ordinary isfenlible perfpiration of the human body, that of the fun-flower is only as 15 to 50 ; but the bulk or folid fubfance of the two being extremely different, that of the vegetable being fo much nore dilated, it is found the latter peripires feventeen times more, in proportion to its bulk, than the human frame. Thefe proportions of courfe vary in both, according to circumitances. If the roots be plentifully watered, the evaporation by the leaves is the more copious and rapid. In newly removed plants, the abforption by the leaves fupplies the wants of the vegetable body, till the roots have fhot forth new fibres in order to obtain moifture in that their natural direction ; but if fuch plants be immoderately watered, they may be killed by excefs of moitture; for no evaporation by the leaves being allowed to take place, nothing can be imbibed by the roots. In certain ftates of the atmolphere, fom plants are frequently exhaufted by their perfpiration, and droop for want of adequate fupplies from the roots; while others are fo conftructed as to perfipire very flowly, and therefore to refift the effects of the molt parching air or furn Such is the nature of the cuticle that covers the leaves of aloes, and of all fucculent plants, more or lefs, that althougk they perfpire but very flowly, they abforb with great facility. Hence thefe plants are admirably adapted to thrive on diy funny rocks, or amid the molt arid fandy deierts of $A$ frica, where the rare and trivial fupplies of rain which fall to their lot during a great part of the year, prove fufficient for their fupport in confequence of their tardy perfiriation. It is truly worthy of remark, that this differcnce, in their powers of imbibing and giving out moiture, exilts only while thefe plants retain their living principle. When killed by the application of great heat or cold, their leaves dry as quickly as any bodies of equal thicknefs. Evergreens are found to perfire much lefs than other fhrubs, while the Ccrnus mafcula, or Comelian clerry, a plant with a thin dry leaf, wast

## LEAT.

found by Du Hamel to perfpire to the amount of twice its whole weight in 24 hours.--See Persphation of Plants.

The bef obfervations on the abforbing power of leaves, and its difference in different plants, have been made by Bonnet, and are recorded in his book entitled Recherches fur l'Ufage des Frailles. By laying good, healthy, full-grown leaves of various herbs or trees upon the furface of water, fome with the upper, and others of the fame fpecies with the under, fide applied to the water, he obferved in which fituation they continued longeft in health and vigour ; and alfo how far different fpecies differed from each other in this refpect. In general, herbaceous plants futained the longett this continual and copious application of wet to their upper furface, while various trees on which the fame experiment was made, decidedly preferred abforption by their under fide.

The abforption and evaporation in the leaves of aquatic plants; whether, like many fpecies of Potumogeton, as well as the Zannichellia, the Chara, and all the fubmerfed Alya, they are entirely under water ; or whether, like the Njmphban, they float on its furface; appear in general to be very rapid; fuch plants, however juicy, drying with great rapidity wh $n$ taken into the air. They are, for the molt part, bighly vafcular, and, no doubt, have an equal faciity in imbibing and in giving ont water.

Although moit leaves are fo formed as to have decidedly an upper and an under furface, the fword-flaped plants (fee Ensates) are an exception. Their foliage is vertical, and has little or no upper furface, except where it embraces the ftem; what is analogons to the under fide of ordinary leaves, being in fact fo circumaltanced in thefe, as to conHitute their whole furface. Other leaves are fo cylindrical, that no difference of fides can be traced. In all thefe the abforbent veffels and the perfipiring ones mult be difperfed alike over the whole expanfion of the leaf; as they are over ftalks, and efpecially over the ftems of plants that have no leaves at all, in which neverthelefs all the known functions of leaves neceffarily take place. This latter is the cafe in the whole genus Stapelia, and in many fpecies of Catus, as well as in feveral rufh-like planits, and thofe fingular productions the Cufcuta and Cafyther.

There are, in a very few inftances, ftrange abersations of configuration in leaves, deftined to the accomplifhment of fome particular purpofe. Thus, thofe of the Dionach, (fee that article, ) bear an appendage like a rat-trap, the toothed lobes of which, when Itimulated, clofe upon each other, and imprifon any infect that may have happened to alight upon them. The leaves of the Sarracenica are tubular, and thofe of the Ncpenthes bear each a tubular appendage with a lid. Thefe are found for the molt part full of water, that feems to be fecreted or poured out by the veffels of the leaf, rather than received, as has commonly been fuppofed of the Sarracizis, from the atmofphere. This water is the refort of infects, who mollly perifh in it, and the materials of their decompoling bodies are fuppofed to minilter to the health of the plant. The Drofere, found in our bogs, entrap infects by the vifcid and irratable hairs of their leaves, apparently for a timilar purpofe.

This leads us to conlider the effects of air and light upon vegetables, through the medium of their foliage, which, in this puint of view, is tranfeendently important.

Grew and Malpighi, independent of each other, but about the fame period, detected, in the leaves of plants, abumdance of velicles full of air, as alfo the fpiral-coated tubes or veffels of the ftems, confidered by their difcoverers,
as well as by fubfequent phyfiologifts till very lately, in the light of air-veffels likewife, becaufe, like the arteries of tho animal frame, they appeared, on diffection, to be empty, or at lcaft not occupied by the fap or juices of the plant: On the detection of thefe veficles, phyfologitts theoretically fuppored leaves to imbibe air, "which the fpiral vef. fels were believed to convey all through the plant, in order that it might act on the fap as it docs on the animal blood. 'The analogy thns underlloed was not correct, becaufe air' is conveyed no futher than the lungs of animals; but without this hypathefis no ufe could be found for the fuppofed longitudinal air-veffels." Now it is proved that thefe longitudinal fpiral-coated tubes do reaily tranfonit the fap from one part of the vegetable frame-to-ancthier, finally conveying it into the leaves, vihere it is acted upon by the air, either of the above-mentioned velicles, or of the atmufphere. The analogy with animal refpiration holds good, therefore, much more correctly than the authors of, the above hypothefis imagined. On this fubject we need not repeat what is faid under the article Circulation of the Sap.

Dr. Hales's experiments with the air-pump, to proye the tranfmifion of air through the vegetable body, are to ba regarded with caution, as merely fhewing that air will pervade their longitudinal vefficls, when a branch is cut, and its vital principle probably in fome degree injured ; at lealt when the natural movement of its fap is by no means going on, nor that fluid remaining in its natural fituation. Air is obtainct in abundance, by means of the air-pump, from every part of the vegetable body, as well as from recently extracted fap; and plants are found to perifh very foon in an exhaufted receiver. Hales rightly remarked, that air is not only taken in by plants very copioully along with their food, but alfo imbibed by their bark, as well as through the furface of their leaves. Yet we cannot follow him when he adds, " efpecially at night, when they are changed from a perfpiring to a ftrongly imbibing itate." Such a difference between night and day feems merely to regard the watery abforption and perfpiration of leaves, the introduction of air, or rather its action upon them, being doubtlefs carried on chiefly in the light, that body having a principal fhare iu the refult. Nor did this efcape the lagacity of Hales, who, after concluding that "one great ufe of leaves is to perform in fome meature the fame office for the fupport of the vegetable life, that the lungs of animals do, for the fupport of the animal life; plants, very probably, drawing through their leaves fome part of their nourihment from the air :" adds two pages further; "and may not light alfo, by freely entering the expanded furfaces of leaves and flowers, contribute much to the ennobling the principles of vegetables?"

Bonnet's experiments and enquiries, refpecting leaves, principally elucidate their abforbing powers, proving them to be " furnifhed with a fyftem of cuticular abforbents, which carry fluids into their fap-veffels, fo, as to enable them, infonie degrie, to difpenfe with fupplies from the root." This philofopher has not improved upon the ideas of Hales, refpecting the effects of air or light upon plants. He does not appear to have had any conception of leaves imbibing. air and giving it out again; till lefs of their effecting any change in 'its properties. He was not aware that the bubbles he oblerved clinging to leaves, whether dead or living, when placed under water, and expofed to a bright fun, were feparated, by the action of light, from the water itfelf; fo that he has no right to be conlidered as the difcoverer of the expiration of plants.

The great Dr. Priefley firlt pointed out a property in

## L E A F.

growing rigetables, of abforbing carbonic acid gas, denominated by him fixed air, by the upper furface of their leaves, and of giving out by their under furface oxygen gas, or pure refpirable air. Dr. Ingenhoufz improved upon this important difcovery, by obferving light to be neceffary to thefe functions, remarking that in the dark leaves give out a bad or carbonic air, and that fruits and flowers almoft invariably give out the laft-mentioned kind of air, at all times, but efpecially in the dark. Aquatic or bor plants, as the Epilobium and Nympbea, were found by there philofophers to excel remarkably in this faculty of purifying air, or of changing it from a carbonic to an oxygenous nature. This operation is, in moll cales, performed very quickly. A vine-lcaf in an ounce phial of carbonic acid gas, that immediately extinguifhed a candle, being fet in the fun, without water, changed it to pure refpirable air in an hour and a half. Dr. Prieflley found fome of the bog-plants to alter even unmixed inflammable air, or hydrogen. Succulent leaves afford molt of the purified air in queltion, becaufe of the abundance of their cellular parenchymatous fub. Itance, in which the chemical operations of leaves are performed, and in which their green colour chielly refides. This colour therefore does not exilt in leaves never expofed to the light, in which confequently no fuch chemical operations ever take place. The fickly white obfervable in that part of celery falks, or of the fprouts of afparagus, indeed of all plants, which is under the furface of the ground, is entirely owing to the abfence of light; for when expofed to light fuch parts become green like the reft of the herbage. It is found that expoling plants to the ation of hydrogen gas will produce the fane green colour, even if they are kept in the dark.
Every perfon attentive to the growth of plants mult have obferved the conflant direction of the upper furface of their leaves towards the light. When the fituation of branches nailed to a wall is altered, and the pofition of their leaves dilturbed, the latter refume their natural poffure in a day or two, and the more fpeedily in proportion to the brightnefs of the weather. It has long been known that Jighta acts beneficially upon the upper furface of leaves, and hurffully upon their under fide; for if the latter be repeatedly turned to the light, or forcibly kept in fuch an unnatural pofition, the leaves grow fickly, black or difcoloured fpots appear about the veins at their backs, and the cuticle Pcalles off. Thus we have feen ths Magnstia grandiflora, whofe rigid leaves do not readily change their pofture, very materially injured, by nailing it to a wall in hot and bright weather. The under furface of its foliage became fpoited, ard the colour of the other fide fickly; the leaves fell prematurely, and the plant was long in recovering its health. One great ufe of footftalks to leaves appears to be to facilitate their turning to the light, and varying their pofition as the fun furfues his courfe; as may be feen in clover and other papilionaceous plants more efpecially. Leaves feparated from their parent branch, and fufpended delicatcly by a fine thread, turn to the light as effectually Is if in their matural fituations. This power, hovever, of turning to the light, is not equally obvious in all leaves. Such as are very mucli folded or plaited, necefiarily prefenting, on that account, about an equal portion of their furface to the fun in every pofition, are often lefs moveable; and this may account perhiaps for the infenfibility obferved by Bonnet in the mallow. Sword.flaped leaves are always vertical, and do not alter their poffition. Thofe of the paplilionaceous tribe are, as wee have already hinted, among the matt fenfible. Light feems, in many inflances, the fole
caufe of their expanfion, for when it is withdrawn, they fold together and droop as if dying ; fuch a ftate of relaxation being very elegartly, and indeed, as it appears, very correctly, termed by Linneus the fleep of plants, on which fubjećt he has left us a curious diftertation in lis Amocnitates Academice, v. 4. p. 333. He there juftly remarks that the general afpect of a lictd, a garden, or a hot-houfe, is wonderfully changed during a fummer's night in Sweden, fo as to puzzle the moft experienced butanitt, owing to a general alteration in the polture of the foliage of plante. Sime fold the two fides of the leaf together; others tarn their leaves upward, fo as to enclofe the flowers, which they thus thelter from 1.0 external dews that min he interfere with theis impregnation; and many prefs their foliage downwards, clofe to the $1 t e m$ or branch, whofe buds they thus perhaps protect from cold. Such movements evince a portion of that irritability, dependent on life, which is more ftrikingly difplayed in the fenfibility of fome leaves to the touch of any extraneous body. Several fpecies of ATimofa, called for that reafon fenfitive plants, as well as a few others of different genera, fold up tleir leaves when any cuncufion is given to the plant. If any of their leaflets be faken or injured, the irritation is communicated to the neighbouring ones, and thence, with accelerated velocity, to the reft, even to other leaves on the lame branch or root. The leares of the Hedyarum gyrais of Bengal are remarkable for a Spon:ancous movement, apparentiy independent of external itimulation. They are ternate, and their fmall lateral leaflets move frequentiy, but irregularly, up and down, inde. pendent of light, requiring only, for the performance of this action, a warm and ftill air. This, like all other movements of leaves, 15 mofl confpicuous in fuch as are young.

In confequence of the obfervations of Prieftley and Ingen. houfz, confirmed, variouny extended, and explained upors the principles of improved chemiltry by fucceeding philofophers, the effects of light, heat, and atmofpheric air upon leaves, and, where thefe are wanting, upon the green ftems of plants, are now, as far as concerns all vegetables in common, tolerably well underftood. It is agreed that in the day-time the parts in queftion imbibe from the atmo. fphere carbonic acid gas, which they decompofe, abforbing the carbon as matter of nourifhment, which is added to the fap, and emitting the oxygen. Plants abforb the fame gas from water, when by the action of light it is feparated from that fluid. Air contaminated with this gas by the burning of a candle, or the brathing of animals, ferves therefore as food for vegetables, who in their tura purify it again, and render it ht for the fupport of animal lite, by the oxygen given out from their leaves under the influence of light. Hence arifes a mutual and effential dependerce of the animal and vegetable kingdoms on cach other, for the difcovery of which, one of the molt curious and beataiful in natural philofophy, we are prircipally indebted to Dr. Priefley, that great name from which far aticifm would gladly tear, if it could, even the laurels of fcience.

The abore view of the functions of leaves exactly coincides with Mr. Kright's theory of vegetation, of which we have given an outline in our article Cruculation of the $S a p$. That gentleman has proved, that rery little alburnum, or new wood, is fecreted when light is kept from the leaves. We are alfo thus enabled to underftand how effential oils may be produced, which, as well as fugar, are known to te compofed of oxygen, hydrogen, and carbon in different pro. portions. The various modifications of mucilage, detected an diftioguifhed in the vegetahle body by modern chemiftry, are perhaps, as more deperdant on the vital principle for

## L E A F.

their formation, more inexplicable by clemical laws. It is perhaps in vain to attempt to explain how any particular fecretion is elaborated. Still lefs can we comprehend how different tribes of plants, growince in the fane foil, even vegetating in the fane ditilled water, flowuld regularly produce, as far as the health of the individuals wader experiment will allow, their own peculiar fecretions, ever prefervang the molt effential qualities of their fecies in this refpect. How the nutritious $\oint_{\text {ap }}$, originally fimilar in thefe different plants, can be fo operated upon, by the very fame agents, in the this and tender ttructure of the different leaves, as to produce fubltances fo totally unlike each other as we meet with in plants, whence their various flavours and qualities originate; all this $\pm$ inexplicable in our prefent Itate of knowledge, thnugh tranfacted every moment before our eyes. The different fecretions in various organs of the fane individual vegetable body; the acrimony of the leaf, the bitter of the bark, the perfume of the bloffom, the fweetnefs and acidity of the fruit; all thefe are no lefs wonderful. We underlland euough indecd to conceive how the relt may ve accompifled, and may congratulate ourielves on being allowed ever a glimple of thofe mytteries of nature, which our finite powers are inadequate fully to comprchend.

Having faid fo much on the phyfology of leaves, it is negeflary to conlider them in another point of view, for the purpofes of fcientific botamy. In difcriminating the fpecies of plants a knowledge of the various forms of leaves is of the utmolt importance, nor are they entircly ufelefs in the difcrimination of natural tribes or orders. It is univerfal with graffes and the orchis family to have fimple and undivided leaves; it is nearly as general for the papilionaceous or leguminous tribe to have compound ones. In fome orders they are always oppofite, in others alternate; in fome genera evergreen, in others deciduous; but thefe later circumftances are liable to various exceptions. Trees and fhrubs of North America, and even thofe of Europe, generically related to them, have a general tendency to affume very brilliant colours in their foliage, as it verges towards decay. Grafles, on the other hand, are very uniform and conftant in their green colour, which is feldorn changeable. Everg:een leases are commonly darker coivured, though more thining than others, and will often thrive with a lefs proportion of light than is neceffary for other trees. The lower leaves of herbs that grow in lofty and windy ftations, are frequently much lefs divided than the upper coses, while the reverfe is the cafe with molt aquatic plants, whofe lower leaves, inmerfed in the water, are fometimes quite capillary, while the uppermoft are broad, and float on its furface; witnefs the Rananculus aquatilis, whofe white flowers bespangle our pouds in fummer. The action of a running Aream appears to elongate the leaves of this, as well as of many other plants. The dilated form of leaves in general, by which they prefent fo large a furface to the atmofphere, caufes them to be the more eafily diflodged by autumnal florms, when their connection with the brauch or tem has already become gradually loofened by their approaching decay. See Deciduous, and Fall of the Leeaf.

Leaves are, in the firft place, to be confidered as to thenr fituation and pofition.

Folia rudicalia, radical leaves, fring from the root, as in the Primrofe and Cowflip; caulina, them-leaves, grow on the item, as in the White Lily; ramea, branch-leaves, if different from thofe of the main item, require to be diltinguilhed from them, as in Purple Cow-wheat, Melampyrum arvense.

Alterna, alternate leaves, fland folitarily on the ftem or branches, as in Willows and many common plants ; oppofila, oppofite ones are found in the Lilac, and many others equally common; $\sqrt{2} a r f a$, are fcattered without any order, as in the Orange and White Lilies; conferta, are crowded together, as in the Rhododendron and Azalea.

Bina, are only two upon a plant, like thofe of the Lily of the Valley ; terna, ftand three together, as in the fweet Verbcnatriphylla, and often in the Fuch/fa; quaterna, quina, fena, \&c. are when four, five, fix, or more, furround the ftem in a whorl, as in fome kinds of Heath; verticillata, whorled leaves, ufed without any reference to the number, expreffes this mode of growth, as exemplified in the Woodruff, Madder, and many plants of the fame as well as different families.

Fafciculata, tufted leaves, are feen in the Larch and Cedar; imbricata, lying like tiles upon a houfe, in the Common Ling; decufata, fland in pairs croffing each other, as in the Caper Spurge, Euphorbia Lathyris; diflicha, two-ranked, fpread in two directions, yet are not regularly oppofite at their origin, as in the Yew ; fecunda, are unilateral, leaning all toward one fide, as in the Solomon's Seal.

Alpreffa are clofely prefled to the ftem, as in fome kinds of Xeranthenum and Spurge, in which cafe the back of each leaf only is prefented to the light ; varticalia, thand perpendicularly, with both fides equally at right angles with the horizon, like the Lactuca Sariola, but fuch a cafe is rare, except in fivord-fhaped leaves; cretfa, are fuch as grow nearly upright, forming a very acute angle with the ftem; pateritia fpread more in the ufual manner ; borizonsalia, or patentiflima, fpread in the greatelt pofible degree; reclinata incline downward, the extremity of each being lower than the bafe, or point of infertion ; recurva, are curved backward, as in Erica retorta; incurva, turn inward, as in E. empetrifolia; oliqua, are twitted, fo that one part is vertical, the other horizontal ; refupinata, are fo completely turned or reverfed that the upper furface is become the under, as in Alftrame. ria pelegrina ; depreffa, are radical leaves preffed stofe to the ground, like the Hoary Plantain, Plantago media, or any fuecullent omes that are vertically flattened, in oppoition to zomprefla, fiattened laterally ; natantia, float on the furface of water'; denerfa, inmerfa, or fubmerfa, are plunged beneath it ; cmerfa are raifed above the water, others upon the fame plant beng funk below its furface.

The infertion of leaves means the mode in which they are connected with the parent plant.

Peliolata, ftand on footitalks (pectioli) either long or fhort, fimple or compound; peltata, have the footfalks inferted, not into the bafe as ufual, but into the middle of each leaf, like the arm of a man holding a flield, as in the Common Nafturtium or Troprolum; feffilia, feffile leaves, fpring immediately from the item, branch or root, without eny footlalk, of which examples are frequent; amplexicaultia, clafp the ftem with their more or lefs dilatec' bafe, being ufually alternate; connata, or connato-jerfoliata, are oppofite leaves, united at the bafe, fo that the flem runs through them; perfoliata, have the ftem running through them in any way whatfoever, as Bupleurum perfoliatum, called Thoroughowax, from suax to grow, in allution to this circumftance; vratinantia, are fuch as fheath the Item, or each other, with their bafe, which is exemplified in moft graffes, and many liliaceous plants that have no ftem ; equitantia, embrace each other with their compreffed bafe, while they fpread upwards in two ranks, of which the genus Iris affords many examples; dicuricatia, decurrent,

## LEAF.

run down the flem or branch in a leafy border or wing, as in many Thifles, and the Great Mullein; forifera, bear the flowers out of their cifk or margin, as in Rufous and Xylopbslla.

With regard to form, the firlt thing to be confidered is whether leaves are fimple (fimplicia) or compound (comppfita). Of the former kind are thofe of graffes, Orchifes and Lilies, which are not only fimple but undivided, white thofe of the Vine and Mallow are fimple, but lobed; the Hop bears fome leaves lobed, other's undivided, as does Laurus SuTJafras, and the Paper Mulberry. Compound leaves are obiervable in Rofes, Jafmine, and the Un belliferous tribe in general, and confilt of leaflets, or partial leaves, ( foliola, ) connected by a common ftalk, and falling off alorg with it. In compound leaves the footitalk is cuther fimple, as in the Jafmine and Rofe, or compound, as in Parfley, Hemlock, and Fumitory. "In fimple leaves the footitalk, if prefent, mult of courfe be fimple, while in compound ones it mult always be prefent, though nat always fubdivided."

The following are the principal forms of fimple leaves, confidering their outhize only.
Orbiculatum, as nearly a perfect circle as poffible, of which inftances are very rare.

Subrotundum, roundilh, is not uncommon.
Ovatum, the thape of an egs cut longitudinally, a very common form of leaves.
Obvatum, is the fame figure reverfed, the little end being downward.

Ellipiticum, oval, of an equal breadth at each end.
Oblongum, of an indeterminate oblong flape, three or four times longer than broad.

Spatulatum, roundifh, or obovate, with a long taper bale, like a furgeon's 〔patula.

Cureiforme, like a wedge, broad and abrupt at the extremity.

Laiceolatum, lanceolate, of a narrow oblong figure, tapering towards each end, very common, as in Willows, and Plantago lanceolata, or Ribwert.

Lineare, linear, narrow with the fides as nearly parallel as pofible, fuch as the leaves of moft grafles, the various Species of Narcififus, the Rofemary, and many different plants. Linear-lanceolate leaves are of an intermediate fhape between this and the laft, or but flightly lanceolate, of which the gradations are numerous, often upon the fame plant.

Acerofum, needle-fhaped, linear and evergreen, mofly acute and rigid, almoft peculiar to the Fir and Juniper tribe. Such leaves have ufually a joint where they unite with the branch, at which they feparate from it when they fall.
Triangulare, having three prominent ang'es, of whatever meafurement or direction, as in Goofefoot, and fome leaves of Iry.

Quadrangulare, having four angles, as in the Liriodendrum or Thulip-tree, a very peculiar kind of leaf.

Quinquangulare, with five angles, like the Cyclamen, and Ivy.

Deltoides, deltoid, or trowel-fhaped, having three angles, of which the terminal one is much further from the bafe than the two lateral ones, as in Cbenopodiun Bonus-Henricus. Linnæus in lis Pbilofopbia Botanisa, p. 43, cites his fig. 58. of that work as an example of this leaf, which is a mittake, that figure being a reprefentation of the fucculent three-edged leaf, (fol. trigonum,) of Mefembryantbemum deltoides.

Rhombeum, rhomboid or diamond-haped, approaching to a fquare, though the fides are fearcely ever equal. This is feen in Trapa zatans, and the Stinking Goofefoot.

Reniforme, kidncy-flaped, a flort broad rounded figure, hollowed out at the bafe, as in A farabacca.
Cordatum, heart-fhaped, ovate hellowed out at the bafe, according to the vulgar idea of a heart ; a form very frequent in leaves.

Lunulatum. crefcent-fhaped, like' a half-moon, whether the points be directed backward, as in Sagittaria obtufifolia when its leaves are fhorter than ufual, or forward, as in Paffifora lunulata, Sm. Ic. Pict. t. I.

Sagithatum, arrow-Thaped, like Sagitharia farithifolia, and feveral fpecies of Sorrel, Rumex: In the Great White Bindweed, Convolvulus fepium, the polterior angles are abrupt or lopped.

Hafatum, halberd-flaped, triangular, hollowed out at the bafe and fides, the lower lobes fpreading horizontally, at right angles with the foothalk, as in Sheep's Sorrel, and the upper leaves of the Woody Nightflade, Solanum Dul. camara.

Panduriforme, fiddte-fhaped, oblong, blunt and dilated at each end, hollowed out at each fide, of which remarkable figure the Fiddle Dock is a ltriking, and almoff fingular example.

Runcinatum, runcinate or lion-toothed, that is re-uncinatum, hooked backward, being cut into many tranfverfe acute fegments, whofe points are diretted backwards, like the Dandelion.

Lyratum, lyrate, fo named in allufion to the antique lyre, but reve:fed. This leaf has a broad rounded extremity, with feveral tranfverfe rounded ferments, gradually leflening towards its bafe, as in Eryfinum Barbarea. It is molt frequent in the Cruciform and Compound clafles, and by en uccafional deep feparation of the fegments, oftea becomes a compound or lyrato-pinnate leaf.
Fiffim, cloven or fplit, when the margins of the fifures and liegments are ftraight, not rounded, as in the Ginkgo or Maidenhair-tree. Bifidun, trijfdum, mulfifidum, \&ic. exprefs the number of the fegments, but thefe terms are alfo ufed with lefs limitation, to indicate the number of divifions, of whatever fhape, when the latter circumfance does not come under confideration.
Lobatum, lobed, when the margins of the fegments are rounded, as is molt generally the cafe; witnefs the Hepatica. Dilloum, trilobum, \&cc. indicate the number of the lobes.
Sinuatum, finuated, cut along the margin into deep, rounded, or wide openings, like Statice finuata, Mefembryanthemuns pinnatifidum, Curt. Mag. t. 67 , and the Common Oak.
Partitum, deeply divided, almoft to the bafe, like the Mulk Mallow. Bipartitum, tripartitum, multipartitum, exprefs the number of divifions.

Laciniatum, laciniated, cut, or as it were torn, into numerous irregular portions, which may be feen in various fpecies of Senecio, denominated on that account Ragwort.
Incijum and $D i \sqrt{f}$ chum, cut or jagged, are nearly fynonymous with the laft, but exprefs a lefs deep divilion of the whole leaf.
Palmatum, palmate or hand-fhaped, cut into fcreral oblong, rearly equal or uniform fegments, about half way, or rather more, towards the bafe, leaving an entire fpace there, like the palm of the hand, as in the common Blue Paffionflower, whofe leaves however are frequently fill mure deeply divided, and the Fig.
Pinnatifdum, pinnatifid, or wing-cleft, cut eranfverfely into feveral oblong parallel fegments, like feveral \{pecies of Thifte, Carduus, and on a fmallier fcale, though more deefly,

## LEAF.

deeply, Lepidium petraum and alpinum; as well as Coronopus didymaz of 11. Brit.

Bipinnatifidum, doubly fo divided, as in the Long Roughheaded Poppy, Papaver Arsemone, and Eriocalia major; fee that article.

Pectinctum, pectinate, a fine and elegant fort of pinnatifid leaf, whofe fegments are fo narrow and fo regularly parallel, that they refemble the teeth of a comb, exemplified in the Water Violet, Hortomin paluffris.

Incquale, unequal, fometimes called oblique, is when the two halves of a leaf are manifetly unequal in dimentions, efpecially at the bafe, where they are not at all parallel. This is the cafe with moft fpecies of Eucalyphus and Begonia, but it is hardly obfervable in any Britifh plants, except in a fmall degree.
'Interrum, undivided, expreffes a leaf or leaflet being deftitute of all fegment, divifion or lobe, without any reference to its margin, whether toothed or not.

The various terminations of leaves are thus diftinguifhed.
Folium truncatum, an abrupt leaf, has the extremity cut off, as it were, tranfverfely, by a ftraight line, as the Tuliptree, Liriodendruna tulipificra.

Pramorfum, bitten, or jagged-pointed, is blunt with various irregular notches, a very unufual termination, but charactcriftic of Dr. Swartz's genus Aërides, a tribe of Indian Orchidere. Hibifcus pramorfus, Linn. Suppl. has a more dilated leaf with a fimilar termination.

Retufim, retufe, blunt with a broad fhallow notch, like the Mountain Sorrel, Rumex digynus.

Emarginatum, emarginate or nicked, having a fmall acute notch at the fummit, which is rot uncommon.

Obtuf um, blunt, terminating in a fegment of a circle, like the Primrofe leaf, and many others.

Acutum, fharp, ending with an acute angle, as is fill more ufual.

Acuminatum, pointed, having a taper point, like many graffes, and various other plants.
Obtufum cum acunine, blunt with a fmall point, like the Sea Lavender, Statice Limonium.

Mutronatum, or Cu/pidatum, fharp-pointed, tipped with a rigid or pungent fpine, like the Thille tribe.
Tridentatum, three-toothed, when there are three terminal, nearly equal, points.
Triculpidatam expreffes the fame thing.
Cirrofum, cirrofe, tipped with a tendril, as in Gloriofa and Flajellaria, two Indian plants.

The different margins of leaves are defined as follows, 'and are very important to be well underfond, and correctly applied, in forming fpeciñc characters of plants.

Folium intezerrimum, an entire leaf, is dellitute of all marginal teeth, notches or incifions, as in the Orchis and Lily tribes. This term, aliuding folely to the margin, has no reference to, or comparifon with, integrum, which concerns the general figure, or dilk, of the leaf.

Spinofum, fpinous, befet with prickles, though otherwife -perhaps entire, as in Thiltles, and Eryngos. The veins and ribs are fuinous in fome kinds of Solanum, and many Rofes and Brambles.

Inerme, unarmed, is oppofed to fpinous.
Glasiduly fum, glandular, bordered with pores that exude fome peculiar fluid, as in Salix pentandra, the Bay-leaved Willw, and fome cthers.

Cilictun, fringed, bordered with foft parallel hairs, as in Rliododendrumn bivjutum.

Ciariluginemze, cartilaginous, having a hard or horny edge, like feveral fpecies of Saxifrage.

Dintatium, toothed, befet with directly projecting teeth,
of its own fubflance, as in fome fpecies of Plantain and Hawkweed. .

Denticulatum, finely toothed, is much more ufual than the laft.

Serratum, ferrated, having fharp teeth pointing forward, like thofe of a faw, either in a fimple row, like the Nettle, or with fmaller intermediate ferratures, as in the Strawberry tree, (Arbutus Unedo,) various Rofes, and others. Such leaves are called duplicato-ferrata, doubly ferrated.

Serrulatum, minutely ferrated, is ufed when the teeth are very fine, even fo minute perhaps as to be fcarcely perceptible but by the touch.

Crenatum, notched or crenate, when the indentations are blunted or rounded, and not directed towards either end of the leaf, which may be feen in Ground-ivy, and feveral Suxifrages, fome of which are fharply crenate. The two Britifh fpecies of Salvia are examples of doubly crenate leaves.

Erofum, jagged, irregularly cut or notched, like fome fpecies of Senecio or Ragwort.

Repandum, wavy, bordered with fmall projections ard fhallow fegments of circles alternately, as in Fringed Waterlily, Menyanthes nypbroides.

Revolutum, revolute, turned or rolled backwards, as in Rofemary. As this term always regards the margin only, in modern botanical phrafeology, it is needlefs to fay mare gine revolutum.

Involutum, involute, is the reverfe of the laft, as in Butterwort (Pinguicula).

Conduplicatum, folded, when the margins are clapped flatly together, as in Rofcoea purpurea, Sm. Exot. Bot. t. 108, and the bafes of fword-fhaped leaves.

Terms defcriptive of the furfaces of leaves, no lefs requifite to be clearly underftood than the former, are as follows.

Folium glabrum, a fmooth leaf, is ufed in contradiftinction to all kinds of hairinefs or pubefcence.

Lave, fmooth and even, is oppofed to all kinds of roughnefs and inequality whatever. Thus, the bliftered leaf of a cabbage is glabrum, but not lave; that of an Orchis, or of Myrtle, is both.
Nitidum, polifhed, fmooth and fhining, like Laurel.
Vifcidum, vifcid, exuding a clammy juice, as in Butterwort.
$V$ errutofum, warty, befprinkled with hard tubercles, like * the Pearly Aloe, or fome fpecies of Echium; the warts of the latter moflly bearing rigid brittes.

Papillofum, papillary, covered with fofter tubercles, like the Ice-plant.

Scabrum, rough to the touch, from any little rigid inequalities, oppofed to lave.

A/per, is a greater degree of the laft, of which one of the moft eminent examples is Symphytum a/perrinum, Sims in Curt. Mag. t. 929.

Hi/pidum, briftly, befet with rigid or pungent brifles, like the Borage.

Urens, ftinging, when each briftle difcharges a venomous irritating fluid, as in the Nettle; fee Pilus under the article Fulcra.
Hirtum, or Pilofun, hairy, clothed with foft hairs.
Tomentofum, downy, very foft to the touch, as in the Marfh Mallow, and others of that tribe.

Villo fum, fhargy, clothed or befprinkled with long fhaggy hairs, like Hiefacium villofum, and others.

Lanatum, woolly, covered with denfe, entangled, often branched hairs, as in feveral fpecies of Mullein (Verbafcum). Incanum, hoary, whether arifing from clofe filky depreffed hairs, as in Wormwood, and the White-Willow, or

## LEAF.

from a fealy kind of mealinefe, as in Atriplex, and fome fpe. cies of Alyfum.

Glaucum, glaucous, clothed with a fine mealinefs, of a fea-green colour, which eatily rubs off, as in the Cabbage, the $C$ btora, and many others.

Maculatum, fpotted, befprinkled with fpots or ftains of a different colour from the prevailing green of the leaf. In Lamium maculatum thefe fpots are white, in Hypocharis machlata they are of a dark purple.

Coloratum, coloured, is ufed when a leaf, or any part thereof, is of any other colour than green, as in Amaranthus tricolor.

Punalatum, dotted, cither fuperficially, as in Rhododendrum funtatum, Andr. Repof. t. 36 , or with pellucid cells filled with an entential oil, like Hypericum perforatum, and the whole natural order of Juffieu's Aturantia.

Rurooum, rugged, having the veins tighter than the intermediate fpaces, fo that the latter become tumid, as in the Garden Clary, and many other fpecies of Salvia.

Ballutum, bliftery, a more remarkable degree of the laft, frequent in the Garden Cabbage.

- Plicatum, plaited, when the difk of the leaf, efpecially towards the margin, is acutely folded up and down, as in Mallows, and Ladies' Mantle.

Undulatum, undulated, when the dik near the margin is waved obturely up and down, in confequence of being more ample than the adjoining part, as in Cyamus Nelumbo; or than the rib, as in Refeda lutea and albu.

Crifpun, curled, when the border is fo much more dilated than the dik, that it neceffarily becomes curled and twifted, which is the cafe with the Curled Mallow, and fome varieties of Mint, for this mode of growth is juftly fufpected by Linnzus, to be but a variety, or preternatural luxuriance.

Concavum, hollow, depreffed in the centre, owing to a tightnefs in fome part of the circumference, as in Cyamus Neiumbo.

Canaliculatun, channelled, having a longitudinal depreffion, like feveral fpecies of Narcifus.
$V_{\text {enffum, }}$ veiny, when the veliels by which the fiuids are conveyed through the leaf, are branched, fubdivided, and more or lefs prominent, frequently forming an elegant network, in which cafe the leaf is faid to be reticulated, either on one or both its furfaces.

Nervofum, or Coftutum, (fee the latter article,) ribbed, when the veffels extend in fimple lines from the bafe to the point, or towards it. The greater clufters of veffels are generally called nervi or coffo, nerves or ribs, the fmaller vena, veins, whether branched or fimple.

Avenium, veinlefs, and En.rve, riblefs, are oppofed to the lalt-mentioned terms.
Trintrve, three-ribbed, is a leaf with three great or principal ribs, all allke diftinct and feparate from the very bafe, as well as remote from the margin, like the beautiful Blakea zrinergis.

Bafi trinerve, three-ribbed at the bafe, has the bafe cut away, as it were, clofe up to the lateral ribs, as in the Burdock, and Great Annual Sunflower.
Triplinerve, triply-ribbed, is when the fide-ribs branch off from the middle one, at fome diftance above the bafe, as in Laurus Cinnamomuns and Camphora, and many fpecies of Sunflower. The fine and ample South Amcrican genus Melaftoma, is remarkable for the confpicuous ribs of its leaves, which are ufually five, feven, or more, the lateral ones either branching off from the central, or all of them diftinct to the bafe.

Nudum, naked, implies that a leaf is ceffitute of all kinds of clothing or hairinefs, as in the Orchis.

Vol. XX.

Variegntum, variegated, is a fort of varicty or difeale, in which it differs from coloratum, the latter being natural, and proper to the fpecies. Variegation of leaves confifts in white or yellow irregular blotches, as in the Elder, Roundleaved Mint, Holly, ard Aucuba japonica. Such plants are wfually more tender, and difficult of increafe, than when in their natural ftate, as gardeners experience in Gc. raniums.
The following terms exprefs the fublance, peculiar configuration, or fume other circumftance relating to leaves, not included in the foregoing lifts.

Fclium feres, or cylindraccum, cylindrical, is feen in Conchium gibbofun, and fome others of that getus. Sce Conchilm.
Semicylindraceum, femicylindrical, flat on one fide, which is generally the upper, like Salfola fruticofa, and Chenopodium maritimum.

Subulatum, awl-fhaped, tapering from the bafe to the point, like Sa'fola Kali.
Tivulofum, tubular, hollow within, as in the Onion, and fome other fpecies of Allium, forre Rufhes, \&c. T'he tube is double in Labelia Dorimanna.

Carnofum, flefhy, of a thick pulpy fubftance, as in all thofe called fucculen: plants, belonging moftly to the genera of Sedum. Crafula, Aloe, Mrefembraanthcmum, \&c. Of the fingular power in fuch leaves of refifting drought, we have already fooken. When bruifed they foon dry or corrupt.

Giblum, gibbous, fwelling on one fide or both, as in Aloe retufa.

Compreffim, compreffed, flattened iaterally.
$D_{\text {epref }}$ Jum, deprefied, flattened vertically, as already mentioned. Various kinds of Mefembryanthcmum exemplify thefe.

Carinatum, keeled, when the back is longitudinally prominent, like the keel of a boat.

Enfiforme, fivord-fhaped, compreffed, tapering to a point, flightly convex at each fide, neither of which is properly the upper or under furface; as in Iris and its allies.

Anceps, two-edged, is nearly fynonymous with the laft.
Acinaciforme, fcimitar-flaped, and Dolabriforme, hatchetfhaped, are two kinds of fucculent leaves appropriated to two fpecies of Mefembryanthomum, that bear the fame names.
Trigonum, three-edged, has three longitudinal fides ard as many angles, like Mefembryanthemum deltoides, Linn. Phil. Bot. f. 58.
Triquetrum differs from the laft only in being more precifely applied to a three-fided awl-fhaped leaf.
Tetragonum, four-edged, has four prominent angles, as in Iris fuberofa.
Lingulctum, tongue-fhaped, is a thick oblong blunt figure, generally cartilaginous at the edges, as in Saxifraga Cotyledon, and fome of its near relations.

Membranaceunt, membranous, expreffes a thin pliable fort of leaf, the reverfe of fucculent.
Coriacemm, leathery, is thick and tough, without being pulpy or iucculent, like Magnolia grandiflora, Aucuba, Laurel, and many others.

Sempervirens, cevergreen, permanent through one, two, or more winters, fo that the branches are never itripped.
Deciduum, deciduous, (fee that artic'e, ) fuch as falls off at the approach of winter, as in moft trees and flrubs of cold climates.
Alienatum, alienated, when the firf leaves of a plant give place to others totally different from them, as well as from the natural habit of the genus, as in many Mimo $\int$ se of New Holland.

Cucullatum, hooded, when the edges meet in the lower 3 L
part
part and expand in the upper, forming a fleath or hood, of which the genus Sarracenia is a curious example. The Common Lime, Tiflizeuropad, is liable to a varicty in which the fame thing takes place accidentally. A tree of this kind, of which we have a fpecimen, in the church-yard of Zedlitz in Bohemia, is vulgarly fuppofed to bear fuch hooded leaves, in confequence of a parcel of monks having once been hanged upon this tree. It is feldom we can fo clearly trace the caufe of any variety. Some might think the experiment worth repeating.

Appendiculalum, furnifhed with an appendage, or additional organ, for fome purpofe not effential to a leaf, as the irritable lobes at the end of the foliage of Dionaa mufripula; and the pouch with a lid, upon that of $N_{\text {teperthes difillatoria; }}$ of both which we have already treated. Allrovanda and Utricularia bear numerous bladders on their leaves under water, which feem to fecrete air for the purpofe of floating the plants, elpecially perhaps at their flowering feafon.

Foliz comispfita, compound leaves, confitt of two or any Erexter number of partial leaves, connected by a common foottlalk, whether finple or branched. Such partial leaves are termed folizla, leaffets.

Folium articulatum, a jointed leaf, confilts of one leaflet, or pair of leaflets, growing out of the fummit of another, with a fort of joint, as in Fagara tragodes.

Digitatum, fingered or digitate, has feveral leafets at the top of one common ftalk, as in many Potentille.

Binatum, binate, confitts of a pair of leaflets only on one footltalk, as in Zygophyllum, fome Minofe, the Great Everlafting Pea, and other feccies of Latbyrus.

Ternatum, ternate, has three leaflets, like the Trefoil and Strawberry.

Quinatum, quinate, has five.
$\widetilde{P}_{\text {innatum, }}$ pinuate, a very common kind of leaf, is formed of feveral leaflets, ranged laterally aiong one foottlalk, either with or without partial ftalks, and in an oppofite or

- alternate manner. There is ufually a terminal leaflet, as in Rofes, Jafmine, and Elder, which mode of growth is called foliuns pinnatum cum impari, and is that always undertood, when nothing is particularized; abrupte pinnatum means that there is no fuch terminal or odd leaflet. Sometimes its place is fupplied by a tendril, as in Veiches and Peas, and fuch a leaf is termed pinnatum cirrofiun. Interrupte pinnatum, interruptedly pinnate, is when the principal leaflets are ranged alternately with one or more intermediate feries of fmaller ones, as in our Englifh Spirax, and Potentilla anferina. Articulate, juintedly, is when there are apparent joints in the common footitalk, as in IV einmannia pimnata. In the Japanefe flurub Nandina domeflica the leaflets all feparate by a joint at their bafe, very foon after the leaf is gathered. Decurfioc̀, decurrently, is when the leaflets run down the footfalk at their bafe, like Eryngium campefire. Lyrato, in a lyrate manner, has the terminal leaflet largeft, the reft graduaily fmaller, often with intermediate leaflets, as in Germ, and the Turnip. This and the true lyrate leaf often vary iuto each other, in the fame plant or fpecies. Verticillato, in a whorled manner, has the leafers cut into fine divaricated Jegments, embracing the footltalk, of which the curious Sium verticillatum, Fl. Brit. is an inftance.

Auriculatum, an auricled leaf, bears a pair of leaflets at its bafe, that often indeed unite with it, as in the Diffacus $p_{i-}$ lofus, and Salvia trilcba. Hedyfarum gyrans, the Moving Plant, mentioned above, has properly an auricled leaf, rather than a ternate one, the auricles being what move up and down fpontaneoufly.

Conjugatun, conjugate or yoked, confints of one pair of leaflets, and is much the fame as binutum.' Bijurum, trijugum, quadrijugum, multijusum, exprefs particular numbers of pairs
of leaflets, as is fometimes neceffary in the fpecific characters of Mimofe.

Pedatum, pedate or foot-like, is in the firf inftance ternate, but the two lateral leaflets are compounded in their fore part, which may be feen in Helleborus fatidus and $H_{\text {。 }}$ niger. "There is an afinity between a pedate leaf, and thofe fimple ones which are three-ribbed at the bafe.:'

The different degrees in which leaves are compounded are thus diftinguifhed, without any reference to the mode.

Folium compofitum is a fimply compound leaf, as in Rofes.
Decompgitum, doubly compound, is exemplified in the Gout-wced (AEgopodium), and many other umbeliferous plants.

Supradecompofitum, more than twice compounded, is feen in fome cominon umbelliferous plants, as the Hemlock, and in many AImofa.

The following terms exprefs not only the degree but the mode.

Bigeminatum, twice paired, and Tergeminatum, thrice paired, are found in fome Miniffa.
Biternatum, twice ternate, is feen in AEsopodium, and Triternatum, thrice ternate, in Frmaria lutea.

Bipinnaturn, doubly pinnate, Tripiznatum, triply pinnate, are found in many exotic leguminons plants.

Some botanifts, amon, It whom Forfkall feems to have taken the lead, ufe the word lamina for the expanded part of a leaf, that is, for the leaf itfelf, fo that the term is entirely fuperfluous, and is befides appropriated to the border of the petals in a polypetalous corolla. (See Lamina.) What is not le fis footitalk (pectiolus), the part which ufually fupports the leaf, and whofe different kinds will be explained under the article Petiolus. Another appendage to leaves, but not always prefent, any more than the footitalk, is the Stipula. See Fulcrum and Stipula.

In the ufe of the various terms above explained, it is often found neceffary to combine two of them; in order either to exprefs fome intermediate figure, or to provide. for that variety or mutability of fhape, very frequent in the foliage of many plants. Thus, ovato-lanceolatum indicates a lanceolate figure, fomewhat dilated towards the bafe, fo as to approach towards ovate; as elliptico-lancolatum implies a dilatation about the middle. Or fuch compound terms may exprefs, that the foliage, generally lanceolate, occafionally verges towards either of thofe broader forms. . But we mult be careful not to combine terms which are incompatible, as conjugato-pinnata, and digitato-pinnata, employed by fome writers in defining Mimofe; whereas their meaning is conjugata, or digitata, in the firft inftance, and pinnata as regarding the fecondary divifons. Sub is commodioufly prefixed to many terms, when our application of them is doubtful, or not precife, $2 s$ fubbotundum, roundifh, fubfyflik, nearly feffile; but it fhould be fparingly ufed. It too often indicates a want of decifion or perfpicuity in the writer, rather than any uncertainty in his fubject. An acute oblerver can generally feize what is effential, in parts that are the leaft variable, in each paricular tribe; paffing over what is doubtful; and above all, not dwelling on too many particulars in his definitions, when a few are fufficient. The leaves of plants afford, on the wliole, the moft commodious Specific diftinctio :s, as being obvious, molt generally prefent, and independent of the parts of fructification, from which the generic characters are taken. In few cales are the leaves of any gerius fo uniform or fimilar in all the fpecies, as not to exhibit abundance of clear fpecific differences, efpecially when their ltipulas and footllalks are taken likewife into conlideration.

The Leaves of Plants have, in one inflance only, as far as we know, been reforted to for the purfofe of forming

## LE $\Lambda$

## L. E A

a [yftem of botanical arrangement. The celebrated Dr. Sauvages of Montpellicr publithed, in 1751, a Alethodus Foliorum, or an arrangement of the wild as well as garden plants about Montpellier, according to their foliage. It is preceded by an epittle to Limaxus in French, and an introduction in the fame language. His orders are eleven: Aphylliz, Cajpititia, Angufifolia, Latifolie, Adverfifolia, Verticillatu, Digitate, Palmate, Pinnate, Deccmpjfita, and Laciriate. But they offer, in many inftances, to much violence to nature, and are attended with fo little, if any, advantage, that it is not worth while to detail their characters. We doubt much whether this fyltem was ever expected to be prevalent ; but if fo, the author, truly able and excellent in other departments of fcience, and even of fyltematic arrangement, has, in this cafe, bcen totally difappointed.

Leaf, in Agriculture, fuch parts of trees and fhrubs as are annually thed and fall to the ground. Where the leaves of trees or plants can be collected in large quantities, as in parks and woodlands, they may be highly ufeful in aug. menting the manure-heaps of the farmer. And it is advifed by Mr. Young, in his Calevdar, that, in wooded counties, all the leaves that can be had at little expence fhould be raked up in October, and carted to the yards and flanding folds, for littering and making them into dung: he does "it," he fays, "at three-pence per one-horfe cart-load. They do not rot eafily, but that is," he thinks, "no objection to them ; they are a fponge to be faturated with urine, and if not touched previoufly to carting on the land, will convey to the field much of what might otherwife be loft; and they are extremely ufeful in aiding the main object of bedding the yards" in the autumn and winter feafon; and of courfe fave ftraw where that article is fcarce.

Leaf, in Gardening. Leaves are of great ufe in the garden where they can be collected in proper fupplies for mixing in hot-beds and other preparations, where gentle heat is required. They arc, likewife, beneficial as light coverings againtt frolt and fevere feafons in many cales. See Leaf, in Botany.

Leaf-eared, in Rural Economy, a provincial term applied to horfes when their ears are low and badly placed.

Leaf, Indian, in Botany. See Tamalapatra.
Leaf, Water. See Hydropiivlluar.
Leas is alfo applied to the finelt and moft beautiful parts of flowers, more properly called petals.

It is true, all flowers have not leaves or petals; and it is fometimes difficult to determine which is to be called the leaves, and which the calyx of the fame flower.

To prevent confounding the leaves of the flower with thofe of the reft of the plant, the former are called by botanits petala, the latter folia.

Leaves, in Arclitecture, are an ornament of the Corinthian capital, and thence borrowed into the Compofite; confirting in the reprefentation of a double row of leaves cosering the vafe, tympanum, or neck of the column.

Thefe leaves are ufually formed in imitation of thofe of the acanthus; fometimes of thofe of olive, and fometimes of laurel.

The leaves are divided; each making three ranges of leffer, and are bent at top one-third of their height.

Leif-gold. See Gold-leaf.
Leaves, in clocks and watches, are ufed for the notches of their pinions.

## Leaf-filver. See Silver.

LEAGUE, an extent of ground, confidered lengthwife; ferving to meafure the dittances of one place from another; and containing more or lefs geometrical paces, according to the different ufages and cuftoms of countries.

The word comes from leuca, or leuga, an ancient Gaulifi word, for an itinerary meafure, and adopted in that fenfe by the Romans. Some derive the word leuca from neuvo, subite ; becaufe the Gauls, in imitation of the Romans, marked the fpaces and diftances of their roads with white ftoncs. The Gallic leuca was $=1 \frac{1}{2}$ Roman mile $=$ 2415,522 yards.
A fea-league is ufually reckoned 3000 geometrical paces, or three Englifh miles; the large leagues of France arc ufually 3000 , and in fome places 3500 paces; the mean or common league is 2500 paces, and the little league 2000 . Chorier obferves, that the ancient Gaulifh leagues were but 1500 paces; and the modern French league is $=2500$ toifes $=5328,75$. Englifh yards. The term licue, or league, is applied in different parts of France to very dif-
ferent ditances. The aftron ferent ditances. The aftronomical league of 25 to a degree meafures 486 , Englifh yards. The legal lieues, of two French miles, by which the highways were meafured, contain each 4263 Englifh yards. The marine leaguc of 20 to a degree meafures 6o8ı Englifh yards.

The Spaninh leagues are larger than the Frerch, 17 Spanifh leagues making a degree, or 20 French leagues, or $69 \frac{1}{2}$ Englifh fatute miles. The league of Spain is $=$ four an. cient Roman miles $=6441,392$ yards. The large league of Spain is = five ancient Roman miles $=8051,74$ Eng. lifh yards. On roads made fince 1766 , the diftances are laid down at the rate of Sooo varas to the league; that is, 7416 Englifh Yards; fo that five fuch leagues $=21$ Englih miles nearly. But the juridical league is 5000 varas, or 4635 Englifh yards; fo that eight of thefe are equal to 21 Englinh miles. Marine leagues are reckoned at the rate of 20 to a degree. But in different parts of Spain, the leagues are very different. The leagues of Germany and Holland contain four geographical miles each. The German league, or that of Scandinavia, is $=9662,0886$ Enylifh yards. The mile or league of Germany is $=200$ Rhenifh yards $=$ $\$_{239}$, 846 Englifh yards.

The Perfian leagues are nearly the fame with the Spanifh; that is, each is equivalent to four Italian miles; which come nearly to what Herodotus mentions of the parafanga, an ancient meafure among the Perfians, containing thirty Itadia; eight of which, according to Strabo, make a miles.

The Perfians mark their leagues by trees, as the ancient Romans did by ftones, lapides; for which reafon they are alfo called agag, a Turkih word fignifying a tree. In Japan, the league contifts of 1800 fathoms. Thefe are all ditinguifhed by little hillocks, raifed on purpofe by the road-fide. See the leagues of molt countries reduced to the Roman foot, under Mile. See alfo Measure.

League alfo denotes an alliance or a confederacy between princes and Itates for their mutual aid, either in attacking fome common enemy, or in defending themfelves. The word comes from liga; which, in the corrupt Latin, was ufed for a confederacy: "Qua quis cum alio ligatur."
There have been feveral holy leagues entered into by the Chrittians, againit the Saracens and Infidels; called alfo crufados, or croijades.
The Leagae, by way of eminence, denctes that famons one on foot in France, from the year 1576 to 1593. Its intent was to prevent the fucceffion of Henry IV. who was of the Reformed religion, to the crown; and it ended with his abjuration of that faith.

The leaguers, or confederates, were of three kinds: the zealous leaguers aimed at the utter deftruction, not only of the Huguenots, but alfo of the minitry. The Spanijh

## LEA

leaguers had principally in view the transferring of the crown of France to the king of Spain, or the infanta his daughter. The moderate leaguers aimed only at the extirpation of Calvinifm, without any alteration of the government.

League, in Grography. See Grisons.
League of God's Houfe. Sce Gon's Houfe.
League, Grey. See Grey League.
League of the Ten Jurifdiztions, one of the three leagnes into which the Grifons are diltributed. This league ought properly to be called, and is not unfrequently denominated in Switzerland, the league of the eleven jurifdictions, from the number of communities that compofe it; but as on its firlt union it was formed of ten only, the original appellation is itill retained, although one of the jurifdictions has been fince that period divided into two. This territory was formerly under the dominion of the Vats, whofe authority was limited, as the people poffeffed very confiderable privileges. $Q_{B}$ the death of Donatus, the laft baron, the count of Toggerburg, who married his eldeft daughter, fucceeded to lis poffeffous; and Frederic, one of his defcendants, dying in 1436, without ilfue, the communities united, formed an offentive and defenfive alliance, and erected themfelves into a league. After fome vicifitudes, the communities became free, and their independence was folemnly ratified by the emperor Ferdinand III., foon after the peace of Weltphatia. For further particulars, fee Grisoss.
League, Solemn. See Covevant
LEAK, in Sca Language, is a chink or breach in the decks, fides, or bottom of a fhip, through which the water comes in. A fhip is faid to /pring a leak when fhe begins to leak, or let in the water.
The manner of ftopping a leak is, to put into it a plug wrapt in oakum, and well tarred, or in a tarpauling clout, which keeps the water out; or nailing a piece of fheetlead on the place. See Cavliking, and Fothering.

Seamen fometimes ftop a leak by thrulting a piece of falt beef into it. The fea-wate:, fays Mr. Boyle, being frefher than the brine imbibed by the beef, penetrates into its body, and caufes it to fiveli fo as to bear ftrongly againtt the edges of the broken plank, and thereby tops the influx of the water. Works Abr. vol. i. P. ${ }^{4} 47^{\circ}$

A ready way to find a leak in a hip, is to apply the narrow end of a fpeaking trumpet to the ear, and the other to the fide of the fhip where the leak is fuppofed to be; then the noife of the water iffuing in at the leak will be heard ditinctly, whereby it may be difcovered. See Philof. Tranf. No. 201.

LEAKAGE, the ftate of a veffel that leaks; that is, lets water, or other liquid, ooze in or out.

Leakage alfo denotes an allowance of three barrels in thirty-fix, both of ftrong beer or table beer and ale, and after that rate for any greater or lefs quantity, out of the excife, 43 Geo. III. c. 69 . f. 12. The faid allowance to the common brewer of three upon every thirtv-fix barrels of beer or ale, fhall be in full compenfation for all waite or other loffes whatfoever. f. I3.

LEAKE, Joun, M. I)., in Biography, was born of Scottifh parents in Cumberland, and received his cducation at the grammar-fchool at Bihop-Auckland. This being tinifhed, he fet off for London, intending to engage in the military profeffion: but finding fome promifes, with which he had been flattered, were not likely foon to be realized, he curned his attention to medicine. After attending the hof. pitals, and being admitted a member of the corporation of furgeons, an opportunity prefented itfelf of improving himFelf in foreign fchools; he embarked for Libon, and afterwards vifited Italy. On his return, he eftablifhed himfelf as

## L E A

a furgeon and accoucheur in the neighbourhood of Piceadilly; and about that time publifhed "A Differtation on the Pro* perties and Efficacy of the Lifbon Diet-drink." Where he obtained his doctor's diploma is not known; but he became ere long a licentiate of the College of Phyficians, and removed to Craven-ftreet, where he began to lecture, as well as continued to practife, the obltetric art. In 1705, he purchafed a piece of ground on a bui'ding leafe, and afterwards publified the plan for the inftitution of the Weftminfter Lying-in-Hofpital: and as foon as the building was raifed, he voluntarily, and without any confideraticn, affigned over to the governors all his right on the premiles, in favour of the ho!pital. He enjoyed a confiderable fhare of reputation and practice as an accoucheur, and as a lecturer; and was efteemed a polite and accomplifhed man. He added nothing, however, in the way of improvement, to his profeffion, and his writings are not characterized by any extraordinary acutenefs, or depth of refearch; but are plain, correct, and practical. He was attacked, in the fummer of 1792 , with a diforder of the chicft, with which he had been previotify affected, and was found dead in his bed on the eighth of Auguft of that year. He publifhed, in 1773, a volume of "Practical Obfervations on Child-bed F ever;" and, in 1774, "A Lecture introductory to the Theory and Practice of Midwifery, including the Hiftory, Nature, and Tendency of that Science, Scc." This was afterwards confiderably altered and enlarged, and publifhed in two volumes, under the title of "Medical Inftructions to wards the Prevention and Cure of various Difeafes incident to Women, \&c." The work pafied through feven or eight editions, and was tranflated irto the French and German languages. In the beginning of 1793 , a thort time before his death, he publifhed "A practical Efiay on the Difeafes of the Vifcera, particularly thofe of the Stomach and Bowels." Hutchinfon Biog. Med.

Leake, Ricianid, was born at Harwich in the year 162g, and was bred to the fea-fervice. At the reforation he was made maRer-gunner of the Princefs, a frigate of fifty guns ; and in the firlt Dutch war ditinguinhed himfelf by his ncill and bravery in two very extraordinary actions, in one againft fifteen fail of Dutch men of war, and another in 1667, againt two Danifh fhips in the Baltic, in which, the principal officers being killed, the command devolved on him, though only mafter-gunner. In 1669, he was promoted to be gunner of the Royal Prince, a firlt rate man of war. In 1673, he was engaged, with his two fons Henry and John, in the battle againt Van Tromp, when the fhip had all her mafts fhot away, nearly four hundred men killed and difabled, and moft of her upper tier of guns difmounted. As fhe lay like a wreck, a Dutch man of war and two fire-flips came down upon her, and captain Rooke, afterwards fir George, concciving it impoffible to defend her, defired the men to fave their lives, and ftrike the colours. Mr. Leake hearing this, ordered the lieutenant off the quarter-deck, and took the command, faying "the Royal Prince flall never be given up to the enemy, while I am alive to defend her." The undaunted fpirit of the brave gunner infpired the fmall refidue of the fhip's company with refolution, they returned to the fight, and, under the direction of this valiant gunner and his two fons, funk both the fire-fhips, and obliged the man of war to theer off, and having thus faved the Royal Prince, he brought her into Chatham. Mr. Leake's joy in obtaining this victory was miferably damped by the lofs of his eldeft fon Henry, who was killed by his fide. Mr. Leake, in confequence of his great merit, was made, in 1677 , maftergunner of England, and flore-keeper of the ordnance at Woolwich. He invented, among other things, the cuthee-

## LEA

piece, and contrived a new method of firing a mortar. He died in 1686. He had a furprifing genius for all inventions re'ating to guanery, and alfo in the compofition of fireworks. Heleft a fon,

Leake, Johis, who was but fixteen years of age when he was engaged in the battle juft referred to, and in which he took a confpicuous part. He was Mortly after made captain, and performed many prodigies of valour, and, among others, he executed a defperate attempt of convoying fome viturallers into Londonderry, which obliged the enemy to raife the fiege: he was alfo at the battle of La Hogue. In 1702, being commodore of a fquadron, be deftroyed the French trade and fettlements at Newfoundland, and rettored the Englifh to the poffeffion of the whole inland. On his retura he was made rear-admiral, and, in a fhort time afterwards, he was created vice admiral of the blue, and received the honour of knighthood. In 1705, he faved the important fortrefs of Gibraltar from the combined attacks of France and Spain, and was engaged in the reduction of Barcelona. In the courfe of the following year he relieved that fame city, when it was reduced to the lalt extremity, and obliged king Phlip to raife the fiege. Soon after this he took the cities of Carthagena, Alicant, and Joyce, and concluded the exploits of the year with the reduction of the city and ifland of Majorca. On his return home, he was prefented by prince George of Denmark with a valuable diamond ring, worth $400 \%$., and from the queen he received $1000 \%$ as a reward of his important fervices. On the death of admiral fir Cloudefly Shorel, in 1707 , he was made admiral of the white, and commander-in-chief of her majefty's flcet. In the following year he furprized a convoy of the enemies corn, fent it to Earcelona, and thus faved the city and the contederate army from the danger of famine. He reduced the ifland of Sardinia to obedience to Charles king of Spain, and affited lo:d Stanhope in the conquelt of Minorca. Returning home, he was ajipointed one of the council to the lord high admiral, and in 1709 he was made rear admiral of Great Britain. He was feveral times chofen menber of parliament for Rochetter, and in 1712 conducted the farces to take poffefion of Dunkirls. On the acceffion of George I. he was fuperfeded, and allowed a penfion of 60 c ., lupon which he lived in a private manner till his death, which happened at his houfe in Greenwich, in 1720. He left no chlldren, but was fucceeded in his property by

Leake, Stephen Martin, who was fon of captain Martin, the brother-in-law of admiral Leake. Inheriting the property of the admiral, he took his name in addition to that of his own. He went through the different ranks in the Herald's office, till he came to be Garter. He was the firlt perfon who wrote profeffedly on Englin coins: He publifhed a hiitory of Britifh coiss, under the title of "Nummi Britannici Hilloria:" he wrote alfo "The Life of Sir John Leake,' of which only 50 copies were printed : and in 1766 he printed 50 copies of "The Statutes of the Order of the Garter." He died in 1773.

LEAM, a term fometimes ufed for a cut or canal.
Leas, in Geography, a high mountain of the county of Galway, Ireland, fituated on the fouth fide of Lough Currib, near the fmall town of Oughterard.

LEAM-KIEN-SAM, a town of Chinefe Tartary ; 42 miles S. of Poro.

LEAM-YOM-HOTUN, a town of Corea ; 600 miles E.N.E. of Pekin. N. lat. $42^{2} 20^{\prime}$. E. long. $128^{\circ} 4^{\prime}$. LEANDER, in Biography, a French Capuchiafriar, was born at $\mathrm{D}_{\text {ijon, }}$ where he died, in the year $166 \%^{\circ}$. His writings are numerous, and by thefe he acquired a high reputation:
he is frequently referred tw by Dupia, in his "Nova Biblion theca Auctorum Feclefialticernm." One of his verrks is entitled "The Truths of the Gofpel;" in two volumes folio. Moreri.

LEAO, in Gengraply, a siver of China, which runs into the fea; 12 miles W. of Lai-clicon

Leao, or I.elb, a river of Chinefe Tartary, formed by the union of feveral rivers, of which no one bears this name till after it has palfed the barrier between Leau-tong and 'Tartary: It rums into the gulf of Leao-tong, about 12 miles W. of Yar-t the.u.

Leso, in Natural /iifory, a minaral fubftance, approaching to the nature of the lapis ingoli, found in the Eatk Indies, and of great ufe in the Cl in fe porcella'n matnifafture, being the fineft blue ties are puriefied of. This tlone is fund in the Itrata of pit-coal, or ia thofe of a yelluwifh or reddith earth, in the neiglbourhood of the veins of coal. There are often found pieces of it lying on the furface or the ground, and thefe are a fure indication, that more will be fuind on digging. It is generaliy fuund in oblong pieces of the fize of a finger, not rourd, bat flat. Some of this is very tine, and fome coarfe, and of a bad coluar. 'The litter is very common, but the fine fort is fcarce, and greatly valuec. It is not eafy to dillinguilh them at fight, but they are found by experiment, and the trying one piece is generaly fufficient for judging of the whole mine; for all that is fuund in the fame place is ufually of the fame fort.
Their manner of preparing it for ufe is this: They forlt wafh it very clean, to 反eparate it from the earth, or any other foulnefs is may have; they then lay it at the bottom of their baking furnaces; and wilen it has been thus calcined for three or four hours, it is taken out and powdered very firfe in large mo:tars of porcelin, with peflles of flone faced with iron. When the puwder is perfectiy fine, they four in fome boiling water, and grivid that with the rell; and when it is thoroughly incorporated, they add more, and finally pour it off, after fome time fettling. The remainder at the bottom of the mortar, which is the coarfer part, they grind again with more water, and fo on, till they have made the whole fine, excepting a little dirt or grit. When this is done, all the liquors are mixed together, and well Atirred. They are fuffered to ttand two or three minutes after this, and then poured off, with the powder remaining in them. This is fuffeed to foblide gradually, and is the fine blue they ufe in their beft works, our common finalt ferving for the blue of all the common low-priced China-ware. Obfervat. fur les Coûtumes de 1-Afie, P. 326 .

It is plain that this ftone is a fort of lapis lazuli; and the ultramarine tlue, ufed by our painters, is made in a manner not wholly unlike this. It is much to be wihhed, that England were well fearched for fuch a ftone as this leac, fince our mines in Deroy frire afford many blue fubitances, which have not been fufficiently confidered ; and if it fhould be found that either this, or any other European nation, produces it, it will be a fine difcovery, as we fhould not only have the means of giving a fine colour to our own manufactures of this kind, but we might trade with it in China to a valt advantage. If England does not poffeis it, it is very'probable thet Ger any does, the mines there affording an aimoft inexhautible tore of coloured ftones: and this being certainly no other than the flony matter of fome cryftalline nodule, accidentally tinged with fome particlez of copper. See Lazuli Lapis.

LEAO-TCNG, in Geography, a province of Chinefe Tartary, more ufually called Chen-yang, or Mougden. (Sce Cuen yang.) The province is extremely fertile; but it is 500 £ar ditant from Peking, and from the centre of

## L E A

## LEA

the empire, to fenid its provifons thither. Befide, carriage is altogether impracticable, execpt in winter: in this frafon, great quantitics of game, and fifh preferved, or inclofed in ice, according to the Chinefe expreflion, are carried from that country to the capital.

Leso-tosg, Gulf of, or Yellozu Sea, is a large bay or gulf of the Chincfe fea, between the peninfula of Corea and China; about 400 miles from N. to S., and from 100 to 250 from E. to W. N. lat. $34^{\circ} 45^{\prime}$ to +1 .

LEAO-COU.HOTUN, a town of Corea, on the S. fide of the Yatou river; 370 miles E. of Peking. N. lat. $40^{\circ} 9^{\prime}$. E long. $125^{\prime \prime} 4^{\prime}$.

LEAP, in Agriculture, a meafure of capacity, fignifying half a buflel, fometimes termed lip.

Le.tp, in ATufic, is when the fong does not proceed by conjoint degrees. For inttance, when there is an interval of a third, fourth, fifth, \&c. between two notes, the Italians call it a late, falto.

It is to be obferved, that there are two kinds of leaps, regular and irregular, called by the Italians fulli regolari $\mathcal{O}^{\circ}$ irregolari.

The regular leaps are thofe of a third major or minor, whether natural or accidental, fourth, fifth, fixth minor, and octave, and thefe either afcending or defcending.

Irregular leaps are the triton, fixth major, feventh major, the ninth, tenth, and, in general, all beyond the compats of an octave:, at leaft in vocal mufic.

Befides thefe, there are others which may be ufed, but with difcretion; fuch as the diminifhed fourth, the falfe fifth, and flat feventh. The difference between the regular and irregular leaps is, that the former are performed by the voice, without any great dificulty or effort; whereas, the latter require more attention and pains to execute.

Leap, in Fibsing, is ufed for a net, engine, or wheel, made of twiys, to catch fifh in. Stat. + \& 5 Will. \& Mary. cap. 23 .

Leap, in the Manoge, an air of a ftep and a leap.
LEAPING-HORSE, in the MTanege, is one that works in the high manege, or one that makes his leaps with order and obedience between two pillars upon a Atraight line, in volts, caprioles, balotades, or croupades. Ufe excludes a .gallop a terra a terra, and corvets from the number of leaps; becaufe the horfe does not rife fo very high in thefe. Each leap of the horfe ought not to gain, or make above a foot and a half of ground forward.

LIEAP.YEAR, the fame with Biffertile; which fee.
It is thus called, becaufe, in the common year any fixed day of the month changes fucceffively one day of the week; but in the leap-year, it fkips or leaps over one day.

The common year hath three hundred and fixty-five days in it, brit the leap-year three hundred and fixty-fix days; and in this cafe February hath twenty-nine days; which, in the common year, hath but twenty-eicht.

To find the leap-year, the rule is,
" Divide by 4, what's left fhall be,
For leap-year, 0 : for paft, 1,2 , or 3."
For example; is the year 1812 a leap-year, or commonyear.

$$
\text { 4) } 1812(453
$$

There is o remainder, fo that it is leap-year.
LEASBURG, in Geography, a town of Amcrica, being the capial of Cafwell county, in North Carolina: concaining a court boufe, gacl, and a few houfes.

LEASE, from the French laifer, dimittere, to lett, in Lawe, a demife, or letting of lands, tenements, or hereditaments, unto ancther for life, term of years, or at will, for a rent referved.

A contract for the poffeffion of lands or tenements, for fomo determinate period, is an eflate for years (fee Estate); and it takes place where a man letteth them to another for the time of a certain number of years, agreed upon between the leffor, or perfon who granteth a leafe, and the leffe, the perfon to whom it is granted, and the leffee enters thercon. (Litt. §58:) If the leafe be but for half a year, or a quarter, or any lofs time, this leffee is reputed as a tenant for years, and is fo flyled in Come legal proceedings; a year being the fhortelt term which the law takes notice of in this cafe. A year is a determinate and well-knowtr period, confilting commonly of 365 days. (See Bissextile.) A month, (fee Montir) in law, is a leafe month, or 2 S days, unlefs otherwife exprefled; and, therefore, a leafe for "twelve months"" is only for 48 weeks; but if it be for "a twelve-month" in the firgular number, it is good for the whole year. (6 Rep. 6I.) Thefe eltates, for years were originally granted to mere farmers or hufbandmen, who every ycar rendered fome equivalent in money, provifions, or other rent, to the leffors or landlords; but, in order to encourage them to manure and cultivate the ground, they had a permanent intereft granted then, not determinable at the will of the lord. Their pofteffion, however, was deemed of fo little confequence, that they were rather confidered as the bailiffs or fervants of the lord, who were to receive and account for the profits at a fettled price, than as having any property of their own; and, therefore, they were not allowed to have a freehold eftate: but their intereft exifted after their deaths in their executors, who were to make up the accounts of their teftator with the lord, and his other creditors, and were entitled to the ftock upon the farm. The leffee's eflate might alfo, by the ancient law, be at any time defeated by a common recovery fuffered by the tenant of the freehold (Co. Litt. 46.) ; which annihilated all leafes for years then fubfilting, unlefs afterwards renewed by the recoveror, whofe title was fuppofed fuperior to his by whom thofe leafes were granted. Ettates for years, whillt they continued precarious, were ufually of fhort duration, like our leafes upon rack-rent; and we are told (Mirror. c. $2 . \$ 27$. Co. Litt. 45, 46.), that by the ancient law no leafes for more than 40 years were allowable, becaufe any longer poffeffion (efpecially when given without any livery declaring the nature and duration of the eltate), might tend to defeat the inheritance. This law, if it did ever exilt, was foon antiquated; for, in Madox's "Collection of Ancient Inftruments,"" fome leafes for years, of a pretty early date, occur, which confiderably exceed that period; and long terms, for 300 or 1000 years, were in ufe in the time of Edward III., and probably of Edward I. But when, by the flatute $21 \mathrm{Hen}$. VIII. c. 15 . the termor (that is, he who is entitled to the term of years), was protected againft thefe fictitious recoveries, and his interelt rendered fecure and permanent; long terms began to be more frequent than before; and were afterwards extenfively introduced, being found extremely convenient for family fettlements and mortgages ; continuing fubject, however, to the fame rules of fucceffion, and with the fame inferiority to freeholds, as when they were little better than tenancies at the will of the landlord.

Every eftate which mult expire at a period certain and prefixed, by whatever words created, is an elate for years; and, therefore, this eftate is frequently called a term, terminus, becaufe its duration is limited and determined; for every fuch eftate muft have a certain beginning and certain end. (Co. Litt. 45.) But "id certum eft, quod certum reddi poteft ;" therefore, if a man make a leafe to another, for

## LEASE.

fo many years as $\mathbf{J}$. S. fhall name, it is a good leale for years (6 Rep. 35.) ; for though it is at prefent unccrtain, yet when J. S. hath named the years, it is then reduced to a certainty. If no day of commencement is named in the creation of this eitate, it begins from the making, or delivery, of the leafe. (Co. Litt. 46.) A leafe for fo many years as J. S. fhall live, is void from the beginning (Co. Litt. 45.) : but a leafe for 20 or more years, if $\mathbf{3}$. S . fhall follong live, is good, for a certain period is fixed, beyond which it cannot laft, though it may determine foolicr, on the death of J. S. An eftate for life, even if it be pur auter vie, is a freehold; but an eftate for 1000 years is only a chatel, and reckoned part of the perfonal eftate. A leafe for years may be made to commence in futuro, though a leafe for life ca:not. Becaufe no livery of feilin is neceffary to a leafe for years, fuch leffee is not faid to be firech, or to have true legal feitin of the lands. Nor, indeed, does the bare leafe velt any eitate in the leflee; but only gives him a right of entry on the tenement, which right is cailed his "interelt in the term," or interefle ternini ; but when he has actually fo entered, and thereby accepted the grant, the ellate is then, and not befure, vefted in him, and he is poffefoct, not properly of the land, but of the term of years (Co. Litt. 46.) ; the poffeffion, or fcifin of the lund remaining titl in him who hath the freehold. Thus, the word "term" does nat merely figuify the time specified in the leafe, but the eftate alfo and intcrett that paffes by that leafe; and, therefore, the "term" may expire during the continuance of the "time," as by furrender, forfeiture, or the like. See Tenant.

Eflates at will, another fpecies of eftates not frecho'd, are thole where lands and tenements are let by one man to another, to have and to hold at the will of the leffor ; and the tenant by force of this leafe obtains poffeflio. (Litt. $\$ 65$.) Sach tenant hath no certain indefeafible eltate, nothing that can be affigned by him to any other; becaufe the leffor may determine his will, and put him out whenever he pleafes. But every eftate at will is at the will of both parties, landlord and tenant; fo that either of them may determine his will, and quit his connection with the other at his own plesfure. If, indeed, the tenamt at will fows his land, and the landlord, before the corn is ripe, or before it is reaped, puts him out, yet the tenant fhall have the enblements, and free ingrefs, egrefs, and regrefs, to cut and carry away the profits. (Co. Litt. 56.) But it is otherwife, where the tenant himfelf determines the will; for in this cafe the landiord fhall have the profits of the land. (Co. Litt. $55^{\circ}$ ) And if rent be payable quarterly, or half-yearly, and the leffee determines the will, the rent fhall be paid to the end of the current quarter or half-year. (Salk. 414.' ${ }^{\text {I Sid. 339.) Upon }}$ the fame principle, courts of law have of late years leaned as much as poffible againtt conitruing demifes, where no certain term is mentioned, to be tesancies at will; but have rather held them to be tenancies from year to year fo !ong as both parties pleafe, efpecially where an annual rent is.refervec, in which cafe they will not fuffer either party to determine the tenancy even at the end of the year, without reafonable notice to the other, which is generally underftood to be fix months. For another fpecies of eltates at will, fee Copyhold. See alfo Sufferance.

A leafe is either written, called an indenture decdfoll, or leafe in writing; or by word of mouth, called leafe-parol. See Parol.

All eltates, interells of frechold, or terms for years in lands, \&c. not put in writing and figned by the parties, thall have no greater effect than as eftates at will ; unlefs it be of leafes not exceeding three years from the making; whereip the rent referved hall be twothirds of the value
of the things demifed. (Stat. 29) Car. II: cap. 3.) Leafés excceding three years mult be made in writing, and if the fubltance of a leafe be put in writing, and ligned by the parties, though it be not foll ch, it that have the effect of a leafefor yeare, \&cc. Wcod's $I_{11} \mid$. 266 .

But a leafe in writing, therygh net under feal, cannot be given in evidence, unleft to be liamged. (1 Tern. Kep. 7.35 .) Articles with covenants to make a leate to let and make a keafe of lands, for a certais term, at fo. much rent, hath been adjudgedaleafe. (Cro. Eliz. 48゙ $)$ In a coverant, with the words "have, poffefs, and oceapy lants, in confideration of a yeariy rent, whtiont the word demife," it was held a good leafe; and a licence to occupy, take the profi:s, \&ec which palfeth an interet, amounts to a leafo. (3 Bult. 204. 3 Saik. 223.) All agrecment (f the partice, that the leflee thall enjoy the lands, will make a leale; but if the agreement hath a reference to the leafe to be made, and impries an intent not to be per!ected till then, it is not a parfećt leale till made afterwards. (Brinly. 13. 2 Sl:ap. Abr. 374.) If a man, on promife of a leate to be made to him, lays out money on the premifes, he fhall oblige the leffor aftervards to make the leafe; the agreement being exceuted on the leffee's part, where no fuch expence hath been, a bare promife of the leafe for a turn of ycars, though the leffee have poffiffion, thall not be good witho fonce writing. A leafe for years may begin from a day paft, or to conic, at Michaelmas dat, Chriknas next, three or fous years after, or after the death of the leffee, \&c. thou:gh a term cannot commence upon a contingency which depends upon another contingency. (i Inft. 5. I Rep. 15\%) If one makes a leafe for a year, and fo from year to jear, it is a leafe for two years; and afterwards it is but an eftate at will. (I Mod. 4. I Lutw. 213.) And if from three years to three years, it is a good leafe for fix years; alfo, if a man make a leafe for years, without fpecifying the number, it may be grood for two years, to anfwer the plural number. (Wood's Intl. 26\%.) Of all kinds of powers the moll frequent is that to make leafes. In the making of fuch leafes all the requiftes fpecified in the power mult be trietly obferved; and fuch leafes mult contain all fuch beneficial claufes and refervations as ought to be, for the benefit of the remainder-man; the principle being, that the eftate mult come to him in as beneificial a manner as the ancient owners held it. By Itat. 29 Gec. II. c. 3 I. infants, lunatics, and femes-covert, may apply to the courts of chancery or exchequer, or to the courts of equity of the counties palatine of Cheiter, Lancafter, and Durham, or to the courts of great felfion of Wales, by petition or motion in a funmary way, and by the order of the fe courts refpectively, fuch perfons may by deed only, without levying a fine, furrender leafes for lives or years, and take new leafes for lives or years of the premifes comprifud therein. Joint-tenants, tenants in common, and coparceners aray make luafes for life, years, or at will, of their own parts, which fhall bind their comparions; and in fome cafes, perfons who are not feifed of lands in fee, \&c. may make leafes for life or years, by fpecial power enabling them to do it ; when the authority muft be exactly purfued. (Wood's Init. 267.) But there is a difference, where there is a general power to make leafec, and a particular power. (8 Rep. 69.) If joint-tenants join in a lcafe, this fhall be but one leafe, for they have but one frechold ; but if tenants in common join in a leale, it fhatl be feveral leafes of their feveral interelts. 3 Rol. Abr. 64. Com. Dig. title Eflatis (G. 6.) Bac. Abr. Leafes (1. 5.)

A leffor may take diltrefs on the tenements let for the rent; or may have action of debt for the arrears, \&ic. Tenants fuffering houfes to be uncoyesed, or in decay, taking away wainfcot,

## LEASE.

wainfcot, \&c. fixed to the frechold, unlels put up by the lefiee, and taken down before the term is expired; cutting down timber trees to fell, permitting young trees to be dettroyed by cattle, Sic. ploughing up ground that time out of mind hath not been ploughed, not keeping banks in repair, \&cc. are guilty of waltes. (I Intt. 52: Dyer 37. 2 Salk. 368.) Leffees are bound to repair their tenements, except the contrary be mentioned in the leale. Although a leffee for years is not obliged to repair the houfe let to him, which is burned by accident ; if there be not a fpecial covenant in the leafe, that he fhall leave the houfe in good repair at the end of the term; yet if the houfe be burnt by negligence, the leffee thall repair it, although there be no fuch covenant. (Pafch. 24 Car. B. R.) A lefiee at will is not bound to fultain or repair, as tenant for years is. A leffee who covenants to pay rent, and to repair, with an exception of cafualtics by fire, is liable upon the covenant for rent, though the premifes are burnt down, and not rebuilt by the leflor after notice. (I Term Rep. 310.) A provifo in a leafe for two years, that the landiord firall re-enter, on the tenant's committing any act of bankruptcy, on which a commiftion thall iffue, is good. ( 2 Term Rep. 233.) An affignee of a bankrupt, a devifee, and a perfonal reprefentabife, are affignees in law to the purpofe of being liable to adions on a covenant for rent in a leafe to the bankrupt, devifor, or inteltate. (Dongl. 184.) Perfons for whofe lives eftates are held by leafe, \&c. remaining beyond fer, or being ablent feven years, if no proof be made of their being alive, flall be accounted dead. (See 19 Car. I1. c. 6.) Where the term of a leafe is to end on a precife day, then, there is no uccedtion for a notice to quit ; becaule the leafe of courfe is at an end, unlefs the parties come to a fre ha agreement. In the cafe of a tenancy from jesr to year, there mult be half a year's notice to quit, ending at the expiration of the ycar. Six calendar months' no:ice is not fufficient. And there is no diltinction between houfes and lands as to the time of giving notice to quit. I Term Rep. 54-159. 162, 3. Blackit. Com. b. ii. Tomlins's Jacub, tit. Leaje.

Lease ly fatute. There are three kinds of perions, who may make leafes for three lives or twenty-one years, and not exceeding this term, by flatutes, that could not do fo heretofore, wiz. tenants in tail, binding their iflue in tail, but not in remainder or reverfion; hufband and wife, of the wife's land; and perfons feifed of an eftate in fee fimple in right of the church, except parfons and vicars; by the flat. 32 Hen. VIII. c. z8. called the "enalling fatute."

But this flatute fpecifies feveral requifites in order to render the leafes binding: they mutt be by indenture, and not by deed-poll, or parol. They mult commence from the day of making, and not at any greater diftance of time: the old leafe, if thire be any, mult be firt abfolutely furrendered, or be within a year of expiring: it mult be either for twentyone years, or three lives, and not for beth; it mult not exceed the term of three lives, or twenty-one years, but may be for a fhorter time: the leafe mult be of corporeal hereditaments, and not of fuch things as lie merely in grant ; for no rent can be referved out of thefe by the common law, as the leffor cannot refort to them to diftrain : :hough now by 5 Geo. III. c. 17. a leafe of tithes or other incorporeal hereditaments alone, may be granted by any bifhop or ecclefiatical or eleemofynary corporation, and the fucceffor fhall be entitled to recover the rent by an action of debt, which, in cafe of a frechold lea?e, he conld not have brought at the common law. The leafe mult alfo be of lands and tenements commonly letten for twenty years palt ; and the cultomary rent for that term referved; and leafes mult not be macie without impeachment of wafte.

By i Eliz. c. 19. called the "difabling or refraining itatute," it is enacted, that all grants by archbifhops and bimops, other than for the term of twenty one years or three lives from the time of making, or without referving the ufual rent, fhall be void: but this ttatute did not extend to grants made by any bihop to the crown; however, thefe, as well as thofe made to any fukjeet, were comprehended in the prohibition of the flatute 1 Jac. I. c. 3 . The rellrictions of this fiatute were exterded by 13 Eliz. c. 10. explained and enforced by 14 Eliz. co 11. and 14 . 18 Eliz. c. 11. and 43 Eliz. c. 29. to certain other inferior corporations, buth fole and aggregate. Froms all thefe it is collected, that all colleges, cathedrals, and other ecclefiaftical or eleemolynary corporations, and all parfons and vicars, are reftrained from making any leafes of any kind, of their land, unlefs under the following regulations: I They mult not exceed twenty-one years or three lives from the making. 2. The accuftomed rent, or more, mult be yearly referved upon thein. 3. Houfes in corporations or market-towns may be let for forty years; provided they be not the man-fion-houfes of the leffors, nor have above ten acres of ground belonging to them, and provided the leffee be bound to keep them in repair; and they may alfo be aliened in feefimple for lands of equal value in recompence. 4. Where there is an old leafe in being, no concurrent leafe thall be made, unlefs where the old one will expire within three years. 5. No leafe by the equity of the ftatute fhall be made without impeachment of watte. (Co. Litt. 45) 6. All bonds and covenants tending to fraftrate the provifions of the ftatutes 13 and 18 Eliz. fhall be void. The 13 Eliz. c. 20, together with all explanations, \&c. of the fame by 14 th, 18 hand +3 d of Eliz. and much of 3 Car. I. which made them perpetual, are repealed by 43 Geo. III. c. 84. f. 10.

If a biflaop have two chapters, as there may be two or more to one bihopric, both chapters mult coufirm leafes made by the bifhop. (i Int. I 31.) A leafe made by a bifhop to begin prefently for twenty-one years, when there is an old leare in being, is grood, notwithtanding the ftar. of 1 Eliz. c. 19. (Mour. Cuf. 241.) But if fuch a leafe is to commence at a future day, it will be void. ( 1 Leon 44. .) Leafe for three lives by a bilhop of tithes is void again't the fucceffor, although the ufual rent be duly received. (Moor Caf. 1078 .) Leafes of 3 dean and chapter are geod, without contirmation of the bifhop. (Dyer, 273. 2 Nelf. Abr. rog6.) Where there is a chapter and no dean, they may make grants, \&c. and are within the ftatute. (I Mod. 204.) A prebendary's leafe confirmed by the archbihop, who is his patron, is good, without confirmation of dean and chapter. (3 Bulltr. 290.) But where a prebendary made a leafe for years of part of his prebend, and this was confirmed by dean and chapter; becanie it was not confirmed likewife by the bifhop, who was patron and orcinary of the prebend, the leafe was adjudged void. (Dyer 6:.) If a prebendary hath rectories in two feveral diocefes, belonging to his prebend, and his leafe of them is confirmed by the bihop, dean and chapter of the diocefe of which he is prebendary, it is good, though not confirmed by the other. (Litt. 75.) A chancellor of a cathedral church may make a leafe, and it is faid it will be good againtt "the fucceffor, though not confirmed, \&c. (Litt. 15-S.) If a parfon or vicar makes a leafe for life or years, of lands ufually letten, referving the cultomary rent, Sc., it mult be confirmed by patron and ordinary, for they are out of the flatute $32 \mathrm{Hen}$. VIII. c. 28. And if the parton and ordinary make a leafe for years of the glebe to the patron; and afterwards the patron affigns the leafe to another, fuch affignment is good, and is a confirma-

## LEASE.

tion of that leafe to the affignec. ( 5 Rep.15.) A leafe for years of a fpiritual perfon will be void by his death, if it is not according to the tatute; and a leafe for life is voidable by entry, \&c. of his fucceffor. ( 2 Cro. 173.) If a bifhop be not bifhop de jure, leafes made by him to charge the bifhopric are void, though all judicial acts by him are good. ( 2 Cro. 353.) And where a bifhop makes a leafe, , which may tend to the diminution of the revenues of the biflopric, \& co which fhould maintain the fucceffor, there the deprivation or tranflation of the bifhop is the fame with his death. 1 Inft. $\hat{3}^{24}$.

There is another reftriction with regard to college leafes, by that 18 Eliz. c. 6 . which directs, that one-third of the old rent, then paid, fhould for the future be referved in wheat or malt, referving a quarter of wheat for each 6 s. $8 \%$. or a quarter of malt for every 5 s. ; or that the leffees fhould pay for the fame according to the price 1hat wheat and malt flould be foid for, in the market next adjoining to the refpective colleges, on the market-day before the rent becomes due. This money arifing from corn rents is, communibus annis, alinolt double to the rents referved ia money.

But when a quarter of wheat is worth 50 s. and the colleges receive one-third of their rent in corn, i.e. a quarter of wheat, or its value for every $\mathrm{I}_{3}$ s. 4 d . which they are paid in money, it follows that the corn rent will be in proportion to the money rent nearly as four to one. But thefe rents united are very far from the prefent value. Colleges, therefore, in order to obtain the difference, generally take a fine upon the renewal of their leafes.

The leafes of beneficed clergymen are farther reftrained, in cafe of their non-refidence, by flatutes 13 Eliz. c. 20. 14 Eliz. c. 1 r. 18 Eliz. c. 11.43 Eliz. c. 9. which direct, that if any beneficed clergyman be abfent from his cure above fourfcoge days in any one year, he fhall not only forfeit one year's profit of his benefice to be diltributed among the poor of the parih ; but that aill leafes made by him of the profits of fuch benefice, and all covenants and agreements of like nature, fhall ceafe and be void; except in the cafe of licenfed pluralifts, who are allowed to denife the living, on which they are non-refident, to their curates only, provided fuch curates do not abfent themfelves above forty days in ary one year. Blackit. Com. b. ii.

An affignment differs from a leale only in this; that by a leafe one grants an interclt lefs than his own, referving to himfelf a reverfion; in affignments he parts with the whole property, and the affignee ftands to all intents and purpofes in the place of the affignor.

If a leffor accepts of rent from an affignee, knowing of the affignment, it bars him frorn action of debt againft the leffee; for the privity of contract is extinguifhed : but after fuch acceptance, the leffior or his affigns may maintain an action againdt the firit leffee upon his covenant for payment of the rent. (x Saund. 241. 3 Rep. 24.) But acceptance of rent from the affiguce has been adjudged a fufficient notice of the affigument, fo that the leflor could not refort to the firft leffee. 2 Bulttr. 15 I.

Leases of the King. Leafes made by the king, of part of the duchy of Cornwall, are to be for three lives, or thirty-one years; and not to be made difpunihable of wafte, whereon the ancicut rent is to be referved; and eftates in reverfion, with thofe in poffeflion, are not to exceed three lives, \&cc. 13 Car, II. c. 4.

Leafes from the crown of lands in England and Wales, and under the feals of the duchy of Lancatter, \&c. for one, two, or three lives, or terms not exceeding fifty years, are Vol. XX.
allowed time for inrollment, \&e by fat. so Anno c. 18. Leafes made by the pririce of Wales of lands, \&c. in the duchy of Cornwall, for three lives, or thirty-one ycars, on which is referved the molt uftaal rent paid for the greateft part of twenty years before, fhall be good againf the king, the prince, and their heirs, \&cc. and the conditions of fuch leafes be as effectual as if the prince had been feifed of an abfolute cilate in fec-fimple in the lands. Stat. 10 Gco. II. c. 29 .

Lease of Land, in the Econcmy of Cigriculture, a kind of contract or agreement for the letting of lunds, tenements, \&ce. either for life, or a certain term of yeare, under a referved rent. It has been itated by Mr. Marfhall, that the different modes of holding land are firit that of "the tenant holding at will, or until the cultomary notice be given, by either party to the other,-without any legak contract or written agreement, -the conly tic between the owner and the occupier being the cuftom of the edtate, or of the county in which it lies,-and the common law of the land." This, he conceives, may be confidered as "the fimpie holding which fucceeded the feudal or copyhold tenure; but which is now going faft into difule." The fecond mode is that of "holding from year to year, under a written agreement, with fpecified covenants." This, which is a more modern ufage, is, on the contrary, he thinks, becoming more and more prevalent; even where leafes for a term of years were formerly granted." The third, is that of a "leafe for a term of years; as feven, fourteen, twenty-one, or a greater number of years certain; but without the power of affignment, unkefs with the confent of the leffor." And the fourth, that of a "leafe for lives; as one, two, three, or more, without the power of affignment, which he belicves now are rarely granted in England, but in Wales they are ftill prevaleat ; the rent being there fettled according to the value of the land at the time of letting, as on granting a leafe for a term. And, in the wettern extremity of England, what are termed life leafes are ftill common. But that they are in fact rather pledges for money taken up, or deeds of fale for lives, than leafes; as nearly the whole of the entimated fale value of the land, during the life term, is paid down at the time of purchafe, the feller referving only a quit-rent or annual acknowledgment."

It is oonceived by the fame writer, that life leafes may be confidered in different points of view; as "to a tenant who holds at a moderate rent, a leafe for life is gratifying, his. farm becoming a fort of life eftate, in which he is fixed for life; but that uillefs he is a prudent or a fortunate man, it may prove a fource of misfortune to his family, who in the moment of their diltrefs for his lofs, may be lial'e to be turned out, pennylefs, from a houfe and home: a circumftance which can rarely happen, under holdings for certaia terms of years." Thefe forts of leafes have a much better effect, it is fuppofed, on agriculture than annual holdings: and that it is more than probable that life tenancy heretofore has affilted in the advancement of the art. "It is, however, a well afcertained fact, that the manifold and great improvements which have taken place in Englifh agriculture, during the laft half century, have not been effected in Devonilhire nor in Wales, but in Norfolk, and in the midland counties under leafes for terms of years." And "that in a political light, life leafes have a favourable appearance, as tending to fill up a face between ordinary teants and yeomanry or fmall proprietors, and giving their holders better ftakes than lefs certain occupiers have, in the eftablifhed order of things." But that "here it is the light in whick life-holds appear to land proprietors that is entitled to the

## LEASE.

chief attention," which "on whatever ficte they have been viewed by the owners of extenfive edtates during the laft tiventy or thirty years, have doubtlefsily appeared in odious colours. For owing to the rapid depreciation of money there are proprietors who have been receiving, year after year, not more perhaps than one-half, or a lefs proportion, of the fair rental value of many of their lands. And for lich as till hang on good lives, they may not receive more for many years to come." And further, that "owing to the perpetual bondage in which their lands are kept, no general work of arrangement can be effected, nor any individual improvement introduced by a proprietor, who can fcarcely be faid to have any authority either over his eflate or its poffeffors." They have in fact been the bane of very uffeful improvement of the foil, and the great caufe of its want of amelioration in every county where they have exitted to any extent.

It may be noticed, that thofe forts of holdings which are only for the year, "are, to a terant, mof difcouraging ; and to improvement in agriculture moft unfriendly. In a public view they are of courfe highly impolitical : while to a proprietor they are moft convemient, as he may be faid to be in conftant poffelfion of his ellate. He can lay out and execute general improvements, as embankments and drainage, extenfive works of irrigation, the alteration of watercourfes, roads and fences, and complete the arrangement of tenements without controul. It would be unwife, therefore, on an eftate under this fort of tenancy, to alter it, until the requifite improvements were planned, and put in a train of being performed." It has, however, been further juitly remarked, that "whatever difcourages agriculture cannot be permanently profitable, either to a proprietor or the community." And in regard to prefent prolit they mult be highly difadvantagenus to the proprietor or owner.

With refpect to the third holding of land, as that of leafes for terms of years, as "for twenty-one years, though they may be profitable at their commencement, they have, it is Suppofed, been found much otherwife before their expiration: owing to the great rife in the value of farm produce, during the terns. And while proprietors who were letting their lands from year to year, were profiting by this circumftance; the income of thofe whofe lands were under long leafes (whether of lives or years) were ftationary; and this while the expences of living were advancing with the value of lands; which circumitances, added to their being controuled in the required arrangement, and perhaps annoyed during a length of years, by the improper conduct of ignorant, ill-difpofed, purfe-proud tenants (enriched by thefe very circumftances) have determined many perfons in different parts of the kingdom to difcontinue the practice of granting leates; giving written agreements from year to year only; which is much to be lanented for the interelt of agriculture and the community in general." While others have thortened the terms of their leafes to fourteen years. But fuch " has been the rapid depreciation in the value of money, and the nominal increafe of the value of lands, that even this term has been found ferioully inconvenient to a landlord; and the term of feven years (without a covenant of remuneration) is, it is believed, of little ufe to a tenant." Thefe fixed leafes are liable, it is conceived, to another objection. As " although a man of fpirit and worth will not only give an advanced rent, in the firft inflance, but will, through the improvements he has made, be able and illing to give a ftill greater advance at the end of the term; yet, wh:n a leafe of this nature has been unfortunately or improvidently granted to a poor, an ignorant, an indolent, a refentful, or a difhoneft man, the farm thus
let may be left at the end of the term in a much worfe eondition than it was in at the commencement." This renders it highly neceflary for the manager of an eftate to be careful in the choice of tenants. Where great and expenfive im. provements are required, it will be conitantly neceffary, howeter, to have long leafes.
'Ihis may be remedied, in a great meafure, by the renewal of leafes before their tegms are expired.

The above writer confiders it ufeful, for owners or pro. prietors to come to clear underftandings with their tenants, three years previoufly to the terminations of their refpective leafes. "For it is conceived, that, until about that period, a fkilful tenant continues to keep his land in cultivation and condition, for his own intereft; which, until then, may be faid to go hand in hand with that of his landlord. And if, at that period of a leafe, a frefh agreement were entered into, the ruinous confequences of an expiring term might be avoided." And that from proprietors objecting to give leafes for long terms, " it occurred to him, that agreements for holding from three years to three years, inttead of from year to year, would be an eligible fpecies of tenancy. Or, which is precifely the fame thing, granting leafes for fix years certain; with a condition, that of neither party give notice to quit before the expiration of the firft three years, then the term to be prolonged to nine years; and foon, from three years to three years, (or in effect from fix years to fix years,) until three years after notice has been duly given by either party to the other," as by thefe means room is given for a tenant "to turn his hand in. He has, in reality, a frefh leafe of fix years granted him every third year. And this is fufficient to encourage him to keep his lands continually in the moft hufbandlike ftate. And if he execute any of the higher improvements, it is but reafonable that he fhould have, whenever he may quit his farm, an equitable remuneration for the remainder of fuch improvements. Thus the tenant is placed on fure ground ; he may fill manure and improve with much the fame confidence, as if the lands in his occupation were his own property." And "in return for fuch advantages, the tenant cannot befitate, it is fuppofed, to covenant, that, during the laft three years of his term, he will manage his farm in a hufbandlike manner, and at the end of the term leave it in fuch a flate of cultivation and repari, as will induce a good tenant to take it at a full rent ; or fuffer the proprietor to put it in fuch a liate, at his (the out-going tenant's) expence. An eftate which is under leafe on there principles, and under attentive management, car:not, it is conceived, be let down to an unprobitable ftate. It mult continually remain under a regular courfe of hufbandry, and in a flate of cultivation and repair; and the more permanent improvements be kept up. If the acting manager do his duty, even the changing of tenants cannot interrupt its profperity," while "the incoming tenant (under aftive management) fteps into his farm, with the advantagcs that he would have enjoyed, had it been under his own direction, for the three preceding years." But "with a leafe on this principle, and with a proper choice of tenants, removals can rarely happen. What proprietor, who knows the difficulty of procuring a good temant, would wifh to difcharge him? And no fuch tenant would readily leave the tarm he is fettled upon, if be find proper treatment. Even fhould notice be given in confequence of any mifunderftanding between the parties, three years allow time for reflection; and, before they expire, refentment may. die away, and cordiality be re!tored. If, however, either party be diflatisfied, he has an eafy way of diffolving the connection. Or if a proprictor is defirous to make frefh arrangements on his eftate, or to regulate his rent-rcll by the exith-
ing value of money, he need not wait many years to fulfil his detires; for if the temant in occupancy will not agree to pay a fair rent, the owner has three years before him to choofe one who will." It is thus evident, that "a leafe on this principle has a decided preference, by a proprietor, to long leafes. And its advantage over annual holdings is not lefs conliderable. The lands of an eftate are well worth from five to ten per cent. more to a tenant, under the former, than under the latter tenancy. So that befide the convcniencies mentioned, a proprietor may be immediately adding very confiderably to his income, by this principle of management." This has been proved in many cafes in different parts of the kingdom.

Covenants of Leafes.-It is fuggefted, that the neceflary covenants,-the relervations, reftrictions, obligations, penalties, and remunerations, that the leafe (or form of a leafe) of any landed eftate contains, are (or ought to be) a code of private relltraining laws, fuited to the circumftances of that particular eftate, in order to protect it from injury, and to promote its profperity : an honeft tenant confiders the covenants of his leafe merely as inftructions to direct his fteps, but which ought to reiltrain him no farther than to protect the farm or the eltate from injury. But a worthlefs tenant, as a thief, is ever ready to break the laws which bind him; and the proprietor of an eftate ought to have fome means of punifhing him for his fault. Penal covenants in leafes are of courie of the greatef importance to proprietors. But on account of "the great difficulty with which a general law of this nature would be framed, owing to the great diverfity of foils, fituations, and modes of culture, every eftate, ftrictly fpeaking, requiring its own peculiar code to govern and defend it, (and of courfe the great difficulty which a court mult find to decide with any fort of accuracy in cafes of this kind, ) -one would naturally imagine, it is faid, that courts of law would rather be thankful to proprietors of eltates, for furnifhing them with ready and fafe means of doing jultice, than fet their faces againft any covenants, which have been formerly entered into, and legally confirmed by the parties before them. If penalties are exceffive or oppreffively fevere, or have been furreptitioully impofed, it undoubtedly belongs to a court of law to mitigate or remove them. But fevere reftrictions, and exceffive penalties, are hiphly impolitic, and altogether improper to be introduced into the leafe or law of an eftate, inafmuch as they tend to deprefs its character, and may prevent good tenants from fettling upon it ; or drive away thofe whom it may already poffers ;" and of "courfe militating againft one of the firft principles of good management." But " where, by judicious reftrictions and reafonable penalties, defigning men are kept aloof, a general good is gained to the eftate."

The particular covenants that are neceflary, mult be determined by the exiting circumftances of the eftate, or the particular farm for which it is intended; the modes of culture, cropping, \&c. as it is obvious, that "a grafs land farm requires a fet of covenants differing from thofe which are proper for a farm under mixed cultivation. And an arable farm, fituated near a great town, fhould have covenants differing in fome refpects tom thoje of another, which lics in a reclufe diltrict : while every part of an ettate, and all eftates on which hedge timber can be profitably raifed, call for a feries of regulations, which an untimbered eftate, or one on which grown timber only is to be protected, does not require." And that, "much depend's on the time of changing tenants. A fpring and autumnal removal require very different Itipulations refpecting the fates in which the lands of a farm are to be left; how the crops in the ground, and the produce on hand ase to be difpofed of; and by
whom the crops of the fuceceding year are to be put $1 \pi$. Every diftrict las its cultomary time or times of removal, and it can feldom be prudent in an individual to alter it (even though very improperly fixed) as he might thereby diminifh his choice of tenants. Neverthelefs, it is in the power of proprictors conjointly, to effect, in time, the rea quired alteration. Michaelmas and Lady-day may be confidered as the ordinary times of changing tenants in England. The former is not an ineligible time for removing in autumn, but the latter is extremely improper, as being in the middle of fpring feed time, and falling at a time when the winter fodder is partially expended, and the crops of the preceding year are partially thrafhed out." Mr. Marfhall fates, that " in the north of England (Cleveland, in Yorkflaire, being the moft fouthern diffrict in which he has obferved it,) a far more rational plan of removal is eftablifhed. There, the arable lands are quitted at Candlemas; the pafture grounds (Cleveland being much of a dairy diftrict) at Lady-day ; and the mowing ground and the home-ftall at old Mayday." While, in Scotland, fimilar regulations prevail ; but with a well judged difference, which naturally arifes out of the different climatures of the two fituations. There, the premifes are finally quitted at what is termed Whitfuntide, namely, the fifteenth of May old Atyle." And it is the opinion of this writer, that, "for the more fouthern provinces of England, the firt of May, new ityle, would be a proper time for removals in the fpring."

Forms of Leafes. - In refpect to the forms of leafes, thofe which are good do not, it is ftated, "merely require a judicious felection of covenants, but that the feveral claufes flould be properly digefted; and be arranged, worded, and lettered in fuch a manner, as to be intelligible to plain coun-trymen,--to men for whofe guidance and good government they are intended." And the plan, which experience entitles the above writer to recommend, is that " of printing leafes on large folio fheets of firm paper, or theets of parchment, folded in the folio manner; each page containing two columns, and each claufe compofing a diltinct paragraph; with a blauk page, or half page, to receive a fketch, or rough plan of the farm demifed; as well as a particular, or fchedude, of the different parcels of land of which it is compofed: with the number, name, and meafurement of each arranged in the column manner: in order that no doubt may at any time arife refpecting their identity." It is ufeful to have a book in which all thefe, and fome other circumltances, are regularly arranged and marked down.

Mr. Kent, in his " Hints to Gentlemen of Landed Property," ftates, that the ancient feudal tenures had undoubtedly a ftrong tendency to enflave mankind, by fubjecting them to the controul and power of an arbitrary lord; but, like moof other things, there were fome advantages to be found in the fyftem. Every man who held land had a certainty in it, as the tenant generally held his poffeffion for life. When thefe tenures were difcountenanced by the more liberal firit of modern law, fome new compact became neceffary, and terms of years were fubflituted in lieu of the former; for, as land properly managed requires great expence, and feldom anfwers that expence in one vear, it was but reafonable that the man who applied his judgment, devoted his labour, and ventured his capital, fhould have fome reafonable time allowed him to reimburfe himfelf, and derive fome proportionate reward for what he had doue. In the courfe of time, this term began to be reduced into a certain number of years; and as molt of the land was formerly under the regulation of two crops and a fallow, the time allowed was from three to twenty-one years. And the latter in the end became the molt general limitation, $3 \mathrm{M}_{2}$
and is the moft prevalent term for leafes at the prefent period..
'There ean be no doubt, it is fuppofed, but that leafes are the firt, the greatelt, and molt rational encouragement that can be given to agriculture ; yet of late years there are very flrong prejudices entertained againtt them.

Let any impartial man take a view of two dilltricts, where it is the cultom to grant leafes, and where it is not: in the former he will generally find a refpectable yeomanry, and a well cultivated country; in the other, an indigent fpiritlefs race; following a contracted fyflem of hubandry, calculated to anfwer no permanent purpofe of advantage to themfelves or landlords. Yet, there are many gentlemen who, to have fuch people at immediate command, prefer the continuance of a flovenly unproductive ttyle of hufbandry, to neatinefs and fertility. In fome parts of Eugland, the prejudice againit leafes is foltrong, that fome landlords will be tempted atmoft as foon to alienate the fee fimple of their citates, as to grant a tenant a reafonable term in thens. It is very unfortunate fur a county where this abhorrence of leafes prevails, as it keeps back an immenfe fcene of improvement, which othervife would take place, and robs the indultriuns occupier of a deal of comfort which might be beitowed upon him; and it can produce no other confolation to the owner than that of having the country more at command, and forcins a certain degree of refpect from it, which is abfurd to the lat degree; for a landlord may, it is conceived, enfure as much real refpect from a tenant on leafe, as from a tenant at his immediate will and plealure, and at the fame time fecure his property better, and Hipulate for improvements to the extent of his inclination or defire.

It is noticed farther, "that in the eaftern counties, where it is more the cultom to grant leafes than in the midland parts of England, agriculure is upon the moft refpectable footing; and that within half a century there are many eftates more than doubled in their value; which, without leafes, where the meanis of improvement were heavy, could not have carricd a third of the advance that has been put upon them. In fhort, it feems to him unreafonable to expect a man to employ the whole of his capital, and to devote the beft part of his life upon an eltate which, on the death or mere caprice of the lanslord, he is liable to be turned out of at fix months, or peihaps a florter noticc.

It is not, however, meant to imply, that leafes ought not in any cafe to be withheld; there are certainly fome exceptions againg the practice he wifhes to fee eltablifhed: for inltance, if lands are fituated very near a gentleman's houfe, part of which it may, perhaps, be an object, on fome future occafion, to take into hand, or where a minor is very near coming of are, or where there is any immediate view of fale; in fuch cates, it would be imprudent to grant leafes. But where none of thefe contingencies ftand in the way, and where eitates are under an entail, or in a family that has no idea of parting with them, leafing is unqueltionably the molt effectual means of raifing the value of an eltate, as it enables the owner to Itipulate for improvements in what way and proportion he pleafes, which he cannot do fo well in any other manner.

And the author of the "Treatife on modern Agriculture" sontends, that nothing gives Juch a fpring to indultry as the conviction, founded on the experience of ages, that in this ccuntry the fruits of the labours of the indultrious man are fecured to him. Hence, a farmer will be more or lefs active in proportion to the fecurity he holds of reaping the fruits of his induftry, fkill, and capital.

And it is ftill further ftated, that leafes are certainly necerfary and proper, as a compact between man and man ; and
though the mode of cropping and gencral tenor of the leafe mult vary according to times and circumiltances, yet no man who has thought feriouny on the fubject will deny that they are for the benefit of both parties, as they fecure to the landlord the proper management of the land fo leafed, and to the tenant the additional profits which may be expected to arife from his fuperict cultivation of fuch lands or farms.

But as it is neceflary to impofe fome degrese of reltraint upor tenants, the means of doing it in fuch a way that they may not be fo fettered as to be prevented fiom making ufeful improvements, or left fo much at liberty as to do mifo chief; are the poin: that forms the principal dificulty. Hence the circumitance to be chiefly guarded againft by reftrictive penal covenants, are thofe of preventing the breaking-up of old meadows, pattures, or other lands, the removing away hay, Atraw, or other materials convertible into manure; and the improving or deltroying of timber trees. To enforce the leaving of green winter food; the keeping up of all forts of fences; the cleanfing of water-courfes, ponds, pools, \&ic. and the preferving of huildings, gates, pens, and bridle roads in proper repair. To prevent the forming of rabbit-warrens, and the committing of wafte of any kind. And, finally, to regulate the circumilances of the out-going and in-coming tenants with propricty.

Bua althougla it is not poffible to form any pasticular leafe, fo as to inclurde claufes that can apply to every kind of foil, mode of cropping, and gencral management ; yet, as he has had opportunities of perufing a great variety of leafes in different parts of England; and as he is in poffeffion of one which is the moft perfect of the kind he has feen, it is fuggefted that it may convey more information on the fubject than any explanation that could be otherwife given of it.

## Form of Leafe.

" This Indenture, made the day of in the year of our Lord one thoufand eight hundred and between A. B. of in the county of
efquire of the firlt part, and C. D. of in the county of yeoman of the fecond part: Witneffeth, That for and in confideration of the rents and covenants, provifos and agreements, hereinafter referved, expreffed, and contained, and which, on the part and behals of the faid C. D., his executors and adminititrators, are to be paid, done, and performed, he the faid A. B. hath demifed, leafed, fetten, and to farm letter; and by thefe prefents doth demife, leafe, fet, and to farm let unto the faid C. D., his executors and adminitrators, all thofe mefluages, tencments, or farms, called
of and county of
the poffeffion of fituated in the parilh now or late in together with all and fligular houfes, out-houfes, edifices, buildings, barns, cowrhoufes, cattle-fheds, itables, yards, garths, ttack-garths, gardens, lands, feedings, ways, waters, eafements, privileges, and appurtenarces whatfoever, to the faid demifed premifes belonging, or in anywife appertaining, except and always referved out of this prefent demife, unto the faid A. B., his heirs and affirns, all mines, minerals, and quarrics, of what nature or kind foever the fame may be, as well opened as not opened, lying, being, and remaining within or under the faid premifes, or which can or may be ubtained, or gotten forth, or out of the fame, or any part therecf, with liberty to dig brick-earth, and room to work, mould, dry, and burn the fame into bricks, in and upon the faid hereby demifed premifes, or any part thererf: And alfo with fuil and free liberty, power, and atthority, to and for the faid A. B., his heirs or angris, and his and their agents, fervants, and work-

## L E A S E.

then, at feafonable times in the ycar, in the day-time, to fearch for all and every fuch mines, minerals, quarries, and brickearth, and to link pits or thafts, and to make trenches, grocves, drifts, water-gates, canals, water-courfes, and to direct or turn any water-courfe, brook, or river, for the winning and working fuch mines, minerals, and quarries, within the fuid deraled premifes, with fuffecent groundroom aud heap-room for laying the ores, motals, mincrals, coals, flones, clay, earth, materials, and rubbih, to proceed, or be obtained or gotten forth out of the fame or any of them; together with full hiberty and power to build and erect engines, machines, houfes, hovels, lodgres, liables, cabins, and other edifices aud erections whafoever, for the effesual winning and working the fane: And alfo full and free liberty of way, leave, and paffage in, through, and over the faid premifes, or any part ithereof, to and from the faid mines, minerals, quarries, and brịck-kilns whatfocver, with carts, wains, waygons, and any other carriage or carriages neceffary for leading ores, metals, minerals, coals, thones, cinders, bricks, lime, timber, or any othermatter or thing whatfocver, and to make, lay, and place through, over, and upon the fird prenufe, any road or roads, waggonwdy or wargon-ways, rail-ways, or any way or ways, canal or canals, for the parpofe aforefuid, and from time to time to repair the fume, and to do all other acts and things need. ful or neceffary for the winning, working, managing, and carrying on the fuid mines, quarries, and brick-making, as he or they fhall think proper, with liberty to demife or grant to any perfons all fuch liberties as herein before-mentioned : And alfo, except and referved unto the faid A.B., his heirs and affigns, all timber and other trees, woods, underwoods, and plantations, and the ground and foil thereof, now ftanding, growing, or being, or which fhall hereafter at any time during the continuance of this demife, itand, grow, or be upon the faid premifes, with liberty to fell, cut down, or lop fuch timber trees, or other trees, woods, underwoods, and plantations, and to carry ayay the fame, by any means whatfoever: He, the faid proprietor, his heirs or affigns, or his or their grantec or leffee refpectively, making reafonable fatisfaction to the faid tenant, his executors or adminiltrators, for the rlamage or Spoil of herbage or ground, to be occafioned by the ufe or exercife of all and every or any of the liberties aforefaid, fuch fatisfaction to be from time to time fixed and afcertained by two indifferent perfons, one to be named by and on the part of the faid A. B., his heirs or afigns, and the other by and on the part of the faid C. D., his executors or adminiltrators : And alfo, except and referved full power and authority for the faid A. B., his heirs cr aliigns, and his and'their ftewards and agents, with workmen in theercompany, of without, in the day-time twice, or oftener, in every year during the term hereby demifed, to enter in and upon the faid premifes, or any part thereof, to view the ftate and condition of the fame: And alfo, except and referved unto the faid proprietor, his heirs and affigus, free liberty to huat, courfe, hawk, froot, and fifi, in, upon, through, and over all and every the faid hereby demifed premifes, or any part thereof; to have and to hold the faid meffuage, tenemeint, or farm-hold, lands, grounds, and all and fingular other the premifes hereby demifed, or mentioned, or intenced fo to be, with their and every of their appurtenances (except as before excepted), unto the faid C. D, his executors and adminiftrators, from the tiveifth day of May, in the year of our Lord one thouland eight hundred and
for and during and unto the full end and 'term of twenty-one years, from thenceforth next enfuing, and fuily to be complete and ended: yielding and paying yearly, and every year during the faid term
of twentyone jears hereby demifed unto the faid A. B., his heirs or afligns, the clear yearly rent or fum of of hawful moncy of Great Britain, by equal half-yearly payments, at two days or times in the year, that is to fay, the twenty-fecond day of Nowember, and the twelfeh day of May in every year, by even and eqqual purtions; the firlt half-ycarly payment of the faid fearly rent to begin and be: ade upon the twenty-fecond day of November next enfuing the commencement of the faid term hereby demifed: And allo yielding and paying yearly and every year unto the faid A. P., his heirs or affigns, on the feveral days and times aforefnid, over and above the faid yearly rent of the further rent or fitm of pounds an acre, for every acre of the faid demifed premifes, that he the faid C. D., his executors or adminittrators, fhall, at any time or times during the continuance of this demife, break up, tear out, or convert into tillage, or have, or ufe, or employ in any courfe of hufbandry, contrary to the covenants hereafter contained, without the licence and confent of the faid proprictor, his heirs or affigns, in writing for that purpofe first had and obtained, and to in proportion for a greater or lefs quantity than an acre; the firit payment of the faid additional rent to be made on the firit of the aforefaid half-yearly day's of payment, which fhall happen next after the ploughing, breaking up, tearing out, converting into tillage, or having or ufing, or employing in any courfe of hufbandry, contrary to the covenants hereinafter contained, any part of the faid hereby demifed premifes, which faid two feveral and refpective rents are to be paid as above expreffed and referved, free and clear of all taxes, affeffments, charges, and impofitions whatfoever, as well parliamentary as parochal, or otherwife, which the faid premifes now are, or may hereafter be liable to anfwer or pay: Provided always, and upon condition, and it is the true intent and meaning of thefe prefents, that if it fhall happen that the faid yearly and other rents herein and above referved, or any of them, or any part thereof, be behind or unpaid, by the fpace of forty days next over or after either or any of the faid days or times whereon the fame ought to be paid as aforefaid, or in cafe the faid C. D., his executors or adminiftrators, fhall neglect or refufe to do and perform all and every of the covenants or agreements herein mentioned and contained, on his and their parts, to be paid, done, and performed; or in cafe the faid tenant, his executors or adminitratcrs, fhall, or do, at any time or times during the term hereby demifed, alien, let, or affign over the faid premifes, or añy part thereof, unto any perfon or perfons, without the licence and confent of the faid A.B., his heirs or affigns, in writing for that purpofe firt had and obtained, that then, and in any of the faid cafes, it fhall and may be lawful to and for the faid A. B., his heirs or affigns, or fuch perfon or perfons as fhall be by him or them appointed for that purpofe, into and upon the faid demifed premifes, or into and upon any part thereof, in the name of the whole, wholly to re-enter, and the fame to have again, re-pofefs, and recojoy, as in his and their lirft and former eftate, and from and immediately afier fuch re-entry made, the faid term hereby demifed thall ceafe, determine, and becoree utterly void and of none effect, any thing in thefe prefents contained to the contrary thereof in anywife notwithflanding: And the faid A. B. for himfelf, his heirs and afligns, doth hereby covenant, promife, and agree to, and with the faid C.D., his executors and adminiffrators, that it fhall and may be lawful to and for the faid C.D., his executors and adminitrators, (he and they paying the rents and performing the covenants and agreements hercin referved and contained, on his and their

## LEA5 C .

parts, and to be paid, done, and performed, according to the true intent and meaning of thefe prefents), peaceably and quietly to have, hold, ufe, occupy, poffefs, and enjoy all and fingular the faid premifes, with their appurtenances hereby demifed (except as before excepted), for and during the faid term of twenty-one years, without the lawful let, fuit, trouble, denial, hindrance, moleftation, cviction, or interruption of him the faid A. B., his heirs or alfigns, or any other perfon or perfons, claiming by, from, or mader him, them, or any of them: And alfo, that it fhall and may be lawful to and for the faid C. D. his executors or adminitrators (he and they paying the rents and performing the covenaits and agreements as aforefaid), in the harvelt feafon next after the expiration of the faid term hereby demifed, peaceably and quietly to have, cut down, reap and lead the crop of corn or grain by him, them, or any of them, fown and then growing upon two-thited parts of the lands then in ploughing or tillage (according to the covenants hercinafter contained, and the true intent and meaning of thefe prefents), commonly called the way-going crop; and the fame corn or grain to fet in the ftack-yards, and thrafh the fame in the barn or barns of and belonging to the faid demifed premifes: And that he the faid C. D., his executors or adminittrators, fhall, for the purpofes aforefaid, have the ufe of all the ftack-yards, barns, and granaries of and belonging to the faid demifed premifes, until the twelfth day of May next, after the determination of this demife; and the fame corn and grain fo thrafhed (after payment of rents and arrears of rents then unpaid), fhall and may carry away, fell, and difpole of, to and for his or their proper ufe and benefit, leaving and delivering all the ftraw of the faid waygoing crop, as foon as the fame is thrafhed (as hereinafter mentioned), in and upon the faid premifes, unto and for the ufe and benefit of the faid A. B., his heirs and afligns, or his or their nest fucceeding tenant or tenants: And the faid A. B., his heirs and affigns, or his or their next fucceeding tenant or tenants, fhall and will lead the faid way-going crop from the lands where it grew to the barns or itack-yards, and fork the fame from the loaded carts to the flacks: And alfo fhall and will bear and pay one-half the expence of making and erecting new quick fences upon the faid premifes, and of cleaning, rearing, and preferving the fame for feven years, after being firft planted: And alfo, \&c. [Here follow any other covenants on the part of the leflor for new buildings, \&cc. \&c.]

And the faid tenant, for himfelf, his heirs, executors, adminittrators, and affigns, doth covenant, promife, and agree to and with the faid A. B., his heirs and affigns, by thefe prefents, in manner following, that is to fay, that the faid C. D., his executors or adminiitrators, fhall and will well and truly pay, or caufe to be paid, unto the faid A. B., his heirs or affigns, the faid yearly rent or fum of
and alfo the other cafual or eventual rents hererein above referved, and payable on the days and times, and in manner above mentioned for payment thereof, according to the true intent and meaning of thefe prefents: And alfo fhall and will from time to time, and at all times during the term hereby demifed, well and truly pay and difcharge all and all manner of taxes, affeffments, rates, charges, dues, tithes, and impofitions, parliamentary or parochial, whatfoever, which now are, or at any time hereafter during the term hereby demifed fhall be, taxed, affeffed, rated, charged, or impoied upon the faid premifes, or any part thereof: And alfo fhall and will, from time to time, and at all times during the faid term hereby demifed, at his and their own charge and expence, repair, uphold, maintain, and keep, with all manser of needfil and neceffary reparations, all and fingular the
houfes, buildings, barns, cow-houfes, eattle-fheds, Rablei, offices, gates, ttiles, rails, fences, hedges, ditches, drains, and water-courfes, of and belonging to the premifes hereby demifed, or which may at any time hereafter during the faid term, be built, erected, or made upon the faid premiles or any part thereof: And at the end, expiration, or other fooner dctermination of the faid term, fhall and will deliver up all and lingular the faid houfes, buildings, erections, barns, cowhoufes, cattle-fheds, flables, offiees, gates, filies, rails, fences, hedges, ditches, drains, and water-courfes, with their ard every of their improvements unto the faid A. B., his heirs or affigns, in good and fufficient repair and condition, together with the peaceable and quiet poffeffion therenf: And alfor Ghall not, nor will not, at any time or times during the continuance of this demife, fell, difpofe of, fend or carry away, or permit to be fold cr difpofed of, Tent or carried away from off the faid premifes hereby demifed, any of the hay, ttraw, clover, turnips, cabbages, or other fodder, that fhall grow or be produced from, or made thereon, but fhall and will eat and confume the fame (for the increafe of manure) upon the faid premifes: And alfo flall and will, from time to time, during the continuance of this demifc, at the proper feafons in every year, duly lay and fpread upon the fallow grounds of the faid premifes (where moft requifite and proper for the improvement thereof ), in an even, regular, and uniform manner, all the manure, durg, and compoft that flall be bred and made on the premifes; except the manure, dung, and compoft to be bred and made thereon in the year next before the determination of the faid term; and which manure, dung; and compoft, thall be left in the fold-yards, dung-hills, or midden-lteads of the faid premifes, for the ufe and benefit of the faid A. B., his heirs or affigns, or his or their next fucceeding tenant or tenants: And alfo flall not and will not plant or fow any hemp, flax, or muftard, or any rape for feed * upon the faid premifes, or anŷ part thereof: And alfo fhall not, and will not, at any time or times in the year next before the determination of this demife, depalture or graze, or fuffer to be depaftured or grazed upon the faid premifes, or any part thereof, any larger flock of cattle or greater number of ftints than were ufually depaftured or grazed thereon in the two years next preceding the faid latt year of the faid term, or other fooner determination thereof: And alfo fhall and will yearly, and every year during the faid term hereby demifed, catch and deftroy the moles, and fcale, mould, drefs, and clean the grafs-grounds of and belonging to the faid demifed premifes: And alfo fhall and will thrath the way-going crop, at the determination of the faid term, in an uniform manner, fo as to deliver a conttant, regular, daily fupply of ftrav to and for the ufe of the faid A. B., his heirs or affigns, or his or their tenant or tenants: And alfo fhall and will, from and after the firit day of October preceding the ternination of the faid term, hain, free, and keep uneaten, all thofe fields or parcels of ground fown with grafs-feed in the laft fifteen months of the faid term; fave and except that it fhall and may be lawful for the faid C. D., his executors and adminiftrators, from and after the firft day of April next before the end of the faid term, to depafture, with not more than fheep an acre, onehalf of the faid hained clover or new grals, which half fhall be chofen and fet out by the agent of the faid A. B., his heirs or affigns, in the month of March preceding: And alfo fhall and will permit the faid A. B., his heirs or affigns, or his or their tenant or tenants, to fow with grafs-feeds all or any part of the lands fown with corn or grain, for the way-going crop, and to roll in the fame with a roller drawn

* Rape for green foud is allowed.
by horfes, according to the cuftom of the country: And alfo fhall and will permit and fuffer the faid proprietor, his heirs or affigns, or his or their fervants, dranghts, and workmen, from time to time, and at all times, from and after the firlt day of December preceding the determination of this denife, to enter into and upon all the then fallow grounds of the faid premifes, or the grounds which, according to the true intent and meaning of thefe prefents, ought to be in fallow, and the fame to plough, fow, harrow, drefs, manure, lime, and prepare for fuch courfe of agriculture as he or they thall think proper to convert the fame into, without the let or hindrance of him the faid C. D., his executors or adminittrators: And alfo fhall not, and will not, have, ufe, or employ, in ploughing or tillage, a greater quantity of land than acres of the faid premifes at any one time, or in any one ycar, during the term hereby demifed: And alfo ftall and will yearly, and every year during the term hereby demifed, fummer fallow $\dagger$ at lealt one-third part of the tillage, and plough the fame at leatt
feveral times, at proper feafons in each year, and keep the fame free and clear from quick-ins, wild oats, thitles, coltsfout, runch, dead nettles, and every other pernicious plant or weed, and lay and fread upon every acre of fuch fallow, in an even and regular manner, at lealt
fother of well-turned clod-lime, or in lieu thereof twenty fother of good well-rotteu dung, and fo in proportion for a lefs quantity than an acre : And alfo fhall not, and will not, have, keep, or continue in ploughing or tillage, any part of the faid demifed premifes, more than years at one time, that is from being ploughed out from grafs, to being laid down to grafs again: And alfo fhall and will yearly, and every year, fow with grafs-feeds, and lay down to grafs, at leaft one-third part of the ploughing or tillage-lands, after a clean fummer fallowing, and a crop of wheat, or a crop of turnips and white corn, and fow upon every acre thereof at leaft eight pounds of red clover feed, three pounds of white clover, three pounds of rib-wort plantain, and two pecks of rye-grafs $\ddagger$ of the beft quality; the quantity and quality to be aicertained by proper vouchers from the perfons of whom the faid feeds viere bought, and by whom the faid feeds were fown: And alfo fhall and will, whenever any part of the ploughing or tillage lands are laid to grafs, keep and continue the fame in grafs at leaft
il years before the fame, or any part thereof, be again ploughed out, or converted into tillage: And alfo Shall and will, in the lalt three ycars of the faid term, lay down to grals as aforefaid, or have in grafs, and at the end thereof leave in grafs, all thofe fields or parcels of land, called And alfo fhall and will, during the whole of the faid term, keep in grafs, and at the expiration thereof lcave in grafs, all thofe fields or parcels of land § And alio all fuch lands as fhall be converted into watered meadows: A nd alfo fhall and will during the term hereby demifed, bear and pay one-half the expence of making and erecting new quick fences upon
$\dagger$ On the fallow turnips thould be fown, if a proper foil, or cabbages, or drilled beans, at thirty inches ditave.
$\ddagger$ To thefe, upon light foils, are generally added three or four pounds of yellow hop-clover.

If This blank is fometimes filled up with two or one, according to foil, fituation, and circumitances, and weak foils, improper for corn, generally continue in grafs five, tix, or feven ycars, until it is thought they want refeefhing by tillage, which is only ufed in fuch fituations, as being fubfervient to rearing tock.
§ This covenant is ufed only in fuch fituations where there are any rich old grazing lands.
the faid premiles, and of cleaning, rearing; and preferving the fame for feven ycars after being firlt planted. [Hcre follow any other particular covenants that circumftances may: require. J

In addition to this general form of leafe, others with particular covenants become neceflary for each particelar fort of farm.

Leasb, Valuation of, the mode of finding out and afcertaining the value of leafchold property, in which the cirftances that are to be more particularly attended to are thofe of the peculiar nature or conditions of the leafe, and the difference between the leafe rent, and the fuil or actual rental value; as all furts of leafes, where the rent payable is not equal to the jult of true rental value at the period of their being fold, leffen the value of the land, and are obv1oufly an incumbrance in different points of view. The mode of managing this bufinefs with propriety, according to a lase writer, is, after afcertaining the difference between the leafe rent and the full rental value (incumbered with the fame outgoings and repairs as the leafe rent), to multiply it by the number of years that are unexpired, deducting the product in full from the value of the land free from fuch incumbrance; and from the product thus found, to forther deduct half the intereft thereof during the faid number of years, together with that of onchalf year over, where the rent is payable half yearly, and one year where it is payable ann:rally; as all that a purchafer of this fort of property has a right to expect, is that of receiving the full rent for his. land during the continuance of fuch leafe or engagement. See Valuation of Landed Property.

Lease, in Agriculture, a provincial term that implies graffy ground, meadow-ground, or any unploughed ground kept for the ufe of cattle.
Lease and Rcleafe, in Law, is a conveyance of the feefimple, right, or intereft in lands or tenernents, under the ftatute of Ufes, 27 H . VIII. cap. 10 . giving firlt the pofferfion, and afterwards the interef, in the eftate convesed. This fpecies of conveyance was firft invented by ferjeant Moore, foon after the itatute of USes, and it is now the molt common of any, and not to be flaken. Though the deed of feoffment was the ufual conveyance at common law; yet fince the flat. of 27 Hen . VIII. of ufes, the convcyance by leafe and releafe has taken place of ir , and is become a very common aflurance to pafs lands and tenements; for it amounts to a feoffment, the ufe drawing after it the pofficifion without actual entry, ôcc. and fupplying the place of livery and feifn, required in that deed : in the making of it, a leafe, or bargain and fale for a year, or fuch like term, upon fome pecunary confideration, is firft prepared and executed, to the intent that by virtue thereof the leffee may be in actual poffeffion. of the lands intended to be conveyed by the releafe, and thereby and by forse of the flatute 27 Hen. VIII. c. 10. for transferring of ufes into poffefion, be enabled to take and accept a grant of the reverfion and inheritance of the faid lands, \&c. to the ufe of himfelf and his heirs for ever. Upon which the releafe is accordingly made, reciting the leafe and declaring the ufes; and in thefe cafes a pepper-corn rent in the leafe for a year is a fufficient refervation to raife an ufe, to make the leffee capable of a releafe. (2 Vent. 35. 2 Mod. 262.) This is held to fupply the place of livery of feilin; and fo a conveyance by leafe and releafe is faid to amount to a tcoffment. (Co. Lit. 270. Cro. Jac. 204.) Black. Com. b. ii. Tomlin's Jacob Dict. vol. ii. tit. Lrase and Release. Spe Barcais and Sale, and Converance.

The form of this conveyance is originally derived to us from the common law ; and it is neceflary to diltinguifh in

## LEA

## LEA

what refpect it operates as a common-law conseyance, and in what it operates under the tatue of Ufes. At the common law, where the ufual mode of conveyance was by fcoffment with livery of feifin, if there was a tenaut in poffeffion, fo that livery could not be made, the reverfion was granted, and the tenant attorned to the reverfioner. As by this mode the reverfion or remainder of an eltate might be conveyed without livery, when it depended on an eftate previoufly exilting, it was natural to proceed one ftep further, and to create a particular eltate for the exprefs and fole purpofe of conveying the reverfion; and then by a furrender or releafe, cither of the particular ellate to the reverlioner, or of the reverfion to the particular tenant, the whole fee vefted in the furrenderee or releafee. It was afterwards obferved, that there was no neceffity to grant the reverlion to a flranger ; and that if a particular eftate was made to the perfon to whom it was propafed to convey the fce, the reverlion might be immediately releafed to him, which releafe operating by way of erlargement, would give the relcafee (or releflee as he is fometimes termed) a fee. In all thefe cafes the particular eftate was only an eltate for years; for at the common law the ceremony of livery of feifin is as neceffary to create even an eftate of freehold, as it is to create an eltate of inheritance. Still an actulal entry would be neceffary on the part of the particular tenant ; for without actual poffeffion the lefiee is not capable of a releafe, operating by way of enlargement. But this neceflity of entry for the purpofe of obtaining the poffeffion, was fuperfeded or made unneceffary by the ftatute of Ufes ( 27 Hen, VIII.c. Io. above alluded to) ; for by that flatute the poffeffion was immediately transferred to the cyfui que ufo; fo that a bargaince under that ftatute is as much in poffeffion, and as capable of a releafe before or without entry, as a leffee is at the common law after entry. All, therefore, that remained to be done to avoid on the one hand the neceffity of livery of feifin from the grantor, and to avoid on the other the neceffity of an actual entry on the part of the grantee, was, that the particular eltate (which, for the reafons above-mentioned, fhould be an eftate for years) fhould be fo framed as to be a bargain anc̀ fale within the flatute. Originally it was made in fuch a manner as to be both a leafe at the common law, and a bargain and fale under the flatute: but as it is held, that where conveyances may operate both by the common law and ftatute, they fhall be confidered to operate by the common law, unlefs the intention of the parties appears to the contrary, it became the practice to infert, among the operative words, the words bargain and fell (in fact, it is more accurate to infert no other operative words); and to exprefs that the bargain and fale, or leafe, is made to the intent and purpofe that thereby, and by the flatute for transferring ufes into poffefions, the leffee may be capable of a releafe. The bargain and fale therefore, or leafe for a year, as it is generally called, operates, and the bargainte is in the poffeffion, by the thatute. The releafe operates by enlarging the eftate or poffeffion of the bargaince to a fee. This is at the common law; and if the ufe be declared to the releafee in feefimple, it continues an eftate at the common law; but if the ufe is dechared to a third perfen, the flatute again intervenes, and annexes or transfers the poffeffion of thie releafee to the ufe of the perfon to whom the ufe is declared. It has been faid, that the poffeffion of the bargainee under the leafe is not fo properiy merged in, as enlarged by, the releafe; but at all events it does not, after the releafe, exift diftinct from the ettate pafied by the releafe. I Init. 27 I , b . in n.

As the operation of a ieafe and releafe depends upon the leafe, or bargain and fate; if the grantor is a body corporate, the leafe will not operate under the flatute of Ufes;
for a body corporate cannot be feifed to an ufe, and therefore the leafe of poffeffion, confidered as a bargain and fate under the itatute, is void; and the releafe then mult be of no effect for want of a previous pofleffion in the releafee. In cafes of this mature, therefore, it is proper to make the conveyance by feoffment, or by.a leafe and releafe with an actual entry by the leffee previous to the releafe; after which the releafe will pals the reverfion. It may alfo be obferved, that in exchanges, if one of the parties dic before the exchange is executed by entry, the exchange is void. But if the exchange be made by leafe and releafe, this inconvenience is prevented, as the tatute executes the poffefion without entry ; and all incidents annexed to an exchange at common law will be prelerved. IInd. 271. b, in n.
When an ellate is conveyed by leafe and relcafe, in the leafe for a year there inult be the words, bargain aud foll for money, and five fhillings or any other fum, though never paid, is a good confideration, whereupon the bargainee for a year is immediately in poffeffion on the executing of the deed, without actual entry: if only the words demife, grans and to farm let are ufed, in that cafe the leflee cannot accept of a releafe of the inheritance, until he hath actually entered, and is in poffeffion. ( $2 \mathrm{Lall} . A b r .435$.) But where Littleton fays, that if a leafe is made for years, and the leffor releafes to the lefiec before entry, fuch releafe is void; becaufe the lefiee had only a right, and not the poffeffion; and fuch releafe fhall not enure to enlarge the eftate, without the poffefion: though this is true at common law, it is not fo now upon the flatute of Ufes. (2 Mod. 250, 251.) And if a man make a leafe for life, remainder for life, and the firt leffee dieth; on which the leffor releafes to him in remainder, before entry ; this' is a good releafe to enlarge the eftate, he having an eftatc in law capable of enlargement by releafe, before entry had. I luft. $2 \%$ o.
No perfon can make a bargain and fale, who hath not poffeffion of the lands: but it is not neceflary to reierve a rent therein; becaule the confideration of money raifes the ufe. If a leafe be without any fuch confideration, the leffee hath not any eftate till entry, nor hath the leffor any reverfion ; and therefore a releafe will not operate, \&c. (I Iuft. 270. 27 S. Cro. Jac. 169 . i Mod. 263.) On leafe at will, a releafe fhall be good by reafon of the privity between the parties; but if a man be only tenant at fufferance, the releafe will not inure to him ; and as to the perfon who hath the reverfion it is void, for fuch tenant hath not any poffeffion, there being no ellate in him. Lit. f $46 \mathrm{I}, 462$. Cro. Eliz. 21. Dyer 25 I.
In a leafe and releafe, to make a tenant to the pracipe to fuffer a recovery, where the releafe is made to A. B., and his heirs (viz. the tenant to the pracipe), it mult be alfo faid to the ufe of him the faid A. B., and his heirs and afligns for ever; for the releffee muft be abfolute tenant of the freehold. (2 Vent. 312. Lil. Conveyance, 251 .) And a releafe made on truit, muit be to A. B., his heirs and affigns, to the only ufe and behoof of the releflee, his heirs and afligns for ever; in truit for C. D., who is to be a party to the decd, and the purchafe-moncy to be paid by the ceflui que trafl. If the words to the we, \&c. are not inferted in the releale, the eftate doth not execute by the tlatute of Ufes, and the trutt is void. Lil. Conv. 231, 251. See Recovery and Trust.
A leafe and releafe make but one conveyance, being in the nature of one deed. I Mind. 252. See Release.
LEASEHOLD Tinure of Lends, in Agriculuure, is that fort of tenancy which is held under leafe or fpecial agreement for any definite term, whether of lives or years; which alfo admits of feveral diftinctions, as, where the term is

## LEA

for a great length of time, as a thoufand years, and where it is for life, of which there are different kinds, as where the fine is certain, or under certain limitations on renewal, with an uncertain fine; payable to a proprietor or other fupcrior, who has merely referved a conventional rent, the tenant having given a fum of moncy to obtain the leafe and the right of alienation; this is a practice common in the weftern counties: with an uncertain fine payable to a proprietor, who receives the full rent of the land at the time of granting the leafe, the landlord having a power of alienation; this is a practice common in Wales, and fome parts of this country: and where it is for an ordinary term, (as for lefs than 100 years,) with the power of alienation. They are all tenures, which Sive a fort of temporary property or interelt in the lands, by which they are rendered liable to bargain or fale as other forts of property by the holders of them. See Tevant and Tenure.

LEASH, or Leasue, among Sporifmen, denotes three creatures of any kind; but chiefly greyhounds, foxes, bucks, and hares.

We fay a leafh of greyhounds, a couple and a half of hounds.

LeASing, or Lesince See Gleaning.
LEAT, is ufed for a trench to convey water to or from a mill. It is mentioned in the fatute 7 Jac. I. cap. 19.
LEATHER, in Commerce, the fkins of feveral forts of beafts dreffed and prepared for the ufe of various manufacturers, whofe bufinefs is to make them up, according to their different employments. The butcher and others, who flay them off the carcafes, difpofe of them raw or falted to the tanner and tawer; they to the fhamoy, morocco, and other kind of teather-dreffers, who prepare them according to their refpective arts, in order to vent them among the curriers and leather-cutters, glovers, harnefs-makers, coachmakers, fadlers, breeches-makers, gilt-leather-makers, chairmakers, fhoe-makers, book-binders, and all in any way concerned in the article of leather.

Leather has divers names according to the ftate wherein it is, and according to the different kinds of flins of which it is prepared, and its peculiar qualities when fo prepared. r. The lkin is raw as it comes off the animal. 2. Some are falted with fea-falt and alum, or with natron, which is a ipecies of falt-petre, or white falt-wort, to prevent corruption in keeping, or fending to diftant tangeries during hot feafons.

Skins dried with the hair on, are commonly thofe of oxen and cows, or buffaloes, cither tame or wild. Molt of thofe in France come from foreign countries. The places which furnifh the largeit quantity, are Peru, the ifle of St. Domingo, Barbary, Cape Verde Illes, the river Senegal in Africa, Mufcovy, Ireland, the illand of Cuba. Thofe of this latter place are the molt efteemed; they are called Harannah fkins, from the name of the capital city of that inahd, whither they are carried in order to be fent to Spain, and from thence into other parts of Europe. After thefe Ikins are ftript of their hair, they are fold to the tanners. Sce Curhying, Taning, and Skins.

The three principal affortments of leather are tanned or tawed, and oil and alum leather, all which are dreffed in fome yards.

The art of dreffing leather in oil confirts in firt foaking the fkins ; then throwing them into the lime-pit; and when they are taken hence, pulling them and delivering them to the friezer; they are then \&truck with the oil, and fent to the mill; when they are milled fufficiently; they are thrown into the ditch to be fcoured, and by fome fcudded, and afterwards hung upon the houks to dry. When they lave been lol. XX.

## L E A

weighed and marked by the proper officers, in order to fix the excife duty, they are fit for fale. The forts of \& cins dreffed in oil are thofe of deer, theep, and lambs, and fome few of goat, and the oil ufed for this purpofe is Newfoundland, or cod's liver oil. The alum leather-dreffers' art confifts in properly foaking, liming, wringing, (an operation fometimes omitted,) and friking them in a liquor compofed of water, falt, and alum, and then drying them properly; The forts of Rkins dreffed in alum are thofe of theep and lambs, and a large quantity of kid. Poflleth. Dict. Com. art. Leather.

There are feveral ftatutes relating to leather; the 27 Hen. VIII. c. I4 directs packers to be appointed for leather to be tranfported: but the 18 Eliz. c. 9- prohibits the Thipping of leather on penalty of forfeiture, \&c. 'though by 20 Car. c. 5 . tranfportation of leather was allowed to Scotland, Ireland, or any foreign countrics paying a cuftom or duty; which ftatute was continued by divers fubfequent acts.
No perfon fhall ingrofs leather to fell again, under the penalty of forfeiture. None but taniers are to buy any rough hides of leather, or calves' nkins in the hair, on pain of forfeiture ; and no perfon fhall foreftall hides, under the penalty of $6 s$. Sd. a hide. Leather not fufficiently tanned is to be forfeited. In London, the lord mayor and aldermen are to appoint and fiwear fearchers and fealers of leather out of the company of cordwainers, \&c. and alfo triers of the fufficiency of leather; and the fame is to be done by mayors, \&c. in other towns and corporations; and fearchers allowing infufficient leather, incur a forfeiture of 40 s . Shoemakers making fhoes or boots of infufficient leather are liable to forfeit for every pair $3 s .4 d$. and the value thereof. (i Jac. I. c. 22.) Red tanned leather is to be brought into open leather markets, and fearched and fealed before it be expofed to fale, and on fale is to be regiftered, or fhall be forfeited; and contracts for fale otherwife to be void. ( 13 \& 14 Car. II. c. 7.) Hides of leather are adjudged the ware and manufacture of the currier, and fubject to fearch, \&c. All perfons dealing in leather may buy tanned leather, fearched ia open market, and any perfon may buy or fell leather, hides, or Kkins, by weight. I W. \& M.c. 33 .

The firft ftatute concerning leather, which it is neceffary for us to refer to in this article, is the I Jac. c. 22; which teduces all preceding acts relating to that commodity into one; and therefore to this we fhall have a retrofpect in the progrefs of this article; premifing that all forfeitures by this act, not otherwife fpecially directed, fhall be divided, one-third to the king, one-third to him that fhall fue, and one-third to the city, town, or lord of the liberty. By 9 Ann. c. II. any two juftices near the place where the forfeitures are incurred, or offence committed, may hear and determine the fame. All forfeitures, by the att of 13 \& 14 Car. II. c. 7. fhall be recovered in any court at Weftminfter, or in any court of record in the city, \&c. where the offence fhall be committed; to be diftributed half to the king, and half to the informer. By 39 \& 40 Geo. III. c. 66. it is enacted that proper places and times for infpecting all raw hides and fkins of cattle, fheep, horfes, and hogs, fhall be fixed by the mayor, bailiff, or head-officer of any city, town corporate, borough, or market-town, or any two magiftrates acting for the fame, or any two juftices acting for the divifion within or neareft to fuch city, \&c. The manner of appointing infpectors is alfo prefcribed by the faid acts. And by the fame, butchers, \&c. who are chargeable with wilfully or carelefsly injuring hides, fo as to make them lefs valuable, are liable to penalties, not exceeding 550 (4rGeo. III.) nor lefs than Is. for the raw hide of every ox,

## LEATHER.

bull, cow, or heifer, \&cc. ; and nce exceeding as. 6d. ( 41 Geo. III.) nor lefs than $6 d$. for the fkin of ecery calf; and not excecding $2 s .6 \mathrm{~d}$. ( 41 Gco . III.) nor lefsthan 1 s . for the hide of every horfe, mare, or yclding; and not exceeding Gd. nor lefs than 3 d. For the hide of every hog, pig, fheep, or lamb. Infpectors are required to take a prefcribed oath, and are allowed certain fees for examining and infpecting hides. \&c. (Sce alfo 43 Geo. III. c. 106.) Thefe infpectors may impofe penalties for damaging hides, \&cc.; which penalties fhall be recovered before a juftice, one half of which, by 41 Geo . III. c. 53. fhall be given to the in. fpector, and the other half applied to the purpofe of better carrying on the objects of thefe acts. By the above-cited acts, 39 \& 40 Geo. III. c. 66, the infpectors of raw hides hhall provide proper ftamps, and itamp the hides, not damaged or otherwife; and feize fuch hides or fkins as have teen damazed, and fell the fame, provided the penalties be not paid in lefs than 4 S hours after fuch feizure. Butchers or others neglecting to bring hides to be marked, fhall forfeit not exceeding 5 ?. nor lefs than 4os. for every fuch hide. The regulations of this aet fhall extend to all hides found in Great Britain. (41 Gco. III. c. 53.) All difputes flatl be fettled by any five impartial and refpectable perfons concerned in the manufacture of leather, fummoned by a magittrate, before whom fuch difpute fhall be brought. All penalties and forfeitures fhall be recovered before one jeftice or magitrate of any city, town, or place, where the offencé fhall be committed, upon conviction, confeffion, or the oath of one witnefs, and levied by diftrefs; and for want of fufficient diftrefs, the offending party fhall be committed by fuch juftice or magiltrate to the common gaol or houfe of correction, for a time not exceeding one month. All penalties and forfeitures, not otherwife difpofed of, fhall go, half to the informer, and half to the execution of the purpofes of the act. Perfons aggrieved may 'appeal to the next feffions. ( 39 \& 40 Geo. III. c. 66.) By the fame and 41 Geo. III. c. 53. informations for offences arainft this act for wilfully or carelefsly gafhing raw hides, fhall be laid within three days after the commiffion of the offence; and for any other offence within It days after the offence committed. By 43 Geo . III. c. ro6. the provifions of 39 \& 40 Geo . III. c. 66. and 41 Geo. III. c. 53 , are extended to London, Weltminfter, and Southwark, and to all places within fifteen miles of the Royal Exchange. All raw hides within five miles of the Royal Exchange chall be brought to Leadenhall market, and the fkins of fheep and lambs to one of the three fheep-lkin markets in Southwark, the Whitechapel market, or the market at Wood's Clofe. Proper places and hours for infpection are to be appointed within three months after the paffing of this a\&. For the market at Leadenhall, eight infpectors are to be appointed; four from the company of butchers, two by the company of curriers, and two by the company of cordwainers; and befides, there fhall be appointed four infpectors for the fheep market at Wood's Clofe, two for Southwark, and two for the market of Whitechapel. One half of the infpectors at each of the three laft-mentioned markets to be appointed by the company of butchers, and the other half at each of fuch markets in equal proportions by the companies of curriers and cordwainers. Provifion is made for increafing their number and regulating their attendance. Infpectors for Leadenhall market are required to attend on the ufual market days, from lix in the morning till five in the afternoon, from the 25 th of March to the 2 ath of September; and from feven in the morning until four in the afternoon, from the 30 th of September till the 2,th of March.

The distribution of fines and fees is prefcribed, fo that onc-
hatif thall be equally divided between the infpectors, atting at the refpective markets, and the remaining half-part fhall be paid weekly to the arbitrator of the market, in refpect to which they are received, and paid monthly by the faid arbitrators to the refpective perfons appointed by the courts of affiftants to receive the fame. 'There is a penalty for impeding infpectors, not excedirg $5 l$ nor lefs than 10 s. for each offence, and alifo a penalty not exceeding 20\%. on infpettors receiving, and perfons offering bribes. Salefmen are required to deliver an account of hides or flins fold, under a penalty for every offence of 101 . The lord-mayor of London is empowered to incrafe the fees of the infpectors, under the reprefentation of the courts of affiftants of the companies concerned, to any fum not exceeding $1 d$. for every hide, $\frac{1}{2} d$. for every calf-fkin, hog flkin, or pig-flin, and $\frac{1}{4} d$. for every theep or lambenkin. The refpective courts of affittants are required to appoint annually four arbitrators, to fettle difputes arifing in any of the markets above-mentioned; and thefe arbitrators are empowered to fine infpectors, and alfo butchers and falefmen, for frivolnus decifions and exorbitant impofitions. Infpectors and arbitrators are liable to be difmiffed for mifconduet in their refpective offices, or to a fine not exceeding 5!. nor lefs than ios. Buyers and fellers of unitamped hides or fkins are liable to a forfeiture not exceeding 20s. nor lefs than 5 s. for every hide; and not exceeding 5s. nor lefs than is. for every thin of hogs, pigs, or calves; and not exceeding is. nor lefs than $6 d$. for every fheep or lanb-finin. The treaiurers are appointed by the refpective courts of affilants to receive the fums collected by the arbitrators ; one-lialf of which fhall be paid to the trea* furer appointed by the company of butchers, one-fourth to the officer of the company of curriers, and one-fourth to. the officer of the company of cordwainers; which fums fhall firt of all be applied for the execution of the acts, andto the ufe of the poor of the faid companies.

For particular regulations concerning tanners and curriers of hides, fee thefe articles refpectively. The mayor and aldermen of London (on pain of 40 l. for every year they make default, half to the king and half to him that fhall fue) fhall yearly appoint eight freemen of fome of the companies of cordwainers, currieri, fadlers or girdlers, of wkom one fhall be a fealer, and keep a feal for the fealing of leather; they flall be fworn to do their office truly; and they fhall fearch and view all tamed leather brought to market, whether it is thoroughly tanned and dried : and if it is, flall feal the fame. Four of thefe officers fhall be changed every year; no officer thall be continued above two years together, nor be re-elected till after the end of three jears, on pain of Iol. a month. A fimilar regulation extends to other places. The wardens of the curriers fhall fearch and feal curried leather, for which they are entitled to fees, to be paid by the currier; on pain of forfeiture for every hide not fearched and fealed, 6s. 8d. If any fearcher or fealer fhall neglect his office or milbehave, he fhall forfeit $405 .:$ if he fhall take a bribe, or exact a fee not appointed, he fhall forfeit $20 \%$; and if he thall refufe to execute his office, he thall forfeit 10l. If any perfon fhall hinder the fearcher in the execution of his office, he fhall forfeit 5\%. (1 Jac. c. 22.) The mayor of London (on pain of 5 l. half to the king, and half to him that fhall fue) fhall, within fix days after notice given of any feizure of any leather, red and unwrought, appoint fix triers, two of the cordwainers, two of the curriers, and two of the tanners, ufing Leadenhall market, who, upon their oaths taken befure him, fhall, on the fecond or third market-day for leather, try the fame, whether it be fufficient or not. The fame regulation extends to other places. Triers not doing their duty thall forfest 5 l. The offering for fale of unfearched

## LEATHER.

and unfealed leather incurs a forfeiture of the fame, or its value, and for every hide or picce 6s. 8 d . ; and for every dozen of calves' fkins. 3 s. qd.; but no perfon Thall incur any penalty for felling or buying any fleep.flins, unfearched or ,unfealed. (1 Jac. c. 22. 4 Jac. c. 6.) All red tanned leather mall be bought only in the open fair or market, and not in any houfe, yard, fhop, or other place, on pain of forfeiting - the fame, or its value, and rendering the contract void : and fuch leather thall be fearched and fealed before fale, and on fale fhall be regitered, on pain of forfeiting the fame, or its value. ( $x_{3} 814$ Car. II. c. 7.) Searchers and fealers fhall keep a regiiter of all bargains made for leather, during the fair or market, with the prices; taking for fearching, fealing, and regiftering of every ten hides, or butts, of the feller 2 d ., and fo in proportion; and for every fix dozen of calves'-.jkins, or fhecp-fkins, 2d. : and of the buyer after the fame rate. Red tanned leather, brought into London, or within three miles of it, fhall be brought to Leadenhall, to be viewed and regittered by the fearchers, with half fuch fees to be paid for tanned leather bought out of Londou, or within three miles, and fearched and fealed before it be brought within the city ; on pain that every perfon houfing, or not bringing his leather to Leadenhall, fhall forfeit for every hide or fkin $6 s$. $8 d$. No perfon fhall buy any tanned leather, unwrought, but who fhall work the fame into wares, on pain of forfeiting the fame, or value. (I Jac. c. 22.) But by 12 Geo. II. c. 25, all perfons who deal or work in leather may buy all forts of tanned leather in open fair or market, whether curried or uncurried, being firft fearched and fealed, and may cut and fell the fame in any fmall pieces in their open fhops. (See alfo I W. feff. I. c. 33.) Within London, or within three miles, no perfon fhall fell any wares appertaining to the myttery of any artiGicer cutting leather, but only in open fhop, common fair, or market, whereby the wardens may have fearch thereof : on pain of forfeiting the fame, and alfo los. I Jac. C. 22 .

No fhoemaker fhall make any boots or fhoes, or any part of them; except of leather, well and truly tanned and curried, or of leather well and truly tanned only; nor put into any part of any fhoes or boots, any leather made of a fheep-fint, bull-hide, or horfe-hide, \&c. \&c., on pain of forfeiting for every pair of fhoes or boots 3 s. 4 d ., and the value. And if any artificer ufing leather do make any wares of any tanned leather infufficiently tanned, or of tanned and curried leather, not fufficiently tanned and curried, he fhall forfeit the fame, and value. If any floemaker or cobler within London, or three miles of it, fhall put any tanned leather into any boots or fhoes, or other things made of tanned leather, which fhall not be well and perfectly tanned, or do put any curried leather into boots or fhoes, or any things made of leather, which fhall not be fufficiently tanned and curried, and alfo fealed; he fhall forfeit the fame and value. 1 Jac..c. 22.

All forts of leather and fkin, tanned or dreffed, may be exported. 20 Car. II. c. 5. 9 Ann. c. 6.

By 43 Gro. III. c. 69, a duty is laid upon all hides and Rkins, vellum and parchment, imported; and drawbacks allowed on the exportation of them. Other duties are alfo impofed by 49 Geo. III. c. 98. For which we refer to the act, fched. A. After the duty on importation flall be paid, the officers of the cuftoms fhall caufe every hide or fkin to be marked, to denote the payment of the duty. (9) Anue. c. I r.) But by 15 Geo. 111. c. 35, raw or undreffed goatfkins may be imported for tive years, duty free; and this act was made perpetual by $3^{1} \mathrm{Gco} .1[1 . \mathrm{c} .43$. The feveral duties for and upon all hides and ficins, and parts and
pieces of hides and fkins, tanned, tawed, or drefed, to be paid by the tanners, tawers, and dreffirs of hides and flkins refpectively, and the dutics upon vellum and parchment, to be paid by the refpective makers thereof; and certain drawbacks are allowed on the exportation thereof. By tanued hides or fikins, or pieces thereof, are meant only fuch as are tanned in wooze, made of, the bark of trees, or flumack; and by hides and flins, drefed in sil, are meant fuch as are made into leather in oil, or with any materials, of which the chief ingredient fhall be oil; and by taveed hides or thine, are meant fuch as are dreffed or made into leather, in alum and falt, or meal, or other ingredients properly ufed by tawers of white leather. 9 Ann, c. 11. Ћ. 3 .
By 43 Geo. III. c. 69, every tamer flall take out a licence annually, for which he thall pay, if within the bills of mortality, 5 l., elfewhere 2 l. xos., on pain of 301 . $2+\mathrm{Geo}$. 111 . c. 4 . Sefl. 2. § 1.) And every tawer thall tale out a licence annually, for which he fhall pay 1\% on the penalty of 10\%. And every drefer of hides in oil flall take out a hicence annually, for which he fhall pay 21 . on the peralty of $20 \%$ And every currier fhall take out a licence-annually, for which he fhall pay 2l. on the penalty of $20 l$. And evcry maker of vellum or parchment flall take out a licence an. nually, for which he fhall pay $1 \%$ on the penalty of $10 \%$ And every perfon who fhall take out fuch licences fhall renew them annually, ten days before their expiration, on the penaltics above itated. Collar-makers, glovers, bridlecutters and others, who drefs fkins or hides, or pieces thereof, in oil, alum, and falt, or meal, or other ingredients, and who cut and make the fame into wares, fhall be accounted tawers, or drefiers. ( 2 Ann. c. ir. § 2S.) Any hide or fkin, which hath once paid the duty, fhall not be charged under any other denomination ( 9 Amn. c. 11. § 3.) The commiffioners of thefe duties, appointed by the commifioners of the treafury, flall have the fame power as the commiffioners of excife. Tanners, tawers, curriers, or dxeffers of hides or ikins, and makers of vellum or parchment, are required to give notice in writing to the officer, of their names and places of abode, and of their tan-houfes, yards, work-houfes, milis, or other places where they intend to tan, taw, or drefs hides or flkins, or make vellum or parchment, before they ufe the fame; on pain of 5ol. Thofe who ufe fuch places without entry of them, fhall forfeit $20 \%$, and the goods found in them, or their value, fhall alfo be forfeited. The officers, at all feafonable hours, fhall enter and furvey thefe places, and if the owner or occupier refufe them entrance, he fhall forfeit 1o\%. And if any hide or fkin, tanned, tawed, or drefled in oil, be found in any place not entered, without a ftamp denoting that the duty has been charged, the fame Thall be forfeited and feized ; and the perfons in whofe pof. feflion it thall have been found, fhall for each offence forfeit Iool. (4I Geo. III. c. 9r. §10.) Tanners and others fhall give two days notice to the proper officers of the removal of goods to the drying place, that an account of them may be taken; and before they are carried 'away from the drying place, two days notice fhall be given; and they fhall be entered with the officer with refpect to their number and quality, and verified on oath before a juftice of peace, collector or fupervifor ; nor fhall they be removed, till the duty be firft charged, entered and marked. The penalty for neg. lect is $20 \%$. and forfeiture of the goods, or their value. Concealment of any hide or fkin, vellum or parchment, in order to avoid the duty, incurs a forfeiture of $20 \%$ and the goods or their value. If any tanker or other perfon fhall fhave any hide or calf-1kin, before the fame be thoroughly tanned, fo as to impair it and diminifl the duty, the fame or its value thall be forfeited. Tanners or other fuch perfon fhall keep

## LEA

juit feales and weights; and the penaley for neglect or not allowing the ufe of them, fhall be a forfeiture of 50 . The ufe of falle fcales incurs a forfeiture of $100 \%$. ( 10 Geo. III. c. 4t. 28 Geo. III. c. 37.) Cheating or obftructing oflicers fubjects to a forfeiture of 100 . ( 26 Geo . MII. c. 77.) When the dutics are afcertained, the officer fhall enter them in a book, and return them to the commiffioners, or a perfon appointed by them; and when the duty is fettled, the officer fhall caufe every hide or Akin, and every piece of both, and all vellum and parchment to be marked. And if the goods be removed before the duty is charged, and they are marked, the penalty is a forfeiture of 50 l . and the faid goods; and any perfon counterfeiting the ftamps, or knowingly felling any of the faid goods with a counterfeit famp, is chargeable with felony without benefit of clergy. (9 Ann. c) 1 11. 5 Geo. II. c. 3. 33 Geo. III. c. 54.) Stamped and unitamped goods shall be kept feparate, on pain of $10 \%$ ( $5 \mathrm{Geo} . \mathrm{c} .2$.) And thofe that have been ftamped fliall not be removed for 24 hours after ftamping, \&c. under a forfeiture of $20 \%$. ( 5 Geo. III. c. 43.) Scales and weights flall be kept for reweighing them, and affiftance given to the officer, on pain of $50 \%$. Perfons within the bills of mortality fhall pay off the duties within 14 days to the commiffioners, and in other places in fix weeks, after the goods have been marked. ( 9 Ann.c. 11.) Thofe who do not pay in this manner fhall forfeit double duty; and they fhall not be delivered out till the duty be paid, on pain of double value. Every tanner, and other fuch perfon, fhall balance their accounts with the officers once in three months, on pain of 50 . Any two juftices refiding near the premifes may hear and determine offences, and order the penalties to be levied by ditrefs and fale, if not redeemed in fix days.

Foreign manufactured gloves imported thall be forfeited, and may be fearched for and feized by any officer of the cuftoms or excife; and every perfon importing or vending the fame, fhall alfo forfeit $200 \%$ with double colts. 6 Geo. III. c. 19.

## Leather, blacking for. See Bìacking. <br> Leather, buff. See Buff.

Leather, fofil, alluta montana, is a foliated amianthus, confifting of foit fibres interwoven together and frequently containing fparry cryitals inclofed in it.

LEATHERHEAD, in Geography, a large parifh, formerly a market-town of Surry, England, is 12 miles E.N.E. from Guildford, and 19 S.W.by S. from London. In the year $\mathbf{1 8 0 0}$, the town confifted of 200 houfes, and contained 1078 ioh bitants. This place is chiefly remarkable for a large fair, held here on the 1oth of October, for cattle, horfes, pigs, toys, \&c. The river Mole paffes through this parihh, and emerges to day here, after having been hidden in a fubterraneous channel from the foot of Boxhill. This is a fin. gular character of the Mole. At this place it is croffed by a bridge of 14 arches. In the vicinity of Leatherhead are feveral feats; fome of which are particularly noted for the picturefque and beautiful character of their contiguous
fcenery, and fine profpects. The principal of thefe is Norbury-park, the feat of William Lock, elq. ; a very irrterefting defeription of which, and its painted room, by Barret, will be found in Gilpin's "Obfervations on the weftern Parts of England," 8vo. 1798. See alfo Mannisg and Bray's "Hifory and Antiquities of Surry."

LEATHERWOOD, in Gardening. See Dirca.
LEAU, in Geography, a town of France, in the department of the Dyle, and chief place of a canton, in the diftrict of Louvain. The place contains 715 , and the canton 6264 inhabitants, on a territory of $97 \frac{1}{2}$ kiliometres, in 13 cominunes.

LEAVE and Takc. See Take.
LEAVEN, any thing that will mako a body fwell and ferment.

The word is formed of the French levain, which fignific3 the fame, of the verb lever; or Latin levare, to raife.

Beer, ale, wine, and cyder, only work by means of the leaven in them. Sour pafte, barm, rennets, \&c. are leavens ufed in baking bread, brewing beer, making cheefe, \&e.

Leaver. See Lever.
LEBA, in Geography, a town of Pomerania; 16 milds N. of Lauenburg.

LEBACH, a town of France, in the department of the Sarre, and chief place of a canton, in the diftrict of Sarrebruck. The place contains 506, and the canton 8392 inhabitants, in 66 communes.

Lebadere, Livadia, in Ancient Geograpby, a towni of Greece, in Boootia, built on a plain upon the fmall river Hercyna. The inhabitants at a former time occupied a town on an adjoining eminence, and their town was called Midza; but an Athenian, named Lebadus, perfuaded them to build another on the plain, which was called after his nameOn the banks of the Hercyna was a temple dedicated to He cyna. The facred grove of Trophonius was near this town, in which was a temple of this name, with a fatue made by Praxiteles. Ceres, furnamed Europa, had a temple here, and Jupiter Pluvius had a ftatue. Near this place was a temple of Proferpina confervatrix, and another of Jupiter rex. The flatue of Trophonius at Lebadex. is faid to have been the work of Dxdalus. Paufanias, 1. ix. Bootic. c. 40 .

LEBAA, a town of Macedonia, anciently the capital of this kingdom, the precife fituation of which cannot be afcertained.

LEBANON, or Libanus, a celebrated mountain of Alia, fituated on the borders of Paleftine and Syria. It takes its name, as fome fay, from the Hebrew laban, on account of the whitenefs of its fummits, which appearcovered with fnow a great part of the year. Others derive: it from the Greek libanos, frankincenfe, alleging, without fufficient reafon as Reland obferves, that it furnifhed this or any other aromatic gum. The antilebanan, or antilibanus, is fo called from its parallel courfe in oppofition to, the other. Some ancient fathers, as St. Jerom and Eufebius, have defcribed the libanus and antilibanus as one continued ridge, winding about in the form of an horfe-floe, which begins about three or four leagues from the Mediterranean, a little above Smyrna, and running fouthward towards Sidon, takes an eaftern courfe towards Damafcus ; winding thence northward towards Laodicea Cabiofa. The wettern ridge is that which is properly called Libanus ; the eaftern is Antilibanus, and the hollow between is Coclefyria. (See Antilibanus and Caflesyria.). St. Jerom reprefents Libanus as by far the luftieft hill in the whole land of promife, as well as the molt woody and thick-fet,

## LEBANON.

and 'Theodoret alfo ftates it to be the highert of all Paler tine. Modern travellers concur in this account of its great height. "Scarcely," fays Volney, "do we depart from Larnaca in Cyprus, which is 36 leagues diftant, before we difcover its fummit capped with clouds. This is alfo diftinctly perccivable on the map, from the courfe of the rivers. The Orontes, which flows from the mountains of Damafcus, and lofes itfelf below Antioch; the Kefmia, which, from the north of Balbee, takes its courfe towards Tyre; the Jordan, forced by the declivities towards the fouth, prove that this is the highelt point." Although the height of this mountain has not been determined by the barometer, Volney deduces it from another confideration. In winter the tops of the adjoining mountains are entirely covered with fnow from Alexandretta to Jerufalem; but after the month of March it melts, except on mount Lebanon, where, however, it dues not remain the whole year, except in the highelt cavities, and towards the N.E., where it is theltered from the fea-winds and the rays of the fun. Since it is well known that fnow in this latitude requires an elevation of 15 or 16 hundred fathoms, we may conclude, fays Volney, that to be the height of Lebanon, and that it is confequentiy much lower than the Alps, or even the Pyreneés. Mount Blanc, the loftielt of the Alps, is eftimated at 2488 fathoms above the level of the fea; and the peak of Olfian, in the Pyreneés, at 1900. Lebanon, which gives its name to the whole extenfive chain of the Kefraouan, and the country of the Druzes, prefents us every where with majeltic mountains. At every ftep we meet with fcenes, in which nature difplays either talter grandeur, fometimes fingularity, but always variety. When we land on the coalt, the loftinefs and iteep afcent of this mountainous ridge, which feems to inclofe the country, thefe gigantic mafles, which fhoot into the clouds, infpire aftonifhment and awe. Should the curious traveller then climb thefe fummits which bounded his vierr, the wide extended fpace which he difcovers becomes a frefh fubject of admiration; but completely to enjoy this majeftic fcene, he mult afcend the very point of Lebanon, or the "Sannin." There, on every fide, he will view an horizon without bounds; while, in clear weather, the fight is loit over the defert, which extends to the Perlian gulf, and over the fea, which bathes the coalts of Europe. He contemplates, befides rocks, woods, torrents, hill-fides, villages, and towns, which are nearer and more diflinct objects, the valley obfcured by formy clouds, and fmiles at hearing the thunder, which liad fo often burlt over his head, growling under his feet; while the threatening fummits of the mountains are diminifhed till they appear only like the furrows of a ploughed field, or the iteps of an amphitheatre, and he feels himfelf flattered by an elevation above fo many great objects, on which pride makes him look down with a fecret fatisfaction. Such is the picturefque defcription of Volney, which he purfues more in detail. Mount Lebanon is computed at about 100 leagues in compais, and is bounded by Mefopotamia on the E., Armenia on the N, Paleftine on the S., and the Mediterranean on the W. It confifts of four ridges of mountains, which rife one above the other; the firit of thefe is very fertile in grain and fruit; the fecond is barren and rocky, producing nothing but briars and thorns; the third, though ttill higher, is faid to enjoy a conllant verdure and fpring, its gardens and orchards producing fuch a variety of herbs, fruits, \&c. that it hath been ftyled an earthly paradife; the latt and loftieft is uninhabitable, by reafon of its exceffive coldnefs, being covered with deep fnows almoft all the year. It is monly inhabited by the Maronites below,
and by the wild Arabs, called Amadea, of the fect of Hali, every where elfe but on the top. Here are feveral churches; convents, and chapels, and caverns cut into the rock. Tho Monks that inhabit it are very poor, but courteous to tra. vellers, from whom they expect fome token of beneficence. The convent, or crnobium, where the Maronite patriarch refides, lies almolt in a bottom: the defcent to it is very theep, narrow, and winding, and it has only that one avenue, which makes it fo much the fafer, as well as the more retired. It chiefly confifts of fundry grotts, cut into the rock; of which the church is one of the largeft. A river which empties itfelf at Tripoli, runs a little below it, and fupplies it with water. Near the grott of St. Marina, who is reputed to have lived here as an hermit, in man's clothes, are fome vines, which afford excellent wine; and fine young mulberry trees, as well as cedars, and other curiofities. Of the boalted cedars of Lebanon, there are no very magnificent remains; four or five of them only deferving notice: but the number of firs, oaks, brambles, mulberry trees, figs, and vines, is much more confiderable. The wines of Lebanon have been much extolled by the Grecian and Roman epicures. It is probable, that the inhabitants of this territory have made no change in their ancient method of making wines, nor in the culture of their vines. They are difpofed on piles of fix or eight feet in height. They are not pruned as in France, which muft certainly, fays Volney, greatly injure both the quantity and quality of the crop. The vintage begins about the end of SeptemberThe convent of Mar-hanna makes abont 150 rabia, or earthen jars, containing about 110 pints each. The price current in the country is about feven or eight fols (fourpence) the French pint. Of the numerous kinds of wine made in Syria, the chief is the Vino d'Oro, or "golden: wine" of mount Lebanon. This is not boiled, as is the cafe in the preparation of other wines, but left to purify itfelf by keeping: the quantity produced is fmall. It is, as its name implies, of a bright golden colour, and is highly prized even on the fpot. Several confiderable rivers have their fource in this mountain, viz. the Jordan, Rucham, Nahar-Roffian, and Nahar-Cadicha; befides many leffer itreams, that run between the valies; particularly that of Ahouali, which flows down into the "Ronantic valley," focalled, becaufe it is furrounded on all fides with high rocks. Thefe rivers, rufhing down from fuch heights, form feveral beautiful cafcades, like thofe of the Nile. This mountain has been, and is itill to this day, a place of retreat and refuge for a great number of robbers, and other defperate people. The ftose which compofes the mountains of Lebanon and Antilebanon, and thofe of Syria in general, is a hard calcareous ftone of a whitifh colour, fonorous like free-itone, and difpofed in ftrata varioully inclined. Of this itone the inhabitants build their houfes, and make lime.

Lebanoz, a poft-town of America, in York county, Maine, on the eaft fide of Salmon-Fall river; roo miles N. of Bofton. It was incorporated in 17\% 67 , and in 1790 contained 1275 inhabitants.-Aifo, a poftetown in Windham county, Connecticut, fettled in 1697. The foil is equal to almoft any in the ftate, and the inbabitants are generally farmers, of whom many are rich. The number of inha. bitants is $3652 ; 9$ miles N. of Norsich.-Alfo, a poit-town in Gration county, New Hamphire, on Mufcoury river, and on the eaft fide of Connecticut, 2 miles below Dartmouth college; incorporated in 1761, and in the year 1800 containing 1574 inhabitants. - Alfo, a polt-town of Pennfylvania, fituated on the fouth fide of Quitapehilla creek, in Daupbin county; containing about 300 houfes regularly: built.

LEBIEDA, a town of Lithuania, in the palatinate of Wilna; 10 miles $S$. of Lida.

LEBIEDZIOW, a town of Lithuania, in the palatinate of Wilna; 56 miles E.S.E. of Wilna.
I.EBLANC, MiChiel, in Biography, born at Dijon in the year 1653 , entered into the order of the Jefuits, and was one of the fourteen mathematicians whom Lewis XIV. fent to the king of Siam in 1687. Leblanc went and refided with the priefts of the country, to learn their language; but the revolution taking place, which deprived the king of his crown, put an end to the hopes of the miflionaries, and he was obliged to return to l'aris. He had the misfortune of being taken prifoner by the Dutch, and thrown into prifon at Middleburg, in Zealand. In the year I 'igo he was fet at liberty, and returned to Dijon, where he was em. ployed as profeffor of mathematics in the Jefinits' college. In 1695 he joined a new miffion for China, and embarked at Lifbon. During the voyage he met with an accident, which put an end to his life at Mozambique, in the year 1693. As a writer he is principally known by "A Hiltory of the Revolution of the Kingdom of Siam in 1688 , and of the prefent State of the Indies," 2 vols. 12 mo . Moreri.

LEBNA, in Scriphure Geograply, a itrong city of Paleftine, in the tribe of Judah, lituated on a narrow neck of land, which ran northwards between the tribes of Dan and Benjamin. Jofhua took it and gave it to the Levites of this tribe, and it becamn a city of refuge. This had been an encampment of the Ifraelites in the Defert.

LEBNEK, in Georraplyy, a town of Tranfylvania; 15 miles S.E. of Schefburg.

LEBNI, in the Materia Mrdica of the Ancients, a name given by fome to ftorax. A vicenna las treated of this drug is three feparate chapters. The Greeks were very nice in
diftinguifing the feveral kinds of forax, and the Arabians feem to have followed their example: nay, they have even borrowed fome of the terms, by which they called the particular forts. The foft, or liquid florax of the Greeks, feems to have been very common among thefe people, and they have called it mel lefni, the honey of forax. I'his was a common word with them to exprefs any thing foft.

LEBO, in Gcography, a river of Chili, whech runs into the Pacilic ocean, S. lat. $37^{\circ} 30^{\prime}$.

LEBRIL.LA, a town or village of Spain, in the province of Murcia, containing about 1000 inhabitants ; almolt divided into two by a fort of long, broad, and deep bog, formed by rains, over which is a bridge; in miles from Murcia.

LEBRIXA, or Lemmis, a town of Spain, in the territory of Seville, fituated formerly on a branch of the Guadalquivir, but now, in confequence of its being choaked up, 6 miles from the river. It has a callle; and the environs produce olives, which afford fome of the bett oil in Spain; 20 miles $S$. of Seville.

LEBSKO1, a town of Ruffia, in the government of Archangel, near the union of the rivers Mezen and Pezna; 168 miles E. of Archangel.

LEBUS, a town of the Middle Mark of Brandenburg, fituated on the Oder, containing about 14,000 inhabitants. Its fcite is low, and among hills, which intercept the view of it; $;$ miles N.W. of Franckfort on the Oder. N. lat. $52^{-2} 23^{\prime}$ E. long. $14^{\circ} 44^{\prime}$.

LECA, a town of the illand of Samos.
LECANOMANTLA, $\Lambda_{\text {exavoparisis, }}$ in Antiquity, a kind of divination performed in a bafon with wedges of gold or filver. See Hydromancy.

LECASELLO, in Gcography, a town of the Ligurian republic; 20 miles N.E. of Genoa.

LECCE, Aletium, a city of Naples, the capital of the province of Otranto, and fometimes giving name to the province. It is a large, well-built town, the fee of a bihhop, fuffragan of Otranto. The wool produced in its environs was formerly much celebrated; and the adjacent country yields abundance of almonds and olives. It contains, befides the cathedral, three parifh churches and feveral convents. It is the refidence of the governor, and the number of inhabitants is eltimated by fome at 3,000 , by others at I8,000; 24 miles from Brindifi, and as far from Otranto, and 8 miles from the eaftern fhore. N. lat. $40^{\circ} 40^{\prime}$. E. long. is: 8'.

LECCI, a town of the illand of Corfica; 5 miles N , of Porto Vecchio.

LECCO, a town of Italy, and capital of the department of the Montagna, on the lake Como, whence a branch of the lake is called "the lake of Lecco; $1+$ miles E.N.E. of Como. N. lat. $45^{\circ} 5^{\prime}$. E. long. $9^{\circ} .3^{\prime}$.

LECETA, a town of Spain, in Navarre; 17 miles N.N.W. of Pamplona.

LECH, in Metallurgy, a term ufed by the miners to exprefs the gold ore which has been powdered and wafhed, and afterwards run with the affiftance of limeiftone. The lech is afterwards burnt in a fire of charcoal, in order to render it fit for the feparation of the metal, by means of lead, which abforbing and forifying the extraneous matter, renders the gold pure.

LECHIEUM, in Ancient Geograply, a town and promontory of Greece, on the gulf of Corinth, which ferved as a port to Corinth. It had a temple of Neptune, in which was a bronze ltatue of this deity. Venus had alfo a temple here.

## LECIEA.

LECHEA, in Bolany, was fo named by Linneus, at the fuggeftion of Kalm, in honour of Profeffor John Leche, of Abo in Finland, Member of the Stockholm Academy, feveral of whofe memoirs, relating to zoology, botany, and rural economy, are found in the Tranfactions of that learned body. He has alto left us three differtations, publihed under his prefidency: 1, Primitix Flore Scanicis; 2, Nove Infecsorum Species, written by his pupil Uddman, a piece highly valued for its merit and rarity; 3, De Conmoratione bybernali et peregrinationilus birundinum. He died in 1764, aged 60. The name is pronounced Lekéa. Limn. Gen. 43 . Schreb. 59. Willd. Sp. PI. v. 1. 495. Nart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 1. 88. Juff. 303. Lamarck. Illuftr. t. 52. Gxertn. t. 129. Michaux BorealiAmer. v. 1. 76.-.Clafs and order, Triandria Trigynia. Nat. Ord. Caryopbyllei, Linn. Juff.
Gen. Ch. Cal. Perianth inferior, of three ovate, concave, fprcading, permanent leaves. Cor. Petals three, oblong, narrower than the calyx, but about as long, concave. Stam. Filaments three, fometimes four or five, capillary, longer than the petals, lying over the pittil, equal ; anthers roundin. $P_{i j}$. Germen fuperior, ovate; ityles none; Atigmas three, feathery, fpreading. Pcric. Capfule ovate, nightly triangular, of three cells, and three valves, cohering at their bafe, with three central linear receptacles. Sechs folitary, ovate, angular at the inner fide, where they are attached to each receptacle.

EIT. Ch. Calyx of three leaves. Petals three, oblong. Capfule fuperior, of three cells, and three half-diftinct valves, with three central linear receptacles. Sceds folitary.

1. L. minor. Leffer Lechea. Linn. Sp. Pl. 133. Am. Acad. v. 3. 10. Lamarck. t. 52. F. I ? (L. major ; Michaux ת. I, by the defcription. - Hairs of the flem and branches fpreading. Lower leaves whorled, elliptical, with a fmall point; upper alternate, lanceolate, acute. Flowers panicled, fomewhat corymbofe.-Gathered by Kalm in the dry fandy fir woods of Canada. - The root is perennial and woody. Stems feveral; the barren ones about a fpan long, lax, and fpreading, with numerous, ternate or quaternate, flort, leafy branches, all clothed with long, white, fpreading hairs; \&lowering flems much taller and flouter, from one to two or three feet high, panicled, leafy, round, clothed with rather lefs spreading hairs. Leates of the barren items three or four in a whorl, on fhort ftalks, fpreading, a quarter of an inch long, broadly elliptical, entire, with a fhort point, the margin and rib fringed with long white fpreading hairs: thofe of the flowering ones fcattered, longer, and narrower. Flowers numerous, frall, terminating the lateral branches, i: fmall corymhofe clufters, whofe ftalks are hairy, and more or lefs furnihed with lanceolate bracteas. Calyx-licaves broad, keeled, very concave, fmooth. Capfule polifhed.
This is certainly what Linnxus originally intended for Lechea minor, though the afterwards confounded other ftill finaller fpecies with it, and the name being oppofed to his major, which is a nonentity, is unmeaning, if not falfe. Lefs inconvenience, however, mult arife from retaining than from changing it, unlefs we were furnithed with more ample and certain materials for new modelling the whole genus. Our aim here is to correct fuch errors as we can, for the ufe of thofe who may take up the fubject hereafter.
2. L. major. Greater Lechea. Linn. Sp. Pl. 133. Am. Acad. v. 3. 11.t. I. f. 4; copied in Lamarck, fo 2."Leaves ovato-lanceolate. Flowers lateral, fcattered."Native of dry lituations in Canada. Linnæus, in his manufcripts and Sylt. Veg. quotes for this, Menandra ramis altermis, Gron. Virg. ed. 2. 20, that is, An Cumeraria Jpecies, foliis latioribus oblongit: fubtus argeintis, cain! rubro, calfulu
ample triloculari of Clayton, who found his plant, flowerip! in Augult, on fandy hills at point Comfort, in the count'y of Gloucelter, Virginia. It is deferibed as Mrubby, with the afpect of Ci, /,us Jfcliantbocmury or of Faccinium O.ycoccir, two plants between which it is difficult to find any perint of refemblance; the lerves alterrate, oblong, and entire. Corolla none. Samens four, as long as the calyx, the two uppermolt fpringing from the fame point of the receptacle, the two lateral ones oppofite. Style none. Stigma hifpid. The relt of the account accords with the gericrec character. It mult be obferved that when Clayton gueflis his plant to belong to Cameraria, he means that of Dillenius, which is the Limman Montia. Linnxus, in the Amonitates, defcribes his L. major thus. "Stoms purplifh, round, with fimple, alternate, diltant branches. Seaves alternate, ovallanceolate, rough above, downy beneath, reffexed at the margin, fearce perceptibly ftalked. Flosvers two, threc or four from the fmall uppermolt branches." Now it happens that the fpecimen in the Linnecan herbarium is no other than Cijhus canadenfis, with the numerous flamens proper to that genus, and totally foreign to Lechea. The capfule alfo has imperfect partitions from the middle of the valve.. The feeds indeed appear to be but one in each cell, and large, the only circumitance which cculd induce a reference of this Cifus to Lechea. Yet there can be no doubt of the defcription in the Amocnitates having been made from this plant, though the figure is unlike it, and more refembles $L$.. minor, for which indeed, as well as for the major, it is quoted by Linnrens in $\mathrm{Sp} . \mathrm{Pl}$, and being in itfelf too imperfect to convey a precife idea of any thing, it can determine nothing in the prefent cafe. What is L. major of Kalm we know not, nor that of Hort. Kew. That of Michaus appears clearly to be our minor, whote lower leaves are indeed fo much like Oxycoctus, while its upper are not sery unlike Heliantbenum, that Clayton might poffibly have that fpecies in view when he made the above defcription, but the "large capfule with threc cells", agrees beft with the above Ciffus. Amid all this uncertainty we would rather ftrike out $L$ : manjor, and give a new name, perhaps beteropbylla, to our minor:
3. L. racemulysu. Many-cluitered Lechea. Michaux Boreali-Amer. v. 1. 77. (Menandra ramis ternis; Gron. Virg. ed. 2. 21.)-Hatrs clofe-preffed. Leeaves linearlanceolate, acute, hairy beneath. Flowers in numerous flender clufters. Calyx hairy-Gathered by Clayton in the fame place, at point Comfort, with the latt. Specimens from him are in the Linnæan herbarium, anfivering to the account of. Michaux, who alfo gathered his plant in Virginia. We have others, probably of the fame fpecies, from Kalm, and from the Rev. Dr. Muhlenberg of Lancafter in Pennfylvania. Thofe of Clayton have a panicled feen, a foot or two high, clothed with clofe-preffed, fomewhat filky, hairs; the branches either ternate, oppolite, or fcattered. Leaves of the ftem lanceolate; thofe of the branches linear, gradually fmaller upwards, and often accompanying the flowers, but fometimes the cluffers are leafefs; they are elongated, flender, hairy or filky. The caly:w alfo is hairy, and greatly refembles that of a little annual Cijfus.
4. L. thymifolia. Thyme-leaved Lechea. Michaux Bo-reali-Amer. v. 1. 77, excluding the fynonym. (Capraria foliis integerrimis; Gron. Virg. ed. 1. 55. Herb. Linn. from the author.) -Hairs clofe-preffed. Leaves lanceolate. Stem panicled. Clufters leafy. Bracteas linear, much longer than the flowers.-Gathered by Clayton in Virginia; by Michaux in dry expofed fituations in North a:d South Carolina. Stem a foot high, round, reddifh, rough with clofe-preffed hairs; fimple and naked below; panicled and leafy above. Leaves oppofite or fcattered, various in fize, fightly,

## L E C

nightity Atalked, lanccolate, acute, the margin and rib fringed. Flozvers in numerous, flender, hifpid clufters, furnifled with copious linear braleas, two of which, extremely narrow and obtufe, accompany every flower at the bafe, and are twice as long as the calyx; which is likewife hairy or hifpid.
${ }_{5}$. L. tenuifolia. Slender-leaved Lechea! Michaux Bo-reali-Amer. v. 1. 77.-Stems bufhy, decumbent, afcending, with fpreading branches. Leaves linear-awl-fhaped. Flowers ranged alteraately, and rather remotely, 'along the branches. On fandy hilis near the Santee river, flowering in A pril and May. We know nothing of this fpecies but from Michaux, who defcribes it as of humble and bufhy growth, with capfules rather larger, in proportion to the plant, than is ufual in this genus.
6. L. verticillata. Whorled Lechea. Willd. n. 3.Leaves elliptical, ferrated. Flowers whorled.-Sent by Dr. Rottler from Madras. The root feems, as in all the former, to be perennial. Stems feveral, fipreading or decumbent, fimple or branched, a fpan long, round, leafy, clothed with foft fpreading hairs. Leaves oppofite, ftalked, half an inch long, elliptical, acute, finely and fharply derrated, hairy, tapering at the bafe. Flozvers numerous, in denfe axillary whorls, fufficiently agreeing with the character of the genus, to which Willdenow has judicioufly referred it. The ferrated lizves, however, are very peculiar.

Another fpecies, L. chinenfis, is mentioned in Loureiro, Cochinch. 60; but this, though adopted by profeffor Martyn, caunot, in our opinion, have any right to a place here, the author's defcription fhewing it evidently to be nearly allied to Commelina, confequenly more remote, if poffible, than even the above Ciflus canadenfis from Lechea. S.

Lechenaul.TIA, named by Mr. R. Brown, in compliment to his friend Lechenault, an eminent French botanift and traveller, who has undertaken to illuftrate the plants of the weftern coaft of New Holland more efpecially, as wcll as thofe of Java and Timor. Brown Prodr. Nov. Holl. v. 1. 581. Clafs and order, Pentandria Monosynia. Nat. Ord. Campanacea, Linn. Campanulacea, Juft. Goodenevia, Brown.

Eff. Ch. Calyx fuperior. Tube of the corolla flit longitudinally on one fide. Anthers cohering. Pollen of compound grains. Stigma obfolete, in the bottom of a twolipped cover. Capfule prifmatic, of two cells, and four oppofite valves with central partitions. Seeds cubical or cylindrical, fhelly. Brown.

Obf. The grains of pollen, in all the fpecies, are compofed of four combined globules, which mark, though minute, is efteemed by Mr. Brown very effential to diftinguif this genus from all the reft of its natural order, and efpecially from its near ally Anthotium.

The fpecies are generally fhrubs of humble growth, rarely herbaceous, and are fmooth, with narrow entire leaves. Flowers axillary or terminal, moftly folitary.

Sec. I. Small fhrubs, with heath-like leaves. Flowers axillary or terminal. Capfule valvular. Seeds cubical.
I. L. formofa. Flowers axillary, folitary, drooping, without bracteas. Corolla fmooth, two-lipped.-Gathered by Mr. Brown on the fouth coalt of New Holland.
2. L. tubiflora. Flowers nearly terminal, folitary, Пightly ftalked. Corolla tubular, curved, with a clofed limb. Leaves awl-fhaped, with a fmall pellucid point.-Native of the fame , country.
3. L. expanfa. Corymbs axillary, of few flowers. Stalks with a pair of bracteas each. Corolla with one lip, in fringed Segments.-Native of the fame country.

Seld. 2. Herbaceous. Elower oppofite to a leaf. Cap.
fufe opening only when far advanced, its valves cohering by a narrow neck. Seeds cylindrical.
4. L. filiformis. Leaves alternate, thread-fhaped, fomewhat compreffed.-Gathered by Mr. Brown in the tropical part of New Holland.

LECHERAINE, in Geography, a town of France, in the department of Mont Blanc ; 10 miles N.N.E. of Chambery.

LECHIA, in Ichthyology, a name given by Paulus Jovius, and others, to the fifl called by others amia and glaucus, and by the ancient Grecks amia and trotus. See Scossber.

Lechlade, or Leachlade, in Geography, a fmall market-town and parifh in the hundred of Brightwells-barrow, Glouceflerfhire, England, is fituated, 76 miles, diftant from London, on the north fide of the xiver lfis, or Thames, near the point where the counties of Berks, Oxford, and Gloucefter unite; and not far from the place where the Leche rivulet empties itfelf into the Thames. From the latter circumflance Lechlade is faid to have derived its name: lade being a contraction from the Saxon ladean, to unload or empty. In Domefday bcok is the mention of a finhery here of 17 ; eels. The manor, at the period of that furvey, was the property of Henry de Fereres, anceltor of the Ferrers, earls of Derby, from whom, by the marriage of Ifabel, an hieirefs, it was conveyed to Roger Mortimer. A priory, or hofpital for Black Canons, and condifting of a mafter and certain poor and infirm brethren, was founded here upon a piece of ground coflled Lade, near the ancient bridge over the Thames, given for that purpofe by lady Ifabel Ferrers. The hofpital was fupprefled in the year 1473, and its revenues applied to the foundation of a chantry of three prielts in the parifh church. Some foundations of buildings, fuppofed to have belonged to the priory, have been dug up near the bridge. The church is a handfome ftructure in the pointed ftyle, and was erected, about the middle of the fifteenth century, at the joint expence of the then vicar, Conrade Ney, the inmates of the priory, and the inhabitants of the parinh. The nave is fpacious, and divided from the ailles by light pillars; at the weft end is a fquare embattled tower, terminated by a well-proportioned fpire : the pulpit is of fculptured fone. At this town the Thames becomes navigable; and here the junction of the Thames and Severn is completed by the canaL. Moft of the Wiltfhire and Gloucelterfhire cheefe, confumed in the metropolis, is brought in waggons to this town, where it is put on board the veffels which convey it down the Thames. A weekly market is held on Tuefdays, for which the grant was obtained by Richard, earl of Cornwall : an annual fais, held on the ninth of September, is much frequented. According to the returns made in 1800 , under the population act, the inhabitants of this parilla amounted to 917 ; the number of houfes to 193 .

In a meadow near Lechlade, was lately difcovered a large fubterraneous building, fuppofed to have been a Roman bath: it was nearly fifty feet in length, forty in breadth, and four in height; the floor was fupported by pillars of brick, and curioully inlaid with ftones of variegated colours. Ridge's Hittory, \&c. of GloucefterMire, 2 vols. Svo. Beauties of England and Wales.

LECHNICH, a town of France, in the department of the Roer, and chief place of a canton, in the dillrict of Cologne. The plase contains 1053, and the canton 11,462 inhabitants, in $3^{I}$ communes.

LECHONES, Os, a clufter of fmall illands in the Atlantic, near the 'W. coalt of Portugal ; three miles N. frona
I. E C
the mouth of the Duero. N. lat. $41^{\circ} 43^{\prime}$. E. long. $8^{\circ} 25^{\prime \prime}$.

LECHWAR, a town of Hindooltan, in Bahar; 30 miles S. of Bahar.

LECK, a town of Denmark, in the duchy of Slefwick; 14 miles N. of Breditede.

LECKNESS, a town of Norway; 22 miles W. of Chriftianfand.

Le Clerc, Daniel, in Bigraphy. See Clerk, Daniel le.

L'ECLUSE, in Geography. See Eczuse.
LE COQ, Anthony, in Biography, a Parifian phyfician, graduated in the faculty of that city, and practifed there with great reputation until his death, which took place on the 28th of March, 1550. He was elected dean of his faculty in 1538 ; and in the following year was called, in confultation with Fernel, to vifit the French king, Francis I. who had contracted the venereal difeafe. He fhewed his knowledge of the nature of the difeafe, by infiting, in oppofition to Fernel, who was not difpofed to employ any other remedy than his antivenereal opiate, that mercurial frictions were neceffary ; but his mode of propofing it evinced that he was a novice in the manners of a court. He obferved to Fernel, fpeaking of the king, "C'eft un vilain qui a gagné la vérole ; frottetur comme un autre, et comme le dernier de fon royaume, puifque il s'eft gaté de la même manière." This was reported to the king, who laughed, and was pleafed with his franknels. Le Coq left two works: 1. "De Ligno farcto non permifcendo in imperitos fucatofque medicos," Paris, 1548. 2. "Confilia de Arthritide," Francfort, 1540. The latter comprehended alfo fome other treatifes on the gout, efpecially thofe of Sylvius and Fernel ; in conjunction with whom, Le Coq had been confulted on the fubject by Louis of Flanders, and by Eleo. nora, queen of France. Eloy. Dict. Hif.

LECTICA, among the Romans, a litter, or vehicle, in which people were carried. The fella differed from the ledica, as being higher, and becaufe people always fat in it; on which account the fella, from the time it was firlt brought into ufe, was efteemed the more honourable carriage of the two. See Litter.

The lectica was alfo ufed as a bier for carrying out the dead, who were dreffed in habits fuitable to their quality and fex. Pitifc. in voc. See Buryisg.

LECTICARII, among the Romans, fervants who carried the lectica.

LECTICARIUS, was alfo an officer in the Greek church, whofe bufinefs it was to bear off the bodies of thofe who died, and to bury them. Thefe were otherwife denominated decani and copiate.

Lectio, Reading. Confidered in a medicinal view, it is faid by Celfus, lib. i. cap. 4 . to be bad, efpecially after fupper, for thofe whofe heads are weak: and in lib. I. cap. 8. he recommends reading with an audible voice, for fuch as have weak ftomachs. It is alfo directed by Paulus Æginetus as an exercife, lib. i. cap. I9.
L.ECTISTERNIUM, a religious ceremony among the ancient Romans; being a feftival prepared, and folemnly ferved up, in a temple, at a time of public calamity aud danger.

And becaufe, according to the cuftoms of thofe times, they placed beds around the tables, and fet the fatues of the gods on thofe beds, in the fame manner as men fat at meals, they called the folemnity lectifternium, from leaus, bed, and ferners, of ferno, to fpread, prepare.

It this ceremony the Sibylline decemvirs prefided, till Vol. XX.
the year of Rome 558, and afterwards the Epulones. See Epulo.

Cafaubon has obferved, from a paffage in the fcholiaft of Pindar, that the Greeks had alfo a fort of lectifternium in ufe.

Livy obferves, that the firft lectifternium feen in Rome, was that which held for eight days fucceftively, in honour of Apollo, Latona, Diana, Hercules, Mercury, and Nep. tune; on occafion of a contagious difeafe which killed almoft all their cattle, in the year of Rome 354 ; though Valerius Maximus mentions one before that.

LECTORES, among the Romans, fervants in great nien's houfes, who were employed in reading while their malters were at fupper. They were called by the Greeks anagno/ze.

LECTOURE, in Georraphy, a town of France, and principal place of a diftrict, in the department of the Gers, feated on a mountain, having accefs only on one fide, near the Gers, and well defended. Before the revolution it was the refidence of a governor, and fee of a bilhop. The place contains 5433n and the canton 13,655 inhabitants, on a territory of 265 kiliometres, in 17 communes; 16 miles S. of Agen. N. lat. $45^{\circ} 5^{\prime}$. E. long. $0^{\circ} 22^{\prime}$.

LECTUM, in Ancient Geograpby, Cape Bala, a promontory of Afia Minor, belonging to the Troades, fituated between the ifle of Lefbos to the fouth, and that of Te nedos to the north, at the extremity of Mount Ida. To the north it terminated the gulf of Adramyttium.

LECTURERS, in England, are an order of preachers in parifh churches, diftinct from the rector, vicar, and curate. They are chofen by the veltry, or chief inhabitants of the parifh, fupported by voluntary fubicriptions and legacies, and are ufually the afternoon preachers in the Sunday fervice. The term is alfo more generally applied to thofe who preach on Sunday, or on any ftated day of the week, in churches, or other places of public worhip. By 13 \& 14 Car. II. cap. 4 lecturers in churches, unlicenfed, and not conforming to the liturgy, fhall be difabled to preach, and thall alfo fuffer three months' imprifonment in the common gaol : and two juftices, or the mayor, or other chief magiltrate, in a town corporate, fhall, upon certificate of the offence from the ordinary, commit them accordingly. Where there are lectures founded by the donations of pious perfons, the lecturers are appointed by the founders, without any interpofition or confent of rectors of churches, \&c. though with the lease and approbation of the bifhop: fuch as that of lady Moyer's at St. Paul's. But the lecturer is not entitled to the pulpit, without the confent of the rector or vicar, who is poffefled of the freehold of the church.

## LECTURES. See Boyle's Leafures.

Lectures of Divinity, \&cc. in the univerfities. See Re. arus Profeffors.

LECTUS Igneus, among the Romans, a kind of inftrument of torture firf invented by Decius. The bottom of it was fet with ferrated teeth or fpikes, and ftrewed with falt; while melted tallow was poured from above on the unhappy tortured perfon.

LECYTHIS, in Botany, fo denominated by Lœfling, from the Greek word $\lambda r \times v i o ;$, an oil jar, or large pot. He confounds it with $\lambda_{\text {sxs }}$ os, the yolk of an egg. The latter has been ufed for the pea, alluding to the yellow colour of its internal fubftance : $\lambda_{r} \times \cup \mathcal{S}_{0} 5$ applies to the form of the feedveffel, which is that of a great pot with a cover. Loefl It. 189. Linn. Gen. 268. Schreb. 359. Willd. Sp. Pl. v. 2. 1172. Mart. Mill. Dict. v. 3-Jacq. Amer. 168. 30

Gen. Ch. Cal. Perianth fuperior, of fix roundifh, concave, permanent leaves. Cor. Petals fix, very large, oblong, obtufe, flat, the two uppermoft widely fpreading. Nectary petal-like, of a fingle tougue-fhaped leaf, flat and perforated at the bafe to admit the germen, bordered; its oblong part bent inwards and upwards from the bottom of the flower, linear, externally convex, thicker and ovate at the extremity, covering the pittil with the flamens. Stam. Filaments very nemerous, inferted upon the difi of the bafe of the nectary at the inner lide, very fhort, fivelling upwards; anthers oblong, fmall. Pif. Germen inferior, depreffed, pointed, encompaffed with the receptacle of the flower, Atyle very fhort; ttigma bluntifh, conical. Peric. Capfule woody, roundifh at the bafe, abrupt at the top, encompaffed with the remains of the calyx, cut round, and opening by a circular lid, imperfectly divided into four, fometimes two or fix cells. Sceds few, polifhed, with rough edges.

Eff. Ch. Petals lix. Calyx of fix leaves. Nectary tongucfhaped, bearing the ftamens. Capfule with a lid, and many feeds.

1. L. ollaria. Linn. Sp. Pl. 734. Loef. It. 189 . (Jacapucaya; Marcgr. Braf. 128. Pif. Braf. 135.)-Leaves feffle, ovate, fomewhat heart-fhaped, nearly entirc.-Native of Brafil and the Caracaos. This, according to Licofling, is a vall tree, with large unequal branches, bent in various directions, and a rough bark. Leaves about the ends of the branches, alternate, feffile, ovate inclining to heartfhaped, firm, fmooth, nearly entire, flightly waved, of a brownilh green. Flowers in terminal cluiters, flightly drooping, on alternate, horizontal, fomewhat angular italks, with ovate, concave, foon deciduous braileas. Corolla white, with a yellow nectary.-Marcgraave fays the leaves are ferrated, the fruit like a pot with its cover, as big as a child's head, containing feeds like chefnuts, eatable either rav or roafted, and that the bark of the tree ferves to make ink.
2. L. minar. Linn. Sylt. Veg. ed. 14. 494. Jacq. Amer. 168. t. 109. - Leaves Italked, lanceolate, ferrated.Obferved by Jacquin in woods near Carthagena, Sonth America, flowering in June and July, ripening fruit in December. An elegant branching tree, 60 feet high. Leaves numerous, fix inches long, alternate, fpreading in two directions, lanceolate-oblong, pointed, ferrated, fmooth. Spikes terminal, each often accompanied by a fmaller axillary one below, fhorter than the leaves; the flowers nearly feffile, Slightly fcented. Petals and neEary white. Stamens yellow. Fruit very hard, brown, two inches wide. Seeds about eight. Jacquin thought he experienced a giddinefs and ficknefs after eating one of them, though its tafte proved very agreeable. Some perfons told him thefe feeds were eatable, others reported them to be poifonous. Monkies are faid to be fond of them. The flowers are infefted with a kind of black wafps, very troublefome to thofe who attempt to gather any.
3. L. grandiflora. Aubl. Guian. v. 2. 712. t. 283-285. (L. Ollaria; Linn. Aın. Acad. v. S. 258; Herb. Linn.) Leaves italked, obovate, entire. Clufters many times longer than the foottalks. Petals obtufe, - Native of Guiana and Surinam. A large tree. Leaves from four to feven inches in length, and two or three broad, obovate-oblong, with a little point, entire, fightly wavy, fmooth, with one rib and many parallel tranfverfe veins. Fooffalks an inch long. Cluffers about the ends of the branches, axillary, pendulous,
of numerous large rofe-coloured flowers, whofe partial ftalks are an inch long, bearing a pair of blunt brateas, and whofe blunt concave petals are nearly an inch and laalf in length. Calyx-leaves rounded, obtufe, flat. Fruit about feven inches long, and four wide; the opening about $2 \frac{3}{2}$. Seedr, according to Aublet, very grod to eats 'The flowers appear in January, the fruit is ripe in April.
4. L. amara. Aubl. Guian. 716. t. 286 and 285.Leaves elliptic-oblong, pointed, entire. Clufters axillary and terminal, twice the length of the footitalks. Petals acute.-Found in the woods of Guiana, by Aublet, whofe ligure and defcription afford all the knowledge we have of this fpecies. He fays the trunk is' 10 feet high, bearing at the top many Atraight and horizontal brancbes, whofe fubdivifions are pendulous and leafy. In his French defrription, which will gencrally be found the molt original and authentic throughout his work, he lays this is a very lofty tree. The flowers are fmall, yellow, with two or three fcales upon their footltalks. Fruit the fize of an egg, its coat thin though hard. Seeds bitter, but eaten by monkies.
5. L. Zabucajo: Aubl. Guian. 718. t. 288 -Leaves elliptic-oblong, pointed, entire. Clullers terminal. Petals obtufe, Calyx-leaves lanceolate. - Gathered by Aublet in the defert woods of the interior of Guiana, flowering in March, and bearing fruit in July. We have from fir Jofeph Banks a fpecimen of this fepcies, gathered in Dutch Guiana by Mr. Alexander Anderfon, which agrees well with Aublet's defeription, and helps us better to underftand the diftinctive characters, than profeffor Willdenow was able to do from his incorrect figure. The profeffor rightly expunges the quotations of Pifo, which belong to the firft ; but it is unlucky that the fpecific name belongs to them, or rather perhaps is common to many fpecies. This is a valt tree; its trunk 60 feet, or more, in height. Wood white, red in the centre. Leaves ftalked, from fix to ten inches long, and two or more in breadth. Cluffers at the ends of the branches, pendulous. Partial flower-falks an inch long, fwelling upward. Caly. -leaves broadilh at the bafe, tapering, concave, fharpifh from the inflexion of their edges at the fummit, flefhy, one-third of an inch in length, reddih when frelh. Petals large, rounded, flefhy, white bordered with rofe* colour, two of them much bigger than the reft, being equal to thofe of $L$. grandiffora. The fruit is about four inches in diameter. Seeds fweet, eatable, preferable to our almonds.
6. L. Idatimon. Aubl. Guian. 721. t. 289.-Leaves elliptical, pointed, entire. Clufters axillary. Stalks glandular. Calyx-leaves ovate, acute. Petals obtufe.-Native of wild forefts in Guiana. A tree agreeing with the laft in height, and in the general afpect of its leaves. Cluflers axillary, with zigzag, glandular red ftalks. Flozvers rofecoloured, not half the fize of the latt, with broader calyxleaves. Fruit little more than an inch in diameter. Aublet oblerved what he deemed a variety only, with yellow flowers.
7. L. parviffora. Aubl. Guian. 717. t. 287 and 28 .Leaves elliptic-oblong, pointed, entire. Clufters terminal, panicled. Petals acute. Capfule of two cells.-Found about the banks of rivers in Guiana. Aublet. A friall tree, with drooping branches. Leaves three or four inches long. Flowers much fmaller than even thofe of $L$. amara, bright yellow, and very frezrant. Fruit fmall, thin and brittle, of only two cells. Secds folitary, bitter.
8. L. multififora.-Leaves .... Cluiters terminal, panicled. Petals obtufe. Calyx-leaves broader than long, rounded, blunt, downy.-A native of Guiana, communicated by E. Rudge, efq. as a new fpecies of Lesythis,

## L E D

*hich it really appears to be. The leaves are wanting in our fipecimen. Cinflers plentifully terminating the little branches at the ends of the main ones, bearing many flowers, which are of a moderate fize, and feem to be yellow, their petals rounded and blunt. The partial faiks are an inch long, fwelling upwands, downy or glandular, naked. Germen hemifpherical, downy, crowned with the fix calyxleaves, which are very fhort, rounded or heart-fhaped, blunt, minutely fringed, very like thofe of a Myrzus or Eugeria.
9. L. bradenta. Willd. n. 8. (Courcupita guianentis; Aubl. Guian. 708. t. 282. Pekia fructu maximo globofo ; Barrere France Equinoxiale, 92.)-Leaves tralked, obovate, pointed, entire. Clulters latcral. Calyx with a pair of acute bracteas at its bafe. Fruit of fix cells.-Native of Cayenne, where the fruit is known by the name of the cannon ball. This is a large tree, with a thick rugged bark, and white foft and indifferent wood, red in the middle. 'T'he fhape of the leaves feems molt to approach thote of E. grandiflora, and thefe two fpecies agree alfo in heving a pair of bracieas on each partial italk, juft below the calyx. Thefe are acute in the prefent, blunt in the former. Both alfo have a deciduous bractea at the bafe of cach partial ftalk. All this confirms the propriety of reducing them to one genus, though the fruit of that now under confideration has fix cells, and its coats are feparated by an intermediate pulpy and fibrous fubltance, which may alfo be the caufe of its lid not falling off, as in all the above-defcribed. L. bracfeata is in flower and fruit nearly all the year round. Its corolla is of a full rofe-colour, beautiful and fragrant. The fruit is as large as a cannon ball of 36 pounds, and Aublet remarks that its weight is fuch as to render it dangerous in falling. The pulp is red, acid, and not difagreeable, diffufed, as the fruit ripens, through all the internal part, among the feeds.

LECYTHUS, in Ancient Geography, a town of Greece, in Eubcea. Thucydides.

LECZENGA, in Geography, a river of Africa, which runs into the Mozambique gulf, S. lat. $17^{\circ} 20^{\prime}$.

LECZNA, a town of Poland, in the palatinate of Chelm; 24 miles N.W. of Chelm.

LEDA Negus, a town of Abyflima, in the province of Gojam; 120 miles S.S.W. of Gondar.
LEDAH, a town of Hindooltan, in the circar of Gangpour; 20 miles S. of Gangpour.

LEDBURY, an ancient borough, and market town in the hundred of Radlow, and county of Hereford, England, is fituated on a declivity within a fmall valley, formed by the Dog-kill and other eminences, about one mile welt from the river Leddon, from which it derives part of its name. The town confills chiefly of two ftreets, croffing each other at right angles; the principal flreet runs north and fouth, and has a middle row near the old market houfe. This building is elevated on ftrong oak pillars, and compofed of timber and lath plaitered and white-wathed; the beams being coloured black. This mode of building is prevalent in the more ancient parts of the town; and many of the houfes have projecting flories: the modern houfes are of red brick, and of a refpectable appearance. The pavement, even in the high itreet, is very bad, and full of inequalities; the fmall flones that form it being preffed into the ltiff clay, which is the general foil of the county. Ledbury formerly belonged to the fee of Hereford; and bifhop Bohun procured the charter of a market from king Stephen, to be held on Saturdays ; but this having fallen into difufe, queen Elizabeth granted a new charter for a Tuefday market, and -two annual fairs; the tolls ariling from which were to be given to the poor. This borough had once the privilege of
fending two members to parliament, but furrendered the right, on the plea of inability to fupport them. The church, which is a large edifice, of Saxon origin, confifes of a nave, fide aifles, and chancel; a chapel called St. Catherine's, and a detached tower, terminated by a finely proportioned fpire, about fixty feet high. Bihop Foliot founded an hofpital in this town in the year 1232 for the maintenance of poor men and widows: it was refounded and further endowed by queen Elizabeth. The hofpital is a very ancient timber and plafter building. Here are alfo a free fchool, a charityfchool, and feveral alms-houles. The clothing trade was, at one period, very flourihing in this town; but the principal bufinefs now carried on is the manufacture of ropes, lincs, and facks. The cyder trade is very confiderable; great quantities being made in the vicinity. Ledbury is dittant from London 121 miles; the inhabitants, as afcertained under the act of 1800 , amounted to 3058 ; the number of houfes being 618 . The bifhops of Hereford formerly lad a palace liere.

On the Dog-hill, to the north of Ledbury, is Hope End, the feat of tir Harry Vane Tempett, bart. About two miles fouth of the town is the Vineyard camp; the works of which have been almoft defaced by the plough, and the area is cultivated. Beauties of England.
LEDER, a lake of the county of Tyrol; i8 miles W. of Trent.

LEDESMA, an ancient town of Spain, formerly called Bletija, in the province of Leon, fituated four or five leagues from the mouth of the Tornies, and defended both by nature and art: In its jurifdiction are 380 villages, which have about 16,000 houfes. To the E. of Ledefma and rear it is a medicinal bath, made by a Moor for the ufe of the public. The water is moderately warm, and is reckoned good for the cure of different difeafes, particularly the itch; iS miles W. of Salamanca.
LEDETSCH, a town of Bohemia, in the circle of Czaffau; 13 miles S. of Czaflau. N. lat. $49^{\circ}$ 40'. E. long. $15^{\circ} 15^{\prime}$.

LEDETZ, a town of Bohemia, in the circle of Boleflaw ; feven miles S.E. of Jung-Buntzel.
LEDGER. See Book and Book-keeping.
Ledgers, among Builders. See Putlogs.
LEDGES, in a Ship, oak or fir fcantling, ufed in framing the decks, which are let in the carlings athwart the Chip. Thofe for gratings arch upwards, agreeable to the head ledges, which form the hatchways, \&c.
LEDIANAIA, in Geography, a bay or gulf of the Frozen fea, on the coalt of Nova Zembla. N. lat. ${ }_{7} 6^{\circ} 40^{\prime}$. E. long. $59^{\circ} 1^{\prime \prime}$.

LEDIANOI, a cape on the N. coaft of Nova Zembla. N. lat. $78^{\circ}$. E. long. $73^{\circ} 24^{\prime}$.

LEDIGNAN, a town of France, in the department of the Gard, and chief place of a canton, in the diltrict of Alais. The place contains 666 , and the canton 3965 inhabitants, on a territory of $102 \frac{1}{2}$ kiliometres, in 13 communes; 15 miles N.W. of Nifmes.

LEDON, in Gardining. See Cistus.
LEDONG, in Gcograply, a town on the E. coa? of the ifland of Bornen. N. lat. $+33^{\circ}$. E. long. I1 $6^{\circ} 42^{\prime}$.

LEDOREN, a fmall ifland on the W. dide of the gulf of Bothnia. N. lat. $63^{\prime \prime} 12^{\prime}$. E. long. $20^{\circ} 56^{\prime}$.
LEDOYRA, a town of Spain, in Galicia; 12 miles N E. of Santiago.

Le dran, Henry Francis, in Eiography, a celebrated furgeon of the 18 th century, was a native of Paris, where his father practifed the fame profefion with confiderable reputation, and was deemed the firlt operator of his

## L E D

time. He foon equalled his father in reputation; and uniting with great dexterity, an excellent judgment and much acutenefs of mind, learning, and experience, he not only practifed with great fuccefs, but was the author of feveral works, which gave him a high rank among the furgeons of France. Thefe are, "Parallele des différentes manières de tirer la pierre de la veffie," Paris, 1730. "Obfervations de Chirurgic, auxquelles on a joint plufieurs Reflexions en faveur des Etudians," Paris 1731 , two vols. 12 mo . Both thefe works were tranilated into other languages, and paffed through feveral editions. "Traité des Operations de Chirurgie," ibid. 1731, 8vo. This was alfo a valuable work, was tranflated into Englifh, and feveral times reprinted. "Reflexions fur les plaies d"armes à feu," ibid. ${ }^{7} 3^{7} 7,8 \mathrm{Ec}$. 12 mo . A fhort treatife, but full of judicious and interefting obfervations, the refult of the author's practical obfervation during feveral campaigns, in which he accompanied the French ârmies. "Suite du parallele de la taille," ibid. 1756,8 vo. "Confultations fur la plupart des maladies qui font du reflort de la Chirurgie," ibid. 176;" another judicious and valuable work, which contributed to fupport the eminent character of the author. But his laft work, "Traité économique de l'Anatomic du corps humain," ibid. 1768, was inferior to the reft, his genius feeming to partake of the debility which age had now occafioned in his frame. Eloy. Dict. Hift.

LEDUM, in Botany, a name adopted from the Greeks, whofe $\lambda$ nioy is generally believed to be a fpecies of Ciffus. Linnæus, in applying it to defignate a not very diffimiar genus of flurubs, whofe fcent is fo powerful as to be unpleafant and hurtful, offers an etymology expreffive of that circumftance, a ledendo; but fuch explanations have fcarcely more than the merit of a pun, and none in this cafe was wanting. Linn. Gen. 218. Schreb. 294, Willd. Sp. Pl. v. 2. 602. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 3. 48. Juff. 159 . Lamarck Illuftr. t. 363. Gærtn. t. 112. Clafs and order, Decandria Monogynia, Nat. Ord. Bicornes, Linn. Rbododendra, Juff.

Gen. Ch. Cal. Perianth inferior, minute, of one leaf, with five teeth, permanent. Cor, of one petal, wheelfhaped, regular, in five deep, ovate, concave, rounded fegments. Stam. Filaments ten, thread-fhaped, fpreading, as long as the corolla ; anthers ovate-oblong, vertical, opening by two terminal pores. Pif. Germen fuperior, roundifl; tyle thread-fhaped, the length of the ftamens; ftigma obtufe. Peric. Capfule roundifh-oblong, of five cells, and five valves, feparating from the bafe, their inflexed margins forming the partitions. Seeds numerous, oblong, narrow, their extremities acute and very thin, attached to five linear pendulous receptacles, proceeding from the central column.

Eff. Ch. Calyx five-cleft. Corolla flat, in five deep regular fegments. Capfuie of five cells, fplitting from the bafe; partitions from the margin of the valves.
I. L. paluftre. Marth Ledum. Linn. Sp, Pl. 56I. Fl. Lapp. ed. 2. 127. Ehrh. Arb. 113. Fl. Dan. t. 1031. (L. filefiacum ; Cluf. Pann. 69. Hilt. v. I. 83. Ger. em. 1288. Rofmarinum fylveftre ; Camer. Epit. 546.) Leaves linear, revolute, woolly beneatti.-Native of fpongy bogs in the noth of Europe, very plentiful in Lapland. With us it flowers in April and May, being cultivated in bog earth, like the fhrubs of North America. The Jlem is flarubby, erect, much branched in a determinate manner, about two feet high; the young branches woolly. Leaves fcattered, numerous, flalked, an inch or more in length, linear, obtufe, entire, revolute; dark green and fmooth above; clothed with denfe rufty wool beneath. Flowers numerous, in denfe, fimple, terminal, bracteated corymbs,
white and very pretty. The whole plant, efpecially when bruifed, has a ftrong aromatic oppreffive fcent, fomewhat like hops, inftead of which the inhabitants of Dalecarlia are faid by Linnæus fometimes to make ufe of it, but the confequences are a molt pernicious kind of intoxication, with obftinate head-aches, The Swedes walh their oxen and fwine with a decoction of it, to kill lice, and the fettlers in Lapland ftrew its branches among their grain to drive away mice.-A procumbent variety, a fpan long, is faid to be found at Hudfon's bay, juft as the birch grows humble, and almolt proflrate, in the upper parts of Lapland.
2. L. latifolium. Labrador Tea, or broad-leaved Ledúm. Ait. Hort. Kew. ed. I. v. 2. 65. Jacq. Ic. Rar. t. 464. (L. groenlandicum ; Fl. Dan. t. 567. )-Leaves elliptical, revolute, woolly beneath. Stamens fcarcely more than five. -Native of bogs in Greenland, Labrador, Newfoundiand, \&c. Differs from the laft chiefly in the broad form of its leaves and the very con'picuous denfe rufty wool of their under fide. The flamens are ufually from five to feven or eight, feldom ten.
3. L. buxifolium. Box-leaved Ledum. Bergius in Act. Petrop. for 1777, part 1.213. t. 3. £. 2. Dryand. Leaves elliptical, fmooth on both fides, nearly flat. Native of Carolina and New Jerfey. Introduced to our gardens by the celebrated Peter Collinfon in $173^{6}$. It is a much fmaller /hrub than either of the foregoing, with leaves refembling thofe of Azalea procumbens at firf fight. They are about $\frac{1}{4}$ of an inch long, elliptical or obovate, fmooth on both fides, moft fhining above, their edges fcarcely revolute, their midrib prominent underneath. Flowers white, about a quarter of the fize of the firlt fpecies.

Ledum, in Gardening, comprehends plants of the hardy evergreen kind, as the marf ciltus, or wild rofemary. The fpecies cultivated is the marfh ledum, (L. paluttre.)

It has varieties with erect and decumbent branches.
Method of Culture. - Thefe plants are increafed by fowing the feeds in pots filled with boggy earth, or in fhady borders of the fame kind of mould, in the fpring feafon. But the beft method is to take up the plants in their native fituations, with balls of earth about their roots, and plant them in horders of the above kind, keeping them well watered.

It is alfo found that layers of the young thoots will fometimes grow.

Thefe plants afford variety in flady fituations, where the foil is of the boggy kind.

LED.YARD, in Biograpby, a native of America, who feems from his youth to have indulged an invincible defire of acquainting himfelf with the unknown, or imperfectly difcovered regions of the globe. His hiftory is fo extraordinary? that a detail of fome of its leading particulars cannot be unamufing to our readers. Having lived for feveral years with the Indians of America, he had ftudied their manners, and had practifed in their fchool the means of obtaining the pro* tection, and of recommending himfelf to the favour of favages. In the humble fituation of a corporal of marines, to which he fubmitted rather than relinquifh his purfuit, he had made with captain Cook the voy age of the world; and feeling on his return an anxious defire of penetrating from the northweftern coaft of America, which Cook had partly explored, to the eaftern coalt, with which he himfelf was perfectly familiar, he determined to traverfe the valt continent from the Pacific to the Atlantic ocean. His firlt plan for the purpofe was that of embarking in a veffel, which was then preparing to fail, on a voyage of commercial adventure, to Nootka found, on the weftern coaft of America; and with this view he expended in fea-ltores the greateft part of the money with which he had been fupplied by the liberality of

## LEDYARD.

fir Jofeph Banks, who has eminently diftinguifhed himfelf in this tray on other occafions for the promotion of every kind of ufeful feience. But this fcheme was fruftrated by the rapacity of a cuftom-houfe officer; and therefore Mr. Ledyard determised to travel over land to Kamtfchatka, from whence the paflage is extremely fhort to the oppofite coalt of America. Accordingly, with no mere than ten guineas in his purfe, which was all that he had left, he croffed the Britifh channel to OAtend, towards the clofe of the year 1586, and by the way of Denmark and the Sound, procceded to the capital of Sweden. As it was winter, he attempted to traverfe the gulf of Bothnia on the ice, in order to reach Kamtichatka by the fhortelt courfe; but iinding, when he came to the middle of the fea, that the water was not frozen, he returned to Stockholm, and taking his courfe northward, walked to the Arctic circle, and paffing round the head of the gulf, defcended on its eaftern fide to Peterfburg, where he arrived in the beginning of March 1787. Here he was noticed as a perfon of an extraordinary character; and though he had neither ftockings nor fhoes, nor means to provide himfelf with any, he received and accepted an invitation to dine with the Portuguefe ambalfador. From him he obtained twenty guineas for a bill, which he took the liberty, without being previoully authorized, to draw on fir Jofeph Banks, concluding, from his well known difpofition, that he would not be unwilling to pay it. By the intereft of the ambaffador, as we may conceive to have been probably the cafe, he obtained permiffion to accompany a detachment of ftores, which the emprefs had ordered to be fent to Yakutz, for the ufe of Mr. Billings, an Englifhman, at that time in her fervice. Thus accommodated, he left Peterfburg on the 21ft of May, and travelling eaftward through Siberia, reached Irkutik in Augult; and from thence he proceeded to Yakutz, where he was kindly received by Mr. Billings, whom he recollected on board captain Cook's hhip, in the fituation of the aftronomer's fervant, but who was now entrufted by the emprefs in accomplifhing her fchemes of difcovery. He returned to Irkutfk, where he fpent part of the winter; and in the fpring proceeded to Oczakow, on the coaft of the Kamtfchatkan fea, intending, in the fpring, to have paffed over to that peninfula, and to have embarked on the eaftern fide in one of the Ruflian veffels that trade to the wettern fhores of America; but finding that the navigation was completely obftructed, he returned to Yakutz, in order to wait for the termination of the winter. But whilit he was amuling himfelf with thefe profpects, an exprefs arrived, in January 1788, from the emprefs, and he was feized, for reafons that have not been explained, by two Rulfian foldiers, who conveyed him in a nedge through the deferts of Northern Tartary to Mofcow, without his clothes, money, and papers. From Mofcow he was removed to the city of Moialoff, in White Ruffia, and from thence to the town of Tolochin, on the frontiers of the Polih dominions. As his conductors parted with him they informed him, that if he returned to Ruffia he would be hanged, but that if he chofe to go back to England, they wifhed him a pleafant journey. Diltreffed by poverty, covered with rags, infelled with the ufual accompaniments of fuch clothing, haraffed with continual hardfhips, exhaufted by difeafe, without friends, without credit, unknown, and reduced to the mott wretched ftate, he found his way to Konigfberg. In this hour of deep diftrefs, he refolved once more to have recourfe to his former benefactor, and fortunately found a perfon who was willing to take his draft for five guineas on the prefident of the Royal Society. With this affitance he arrived in England, and immediately waited on fir Jofeph Banks. Sir Jofeph, knowing his difpotition, and conceiving,
as we may well imagine, that he would be gratified by the in formation, told him, that he could recommend him, as he believed, to an adventure almoft as perilous as that from which he had juft returned; and then communicated to him the wilhes of the Affociation for difcovering the Inland Countries of Africa. Mr. Ledyard replied, that he had always determined to traverfe the continent of Africa, as foon as he had explored the interior of North America, and with a letter of introduction by fir Jofeph Banks, he waited on Henry Beaufoy, efq. an active member of the fore-mentioned affociation. Mr. Beaufoy fpread before him a map of Africa, and tracing a line from Cairo to Sennar, and from thence weftward in the latitude and fuppofed direction of the Niger, informed him that this was the route by which he was anxious that Africa might, if poffible, be explored. Mr. Ledyard expreffed great pleafure in the hope of being employed in this adventure. Being afked when he 'would fet out? "Tomorrow morning" was his anfwer. The committee of the fociety affigned to him, at his own defire, as an enterprife of obvious peril and of difficult fuccefs, the tafk of travering from ealt to weft, in the latitude attributed to the Niger, the wideft part of the continent of Africa. On the 30 oth of June, 1788, Mr. Ledyard left London; and after a journey of 36 days, feven of which were confumed at Paris, and two at Marfeilles, he arrived in the city of Alexandria. On the 14th of Auguft, at midnight, he left Alexandria, and failing up the Nile, arrived at Cairo on the 19th. From Cairo he communicated to tha committee of the fociety all the information which he was able to collect during his ftay there: and they were thus fufficiently apprized of the ardent fpirit of inquiry, the unwearied attention, the perfevering refearch, and the laborious, indefatigable, anxious zeal with which he purfued the object of his miffion. The next difpatch which they were led to expect, was to be dated at Sennar : the terms of his paffage had been fettled, and the day of his departure was appointed. The committee, however, after having expected with impatience the defeription of his journey, received with great concern and grievous difappointment, by letters from Egypt, the melancholy tidings of his death. By a bilious complaint, occafioned probably by vexatious delay at Cairo, and by too free an ufe of the acid of vitriol and tartar emetic, the termination of his life was haftened. He was decently interred in the neighbourhood of fuch of the Englifh as had ended their days in the capital of Egypt.

Mr. Ledyard, as to his perfon, farcely exceeded the middle fize, but he manifetted very remarkable activity and ftrength: and as to his manners, though they were unpolifhed, they were neither uncivil nor unpleafing. "Little attentive to difference of rank," fay's his biographer, "he feemed to confider all men as his equals, and as fuch he refpected them. His genius, though uncultivated and irregular, was origioal and comprehenfive. Ardent in his wifhes, yet calm in his deliberations; daring in his purpofes, but guarded in his meafures; impatient of controul, yet capable of frong endurance ; adventurous beyond the conception of ordinary men, yet wary and confiderate, and attentive to all precautions, he appeared to be formed by nature for achievements of hardihood and peril."-" They who compare the extent of his pilgrimage through the vaft regions of Tartary with the fcantinefs of his funds, will naturally ank, by what means he obtained a fubfiftence on the road? All that I have ever learned from him on the fubject was, that his fufferings were exceffive, and that more than once he owed his life to the compaffionate temper of the women. This remark is Atrongly confirmed by the following extract from his account of his Siberian tour: "I have always remarked, that women, in all countries, are civil, obliging, tender, and

## L E E

humane: that they are ever inclined to be gay and cheerful, timorous and modelt; and that they do not hefitate, like men, to perform a generous actiono- Not haughty, not arrogaut, not fupercilious; they are full of courtefy, and fond of fociety; more liable, in general, to err than man ; but in general, alfo, more virthous, and perforining more good actions than he. 'To a woman, whether civilized or favage, I never addreffed myfelf in the language of decency and friend hip, without recciving a decent and friendly anfwer. With man it has often been otherwife. In wandering over the barren plains of inbofpilable Denmark, throuzh bongl Sevedin and frozen Lapland, rude and churlifh Finland, unprincipled Rufias and the zuide-pread regions of the wandering Tarlar, if hungry, dry, cold, wet, or fick, the women have ever been friendly to me, and uniformly fo; and to add to this virtue (fo worthy the appellation of benevolence), thefe actions have been performed in to free and fo kind a manner, that if I was dry, I drank the fweeteft draught; and if hungry, I eat the coarfe morfes with a double relifh." Similar to this was the experience of Mr. Park. (See Africa.) Neverthedefs, though Mr. Ledyard found frequent relief and affittance from temale attention and kindnefs, he feems on many occations to lhave endured the utmof preflure of diltrefs. "I am accuftored," faid he, in his balt converfation with the writer to whom we are indebted for this account of him, "to hardflips. I have known be:h hunger and nakediefs to the utmolt extremity of human fuffering. I have known what it is to have food given me as charity to a madman; and I have at tumes been obliged to fhelter my felf under the mileries of that character to aroid a heavier calamity. My diltreffes have been greater than I have ever owned, or ever cill own to any man. Such evils are terrible to bear; but they never yet had power to turn me from my purpofe. If I live, I will faithfully perform, in its utinolt extent, my engagement to the fociety; and if I perihh in the attempt, my berour will till be fafe, for death cancels all bonds." Proceedings of the Affociation for promoting the Difcovery of the Interior Parts of Africa. London, 1790.

LEE, Nathamel, fon of a clergyman, was educated at Weltminfter fchool under Dr. Bußy. He was admitted a fcholar of Trinity college, Cambridge, in 166S, but quizted the univerfity without a fellowfhip, and attempted to pufh his fortune at court. In this he was unfuccefsful, and then began to write for the dlage. His firlt piece was the tragedy of Nero, produced in 1675 , and from this time, till 1681, he produced one tragedy every year, all which appear to have had temporary fuccefs. He made a trial of his talents as an actor, but did not fucceed in the attempt. About the year 1684, he was bereaved of his underftanding, an alliction which proved fo fevere as to bafle the powers of his medical friends, and which obliged his relatives to obtain for him an afylum in Bedlam. Here he remaincd about four years, during which he was able to write two tragedies. He died, in 1690 , fo poor, as to have been buried by the parinh of St. Clement Danes. According to Addifon, Me. Lce was equal to any of his contemporaries in a natural genius for tragedy, but his impetuolity led him into a turgid Hyle, approaching to bombaft, and he was apt to bury his thoughts in fuch a clond of words, that it was difficult to difeern their beauty. He is reckoned to excel in reprefenting the palfiun of love, which he fometimes touched with exquite tendernefs and force. Two of his pieces only are, at this time. ever brought on the flane, wiz. his "Theodolins," and his "Rival Queens." Biog. Brit.

Lee, in Geograply, a river of Ireland, which rifes in the mountains, on the weltern bonder of the county of Cork,
and having pafled Loughs Gougane-barra and Allun, fowe ealtward through the barony of Mulkerry. It receives in its way the rivers Sullane, Dripfy, Blarney, and Bride, with feveral fmaller Atreams, and below the city of Cork, which is built chiefly on iflands formed by it, it expands into that capacious and beautiful harbour, called Cork harbour. (Sce Cork.) There is alfo a fmall river of this name, which runs into Tralee bay, in the county of Kerry.

Lee, a county of Virginia, in the S.W. corncr of the flate, bounded S. by North Carolina, and W. by Kentucky : its form is triangular, two fides being 60 miles long, and the other about 30. In this county is Powcl's fertile valley, but a third part of the county is mountainous. It contains 3295 free inhabitants, and 243 flaves. The chicf town is Jonefville.-Alfo, a fmall town in Strafford county, New Hamp fhire, about 12 miles N. of Exeter; formerly part of Dover and Durham ; incorporated in 1766, and containing 978 inhabitants.-Alfo, a townfhip in Berkfhire county, Malfachufetts; 140 miles W. of Bollon ; incorporated in 1777, and containing 1267 inhabitants. Houfatonick river runs towards the fouth through this town.

Lee, a term varioufly ufed at fea; though iss general ufe be to fignify the part towards, or oppolite to the wind.

This expreffion is chiefly ufed when the wind crofies the line of a fhip's courfe, fo that all on one fide of her is called to windward, and all on the oppofite fide, to lee-ward. Hence,

Lee-Shore is that on which the wind blows; fo that to be under the lee of the fhore, is to be clofe under the weatherfhore, or under wind; or at a fhort diftance from the fhore which lies to windward.

A-Lee the Helm. Sce A-Lee.
Lee, Harda. See Hard.
Lee-Hatch, take care of the, is a word of command to the man at the helm, to take care that the fhip do not go to the lee-ward of her courfe.
To Lee-sward, denotes towards that part of the horizon which lies under the lee, or whither the wind bloweth.

Lee-ward Ship, is one that is not faft by the wind, or which doth not fail fo near the wind, nor make fo good way as the fhould; or which is much to leeward of her courfe, when failing clofe-hauled.
Lee, To lay" a Ship ly the, or to come up by the Lee, is to bring her fo, that all her fails may lie flat agaiuit her mafls and fhrouds, and that the wind may come right upon her broadfide.
Lee-Fangs, are ropes reeved into the cringles of a yacht's or hoy's fails.
Lee-Larches, fignify the fudden and violent rolls which a fhip often takes to the leeward in a ligh fea, particularly when a large wave ftrikes her on the weather-lide.
Lee-Side, denotes all that part of a fhip or boat, which lies between the malt and the fide fartheft from the direction of the wind ; or that half of a fhip which is preffed down towards the water by the eflort of the fails, as feparated from the other half hy a line drawn through the middle of her length ; that part of the fhip, which lies to the windward of this line, is accordingly called the weather-f:de. Thus, if a fhip fails fouthaward, with the wind at eaft, then is her flarboard, or right fide, the lee-fide; and the larboard, or left, the weather-1ide.

Lee-I I'ap, or Leee-vard Way of a Ship, is the angle made by the line on which the thip mould run according to her ceurfe, or the point of the compals fteered upon, and the real line of the fhip's way'occalioned by contrary winds, and a rough fea.

All thips are apt to make fome lee-way ; fo that in calting

## LE E

up the log-board, fomething mult be allowed for lec-way. But the lee-way made by different fhips, under the fame circumflances of wind and fails, will be different; and even the fane fliip, with different lading, and having more or lefs fail abroad, will make more or lefs lee-way. The ordinary rules of allowing for it are thefe : they were given by Mr. John Buckler to the late Mr. William Jones, who firtt publifhed them about the year 1702.

1. When a fhip is clofe-hauled, has all her fails fet, the water fmooth, and a moderate gale of wind, fhe is then fup. pofed to make little or no lee-way. 2. Allow one point, when it blows fo frefl, that the fmall fails are taken in. 3. Allow two points, when the top-fail mult be clofe-reefed. 4. Allow two points and a half, when one top-fail mult be handed. 5. Allow three points and a half, when both topfails are to be taken in. 6: Allow four points, when the fore-courfe is handed. 7. Allow five points, when trying under the main-fail only. 8. Allow fix points, when both main and fore-courfes are taken in. 9. Allow feven points, when the thip tries a-hull, or all fails are handed. When the wind has blowed hard in either quarter, and fhifts acrofs the meridian into the next quarter, the lee-way will be leffened. But in all thefe cafes, refpect mult be had to the roughnefs of the fea with the trim of the fhip; and hence the mariner will be able to correct his courfe.
LEEA, in Botany, fo named by Linnæus, at the fuggeftion of Profeflor David Van Royen of Leyden, in honour of the late Mr. James Lee, of the Vineyard at Hammerfmith, author of an Introduction to Botany, of which the firf edition appeared in 1760, the fourth in 1810 . This book, whofe principles are borrowed from Limnæus, but which is particularly valuable for its gloffaries and tables of fynonyms, has been of primary ufe in making the Linnæan fyftem popular here. Its author was one of the belt practical botanifts, and mott experienced and fuccefsful cultivators. He loved to encourage and affilt all who had a talte for natural hiftory, and died generally efteemed, at an advanced age, in July 1795, leaving a fon in every refpect worthy to fuftain and extend his reputation. Linn. Mant. 17. Schreb. 638. 796. Willd. Sp. Pl. v. I. Ir 77. Mart. Mill. Diet. v. 3. Ait. Hort. Kew. ed. 2. v. 2. 50. Juff. 153. (Aquilicia; Linn. Mant. 2. 146. Schreb. 154. S24. Juff. 266. Lamarck. Illufr. t. 139. Gærtn. v. I. 275. t. 57. f. 7.)-Clafs and order, Pentandria Monoğynia. Nat. Ord. Melie, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, coriaceous, bell-fhaped, five-toothed, permanent. Cor. of one petal; tube the length of the calyx; limb in five ovate, acuie, recurved fegments. Nectary attached to the infide of the tube, ereê, pitcher-fhaped, fhorter than the tube, with five notched lobes. Stam. Filaments five, connected with the nectary, between the lobes, a little way down, incurved; anthers ovate, verfatile, cohering together before impregnation and covering the ftigma. Pijf. Germen fuperior, nearly globular; ftyle dimple, fhorter than the nectary; ftigma capitate. Peric. Berry orbicular, deprefled, with five prominences, of one cell. Seeds five, gibbous at the outide, angular at the inner.

Eff. Ch. Corolla of one petal; limb in five fegments. Nectary of one leaf attached to the tube, five-cleft, erect, bearing the ftamens. Berry inferior, with five feeds.

## L E E

finooth. Leaves finooth, doubly pinnate; the terminal leafet largelt. - Native of the Ealt Indies, from whence it was procured for the Kew garden, by Sir Jofeph Banks, in 1790. It is a fmooth forind or fmall tree ten or twelve feet high, with the afpect of Elder; the branches tumid at the infertion of the leaves, Atriated and more or lefs angular. Leaves alternate, large, doubly pinnated; leaffets falked, oppofite, elliptic-oblong, pointed, veiny, Arongly furrated, very fimooth, paler bencath; the odd ones largeit. Panicles cymofe, oppofite to the leaves, pubefcent. Flowers finall, whitifh. Berris rather acrid, the fize of a pea, deprefled, black, purplifh internally. A decoction of the roots or wood feems, by the accounts given of its ufes, to be a valuable tonic medicine.
2. L. aquata. Dorny Leea. Linn. Mant. $124^{\circ}$ (Cajoe toca of the Malays.) - Stem round, downy. Leaves doubly pinnate, rough.-Native of the Eaft Indies, from whence Mr . Lee received and cultivated it before the year 1777. We find no figure of this fecies. Linnzus did not dittinguih it from the former, but they are very different. In both the leaves are bipimnate, or rather ternate in their firt divifion, pinnate in the fecond; but in this \{pecies the terminal leaflet is not larger than the relt, except in fome of the lateral divifions, and all the leaflets, as well as their fialks, are rough with minute rather rigid pubefcence. The ferratures are lefs ftrong than in L. Jumbucina.
3. L. crifga. Wing-ltalked Leea. Linn. Mant. 124. Meerburgh Ic. v. I. t. 50 . (L. pinnata; Andr. Repof. t. 355.)-Stem angular, with crifped wings. Leaves fimply pinnate.-Native of the Ealt Indies, not, as Linnxus fuppofed, of the Cape of Good Hope. The roots are tuberous. Stem fcarcely flarubby, remarkably bordered, as are the leaf-ltalks, with parailel, partly crifped, wings. Leaves pinnate, generally of two pair, with an odd one, of elliptical, pointed, ftrongly ferrated and copioufly veined leafiets, roughiih to the touch when dry, but not pubefcent. Fiocucrs much as in the former, with channelled, angular, or winged ftalks. Each fegment of the corolla, according to Andrews, is hooded at the point. We have feen one leaf imperfectly bipinnate.

It appears, from the Linnean herbarium, that Linnæus originally deftined the name of Hippia for his Leea; but he afterwards applied the former to a very different genus. (See Hippia.) From the fame fource the identity of his Leca and Aquilicia was firf difcovered, and the latter name gives place, as being the more recent, to fay nothing of the claims of the former refpecting the perfon it commemorates.

LEEBYRAN, in Geography, a fmall inland in the Eaft Indian fea, near the northealt coalt of Borneo. N. lat. $6^{2}$ 1'. E. long. $1 \mathrm{I}^{\circ} 12^{\prime}$.
LEECH, in Zoslogy. See Hirudo.
The hilfory of this animal, and the ftructure of its parts, by means of which it becomes ufeful to us, in fupplying sery happily the place of the lancet, with every other particular circumitance of its life and food, have been very accurately given by Mr. Morand, in the Memoirs of the Academy of Sciences, in the year 1739.

The more vulgarly known particulars of this animal are briefly mentioned by this gentleman; fuch are the cutaneous annules of its outer coat, the beautiful arrangement of the feveral rays, the colours, the pyramids, and points, with which it is ornamented; the avidity with which this creature feizes the flefh of animals; the manner of its applying its mouth; the vermicular motion obferved within it while fucking, which refembles the common motion of deglutition; the tirse they have been known to live in the water without

## LEECH.

without any vifible food; and the faculty they have, in common with many other animals, of moving when cut into feveral pieces: thefe the awthor fuppofes already fufficiently known, and paffer on to what is lefs fo, the ftructure of its inner parts.

The part of this animal, by which it pierces the fkin of any creature to get at its blood, is generally called, fimply, its mouth; but it really confifts of five different parts, which are confounded under that general name. Thefe are two regular lips, a cavity, which is properly the mouth, certain initruments to pierce with, others which ferve it for fucking, and finally a fort of throat, or efophagus, through which it fwallows the blood. When the leech is in a flate of reft, its upper lip forms a regular femicircle, and the lower a portion of a much larger circle.

When the creature lengthens its head to move, the femicircle of the upper lip becomes two oblique lines, the junction of which makes a faliant angle, which the creature applies to whatever it would fix itfelf to. That angle is marked by a regular black fpot on the outer edge of the lip. The extreme foftnefs of the fibres of this part makes it very ferviceable to the animal, in that it readily affumes any figure, according to the occafion of feizing any thing folid, in order to move the reft of its body; or on the flefh of an animal, to give oppertunity to the piercing inftruments to exert their force and action.

Whether it be for either of thefe purpofes, that the creature fixes its mouth, the two lips regularly fix, and make in this ftate a fort of acetabulum, like the hollow of the tail. This may be feen in their fixing on the fides of a glafs-veffel in which they are kept, and the mouth, or aperture between the lips, is diftinctly feen. This mouth is formed, like the lips, of fuch extremely fupple fibres, that it takes the figure of the part to which it is applied, and fixes perfectly clofe to it. When the lips are fixed on the fefh, in order to fuck, this little mouth continues moveable under them, and fearches over the compafs of flefh, inclofed in the larger circle of the lips, for the fpot where it will be eafieft to draw much blood.

Within this mouth is placed the inftrument for piercing the fkin, which is more than the mere fucker of the gnat, or the like kind of flies; fince the quantity of blood to be fucked by the leech, is much larger, and the aperture of the veffel mult therefore alfo be larger. The fhape of this weapon may be difcovered by examining the wound it leaves. This is compofed of three cuts, making three rays, and uniting in a centre, under equal angles. This ftructure of the wound is mofl diftinctly feen when the fwelling is gone down, and the fkin is clean; and this is ufually on the fourth day after the application. The three openings are then plainly feen not to be punctures, but abfolute wounds, or cuts, as if made by a fine lancet. In examining the creature, the organ, deltined for making the wound, is found to be placed between the aperture of the lips and the bottom of the mouth; and on cutting up the animal, and drawing the finger carefully over this part of it, there is felt a roughnefs like that of a fine file, which evidently is owing to fome rough fubftance, of the hardnefs of bone. This is, in reality, a number of fine and fharp teeth; and when examined by a microfcope, they are found to be difpofed in three feries on three ribs, or, as they may be called, jaws; each of which is placed along the middle of a Arong mufcle of its own length; and thefe correfponding regularly to a triangular opening, which the creature has in its mouth. When that has feized on a proper part for the getting blood, and is fixed, thefe mufcles exert their action, and Arike in the teeth through the ikin.

Thefe are the infruments which pierce the veffel which is to afford the blood; and for the receiving it into the body of the animal, there is between thefe rows of teeth, or in the common centre of the mouth, a fmall aperture; and within this there is a little body to be difcovered, which by its motion feems very plainly to be a tongue, and which probably acts as a pifton to take up the blood flowing from the triple wound, in the centre of which it naturally flands, while the larger circle of the lips, \&c. perform the office of the body of the pump, and the blood is eafily, by this means, conveyed into the body of the arimal. Finally, between the root of the tongue and the beginning of the ftomach, there is a fpace of two lines in length, in which it is eafy to difcover two different arrangements of fibres; the one fet are flat and plain, the others are circular. Thefe evidently have a power of widening or contracting the cavity of the pump, and by that means facilitate its office; the plane ones contracting in length, to enlarge the capacity, and the circular ones determining the blood towards the ftomach, by their power of contracting the hollow, when the blood is received. The blood from hence enters into 2 membranaceous fort of fack, which ferves the animal for the ftomach and guts, and occupies the greateft part of the body of the creature. If the air is admitted into the body by the mouth, it may be feen to make its way down a longitudinal canal, and fill, as it goes, a number of facks, or little bags, which are on each fide. Thefe veficles, receive the blood, and becoming filled with it, fwell out the body of the animal to a great fize. It remains here many months, and nourithes the creature; and if any thing is excreted from it, it mult be merely by an infenfible perfpiration; fince the creature has no anus, fo far as can be yet difo covered, nor any aperture which can fupply the place of one.
Leeches are able to live in oil; and when removed out of this liquor into water again, they throw off a tender fkin, or film, of the regular fhape of their body, and refembling the fkin of an eel in miniature. Their living in oil feems a proof, that their organs of refpiration are not placed on the outfide of their bodies, as they are in many fmall animals, which therefore die on being only rubbed over with oil. But the leech feems to refire by the mouth; and this may be the more plainly difcovered, if the water, in which it is kept, be gently heated ; for then the animal, being uneafy, breathes hard, and very vifibly.

If a leech be kept in an eight-ounce glars phial, about three-fourths filled with water, it will indicate the changes of the weather, in the manner of a weather-glafs. Thus, if the weather continues ferene and beautiful, the leech lies motionlefs at the bottom of the phial, rolled in a firal form: if it rains either before or after noon, it is found at the top of its lodging, where it will remain until the weather be fettled: if we are to have wind, the leech gallops about its limpid habitation with amazing fwiftnefs, and feldom relts until it begins to blow hard: if a remarkable ftorm of thunder or rain is to fucceed, for fome days before, it lodges almoft continually without the water, and difcovers great uneafinefs, in violent throws and convulfive like motions, In froft, as in clear fummer weather, it lies conftantly at the bottom; and in fnow, as in rainy weather, it dwells at the very mouth of the phial.
The phial fhould be covered at the mouth with a piece of linen rag, and the water fhould be changed once a week in the fummer, and once a fortnight in the winter. Gent. Mag. vol. xxiii. p. 28.
Leech, Sea. See Hirudella marina.

## LEECH.

Leecrit is alfo a name given by Boccone to a very particular water-animal, which he found fticking to the fides of the riphias, or fword fifh.

He calls it birudo, or acus cauda utrinque pennata, and obServes, that it is flightly mentioned by Gefner, and by Johnfon, in their books of fifhes. It is about four inches long; the belly is white and cartilaginous, and tranfparent ; there is no regular head to be fecn, but only a hollow fnout in the place of the head; this is covered with a very lard membrane, and differs extremely from the fkin of the belly: this fnout it thrufts up to the end into the body of the fifh, and fucks its blood with it; it has a tail Thaped like a feather, and under it two flender filaments of fibres, longer than its whole body. By means of thefe, when it is not faftened to the body of the fifh, it clings to flones, or fea-plants, to prevent its being carried away by the motion of the water; and when it is on the body of the lifh, thefe ferve it to hold much more fafly with, than it otherwife could do. This creature miferably aflicts the fword-fin, but it is itfelf as much tormented by an animal that preys on its blood and juices. This is a fort of loufe, which is always found upon it; it is of a brownifh colour, and it is geacrally found faftened toward the tail of the creature, fticking as firmly as a limpet to a rock ; it is nearly of the bignels of a pea, and when cruhhed a little, will thruft out feveral flender filaments. This leech is not found, fo far as has yet been oblerved, on any other fifh but the fword.fifh; nor this loule among other creatures, befides this leech. Phil. Tranf. N ioa.

Leecies, Utility of, in the Cure of Difeafes.-Bleeding, or the taking away of blood, for the alleviation and cure of difeafes, is frequently one of the moft powerful means to which the phyfician and furgeon can have recourfe for the relief of their patients. It is divided into general and topical; the firlt fignifying the evacuation, as made from a large vein in the arm, or the temporal artery, the external jugular vein, $\& c$; the fecond denoting the evacuation of blood directly from the velfels of the part affected, or its vicinity, by fcarifications, cupping, or leeches. In the article Bueeding are defcribed moft of the furgical methods of taking away blood, with the exception of that by leeches, which more properly belongs to the prefent place, and of Cupping and Scarifications, for an account of which the reader is referred to thefe refpective terms.

The hirudo medicinalis, as the term denotes, is the proper kind for medical purpofes; and, when it has been caught in a clear piece of water, is not full of blood, and is hungry, in confequence of being kept for fome time in a veffel of pure water, it is in the beft condition for ufe. According to Schmucker, even the medicinal leech, if taken out of unclear, muddy, ftagnant water, will caufe pain, fwelling, and inflammation, after being applied. Vermifchts Chir. Schriften, vol. i. p. 86. edit. 2.
With refpect to the art of collecting medicinal lecches, the beft time for taking them is when they fpawn in the earlielt warm weather of the year. June and July are ac. counted favourable months, if there is a good deal of fun, and the wind is either very flill, or blows gently from a foutherly point. It would be in vain to endeavour to catch them in cold weather attended with northerly winds. The hirudo medicinalis inhabits clear lakes and poads in warm fituations, and freams flowing through, vallies. In culd and woody countries, the horfe leech can only be met with. The warmer the fituation of the water is, and the fatter the foil, the thicker and larger are the leeches. Thofe which are caught in waters abounding with fifh, do not bite and fuck fo well, as others taken out of poorer places. Frefi

Vor. XX.
lively leeches bite the mon readily; but when they have been kept a long while, or have been put out of temperate into very cold water, they generally bite with lefs avidity.

With regard to the mode of appiying leeches, the part on which they are about to be put may firft be wahed with fome clean water and well dried. The leeches are then tw be placed on it with the fingers, either one by one, or all of them together, by putting them firlt into a tumbler, and then applying this to the $\mathbb{k}_{\mathrm{k}} \mathrm{in}$, in the naanner of a cupping glafs. 'The leeches fhould generally be fuffired to fall of the part fpontaneoufly, which they conmunly do, as four. as they are well diftended. But when the patient's weaknefs, or any other circumflance, requires them to be nore fpeedily removed, they may cafily be made to drop ofl hy fprinkling them with a little falt or fnuff. For the purpole of inducing leeches to bite with greater facility, fume prac. titioncrs firft wet the part on which they are to be put with a litule milk, or milk and fugar.

On fome occaficus, the application of lecches will proncure as copious an cracuation as phebotomy itfelf. The quantity of blood which may fometimes be taken away by twelve leeches, would furpife the inexperiunced. Whan the bites are expofed to the fteam of warm water, or fomented after the leeches have dropped off, the bleeding may often be kept up for an extraordinary length of time. The writer of this article las known inflances, where furgeons have been detained for nearly twenty-four hours, in employing means to fupprefs the continuance of the bleeding from the bites of leeches on inflamed parts. In cafes of hernia humoralis, where the fcrotum has been much reddensd and inflamed, he has often feen the hemorrhage, from the application of leeches, laft a very unpleafant length of time. Indeed, the records of furgery prove, that the bleeding from the bites of leeches may even continue to a dangerous extent. Pelletan mentions a cafe, where an infant, four months old, bled to death, in confequence of the application of fix leeches to the cheft, fome women who were in atterdance having contented themfelves with merely wiping away the blood with cloths, as faft as it flowed out. (See his Climique Chirurgicale, tom. ii. p. 243.) In general, however, the bleeding, after leeches have dropped off, readily ceafes, either of itfelf or on cold being applied; and it is only when the part is highly inflamed, or exceffively vafcular, as we know the fkin of a very young infant to be, that the fubfequent hemorrhage is difpofed to continue long. In many inftances, the continuance of the bleeding a certain time is a moft defirable circumftance, as by this means a more effectual quantity of blood can be taken away than could otherwife be accomplifhed.

We learn from Galen, that Hippocrates was acquainted with the medical utility of leeches. (De Hirudimbus 'cum comunent. Sebizii). In inflammation of the liver, they were preferred by Aretreus, of Cappadocia, to cuppingglafles; and they are made frequent mention of in the writings of Diofcorides, Celfus, and Paulus Egineta. Pliny thought, that leeches might be employed with feveral intentions, as, in plethoric cafes, they extract the blood like cupping-glaffes, and, according to his conje:tures, alfo opened the pores. (Hit. Natural. I. xxxii. c. 10.) Horace has taken notice of thefe ufeful little animals in the follon. ing line of his fatires.
" Non miflura cutem nifi plena cruoris hirudo."
The Arabian phyficians well knew the ufefulnefs of leeches, and were in the habit of directing them to be applied in melancholic and hypochondriacal cafes. Rhazes, in particular, recites aumerous cures which he effected with their affite-

## LEE

ance. Yaracelfus uled to apply them in cafer of jaundice. By the chemical practitioners of medicine, leeches were not at all employed, becaufe they were accuftomed to reprobate all evacuations of blood as ufelefs and hurtful; and Van Helmont would not fuffer them to be applied to an hemorrhoidal fiwelling.

The ufe of leeches, in the practice of phyfic and furgery, appears to have been revived by Sennertus and Zacutus Lufitanus.

It would be almoft an endlefs talk to enumerate the great variety of medical and furgical cafes in which leeches may be ufed with advantage. We may ftate, indeed, that in all inflammatory affections they are frequently of confiderable fervice. In inflammations about the throat, in the abdomen, thorax, or cranium, or in the limbs and more fuperficial fituations, the benefit derived from the application of leeches, can often be obtained by no other means. The great good which they often do in inflammatory difeafes of the eye, joints, and teftis, is acknowledged by every practitioner, as well as the relief which they fpeedily afford in cales of inflamed hemorrhoidal tumours. Their utility in inflammations of the breait, and in alleviating the pain, and even retarding the progrefs of fchirrous fwellings of the fame part, deferves alfo to be mentioned. That they fometimes prove even capable of curing and reducing many indurations of the breatt, is a fact proved by daily experience. Nor mult we forget the bencficial effects, frequently arifing from the application of leeches in various examples of buboes, fcrofulous and fympathethic, as well as venereal.

In the majority of cafes, however, we are not to imagine that one application of three, four, or even a dozen leeches, is enough to try their efficacy; in general their application mult be repeated from time to time, and, in fome inftances, once or twice a-day, according to the urgency of the fymptoms.

In infants of tender years, and perfons who have a particular dread of venefection, leeches may be ufed for the relief of all difeafes which require blood to be taken away ; and this method of bleeding has the advantage of not being likely to induce fwooning, debility, and languor, by the blood being drawn too fuddenly.

In many cafes, where the practitioner is fearful of venturing upon general bleeding, the employment of leeches may often be tried with greater fafety.

In painful affections of the ear and teeth, in inflammations and fwellings of the gums, and in numerous inflammatory difeafes affeeting the pares about the neck and throat, topical bleeding with leeches proves of infinite fervice, either alone, or in conjunction with general bleeding, according to the nature and circumitances of the cafe.

In numerous inflances of extravafations of blood under the fkin, ecchymofes, contufions, \&c. leeches are frequently applied with great benefit to the patient.

In cafes of quinfy, when deglutition has been quite obftructed, and repeated venefection has proved uravailing, Schmucker affures us, that he has found the application of leeches attended with an extraordinary degree of efficacy. The fame experienced practitioner alfo obferves, that in pleurifies, he has found topical bleeding with leeches even more ufeful than blifters.

Whitlows, which can fo feldom be cured without fuppuration, Schmucker has fometimes refolved, by applying to them leeches and the faturnine lotion in an early ftage of the complaint.

This diftinguifhed furgeon likewife confirms, how fuperiorly ufeful the application of fixteen or twenty leeches to the perineum frequently proves in cafes of retention of
urine, when venefection, the warm bath, and other means alone are ineffectual. Vermifchte Chirurgifche Schriften, vol. ii. art. 2.

Leech, or Leetcu of a Sail, in a Ship, the outward edge or fkirt of the fail from the earing to the clew, or rather the middle of the fail between thefe two.

The leeches of all fails, whofe tops and bottoms are parallel to the deck, and at right angles with the mafts, are denominated from the fhip's fide, and the fail to which they belong, as the ftarboard leech of the main-fail, the lee-leech of the fore-top-fail, \&c. But the fails which are fixed obliquely upon the mafts, have their leeches named from their fituation with refpect to the fhip's length; as the fore-leech of the mizen, the after-leech of the jib, or fore-flay-fail, \&c. Falconer.

Leecif, or Leetch-lines, are certain ropes faftened to the leeches of the main-fail and fore-fail, and communicating with blocks under the oppofite fides of the top, whence they pafs downwards to the deck, ferving to trufs up thofe fails to the yard, as occafion requires. See Brails.

Leecir-rope, is a name given to that part of the bolt-rope, to which the border of a fail is fewed. In all fails, whofe oppofite leeches are of the fame length, it is terminated above by the earing, and below by the clue. Falconer.
LEECHMAN, William, in Biography, a learned and excellent Scotch divine, was born at Dolphinfon, in Lanerkhire, in the year 1706. He was initiated in grammarlearning at his native place, from whence he removed to the univerfity of Edinburgh. Here he diltinguifhed himfelf by his great proficiency in different branches of learning. He began his theological ftudies in 1724, and in 1727 he was introduced into the weftern part of Scotland, which was deftined hereafter to be the principal fcene of his ufefulnefs. He undertook the education of a young gentleman at Caldwell, in Renfrewfhire, where he refided in the fummer months, but during the remainder of the year he lived at Glafgow, and was honoured with the friendhip of profeflors Hutchefon and Dunlop. About the beginning of 173 I he was licenfed as a preacher, but it was not till the year 1736 that he had any profpect of preferment. He was now ordained minifter of Beith, and remained in the difcharge of the duties attached to that office during feven years. In 1740 he was elected moderator of a meeting of the fynod at Irvine, and opened the affembly at Glafgow on the 7 th of A pril, 1741, with a fermon to the clergy "On the temper, character, and duty of a minifter of the gofpel." This is thought to be one of the ableft charges ever delivered from the pulpit: it has paffed through many editions, and is ftill in very high reputation. In 1743 he publifhed a much longer difcourfe on "The Nature, Reafonablenefs, and Advantages of Prayer; with an Attempt to anfwer the Objections againft it." This fermon, as well as that juft noticed, excited great attention at the time of the publication, and it has been frequently reprinted fince. He was, about this time, invited to fettle with a congregation at Belfaft, in Ireland, with the promife of a better falary than that which he enjoyed at Beith. This offer, upon due deliberation, he declined, and he was fhortly after elected to the profefforfhip of theology at the univerfity of Glafgow; an honour which he obtained only by the cafting vote of the prefident. The oppofite party did all in their power to prevent his being fixed in the fituation: they even commenced a procefs of herefy againft him, which had a direct tendency to injure his reputation and ufefulnefs, and to expofe him to general odium. The charge was founded on the fermon on prayer, which his enemies confidered as having laid too little ftrefs on the atonement and interceffion of

Chritt.

Chrit. A paper of remarks was produced, confiting of eight articles, of what they deemed heretical omiffions. To each of the remarks the profeffor gave in written anfwers, which were neither deemed fatisfactory to the committee nor to the prefbytery, under whofe authority they acted. Mr. Leechman appealed to a higher court, viz. the fynod, the nembers of which, after hearing all that could be adduced on both fides of the quettion, almolt unanimoufly determined, that there was no reafon to charge him with any unfoundnefs in the paffages of the fermon complained againft. "Mr. Leechman's character, both as a preacher and profeffor, fhone out the brighter after this cloud was diffipated. Some of thofe who had appeared his keeneft adverfaries in the church procefs, lived with him afterwards on terms of fincere friendhip: even the prejudices of the common people in Glafgow gradually fubfided; fo that he came to be confidered there, as he had always been in every other plàce, a very acceptable preacher." Soon after he had been eftablifhed in the profefforfhip, he took the degree of doctor in divinity. He continued in the theological chair feventeen years, vindicating and eftablifhing the grand truths of natural and revealed religion, in anfwer to the principal objections made to them by Mr. Hume, lord Bolingbroke, and other fceptical writers. He had, in his lectures, a remarkable talent of felecting what was moft important and ftriking on every fubject that he handled: his arguments were folid, founded on indifputable facts; and they were urged with a degree of warmth which carried his auditors along with him; for they were addreffed equally to the judgment and the heart. Dr. Leechman's fame extended far and wide, the Divinity-hall at Glafgow was crowded, in his time, with a greater number of fcholars than any other in Scotland: and his numerous fcholars, however they might differ in their fentiments on fpeculative theology and church government, were all cordially united in their affection and veneration for their mafter. In the year 1761, Dr. Leechman was raifed to the office of principal of the univerfity of Glafgow by a prefentation from the king. He had previoully to this been in a very bad flate of health, and this change in his avocations was probably the means of prolonging his valuable life for five-and-twenty years. Though releafed from the more fatiguing part of his duties, he could not remain inactive, but entered warmly into every fcheme for the benefit and improvement of the fociety, propofed by other profeffors, and profecuted fome fchemes of his own fuggettion. He gave a lecture, for fome time, once a week, to the ftudents in divinity, and weekly lectures to the whole univerfity. Dr. Leechman's faculties remained in full vigour amidft the increafing infirmities of old age, and his talte for valuable knowledge continued as acute as ever. His mind feemed to be in a great meafure independent of all bodily infirmities and connections. In September, 1785 , he experienced a violent paralytic Atroke, from the effects of which he fpcedily recovered: but a fecond fhock of the fame kind in the following month deprived him of the power of his whole left fide. Still he continued in the full poffeffion of his mental facultics, and was as intelligent, judicious, and even as acute as ever. Another attack carried him off on the third of December, 1785 , wher he was almort eighty years of age. Dr. Leechman committed nothing to the prefs, except nine fermons, which went through feveral editions during his life-time. Thefe were re-publifhed, with others, forming together two volumes, in the year 1789 . To the firft of thefe volumes is prefixed an account of the author, to which the reader is referred for more particulars relating to Dr. Leechman.

LEEDS, in Geography, a populous market-town in the
wapentake of Skyrack, in the Weft Riding of the county of York, England, is fituated on the north fide of the river Aire, over which is a landfome ftone bridge. It is a place of great antiquity, and its name is regiltered in the Domefday furvey. Here was formerly a flrong caftle, probably built by Ilbert de Lacy, whicls was befieged by king Stephen in 1139 ; and here the unfortunate Richard II. was confined about the year 1399. No veltige of this fortrefs remains; but its fcite is faid to have been at a place called Mill-hill. Leeds has long been diftinguifhed as a clothing town; though the pre-eminence it now enjoys is not of a very remote date. Leland fays it is "a pretty market-town, fubfifted clieffy by clothing, reafonably well builded, and as large as Bradford, but not fo quick as it." Its growth, however, probably foon became confiderable, as it was incorporated by king Charles I. At the commencement of the troubles of that reign, it was held for the king by fir William Saville; but after a fharp action, its fortifications were ftormed by the forces which marched out of Bradford under fir Thomas Fairfax. A fecond charter was granted on the 13 th of Charles II., under which the town is now governed. The trade in woollen cloth, which has raifed Leeds to its prefent confequence, is carried on here to an extent unequalled in any place in the kingdom. The cloth-markets are held only on Tuefdays and Saturdays, and then only for an hour and a half each day ; and the merchants are not allowed to buy, or even to look at cloth, but at thefe appointed hours. At fix in the morning in fummer, and feven in winter, the market-bell rings; and in a few minutes, without the leaft diforder, the whole market is filled, and all the benches are covered with cloth, each proprietor at the fame time flanding behind his own cloth. As foon as the bell has ceafed the buyers enter, and having fixed on certain lots, or pieces of cloth, they proceed in a very expeditious and fecret manner to bargain for the fame. (A particular account of the modes of tranfacting bufinefs, \&c. is given in the Monthly Magazine, vol. iii. P. 123, and vol. iv. p. 174.) In thefe places it is related that from ten to twenty thoufand pounds worth of cloth, and fometimes more, is fold with a whifper only; the laws of the market are certainly more ftrictly obferved than in any other place in England: the time of fale is terminated by another bell; and any merchant ftaying in the hall after the bell has ceafed, forfeits five fhillings. This extenfive bufinefs, which ufed formerly to be carried on in the open Atreet, is now conducted in two halls, which have been built for the accommodation of the clothiers. The Mixed-cloth Hall, which is the principal, was erected in 1758 ; it is a quadrangular building, inclofing an open area of about an hundred yards fquare, and is divided into feven particions or ftreets, each of which contains four rows of ftands; and thefe are the freehold property of feparate manufaeturers. The whole number of ftands is 1770 . The White-cloth Hall, built in 1775, is partitioned in a fimilar manner, and contains 1210 flands. Over the former building is an affembly-room, and over the latter a mufic-hall. The manufacture of broad cloth is now almoft wholly performed by machinery, which has occafioned a confiderable reduction in the price. By this means, very few hands are wanted in the firlt flages of the manufacture, particularly in carding and fcribbling the wool, and in fpinning it. This circumftance, on the firft introduction of machinery, deprived great numbers of people of their cuftomary employment.

Previous to the reign of Charles I. Leeds had but one church : here are now, however, feveral ecclefialtical edifices, appropriated to the eftablifhed religion, and to different fects of Diffenters. The church of St. Peter, the original, is built

## LEE

LEE
in the form of a crofs, with a tower in the middle ; and has a painting in frefco of the Afcenfion, by Parmentier, who prefented the town with this fpecimen of his genius. -St. John's church was erected in 1634 , at the fole expence of Mr Harrifon, who alfo built a free-fcheol and a market. crufs, and was in other refpects a great benefactor to the town. The church of the Holy Trinity, which is an elegant ftructure, with a fpire, was built in the eighteenth century. Eight other places of worfhip are appropriated to the feveral denominations of diffenters. Here are three alms-houfes, a charity-fchool, and an extenfive work-houfe, in which children are taight the eafy branches of the woollen manufacture. A fpacious infirmary was built by fubfeription in the year 1786. The Atreets, in the upper part of the town, are narrow; but in the other parts they are broad, and the houfes are moftly uniform, and many of them elegant. Here are feveral large open fquares, the areas of which are in fome cafes planted, and in others ufed as tenter grounds. The buildings are chiefly of brick, and covered with white flate; and every freet has a flagged foot-way on each fide. The civil government of the town is velted, by the charter of Charles II., in a mayor, twelve aldermen, and twenty-four common-council men.

Leeds is 192 miles diftant from London, and 25 miles from York. In the year 1800, it contained, according to the return made to parliament, 11,599 houfes, and 53,162 inhabitants: of the latter, 20,367 were flated to be employed in trade and manufacture, particularly that of woollen cloth. Two fairs are held annually; and two weekly markets, on Tuefdays and Saturdays, are well fupplied with all kinds of provifions. A confiderable pottery is eftablifhed here, which furnifhes large quantities of earthen ware, both for home confumption and exportation. By means of the rivers Aire and Calder, and the Canal Navigation, Leeds has communication with Wakefield, York, and Hull; from which latter place the woollen goods are ufually thipped to foreign parts. The carriage of coals from the interior of Yorkflire is alfo a great fource of traffic: thefe are carried in veffels from 45 to 60 tons burthen, to Selby, York, Howden, Hull, Beverley, and all the intermediate towns fituated on the rivers Oufe and Humber. Three miles from this town are the grand and picturefque ruins of Firkftall Abbey, feated on the banks of the river Aire. For an account of thefe, with an interelting print, fee Day's 'Tour in Yorkfhire, 8vo. 1805. Weft of the town is an ancient feat of the Vavaron family. Aikin's Defcription of the Country round Manchefter, $4^{\text {to }}$, and Monthly Magazine.

Leeds, a county of Upper Canada, bounded.on the eaft iny the county of Grenville, on the fouth by the river St. Lawrence, and on the wett by the boundary line of the late townflip of Pittfourg, runnigg north until it interfects the Ottawa or Grand river, and thence defcending until it meets the north-wellernmoft boundary of the county of Grenville. This county comprehends all the iflands in the river St. Lawrence that are near it. The greater part of it lies fronting the St. Lawrence.-Alfo, a townhip in the county of Leceds, being the twelfth townifip in afcending the river Sit. $f_{2}$ wrence. It is watered by the Gananoque river, which has a good farbour at its entrance. There is a port of entry on the weat banl- of the Gananoque, near its routh in the St. Lawrence.-A. As), a town of America, in the eaftern part of Glonciter county, New Jerfey; 4 miles weft of the mouth of Mullicus ,iver.-Alfo, a town in Komebeck county, on the calt bank of Amerefkoggin river, eppolite to the mouth of Twenty miles ftream, in the sown of 'lurner, in Cumberland county.-Alfo, a town, or
rather village, of Richmond county, Virginia, on the north bank of Rappahannock river; 70 miles N.E. of Richmond; near which is a famous courfe for horfe-racing.
LEEDSTON, a poft-town of Weftmoreland county, Virginia: 105 miles from Wahhington.
LEEGELLAN, a fmall ifland in the Eat Indian fea, near the ealt coalt of Borneo. N. lat. $4^{\circ} 10^{\prime}$ E. long. $118^{\circ} 40^{\prime}$.
LEEHEEM, a fmall illand nearly north-eaft of Borneo. N. lat. $6^{\circ} 9^{\prime}$ E. Long. $118^{\prime} 16^{\prime}$.

LEEK, in Botany, Gardening, and the Materia Medica. See Allium.

Leek, in Geography, a fmall ifland of Pennfylvania, in Delaware river.

Leek-Head, in the Manege. See Wart.
LEEKE, or LEEK-in-the-Moorlands, formerly called $L_{e f,}$, in Geography, a market-town and parifh in the hundred of Totmanflow, and county of Stafford, England, is feated at the northern extremity of that county, at the diftance of 154 miles from London, and 3I from Manchefter. Here are a weekly market on Wednefday, and feven annual fairs. In the year 1800 , this parill contained 780 houles, and 3489 inhabitants. Many of them are employed in the manu. facture of ribbons, filk-twift, and buttons; which may be confidered the ftaple articles of the place. But of late years this latter branch has very much diminifhed, and at prefent the chief trade is in thrown filk, and the manufacture of bandana and other handkerchiefs. The cotton bufinefs has alfo been introduced, within thefe few years, into this town. The church here is a large building, with a lofty fquare tower. In the church-yard is an ancient ftone-crofs, the fhaft of which is about ten feet in height. It has been called Danifh, from "the imagery and fret-work," as Mr. Gough obferves, with which it is ornamented. Near the town was formerly a Ciftertian abbey, called Delacres, or Dieulacres, which was founded in the year 1214 by Ranulph, earl of Chefter; to whom the lordfhip of this town formerly belonged. In the vicinity of Leeke are fome lofty bare crags, called Leek-rocks and Henclouds. Blue-hills, in this neighbourhood, abound with coal-mines; and a fatt-fpring iffues from one of thefe hills. Eight alms-houfes were endowed here in 169G, by Mrs. Elizabeth Afh, for as many widows.
LEER, in Glafs-making, a fort of third furnace, intended to anneal and cool, by proper means, the veffels when made. See Furxace and Glass-house Furnace.
Leer, Lehr, or Lier, in Geography, a town of Eaft Friefland, on a river of the fame name, which foon after joins the Ems; ir miles S. of Einden. N. lat. $53^{\circ} 12^{\prime}$. E. long. $7^{\circ}{ }^{30}$.

LEERDAM, a town of Holland, on the river Linghe, which gave title of count to the noble houfe of Egmont; and afterwards to that of Naffau; in miles S. of Utrecht.- N. lat. $51^{\circ} 55^{\prime}$. E. long. $4^{\circ} 59^{\prime}$.

LEERSIA, in Botany, a genus of grafles, received its appellation from Dr. Swartz, in order, with peculiar propriety, to honour the memory of John Daniel Leers, an apothecary at. Herborn in Naffau, author of the Flora Herbornenfis, publifhed in 1775. This litt'e octavo volume, now very rare, contains fixteen plates, in which all the grafles are engraved by the hand of the author, with fuch exquifite and minute precifion, that they will bear infpection with a magnifier, almoft like the plants themfelves, and are unrivalled in natural hiftory. A life of the author by his fon is prefixed to this book, by which we learn that he dicd December 7,1774 , aged 47. The narrative contains few. diriking particulars, but the effufions of filial piety, with

## L E E

## 1. E E

which it abounds, muft ever be interefting, and do honour both to the father and the fon. A fecond cdition of this work, from another hand, was publifhed many years afterwards, of which the plates ale extremely fanlty and inaccurate copies of the firft. Swartz. Prodr. 21. Ind. Occ. v. 1. 129. Schreb. 818. Willd. Sp. I'l. v. 1.325. Mart. Mill. Dict. v. 3. Brown Prodr. Nov. Holl. v. f. 210. Michaux Boreali-Amer. vo r. 39 . (Afprella; Schreb. 45. Homalocenchrus; Mieg. Act. Helvet. v. 4. 307. Hall. Helvet. v. 2. 20r. illion. Pedem. v. 2. 232. Ehrhartia; Wiggers Prinnit. 63.)-Clafs and order, Tirandria Digynia. Nat. Ord. Gramimu, Liun. Juff.

Gen. Ch. Calyw none. Cor. Glume of two clofed, boas. fhaped, concave, compreffed valves, often fringed with prickles at the back, and nearly equal in length; the outer one larger, oblong, pointed; inner but half as broad, linear, acute. Nectary of two lanceolate acute leafists. Stam. Fizments three, in fome cafes one or fix, capillary, fhorter than the corolla; anthers oblong. $P_{i \%}$. Germen fuperior, ovate, compreffed; flyles two, capililary, fhort; ftigmas feathery. Peric. none except the permanent clufed corvila. Seed folitary, obovace, comprefled.

Eff. Ch. Calyx none. Corolla of two clofed vales.
Obr. Homalo enchrus, the name given to this genus by Mieg, was juftly, as compounded of another, thought exceptionable by Wiggers, who therefure preferred Ebrbartia; but the latter is now otherwife employed. (See Eninharta.) Dr. Solander it feems originally ditinguifhed this genus from Ploclaris, and the name applied to it by Swartz, was adopted from his manuferipts. We cannot account for the error of Wiggers, who afferts it to be gynandrous, the flamens growing out of the top of the germen. We find no traces of any fuch infertion, which would be truly lingular in a grafs.
I. L. oryzoides. Swartz. Prodr. 21. Willd. n. 1. iPhalaris oryzoides; Linn. Sp. Pl. 81. Swartz. Obf. 34. Schreb. Gram. fafc. 2. 6. t. 22.-Panicle fpreading. Flowers fpreading, triandrous; their plumes fringed at the keel. Native of watery places in Germany, France, Switzerland, Aultria, Italy, and Perfia. Seguier fays it is frequent in the rice-fie'ds about Verona," in weeding which this శrafs is detected, in its youngelt itate, by its glaucons foliage, and, at a more advanced period, by the minute prickles at the edges of its leaves.". The roughnefs arifing from thefe prickles feems the origin of the Italian name, Afperella. The roots are perennial, with long runnors. Stems four or five feet high, leafy, erect, fmooth, with hairy joints. Leaves linear-lanceolate, pointed, ftriated, rough, efpecially at the edges, fligh:ly glaucous; witly long, Ariated, roughifh fheaths; and a fhort notched ftipuia. Panicle at firlt enveloped in the upper Meath, then fpreading, a fpan high, with numerous, droaping, compound, zigzay brauches. Flocvers light green, very much refembling thofe of rice, but finaller.
2. L. virginica. . Willd. n. 2. (L. oryzoides; Michaux Boreali-Amer. vo 1. 39. Orỳza glumis carinà hifpidis; Gronov, Virgia. ed. 1. 153. Phalaris oryzoides; ed. 2. 18.)-Panicle, hoofe. Flowers motly triandrous, erect, -clofe-preffed; their glumes fringed at the keel.-Found in Kentucky, Pennlylvania, and Carolina. Michaux. In marfhes in Virginia, amongit Sinilaces and Rubi, flowering in Auguft. Clayton. Michaux thinks this is not fpecifically diftinet from the former; but Willdenow, who has obferved them both' in a garden, fays that, "t thongh much alike, they are conftantly different. The prefent has fhorter and broader Haves; a florter panicle, whole brarches are not zigzag but

Araight, and whofe fowers are clofely preficd to the flalks. The glumes are fimaller, narrower, fparingly fringed. The panicle of this is never covered by a leaf, but always expofed and fpreading." We have feen no fpecimen of this Lecerfic. Willdenow enquires "whether the Jamaica fyecies be the fame with it ?" By this he feems to mean, whether $L$. oryzoides of Swartz, which he lad already quoted with a doubt under the former, be this $L$. virginica. But Swartz no wherc mentions the oryzoides as a Weft Indian plant. He merely gives its character in italics, as ufual in his Prodromus, to contraft it with his own new fpecies, and thereby indicates it not to be a native of the Wefl Indies.
3. L. bexandra. Willd. n. 4. Swart\%. Ind. Occ. v. 1. 131-Panicle nearly erect. Flowers alternate, clofepreffed, hexandrous; their glames fringed at the keel, roughilh. - Native of watery places in the fouthern part of Jamaica, where it was gathered by Browne aild Swartz. Stom two feet high, nearly erect, with hairy joints, but otherwife fmwoth, flender, leafy, fometimes a littic branched. Leaves rather glaucous, lanceolate, acute, fpreading. flriated, rough at the edges. Stipula pointed, beardlefs. Panicle meally erect, the branches a little fpreading in every direction, by no means inclined to droop; the Howering part zigzag. Forers alternate, crowded, erect, fo as to approach the Alatk, purplif, fmaller than in L. oryzoides, but otherwife much like that fpecies. The famens however are conflantly fix. It flowers in the fpring.
4. L. auffralis. Brown Prodr. Nov. Holl. v. i. 210. -Panicle luofe, with alternate branches; the lower oies divided. Flowers hexandrous; their glumes fringed at the keel, finely toothed at their ribs; friooth at the fides.Gathered by Mr. R. Brown at Port Jackfon, as well as in the tropical part of New Holland. He thinks it fo near the laft, as to be doubtful of their being diftinct.
5..L. Lenticularis. Michaux Boreali-Amer. v. I. 39.Branches of the panicle nearly folitary, their fecondary divifions fpiked. Flowers imbricated; their glumes orbicular, tringed. Native of marfhes in the country of the Illinois. Michaux defcribes the glumes as rather large, lenticular, and confpicuoufly fringed.
6 L. monandra. Willd. n. 3. Swartz. Ind. Occ. v. 1. 130.-Panicle fimple, loofe. Spikes rensote, lax. Flowers inonandrous, fomewhat imbricated, fingle-ranked; their glumes roundifl, fmooth.-Obferved by Swartz in chalky groves in Jamaica, Howering in the fpring. He defcribes it as very different from all the other fpecies known to him. The flem is two or three feet high. Leaves long, upright and fmocth, of a bright green. Flowers the fize of Millet-feef, green, fmooth, with only one flamen in each.
Leersia, E. dw. Fund. v. 2. S8. See Encalypta.
LEERSTRAND, in Geograply, a town of Norway; eight miles S.W. of Drontheim.

LEES, the grofelt and thickeft parts of wine; oil, and other liquors; or the fediment found at the boitom of the veffel. See Lixivium.
The word comes from the French lie, and that either from limus, mud, or from Lyaus, one of the furnames of Bacchas; or, according to Du-Cange, from Lia, a corrupt. Latin word, fignif) ing the fame.

A kind of potafh, called cineres clavellatl, is made with the lces of wine burnt, and prepared, ufed by dyers, \&c: which ought to be remembered by people troubled with the tton, \& \& c.

The vinegar-makers makc'a great trade of the lees of wine dried, and made into cakes, after having iqueezed out the remains of the liquor in prefles,

## L E E

All the various kinds of lees, fuch as thole of wine, beer, ale, oil, \&\&c. may be made ufe of as manures, when they can be had in fufficient quantities for the purpofe.

LEESBURG, in Geography, a poft-town of Maryland, in America; 25 miles from Frederickitown.-Alfo, a pofttown of Virginia, and the capital of Loudon county; fituated fix miles S.W. of the Patowmac, and containing about 60 houfes, a court-houfe, and gaol; 20 miles from Salifbury.

LEESNITZ, or Legnica, a town of Silefia, in the principality of Oppeln; 18 miles S.S.E. of Oppeln.

LEET, James, in Biography, was born at Geneva in 1560. He received the early part of his education at home; ftudied law under Cujas, and, through the influence of Beza, obtained a chair in that faculty at Geneva in 1583 . In the following year he was made counfellor of ftate, and the zeal and intelligence which he difplayed in the public fervice caufed him four times to be appointed to the fyndieate, or firft office in government, and likewife to be employed in important negociations; one of which was with Elizabeth, queen of England, in order to obtain fome pecuniary aid for the republic. He was employed upon a fimilar miffion to Holland, and obtained a fum from the prince of Orange, and the ftates general, upon the condition that the academy of Geneva fhould be re-eftablifhed. Leet fupported this meafure, and delivered an oration "De ftudiis libęralibus publica ob mala non deferendis." 'He was employed to defend the rights of the republic with his pen againft the duke of Savoy; and he vindicated the Proteftant religion in oppofition to the attacks of the prefident Favre. He was author of various publications in jurifprudence, and in polite literature. He died in 1611, highly refpected by his countrymen as the model of a good citizen and magiftrate. His principal works are, "Thefaurus Juris Romani, continens rariora meliorum Interpretum Opufcula;" five vols. folio. His other publications confift chiefly of poems, orations, pieces of biography, \&cc. Gen. Biog.

Leer, Leta, (leth, lethe, lathe,) is a term of Saxon original, and feems to be no other than the court of the lathe; as the county court is the court of the county. For in ancient times the counties were fub-divided into latbes, rapes, wapentakes, hundreds, and the like; and the Cheriff twice a year performed his tourn or perambulation, for the execution of juftice through the county. Afterwards the power of holding courts was granted to divers great men, within certain diftricts. And from hence, thefe courts, holden within particular parts of the county, have defcended unto us without variation, under the name of the leet, leth, or lathe courts. See Court-leet, and Frank-pledge.

LEETAKOO, in Geography, a large and populous city of Africa, the capital of a tribe of Kaffers called "Boofhooanas," and the refidence of their chief, fituated at the diftance of 16 days' journey beyond the Orange river in the direction of N.E. from the Cape of Good Hope. The palace of the chief, like the other houfes in the town, was built in a circular form, being about 16 feet in diameter. The lower part, to the height of four feet from the ground, was ftone laid in clay, and wooden fpars erected at certain diftances. On the eaft fide of the circle, about the fourth part of the houfe was open, the other three-fourths entirely clofed. A round pointed roof covered the whole in the form of a tent, well thatched with long reeds, or with the ftraws of the holcus. From the centre to the back part of the houfe, a circular apartment is made off, with a narrow entrance into it, where the head of the family takes his nightly reft; the other members of the family fleep in the tore part,

## L E F

or between the large and fmall circles of the houfe. All the houfes are enclofed with palifades; and the fpace betweeri thefe and the dwelling ferves for a granary, and flore for their grain and pulfe. Thefe granaries are conttructed in the form of oil-jars, of baked clay, the capacity of each being at the leait 200 gallons; and they are fupported on tripods, compofed of the fame material, which raife them about nine inches above the ground. They are covered with a round ftraw roof erected on poles, and fufficiently bigh to admit an opening into the jars, the upper edges of which are from five to fix feet from the ground. Within and without the town are plantations of that fpecies of Mimofa, which conftitutes the principal food of the camelopardalis. The city in its circumference is eftimated as large as Cape Town, with all the gardens of Table valley; but it is im. poffible to afcertain the number of houfes, by a general furvey, on account of the irregularity of the ftreets, and lownefs of the buildings; but they are fuppofed to amount to between two and three thoufand, of the fame kind, but not fo large, as that of the chief. The whole population, including men, women, and children, were eftimated at between ten and fifteen thoufand perfons. The fituation of Leetakoo was calculated to be S. lat. $26^{\circ} 30^{\prime}$, and E. long. $27^{\circ}$.

LEEUWE, or Leeuwen, a town of France, in the department of the Dyle, called by the Flemings "Sout. Leeuwe," fituated on the river Geeta, in the midft of a morafs; formerly a place of ftrength, to which perfons condemned to banifhment were fent; 20 miles W.N.W. of Liege.

LEEWARD Islands, fo called in contraditinction to the Windward iflunds, an appellation given to them from their fituation in a voyage from the ports of Spain to Carthagena, or Porto Bello. Thofe that lie to leeward extend from Porto Rico to Dominica,

LEFCA, a town of the ifland of Cyprus, the refidence of an aga and a cadi. It was one of the four cities that bore the name of Arfinöe; 28 miles N.E. of Baffa.

LEFIKEH, a town of Aliatic Turkey, in the province of Natolia; near it is a convent, which is the refidence of a Greek bifhop ; 16 miles S.E. of Ifnik.

LEFOOGA, one of the Friendly iflands in the South fea, near Hapaee; in reality forming with three other iflands, viz. Haanno, Foa, and Hoolaiva, a group, diftinguifhed by the general name Hapaee. Each is about fix or feven miles long, and of a fimilar height and appearance. Lefooga is joined by a reef to Foa. Lefooga is in feveral refpects fuperior to Annamooka; its plantations were more numerous and more extenfive. Towards the fea, indeed, on the eaft fide, the country is ftill wafte, which is probably owing to its fandy foil, as it is much lower than Amamooka and its furrounding ifles. Towards the middle of the ifland the foil was better, and here were exhibited confpicuous marks of confiderable population, and improved cultivation. The plantations were regularly fenced, and the fences, in a manner running parallel to each other, fermed facious public roads, not only convenient but ornamental. Large fpots were covered with the paper mulberry trees, and the plantations were generally flocked with fuch roots and fruits as are the natural produce of the ifland. At one place was a houfe, four or five times as large as thofe of the common fort, to which, it is fuppofed, the people refort on certain public occafions. Near the landing place was obferved a mount, two or three feet high, covered with gravel; and upon it flood four or five fmall huts, in which, as the natives faid, the bodies of fome of their principal people had been interred. This ifland is not above feven miles long; and, in

## L E G

## L E G

fome places, not above two or three broad. The reef on the eaft fide, confiderably broad, and on which the fea breaks with great violence, is a continuation of that which joins Lefooga to Foa, not above half a mile diftant ; and at low water, the natives can walk on this reef, which is then partly dry, from one ifland to the other. The fhore itfelf is either a coral rock, fix or feven feet high, or a fandy beach; but higher than the welt fide, which is not, in general, more than three or four feet from the level of the fea, with a fandy beach through its whole length. S. lat. $19^{\circ}$ $47^{\circ}$ E. long. $185^{\circ} 40^{\prime}$.
LEFT, a town on the N. coaft of the ifland of Kifhma ; 12 miles N.E. of Kifhma.

LEGaCY, Legatum, in the Civil Lazw, a donation by teftament; anfwering to what in common law is called a demife; and the perfon to whom it is given is ftyled the legatee.

Legacy is ufually defined fome particular thing given by a laft will and tellament ; becaufe if a man thus difpofe, or transfer his whole eftate to another, it is called bareditas ; and he to whom it is given is called bares. Though in common law, the diltinction is this : that he to whom all a man's lands and hereditaments defcend by right of bluod, is bares natus; the other, to whom it is bequeathed, is called hares fatius.

This bequeft transfers an inchoate property to the legatee; but the legacy is not perfect without the affent of the executor; for if I have a general or pecuniary legacy of 1001., or a fpecific one of a piece of plate, I cannot in either cafe take it without the confent of the executor. (Co. Litt. II I Aleyn. 39.) For all the chattels are vefted in him; and it is his bufinefs firlt of all to fee whether there is a fufficient fund left to pay the debts of the teftator; the rule of equity being, that a man mult be juft before he is permitted to be gencrous, or, as Bracton expreffes the fenfe of our ancient law, "de bonis defuncti primo deducenda funt ea qua funt neceffitatis, et poftea que funt utilitatis, et ultime qure funt voluntatis.". In cafe of a deficiency of affets, all the general legacies mult abate in due proportion to pay the debts; but a fecific legacy, as of a piece of plate, a horfe, or the like, is not at all to abate, unlefs there be not fufficient without it. A fpecific legacy is where, by the affent of the executor, the property of the legacy will veft. As in one way there is a benefit to a fpecific legatee, that he fhall not contribute, in cafe of a deficiency, to pay all the legacies, fo there is a hazard in another way : e. go if fuch fpecific legacy, being a leafe, be evitted; or being goods, be loft or burnt ; or, being a debt, be loft by the infolvency of the debtor; in all thefe cafes, fuch fecific legatee Thall have no contribution from the other legatees, and therefore fhall pay none towards them. (I P. Wms. 539.) Hence a queftion of fome importance has arifen, viz. whether a legacy was /pecific or general? A fpecific legacy (Atrictly fpeaking) is laid by lord Hardwicke (I Atk. 417.) to be a bequeft of a particular chattel, fpecifically defcribed and diftinguifhed from all other things of the fame kind; or, in other words, an individual legacy. Money, fufficiently diftinguifhed, may be the fubject of a fpecific bequeft; as money in a certain cheft, or a particular debt. So a bequelt of a part of a fpecific chattel may be equally a fpecific legacy. (3 Atk. Io3.) Legatees, however, of fpecific parts, though not liable to abatement with general le-
gatees, mult neverthelefs abate proportionably among them. felves, upon deficiency of the fpecific thing bequeathed (2 Vez. 563. ) ; or on deficiency of the general affets for payment of debts. (I P. Wms. 403.) And fpecific legatees of diftinct chattels fhall abate proportionably on a deficiency of general affets. 2 P. Wms. 382 .
On the other hand, a mere bequelt of quantity, whether of money or any other chattel, is a general legacy; as of a quantity of flock (1 Atk. $4^{1} 4.2 \mathrm{~V}$ cz. 562.) ; and where the teftator has not fuch ftock at his death, it is a direction to the executor to procure fo much fock for the legatce. (Talb. 227.) The purpofe to which a general legacy is to be applied will not alter its nature. (I P. Wms. 539.) Perfonal annuities given by will are general legacies. 3 Atk . 693.2 Vez. 417 . See Executor and Legatee.

With regard to the payment of legacies, if a legacy when due be paid to the father of an infant, it is no good payment : and the executor may be obliged in equity to pay it again; and where any legacy is bequeathed to a feme-covert, paying it to her alone is not fufficient, without her hufband. 1 Vern. 261.

Executors are not bound to pay a legacy without fecurity to refund; and if fentence be given for a legacy in the eccle. fiaftical court, a prohibition lies, untefs they take fecurity to refund. ( 2 Venfr .358 .). As an executor is not obliged to pay a legacy without fecurity firen him by the legatee to refund, if there are debts, becaufe the legacy is not due till the debts are paid, and a man muft be juft before he is charitable; fo in fome cafes, the executor may be compelled to give fecurity to the legatee for the payment of his legacy ; as where a teftator bequeathed 1000 l. to a perfon, to be paid at the age of 21 , and appointed an executor, and died ; afterwards the legatee exhibited a bill in equity againft the executor, fetting forth that he had wafted the eftate, and praying that he might give fecurity to pay the legacy when it hould become due : and it was ordered accordingly. I Ch. Rep. 136. 257.
If a legacy is devifed, and no certain time of payment is fixed, and the legatee is an infant, be fhall have intereft for the legacy from the expiration of one year after the teftator's death; but if the legatee be of full age, he fhall have no intereft but from the time of the demand of his legacy. Where a legacy is payable at a day certain, it mult be paid with intereft from that day. (2 Salk. 415. 2 Nelf. Abr. 1114.) (See Lapfed Legacy, and Interest on Legacies.) It has been decreed in equity, that although a legacy be devifed to be paid at a certain time, it carries intereft only from fuch time as it is demanded. A perfon having a legacy, of which he was unapprized till a great while afterwards, when the executors publifhed it in the gazette; here chancrry would allow no intereft, but the bare debt. Pr. Chanc. 1 If .

As legacies are gratuities, and no duties, action will not lie at common lave for the recovery of a legacy; but remedy muft be had in the chancery or fpiritual court. (Allen. 38.) If a legacy is payable out of the land, or its profits, an action on the cafe lies at common law ; but the ulual remedy is in chancery. (Sid. 44. 3 Salk. 223*) By chief juftice Holt, a legatee may maintain an action of debt at common law, againft the owner of land, out of which the legacy is to be paid ; and fince the ftatute of Wills gives him a right by confequence he fhall have an action at law to recover it. (2 Salk. 415.) It is now, however, pofitively determined, that no action at law lies for a legacy; the court of chancery being the proper juridiction foi that purpofe. ${ }^{5}$ Term Rep. 690.) An executor being in equity confidered as a truftee for the legatee, with refpect to his legacy, and as a

## LE G

trufee in certain cafes for the next of kin as to the undifpofed farplus, we hence derive the true ground of cquitable jurifdstion in enforcing the payment of a legacy, or diftribution of perfonal eitate. ( ( P. Wms. 544. 575.) The fpiritual court adminilters redrefs in the cafe of febtraction, or the withholding or detaining of legacies, as a confequential part of their tettamentary jurifdiction; but in this cafe the courts of equity exercife a concurrent jurifdiction, as in. cident to fome other fpecies of relief required; and as it is beneath the dignity of the king's courts to be merely auxiliary to other inferior jurifdictions, the caufe, when once brought there, receives there alfo its full determination. Blackit. Com. b. iiii.

Where a teftator gives his debtor a legacy greater than his debt, it flall be taken in fatisfaction of it; though where the legacy is lefs, it thall not be deemed as any part thereof; but as a legacy is a gift, the legatec lias been fornetimes decreed both. (i Salk. 155. 2 Salk. 508.) If a greater legacy is given by a codicil, to the fame perfon that was legatee in the will, it fhall not be a fatisfaction, unlefs fo exprefled. (I P. Wms. 424.) Although a legacy is a gift, yet upon a principle already ftated, that a man fhould be jult before he is kind, a bequeft of the fame fum by the debtor to the creditor, fhall be applied ia fatisfaction of the debt. (Pr. Ch. 394. 2P. Wms. 130. 3 P. Wms. 354. I. Vez. 123. 4 P. Wms.'6ı6.). Yet when there are aflets, and the teltator intended both, it may be as good equity to confider him as both juft and kind; and the conftruction of making a gift a fatisfaction has, in many cafes, been carried too far. (I Salk. 155 . ${ }^{\text {I }}$ P. Wms. 410.2 P. Wms. 616.) Cafes of this nature depend upon circumftances; and where a legacy has been decreed to go in fatisfaction of a debt, it mult be grounded upon fome evidence, or at leaft a ftrong prefurmption that the teftator did fo intend it; for a court of equity ought not to hinder a man from difpofing of his own as he pleales; and therefore the intontion of the party is to be the rule; for where he fays he gives a legacy, the court cannot contradict him, and fay he pays a debt. (Treat. EEq. lib. 4.p. I. c. 1. §.5.) Jacob's Law Dict. by Tomlins, tit. Legacy. See Will.

Legacy, Contingent. See Contingent.
Legacies, Intereft on. See Interest.
Legacr, Lapfed, is where the legatee dies before the teftator, in which cafe the legacy fhall fink into the refiduum. (See Contingent.) A legacy to be paid, when he attains the age of 21 years, is a veffed legacy; an intereft which commences in prefenti, although it be folvendum in futaro; and if the legatee dies before that age, his reprefentatives fhall receive it out of the teftator's perfonal eftate, at the fame time it would have become payable, in cafe the legatee had lived. But if fuch legacies be charged upon a seal eftate, they fhall lapfe for the benefit of the heir; for in regard to devifes affecting lands, the ecclefiaftical court hath no concurrent jurifdietion with chancery. And yet where 1000 l. was given by a perfon out of lands to his daughter, and intereft to be computed from his death, \&c. here, though the legatee died before the time appointed for paying the fame, it was held the legacy fhould be raifed notwithitanding, and the lord chancellor faid that this legacy was a velled one. (2 Vern. Rep. 617. Barnardift, 328. 330.) In cafe of a vefted legacy, due immediately, and charged on land, or money in the funds, which yield an immediate profit, intereft fhall be payable thereon from the teftator's death. See Interest on Legacies, and Legater.

Legacies, SubtraRion of. See Suetraction.
Legacy, in an Ecclefiafical Senfe, was a foul-feat, a bequelt to the church, or accultomed mortuary; which was

## LEG

to hold good, even though the teflament itfelf were declared null and invalid.

LEGAL Column, CEconomy, Subrogation, and Tutorage. See the feveral fubitantives.

LEGALIS, Hosso, in Lazw, a perfon who ftands reflus in curia, not outlawed, nor excommunicated, nor infamous. And in this fenfe are thofe words fo often ufed, probict les sales bomines.

Hence, alfo, legality is taken for the condition of fuch a man.

Legata, fem. Legate, plu. in Mufic. Sce Notes and Syncopation.

LEGATE, a prelate, whom the pope fends às ambaffador to any fovereign prince.

The term legate comes from legalus, which Varro derives from legerce, to chafe; and others from legare, delegare, to find, or delegate. Wicquefort.
There are three kinds of legates; wiz. legates a latere, legates de latere, and legates by cfice, or legali nati.

Of thefe, the moit confiderable are the legates a latere; fuch are thofe whom the pope commiffions to take his place in councils; who are thus called, becaufe the pope never gives this office to any but his greateft favourites aiid confidants, who are always at his fide, a latere; that is, to the cardinals.

A legate a latere may confer benefices without mandate, legitimate baftards to hold offices, and has a crofs carried before him as the enfign of his authority.

The legates de latere are thofe who, not being cardinals, are yet entruited with an apoffolical legation.

Legates by office, legali nati, are thofe who have not any particular legation given them; but who, by virtue of their dignity, and place in the church, become legates. Such are the archbifhop of Rheims and Arles. But the authority of thefe legates is much inferior to that of the legates a la. tere. The power of a legate is fometimes alfo given without the title ; fome of the nuncios are invefted with it.

Legate, Court of the. See Court.
LEGATEE, or Legatary, in Lazv, the perfon to whom a legacy is left; which every perfon is capable of being, unlef particularly difabled by the common law or ftatutes, as traitors, and fome others.

Formerly Papits were under feveral difabilities, both as to purchafing lauds, and taking them by defcent or devife ; but in thefe more liberal and enlightened times, fuch difabilities are removed, and Papitts, or as we fhould rather call them, Roman Catholics, are rendered capable of purchafing and devifing lands, and having them by defeent, purchafe, and devife, on taking the oath prefcribed to them by 18 Gec: III. c. 60.

It feems to be neceflary that a legatee fhould be born at the time of making the will; and it has been adjudged, where legacies were given to a man's cbildren, that thole who were born afterwards fhould have no fhare. (s Bultt. 153.) But it has been otherwife decreed in chancery. (I Ch. Rep. 301.) The general rule with regard to legatees is, that if the legatee die bcfore the teftator, or before the condition upon which the legacy is given be performed, or before it be velted in intcrelt, the legacy is extinguilhed. (Treat. Eq. lib. 4. part I. c. 2.) But a bequeft may be fo fpecially framed as to prevent the death of the legatee from occafioning a lapfe of the legacy. (3 Atk. 572. 5 So.) Nor will the rule extend to a legacy bequeathed to two or more; for though, by the civil law, there is no furvivorhip among legatees, yet it is fettled that a legacy to two or more is not extinguihed by the death of one, but will velt in the furvivor. (Gilb. Rep. 137. 2 Att. 220.) Nor will

## L E G

the rule extend to thofe cales where the legacy is given over after the death of the firit legatee; for in fuch cafes the legatee in remainder flall have it immediately. (I And. 33. pl. 82. 2 Vern. 207. I P. Wms. 274. 3 P. Wms. 113. Pro. Ch. 37. Mofch. 319. 2 Vern. 378.) Nor will a legacy lap fe by the death of the legatee in the teftator's life-time, if he be to take as a truttee; (See I Vez. 140 ; and 2 Vern. 468.) in which latter cafe the point is doubted. When a father makes provilion for a child by his will, and afterwards gives to fuch child, being a daughter, a portion in marriage ; or, being a fon, a fum of money to eftablifh him in life, (fuch portion or fum being in amount equal to, or greater than, the legacy,, it is an implied ademption of the legacy; for the law will not intend that the father detigned two portions to one child. (I P.Wms. 680. 2 Ch. Rep. $5_{5} .2$ Vern. 115.257 . 2 Atk. 216. Ambl. 325. 2 Bro. C.R. 307.) But this implication will not arife, if the provifion by the will be by bequelt of the refidue (2 Atk. 216.); or if the provifion in the father's life-time be fubject to a contingency ( 2 Atk. 49r.), or be not ejifdem generis with the legacy ( r Bro. C. R. 425. ) ; or if the teftator be a flranger (2 Atk. 516. 2 Bro. C. R. 499.) ; and fuch implication is aiways liable to be refuted by evidence. 2 Atk. 516. 2 Bro. C. R. 165.519.

A bequett of money to one at the age of 21 , or day of miarriage, without faying, to be paid at that time, the legatee dying before the term, is a lapfed legacy; and fo it would have been, if the devife had been to her when fhe fhall marry, or when a fon fhall come of age, and they die before. (Godb. 182. 2 Vent. 342.) But a devife of a fum of money, to be paid at the day of marriage, or age of 21 years, if the legatee die before either of thefe events happen, Thall go to the legatee's adminiltrator, becaufe the legatee had a prefent intereft, though the time of payment was not yet come; and it is a charge on the perfonal eflate which was in being at the teftator's death; and if it were difcharged by this accident, then it would be for the benefit of the executor, which was never intended by the teltator. (2 Vent. 366. 2 Lev. 20\%.) If the legacy be to the legatee payable to him at a certain age, and the legatee die befor he attain that age, this is a velted and tranfmiffable intereft in the legatee. (2 Vent. 342. 2 Ch. Car. 155. 3 Vern. 462. 3 P. Wms. 138. 2 Vern. 199.) Otherwife, if the legacy be to the legatee generally, at or when he attains fuch age. (2 Vent. 342. 2 Salk. 415 . I Eq. Ab. 259, 6. 1 Bro. C. R. 119.) If the legacy be made to carry intereft, though the words to be puid or payable are omitted, it is a velted and tranfmiffahle intereft. ( 2 Vent. $3+2.2$ Ch. Car. 255. 2 Vern. 673. 2 Vez. 263.3 Atk. $645^{\circ}$ ) So if the bequelt be to $A$. for life, and after the death of $A$. to $B$., the bequeft to B. is velted upon the death of the teftator, and will not lapfe by the death of B. in the life-time of A. (2 Vent. 347. i P. Wms. 566. 2 Vern. 378. Ambl. 167. i Bro. C. R. 119. 181.) A perfon by will, \&c. gives a portion or legacy to a child, payable at 21 years of age, out of a real and perfonal eftate, and the child dies before the legacy becomes payable; in that cafe, fo much of it as the pertonal eltate will pay, thall go to the child's executors and adminiftrators; but fo far as the legacy is charged upon the land, it is faid that it fhall fink. (2 P. Wms. 613.) dacob's Law Diet. by 'Tomlins, vol. ii. See Legacy and Executor.
Legatee, Refiluary, is the perfon to whom the refiduum, or what remains of an eftate, after funeral charges, debts, and legacies, are paid, is left by will. See Executor.

## LEG

LEGATINE Constitutions. See Constitutions. ILGATIS T'enementis. See Tenementrs.
LEGATO, Ital., in MIffic, bound, tied, conneded, fuf: tained.
LEGATORY, or Legatary, a term ufd in fpeaking of the government of the ancient Romans: Auguftus diyided the provinces of the empire into confular, legatory, and prefidial. The legatory provinces were thofe of which the emperor himfelf was governor, but where he did not refide, but adminiftered affairs by his licutenant, or legatus.

Legatony, or Legatary, the fame with legatee of a will. ( 27 Lliz. cap. 16.) It is derived from the Latin lega. tarius.
LEGATUM, in an Ecclefiafical Sinfe, was a legacy given to the church, or accultomed mortuary.

LEGATURA, Ital., in Modern Mufic, implies a binding note; as when the bar goes through the middle of the note, or two notes of the fame kind are ticd together by a femicirle.

The bar is feldom drawn through the head of the note, except in alla breve time: notes of lefs value are linked together by a femicircle, or tie. See Syncopation.

In old chureh mufic, before the ufe of bars, and when the notes were chiefly fquare, fuch as the large, the long, and the breve, the laws of ligature conftituted the moft difficult and tedious part of a practical mufician's ftudy. The value or length of a note, in the fiftieenth or fixteenth centuries, was changed, by the polition of the tail being upwards or downwards, on the left or right fide of a note, or in the middle of a meafure. In the mufic-fchool at Oxford, a fet of mafs books is preferved, çontaining compofitions by Dr. Fairfax, Taverner, and other old Englifh malters, of Henry VII.'s and Henry VIII.'s time, that are totally unintelligible, except to very curious and fludious profeffors, who have made the ligatures their peculiar ftudy.
Ligatures were ufed by the early contrapuntifts, in vocal mufic, to connect fuch founds as were to be fuftained or fung to one fyllable, as is done at prefent by femicircular marks, called binding-notes, and flurs. The rules for theife are too numerous and vague to be explained without a long: difcuffion, and their powers will perhaps be beft compres hended in the esamples of ancient compofition of different parts, in partition, and barred. However, it may be ufeful to thore who undertake to decypher fuch mufic, to remember that all the fquare notes in ligature, with tail3 on the right band, defcending, are longs; on the leff, breves; and all with tails on the left, afcending, are femibreves. Square notes, without tails, in ligature, are in general breves, though there are fome exceptions to this rule, for which it is not eafy to affign a caufe.

Ligatures

Ligatures explained by equivalent Notes.

Black, fquare, and lozenge notes, when mixed with white, are diminifhed one-fourth of the value they have, while open
or vacuate. And a note partially black, or demivacuate, isfruck twice, in the following proportions:

LEGATUS, among the Romans, a military officer, who commanded as depaty of the chief general.

Of thefe there were divers kinds; viz. a legatus in the army under the imperator, or general, anfivering to our lieutenant-general; and a legatus in the provinces, under the proconful, or governor.

When any confiderable perfon among the Roman citizens had occafion to pafs through any of the provinces, the fenate gave him the title of legatus; that is, of envoy from the fenate, to the end that he might be received with the greater refpect, and that the cities and towns, through which he travelled, might defray his expences. This they called a frce legation, Iibera legatio; becaufe the perfon was not incumbered with any truft, and might lay it alide as foon as he pleafed.

LEGAU, in Geography, a town of Bavaria, belonging to the abbey of Kempten ; 2 miles N.N.W. of Kempten.

LE'GE', a town of France, in the department of the Lower Loire, and chief place of a canton, in the diftrict of Nantes; 21 miles S. of Nantes. The place contains 2893, and the canton 5227 inhabitants, on a territory of $167 \frac{1}{\frac{1}{2}}$ kiliometres, in 5 communes.

LEGEM, ad communtm, entry, in Larw, a writ of entry which lies where tenant for term of life, or for term of another's life, or by courtely, \&c. aliens and dies, when he in the reverfion thall have his writ againft any one that is in poffeflion of the land. New Nat. Brev. 461. See Entry.

Legem facere, to make law, or oath; and legem babere, is to be capable of giving evidence upon oath. "Minor non habet legem." Selden's Notes on Heng. 133.

LEGEND, Legenda, was originally a book ufed in the old Romifh churches, containing the leflons that were to be read in divine fervice.

Hence alfo the lives of faints and martyrs came to be called legends; becaufe the chapters were read out of them at matins, and in the refectories of the religious houfes.

The firt Greek legend which is known is that of Simon Metaphraftus of the tenth century, who writ the lives of faints addapted to every day of the year. The firlt Latin legend is,

Legend, Golden, or a collection of the lives of the faints, compiled by James de Varafe, better knows by his Latin name of J de Voragine, vicar-general of the Dominicans, and afterwards archlinhop of Genoa, who died in 1298.

It was received into the church with great applaufe, which it maintained for two hundred years; but, in effect, it
is fo full of ridiculons and romantic accounts, that the Romanifts themfeives are now generally afhamed of it: The word legend itfelf is, on that account, come into difrepute.
Legend is alfo ufed by authors to fignify the words or letters engraven about the margins, \& \& co of coins.

Thus, the legend of a French crown is, sit nomen domini benedictim; that of a moidore, in hoc signo vinces: on thofe of the laft emperors of Conllaninople, we find iesvs christvs basilevs basileons ihs xps nica, iesvs christvs vincit. For a brief hiftorical account of the legend on coins, and the method of engraving it; fee the article Coinage.
Legend is alfo applied to the infcription of medals, which ferve to explain the figures or devices thereof.

In ftrictneis, the legend differs from the infcription; this lalt properly fignifying words placed on the reverfe of a medal, in lieu of figures. When the letters or words of a medal occupy the field, they are called an inforittion; but when they run round the margin, on either fide of the figures, or on the exergue, they are denominated a legend.

It feems as if the ancients had intended th:cir medals thould ferve both as images, and as emblems: the one for the common people, and the other for perfons of tafte and parts; the images to reprefent the faces of princes; and er blems to reprefent their virtues, and great actions: fo that the legend is to be looked on as the foul of the medal, and the figures as the body.

Every medal has properly two legends; that on the front, and that on the reverfe. The firlt generally ferves only to diftinguifh the perfon by his name, titles, oftices, \&cc; the latter is intended to exprefs his noble and virtuous fentiments, his good deed;, and the advantages the public has reaped by him. This, however, does not hold univerfally ; for fometimes we find the titles fhared between both fides, and fometimes alfo the legend.

In the medals of cities and provinces, as the head is. ufually the genius of the place, or, at leaft, fome deity adored there, the legend is the name of the city, province, or deity, or of both together; and the reverfe is fome fymbol of the city, \&c. frequently without a legend; fometimes with that of one of its magiltrates.

The ordinary fubjects of legends are, the virtues of princes, the honours they lave received, confccrations, fignal events, public monuments, deities, public vows, privileges, \&c.

Legends and infcriptions of medals are either in Latin or Greek. The Greek charater, confiling of majuicule, or

## LEGEND

-apitalletters, appears uniform on all the medals; no change or alteration being fcund in confronting the feveral characters; though it is cortain there was in the ordinary ufe and pronunciation. All we obferve on medals is forcetimes a mixture of Greck and Latin letters.

Upon many' of the coins flruck in the Greek cities, we find the legend of the obverfe in Latin, while that of the reverfe is in Greek. The reafon of this, fuggefted by Mr. Pinkerton, feems to be, that the magiltrate of fuch country mint, not having any portrait of the emperor, fent to Rome for one, which was returned in a die ready cut with the legend. To this a reverfe was made by the Greek artifts; the magilltrate inclining to fave the expence of cutting another obverfe. Th.is opinion is confirmed by the fact, that few or no coins occur with Latim legends on the reverfe, and Greek in front : belides, the dics are haltily done, and after the manner of different mints.

The character was preferved in all its beauty till the time of Gallienus.

From the time of Conftantine, and for the foace of five hundred years, the Latin tonguc was alone ufed in the legends of medals, even in thofe Aruck at Conttantinople. Michael began the firlt, whofe legend was in Greck; and from his time the language, as well as the characters, began to alter for the worfe. See Medil.

The Latin legends are all read from the left to the right; but the legends of fome Greek medals are wrote the contrary way, from the risht to the left. The letters of the circular legends are commonly placed with the bottoms inward; but fometimes with the bottoms towards the edge.

It is obferved by Mr. Pinkerton in his excellent "Effay on Medals," that the legends of the earlieft Greek writers are very brief, rehearfing only the initials of the city or prince: as AӨE, money of Athens; Ir, money of Sybalis, \&c.: afterwards, A, money of Archelaus, king of Macedon; $\Phi$, money of Philip. Afterwards the name was put at full length; as ¢ıлппо , coin of Philip of Macedon; and Alexander the Great has the title of BAELAEYE, or king. In procefs of time, the Syrian and Egyptian kings, the fucceffors of Alexander, added fome cpithet of praife, as ereptetir, beneficent, or the like, together with the year of their era in which the coin was flruck. In this ftate the Greek coinage remained, till the Roman empire fivallowed up all the kingdoms and cities which ufed that language. "Under the dominion of the Roman emperors, the Greek mint affumed more of the Roman form, then more perfect, as to legend, than their own. On the face they gave the Roman emperor or emprefs, with their titles; the founder of their city, with his name; the fenate or the people of Rome, who had protected them; or the ideal buft of the genius of their city: while the reverfe prefents us with a legend indicative of the name of the magittrate under whom the money was ftruck; of fome treaty entered into with one or more neighbouring ftates; of the river or deity reprefented, and the like." The Greek artits, as the fame ingenious writer obferves, to their honour, even when their wint was deprefled by the Roman porwer, feldom or never explain by their legends the reverfes of their coins; commonly, and almoft univerfally, putting for the legend of the reverfe the name of the city, frequently adding that of the magitrate. The fymbols of their deities were familiar, and needed no explanatory legend. Perlonifications, rare on Greek coins, except of their cities and rivers, are eonmonly accompanied by an illuftrative legend; and the Egyptian coins have alfo fimilar legends. The Grecian cuins of 'cities feldom exprefs more in their legends than the game of the town, generally contracted till the Romin
times. When the Roman empire firal!ored up the Grecian the legends on Greek coins were as much diftinguifhed by their length as they had before been by their brevity. The titles of the emperors are tranflated from the Latin as lis terally as poffible, as AYTOKPATRP for Imperator, KAFEAP for Cæfar, \&c. In order to exprefs Latin founds, the Grecks were often obliged to put their own enunciation of the fame word, in characters very different from the Latin, as Kotintos for Quintus. On the reverfes of Greek imperial coins, the legends are very various; fuch are kolNON, the community; OMONOIA, the alliance; ArtoNOMOI, living by their own laws ; EAETOEPOR, free, \&c. Infcriptions filling the whole field of the reverfe are not fo common in Greek coins. Some few, however, occur, particularly upon thofe of Smyrna. Our author further obferves, that the noted S. C., fignifying Scnatus Confullo, by decree of the fenate, and expreffing the authority of the fenate of Rome for triking any coin, never appears upou thofe of gold or filver, in the fame fenfe as when it occurs upon thole of brafs. He fuggeits, that the Roman emperors had the fole difpofal of the gold and filver coinage, but left that of brafs entirely to the fenate. The Roman legends refembled, for fome tires, in their fimplicity thofe of the Greeks ; but gradually proceeded to more explicit length, and in time from elegant and fimple veracity degenerated into flattery. This remark is trictly applicable to the legends of the obverfe; whereas thofe of the reverfe began to flatter as foon as there was a prince, "an idol upon whofe altar to burn the cloudy perfume." Clemency and moderation are found upon the medals of Tiberius, and equivalent virtues upon thofe of Titus. The reverfes of the firlt imperial coins are not, however, wanting in adulation; which, fays Mr. Pinkerton, is not to be wondered at, "when we confider that Virgil and Horace, men of the moft enlightened minds, whatever may be decided of their claim to genius, were yet capable of even forgetting the found dignity of poetry, and proflituting it at the bloody footfool of a tyrant. What Montefquieu fays of the Englifh, that if ever they were reduced to be flaves, they would prove the meaneft of all flaves, was exemplitied in the conduct of the ancient Romans." In procefs of time, "a fucceffion of virtuous monarchs authorized the reverfes fo foreign to moft of their predeceffors. S. P. Q. R. optimo Principi, fo common on the coins of Trajan, is not flattery, but glory. All the virtues appear without impropriety on the medals of Nerva, Trajan, Hadrian, and the Antonini. But in proportion as the empire declined, the more common are flattery and grofs impropriety in the legends of the Roman coin." The Greeks alfo even furpafled the Romans themfelves in the bafe art of adulation. "The legends of the Roman imperial coins are defervedly celcbrated for their beautiful fimplicity, and emphatic brevity, fo as to be accounted models of the kind." Mr. Pinkerton has fubjoined feveral inftances to this purpofe. The compals of a coin is fo fmall, that artitts have always been obliged to ufe abbreviations in the legends and infcriptions. This circumftance occafions coniderable difficulty in interpreting them. Mr. Pinkerton, in the appendix to his valuable work, has furnifhed an explanation of thofe that moft conmonly occur.

Dr. Coningham, in his Tract on Modera Meda's, cited by Mr. Pinkerton, enumerates fise kinds of improper legends on modern medals; viz. poetianl, impious, jingling, intricate, and abufive. Of the firf kind he initances a French medal, flruck on occalion of fome advantage over the Englifh at fea; maturate fugan, which, he fays, reminds us of Virgil and not of the action. Mr. Addion, in his third dialog te ou medals, viadicates poetical legends. But Mr. Pinkerto

## I. E G

jufly obferves, that medals are certainly meant to be hiftow rical, and that poetry has in it fomething alien to hiftory and celtruetive of its reality; and he adds, that the ancients do not afford a fingle example of a poetical legend on a medal. Of the jingling kind of legend is that of Francis Morozini, Jupiter with an urn, gavet flumine non furdine, and alfo that of Ridhard Crommell, non defichat olivif, confounding the ulive-tree with Oliver Cromwell. To the intricate kind is referred the chronological coin of Gultavns Adolphus, king of Sweden, CheistVs DVX eheo TrIVMphVs, the numeral letters making the year 1632. Of the abulive kind is the Dutch medal on their ftadtholder, quantum nutatls ab hllo, and Louis XIV., viro mimortali cempistula in ano. To thefe long legends might be added. The ancient legends are remarkable for fimple brevity and energy; and the beft of the modern clafs are formed ou their model.

For further particulars we refer to Mr. Pinkerton's "Effay on Medals," 1789 , vol. i. \& 12. vol. ii. § 18. See Miviles.

LEGER, Anthony, in Biography, a learned Piedmontefe, was born in the year 1594. After purfuing his ftudies at Geneva, he entered the work of the minilltry, the duties of which he difcharged many years with great punctuality. In 1628 he went to Conftantinople, as claplain to the ambaffador of the States-general in the Ottoman Porte, and there became intimatcly connected with the celebrated Cy rillus. On his return to Piedmont in 1637, he was cholen pattor of the church of St. John, a fituation which he retaingd fix years; during which he difplayed much talent and leapning in the defence of the Proteftant faith. In $16+3$, he was profcribed by the duke of Savoy, and was obliged to feek for fafety in Geneva, where he not only exerciled his profeffion, but was clected profeffor of the Oriental languages, and of divinity. He died in 1661, at the age of lixty-feven. He publifhed at Geneva an edition of the New Teitament in two vols. 4 to. in the Greek and French languages. He left a fon of the fame name, celebrated as an eloquent preacher, who died in 1719, and after his death five volumes of his fermons were publifhed. Moreri.

Leger, Joirn, nephe of Anthony, was born in 1615 , and educated for the profeffion of the miniftry, was chofen to fucceed his uncle when he was obliged to fly for his life to Geneva. In this church he continued his labours till the year 1655 , when the perfecution of the W Aldenses (which fee) broke out with great rage. Leger made his efcape to France, and from thence he tranfmitted an affecting account of the cruelties perpetrated on the Proteltants to Oliver Cromwell, who fent an extraordinary amballador to the duke of Savoy, to remonitrate with him on thofe proceedings. Leger likewife applied to the king of France, and to the Proteflant itates, foliciting their interference in behalf of his countryzuen. A treaty, now agreed on, feemed to promife future fecurity and toleration. Leger was at the ligning of this treaty, which being very fhortly broke, and new oppreffions and perfecutions let loofe on the inhabitants of the vallies, he was appointed deputy general to feveral Proteftant powers to folicit again their mediation with the duke of Savoy. This gave fuch offence to the cuurt of Turin, that Leger was proclaimed a traitor, and his houfe ordered to be razed to the ground. He now became paftor of the Walloon church at Leyden, and in 1.664 he vifited fecretly the vallies, carrying with him confiderable fums of money collected from the Proteftants, for the relief of his perfecuted countrymen. He was author of a valuable hittory of the Evangelical churches in the vallies of Piedmont. Moreri.

## L E G

LEGEREMENT, Fro in Mufic, indicates a movensent more lively than gay; it is the mean between gay and quick, anfwering nearly to vivace in Italian.

LFEGER-LINE is ufed to fignify a line added to the ftaff of five lines, when the afcending and defcending notes run very high or very low. We often meet with feveral of thefe lanes both above and helow the flaff.
1.EGGE, Groncie, in Biografoy, baron of Dartmouth, and an eminent naval commander, was born about the year 1.647. The family derive sheir origin from Italy, but have for leveral centuries been refident in this country. Thomas Legge, from whom Gcorge defcended, was lord mayor of London in the years $13+6$ and 1353 . The fubject of this article, being intended early for the lica-fervice, was brought up under adminal Spragge, and at the age of twenty, obtained the command of allip. In 1673 he was appointed governor of Portimouth, malter of the horfe, and held an office under the dake of York. In 1682 he was railed to the peerage, and in the following year was fent to raze the fortifications of Tangiers. By James II. he was appointed malter of the horfe, general of the ordnance, and conitable of the Tower. He had alfo the command of the fletet at the time of the prince of Orange's invalion, but was prevented from acting by contrary winds. At the revolution he was committed to the Tower, where he died in 1691, at the age of 4. Englifh Peerage.

LegGe, Elizabetir, the eldeft daughter of Edward Legge, efq. an anceltor of the preceding, and alfo of the prefent earl of Dartmouth, was born in 1580: She ftudied the ancient and feveral of the modern languages, and had a fine poetical genius, but became blind by much ftudy. She lived chiefly in Ireland, and died unmarried at the age of 105 , Her family were remarkable for longevity. One of her brothers lived to 109, one fifter to be more than 100, and another died in her 112 th year.

LEGGIADRO, Leggiadramsxte, Ital. in Mufic, implies gaily, lively, brifly. See Ailecgo.

LEGLEA, in Geography, a town of Nubia; 16 miles W.N.W. of Dengola. N. lat. $20^{\circ} 6^{\prime}$. E. long. $29^{\circ} 3^{\circ}$.

Leghenich, or Leckenich. See Legkich.
LEGHI, a town of Arabia, in the province of Yemen; 56 miles E.N.E. of Aden.

LEGHORN, or Livorno, a confiderable, regular, wellbuilt, fortilied and flourilhing city and fea-port of. Etruria (formerly the grand duchy of Tufcany) ; and, on account of its canals, called the New Venice. It is a bihop's fee, defended by a caftle, two fmall forts, and a broad ditch, fituated in a marfhy and infalubrious territory on the fea-coatt, oppofite to Malora, a fmall ifland, and ditant about 14 miles from Pifa. The canals that interfect it environs bave rendered the marih fit for culture, and in fome degree contributed to its greater falubrity. Its flreets are draight, uniform, and fpacious; and many of the buildings are not inelegant. The town is of a fquare form, and 12,790 feet in circuit, and contains a ducal palace, many religious houfes, and from 40,000 to 50,000 insabitants, of $w h \mathrm{hcm} 5,000$ are Jews, who live in a particular part of the city, are allowed a handfome fynagogue, and though fubject to heavy impofts, a:e in a profperous itate, as the greateft part of the commerce of. the city is conducted by them. The Greeks and Armenians have each their peculiar church, moft of them aoknowledg. ing the pope's fupremacy. The free Turks and Turkih flaves have a mofque; but the Proteftants are not permitted: the public exercile of their religion, the Englin excepted, who are allowed to have a chaplain, becaufe of all fureign nations they are the beft cuftomers to Leghorn. Other Proteftants make ufe of chaplains of Mips. Protitutes are

## L E G

reflricted to a particular quarter, confifting of feveral flrects. 'I'he heavy taxes payable to the government, from various neceffaries brought into the town from the continent, together with monopolics of brandy, tobacco, and falt, render provifions and other commodities very dear. The inhabitants carry on an extenfive trade, which is much promoted by the freedom of the port; every bale of goods, great or fmall, paying only two pialtres or fcudi. 'The harbour, whick is fecure, is divided into the ontward and inward; the latter ferving merely for four or five gallies, which are fometimes fent to fea againft the corfairs, under the command of a knight of St. Stephen. In the open place before this harbour ftands a marble ftatue of Ferdinand I., and at the angles of the pedeftal are four brazen ftatues, of a gigantic fize, reprefenting four Turkifh flaves in chains. The outward harbour is formed by a mole or dam, 600 common paces in length, well paved, with a partition in the midule, that ferves to thelter the fhipping from the wind on one fide. "I'he mole ferves alfo for an occafional promenade. The harbour has not fufficient water for large fhips, which therefore lie out of the mole, moored to pillars and lurge iron rings; and they are thus fafer than if they were in the harbour. The road, for a mile or two, is good, but not fecure againtt winds and corfairs. Without the harbour on a rock is a light-houfe, where 30 burning lamps are contained in one lanthorn, and on the fhore, not far from it, is a lazaretto, where quaransine is performed by perfons and groods, that come from fufpected places. (See Lazanetro.) The power of the inquifition at Leghorn extends only to Roman Catholics, and comprehends only cales of religion. In June 1796 the French took poffeffion of this town, and deftroyed the fortifications. N. lat. $43^{\circ} 32^{\prime}$. E. long. $10^{\circ} 16^{\prime}$.

The principal monies of account at Leghorn are the lisa and pezza; the former being chiefly ufed in domeftic trade, and the latter in fureign commerce and exchanges. Each of thefe is divided into 20 parts called foldi, and the foldo is fubdivided into 12 parts called denari. The pezza of Leghorn was originally the Spanifh pefo, and lience it is called the pezza de otto reali by the Italians, the piaftre By the French, and dollars by the Englifh. This pezza, valued in filver, is worth $46 \frac{3}{4} \mathrm{~d}$. fterling, but valued in gold, it is worth 49 d. fterling ; which is the intrinfic par between London and Leghorn, as bills in the latter place are paid in gold. The lira is either the lira moneta lunga, or the lira moneta buona; the former being an imaginary money of account, and the laster the real money of all Tufcany. The lira is, as in Florence, according to the rate of coinage, worth about $8 d$.

Accounts on Leghern are underftood to be in moneta lunga; and 23 lira moneta buona are worth 24 lira moneta lunga. The lira has its fubdivifions. The pezza is worth $5^{3}$ lira moneta buona; or fix lira moneta lunga. Foreign bills in Leghom, unlefs particularly excepted, muft be paid in gold, that is, in Florence fequins or rufponi, by weight. No days of grace are allowed ; but bills are paid three times a week at the "Stanza," a place where merchants meet on Mondays. Wednefdays, and Fridays. In freighting fiips at Leghorn, 20 chelts of fruit, 26 barrels of oil, 44 barrels of wine, 5600 lb . of alum, are reckoned one laft, or two tons. See Kelly's Univerfal Cambit. vol. i.

LEGINAU, a town of Pruffia, in the province of Ermeland; 22 miles S.E: Heilfberg.

LEGION, a kind of regiment, or body of forces, of a number of which the Roman armies were chiefly composed.

The word comes from the Latin legert; to choofe; becaufe
when the legions were raifed they made choice of fuch of their youths as were the molt proper to bear arms.
The number of foldiers and officers of which the legion confilled, was different at different times : but it is impolfible to determine the precife time and manner of their alteration. In the time of Romulus, the inftitutor of this corps, each legion contained three thoufand foot, and three hundred equites, or horfe : thefe were divided into three bodies, which make as many orders of battle; each body confiting of ten companies, or manipules, ranged at fome diftance from each other, though in the fame front. Each body had two gene. ral officers to command it, called tribunes; and each manipule, two centurions.

Under the confuls, the legion confifted of four thoufand, or four thoufand two hundred foot foldiers, who made four bodies, commanded by a conful, or one of his lieutenants; and each legion had its fhare of cavalry, which was three hundred horle.

About the year of Rome 412 , it was compoled of fire thoufand foot; which was the number of a legion during Julius Cæfar's wars with the Gauls. Under Aurultus, each legion conffited of fix thoufand one hundred foot, and feven hundred and twenty-fix horfe. After his death, they were reduced to five thoufand foot and lix hundred horte. Under Tiberius, the legion was raifed again to fix thoufand foot and fix hundred horie. In the time of Septimius Severus, the legion was compuled of five thoufand men: under the following emperors, it was the fame as it had been under Anguitus.

In the time of Marius, thofe four divifions of the legion which had taken place under the confuls, were unite into one, and augmented; and cohorts were appointed from five to fix hundred men, each under the command of a tribune. Each cohort confifted of three companies of manipules, each manipule of two centuries, and the legion was divided into ten cohorts, who made as many diftinct battalions, difpofed in three lines; fo that the legion, then, confifted of fix thoufand men.

Ifidore tells us, that the legion confifted of fix thoufand men, and was divided into fixty centuries, thirty manipules, twelve cohorts, and two hundred troops. According to the French academy, the legion confifted of fix thuufand foot, and feven hundred and twenty-five horfe. The legion confilted of four forts of foldiers, who differed in their age, arms, and names : they were called Velites, Haflati, Principes, and Triarii. (See Arms.) Till the deftruction at Carthage, thefe were citizens of Rome, but after the Social War, the frecdom of the city was gransed to other towns in Italy, and legionary troops were raifed which were called Roman, becaufe as they fhared the privilege of Roman citizens, they were incorporated in the republic.
The legions were by far the moft corifiderable part of the Roman army; their number, in the time of Auguftus; was thirty-three; they were compofed wholly of Roman citizens. The allies formed a body of auxiliary forces. See the fequel of this article.

The ftandard borne by the legions was various; at firt, a wolf, in honour of that which fuckled Romulus; afterwards an hog; by reafon, fays Feltus, war is only undertaken with a view to peace, which was concluded by facrificing a hog. Sometimes they bore the minotaur, to remind their generals, that their defigns were to be kept fecret, and inacceffible as the minotaur in the labyrinth. They alfo, bore a horfe, a boar, \&c. Pliny tells us, that Marius was the firtt who changed all thefe ftandards into eagles. See Eagle.

The different legions were difinguifhed, according to the order

## LEGION.

order in which they were raifed, into firft, fecond, and third, \&c. by the names of the emperors who formed them into legio Auguita, Claudia, Flavia, Trajana, \&cc. by the provinces where they had ferved, as legio Parthica, Macedonica, \&c. and by fome famous exploit or difplay of valour.
We fhall here fubjoin fome further particulars relating to the contitution and military fervices of the imperial legion. It was compofed of infantry and cavalry. 'The heavy-' armed infantry, which compofed its principal Atrength, was divided into ten cohorts (fee Conont), and lifty-live companies, under the orders of a correfpondent number of tribunes and centurions. The firlt cohort, which always clamed the polt of honour, and the cultody of the cagle, was formed of 110 ; foldiers, the moft approved for valour and fidelity. The remaining nine cohorts confifted each of 555 , and the whole body of legionary infantry amounted to O1O0 mea. Their arms were uniform, and admirably adapted to the fervice which they were required to perform; they confited of an open helmet, with a lofty crelt, a breaft-plate, and coat of mail ; greaves on their legs; and an ample buckler on their left arm. The buckler was of an oblong and concave figure, four feet in length, and two and a half in breadth, formed of a light wood, covered with a bull's hide, and ftrongly guarded with plates of brafs. Befides a lighter fpear, the legionary foldier grafped in his right hand the formidable pilum (which fee); and as foon as he had darted this from his hand, he drew his fword, and rufhed forward to clofe with the enemy. His fword was a fhort well-tempered Spanifh blade, that carried a double edge, and was alike adapted to the purpofe of pufhing or ftriking ; but the foldier was always inftructed to prefer the former ufe of his weapon, as his own body remained lefs expofed, while he inflicted a more dangerous wound on his ad*erfary. See Veget. de Re Mil. 1. ii. c. I. Lipfius de Militia Romana. 1. iii. c. 2-7.

The legion was ufually drawn up eight deep; and the regular diltance of three feet was left between the files as well as ranks.

The cavalry, which was necefliary for perfecting the force of the legion, was divided into ten troops or fquadrons: the firft, as the companion of the firft cohort, conlifted of 132 men; whilift each of the other nine amounted only to 66. The entire eftablifmment formed a regiment, according to the modern expreflion, of 726 horfe, naturally connected with its refpective legion, but occafionally feparated to act in the line, and to compofe a part of the wings of the army. The cavalry of the emperors was not compofed, like that of the ancient republic, of the nobleft youths of Rome and Italy, who, by performing their military fervice on horfeback, prepared themfelves for the offices of fenator and corrful; and folicited, by deeds of valour, the future fuffrages of their countrymen. Since the alteration of manners and government, the moft wealthy of the equeltrian order were engaged in the adminiftration of juftice and of the revenue ; and whenever they embraced the profeffion of arms, they were immediately intrufted with a troop of horfe, or a cohort of foot. Trajan and Adrian formed their cavalry from the fame provinces, and the fame clafs of their fubjects, which recruited the ranks of the legion. The horfes were bred, for the moft part, in Spain or Cappadocia. The arms of the Roman troopers confifted in a helmet, an oblong fhield, light boots, and a coat of mail. A javelin, and a long broadfword, were their principal weapons of offence. The ufe of lances and of iron maces they feem to have borrowed from the barbarians. Confiderable levies were regularly made by the Romans among the provincials: and many dependent princes and communities, difperfed
round the frontiers, were permitted, for a white, to hold their freedom and fecurity by the tenure of military fervice. Even felect troops of hoftile barbarians were compelled or perfuaded to confume their valour in remote climates, and for the benefit of the itate. All thefe were included under the general name of auxiliaries; and their number was feldom inferior to that of the legions themfelves. By this inflitntion each legrion, to which a certain proportion of ausiliaries was allotted, contained within itielf every fpecies of lighter troops, and of miffile weapons; and was capable of encountering every nation, with the advantages of its refpect: ive arms and difcipline. Nor was the legion deftitute of what, in modern lauguage, would be ftyled a train of artillery. It confifted in ten military engines of the largett, and 55 of a fmaller fize; but all of which, cither in an oblique or horizontal manner, difcharged itones and darts with irrefiltible violence.

The camp of a Roman legion prefented the appearance of a fortified city, See the defcription of it under Cansp. In their march, the legionaries carried their arms, and alfo kitchen furniture, inflruments of fortification, and provifion for many days. Thus laden, they advanced by a regular liep, to which they were trained, near twenty miles in about fix hours. On the appearance of an enemy, they threw afide their baggage; and by eafy and rapid evolutions converted the column of march into an order of battle. The flingers and archers 1 kirmifhed in the front; the auxiliaries formed the firtt line, and were feconded or fuftained by the ftrength of the legions: the cavalry covered the flanks, and the military engines were placed in the rear.

As to the number of the legions, we may compute, that the legion, which was itfelf a body of 6831 Romans, might, with its attendant auxiliaries, amount to about 12,500 men. The peace eftablifhment of Adrian and bis fucceffors was compofed of no lefs thas 30 of thefe formidable brigades; and moft probably formed a flavding force of 375,000 men. As to the pofition of the legions, they were encamped on the banks of the great rivers, and along the frontiers of the barbarians. As their ftations were, for the moft part, fixed and permanent, the troops may be confidered as diftributed in the fellowing manner. Three legions were fufficient for Britain. The principal flrength lay upon the Rhine and Danube, and confifted of fixteen legions, in the following proportions: two in the Lower and three in the Upper Germany; one in Rhætia, one in Noricum, four in Pannonia, three in Mœfia, and two in Dacia. The defence of the Euphrates was entrufted to eight legions, fix of which were planted in Syria, and the other two in Cappadocia. A fingle legion maintained the domeflic tranquillity of each of the large provinces of Egypt, Africa, and Spain.. Italy was not left deftitute of a military force. About 20,000 chofen Soldiers, diftinguifhed by the titles of "City Cohorts" and "Pretorian Guards," watched over the fafety of the monarch and the capital.

Under Conllantine and his fucceffors, the legions were very confiderably reduced. When feven legions, with fome auxiliaries, defended the city of A mida againft the Perfians, the total garrifon, with the inhabitants of both fexes and the peafants of the deferted country, did not exceed the number of 20,000 perfons. Hence we may infer, that the conftitution of the legionary troops, to which they partly owed their valour and difcipline, was diffolved by Conitantine; and that the bands of Roman infantry, which. ftill afo fumed the fame names and the fame honours, confifted only of 1000 or 1500 men. Neverthelefs, the Tucceffors of Conftantine indulged their love of oftentation, by iffuing their orders to 132 legions, infcribed on the mufter-roll of their
numeroins armics. Under them the complete force of the military eftablifhment was computed at 645,000 foldiers. Cibbon's Decl. \&c. Rom. Emp. vol, io and iii.

Liegiox, Square, legio quadrata, was a legion confilting of four thoufand men.

Eegonum, Domelicus. Sce Domesticus.
Legon, Thundering. Sce 'I'munderivg.
Leglon, Theban, is a name griven by fome authors to a legion of Roman foldiers, who refolving not to facrifice to iduls, fuffered martyrdom under the emperors Dioclefian and Maximilian, about the jear of Chrilt 297. But the whole account of them feems to be fabulous.

LEGISLATOR, LAWGiver, a perfon who frames the laws of a kingdom or tlate founded by him.

The principal ancient legitators are-Mofes, Iegiflator of the Hebrews; Mercurius Trifmegiftus, and Bocchyris, of the Egyptians; Italus, of the Enotrians; Thefeus, Draco, and Solon, of the Athenians; Zoroatter, of the 13 actrians; Charondas, of the Cappadocians; and Charondas, or Phaleas, of the Carthaginians: Androdamas, of the Chalcidians; Eudoxus, of the Cnidians; Phido, of the Corinthians; Minos, of the Cretans; Pythagoras, of the Crotoniates, and moit of the cities of the Grecia Major ; Parmenides and Zeno, of Elea, in Lucania; Xamolxis, of the Getx; Phoronens, of the Greeks; Bacchus, of the Indians; Saturn, of Italy ; Macarius, of the ifle of Lefbos; Zalencus, of the Locrians; Nicodorus Athleta, of the city of Mutina; Hippodamia, of Miletus; Charondas, of Rheggio; Lycurgus, of the Lacedæmonians; Archytas, of Tarentum: Philolaus, of the Thebans.

At Rome the people were in a great meafure their own legiflators; though Solon may be faid, in fome fenfe, to have been their legillator, as the decemviri, who were created for the making of laws, borrowed a great number from thofe of Solon.

With us the legilative power is lodged in the king, lords, and commons affembled in parliament; which fee.

LEGitimate Child, a child born in lawful wedlock, or within a competent time afterwards. "Pater eft quem nuptix demonftrant" is the rule of the civil law ; and this holds with the civilians, whether the nuptials happen before, or after, the birth of the child. With us in England the rule is approved; for the nuptials mult be precedent to the birth. See Bastard.

## Legitimate Delivery. See Delivery and Labour.

Legitidate Tertion. See Fever.
LEGITMMATION, an act by which natural or illegitimate children are rendered legitimate. See Bastard, \&c.

By the French law, the father and mother, by marrying, render their children, begotten before marriage, legitimate; and this is called legitimatio per fubfequens matrimonium.

The right of legitimation was a thing unknown to princes till the time of Conftantire; but, fince his time, has been exercifed by moft of them. The Greek emperors invented feveral kinds of legitimation.

Anaftafius put it in the power of the father to legitimate his natural children by a bare adoption, provided he had no legitimate children. But Juftin, by his conftitution, and Juftinian, by his Novel 74, abolifhed this legitimation, as fearing the too eafy accels to legitimation fhould encourage concubinage.

In lieu of this, he eftablifhed a way of legitimation by the emperor's letters. This rendered baltards capabie of attaining to honours, and even of fucceeding to inheritances, provided the perfons were legitimated with the confent of their father and mother: which is agreeable to the canon law.

LEGIUNCARA, in Gcorraply, a town of Naples, inthe province of Bari; 21 miles N.IV. of Matera.

LEGNA, Asm, among the Ancients, a name given to the borders of the loga and pallium, that were on each hand; the extremities above and beluw being called ora.

LEGNANO, in Geugrapby, a town of Italy, in the Veronefe, on the Adige. The two divifions of this place are comeeted by a drawbridge; the eailern part is called Porto, and the weftern Legnano. It has feveral monatheriss, and a playhoufe. It is a populous town, and carrics on a confiderable trade by means of a corn-market held every Saturday, and a camal, running from Legnano to Oitiglia, in the territory of Mantua. 'Whis was formed in 1762, between the Adige and the lo; and for the better fecurity of its navigation, fluices have been conllructed at both its ends. The French took poffeffion of it in $1799 ; 22$ miles E.S.E. of Verona. N. lat. $44^{\prime \prime} 50^{\circ}$. E. long. $11^{\prime}$ I $18^{\prime}$.

LEGNOTIS, in Botany, fo named by profeflor Swart T, from $\lambda$ sevaios, fringed, becaufe its petals are curioufly laciniated and fringed. Schreb. 357. Swartz. Prod. 84 Ind. Occ. v. 2. $969^{\circ}$. Willd. Sp. M1. v. 2. 117 1. Mart. Mill. Dict. v. 3. (Caffipourea; Aubl. Guian. v. 1. 528. t. 21 1. Juff. 432 . Lamarck. Illuftr. t. 406.) - Clafs and order, Poly. andria Monogynia. Nat. Ord. uncertain.

Gen. Ch. Cal. Perianth inferior, of onc leaf, bell-flaped. four or five-cleft half way down, permanent; fegments ovate, acute, erect. Cor. Petals four or five, longer than the calyx; claws flender, almoft as long as the calyx, inferted into the receptacle; borders ovate, very much fringed, villofe. Stam. Filaments fixteen or twenty, thread-flaped, equal, the length of the calyx, inferted into the receptacle; anthers oblong, erect. Piff. Germen fuperior, roundif ; ftyle cylindrical, as long as the famens; ftigma capitate. Peric. Capfule large, elattic, triangular, with three cells and three valves. Sceds folitary, convex on one fide, angulated on the other.

Obf. Sometimes the number of cells and valves in the fruit is liable to variation

Ef. Ch. Capfule fuperior, of three cells. Petals inferted into the receptacle, very much fringed or torn.

1. L. elliptica. Swartz. Prod. \& \& Willd. n. 1-Leaves elliptical. Flowers on foottalks.-A native of lofty mountains in Jamaica, flowering in May and June.-This is a tree from ten to thirty feet in hreight, having a fnooth, brown bark. Brancbes determinately fubdivided, creet, fmooth; the fmaller ones flightly compreffed. Leaves on footitalks, oppofite, ovate-acuminate, or oblong-lanceolate, entire, fcarcely nervofe, fmooth on both fides, fomewhat rigid; footitalks fhort, flat above, roundifh underneath. ' Stipulas fmall, ovate, membranaceous, downy, deciduous, between the foottialk 3. Flower-flalks axillary, from three to five, fimple; fcarcely fo long as the leaf-talks, with a few minute fcales at their bafe. Capfule fmooth, white and downy within. Flowers. flefh-coloured, villofe with white hairs.

Obf. The downy ftyle becomes elongated to twice the length of the calyx, after flowering.
2. L. Cafispourea. Swartz. Prod. 84. Willd. no 2. (Caffipourea guianentis; Aubl. Guian. t. 211.)-Leaves ovate. Flowers feffile:-A native of moilt places in Cayenne, flowering in January.

A middling-fized trca with a grey bark, about five feet in height, branched at the fummit: finaller branches oppofite, knotty. Its wood is white. Leaves iffuing from the knobs, ovate, acute, fmooth, entire, nearly feffile, accompanied at their bafe by two very minute Jipulas. Flowers axiliary, in tufts, white, feffile, firuated between two oppofite brafleas.

LEGOUZIA, Juff. 45, a name deftined by M. Dit-

## L E G

## L E G

rande, for thofe Campanules which have a nearly flat, or wheel-flaped corolla, and an oblong prifmatic capfule, which L'Heritier has likewife feparated from Campanula, under the appellation of Prifmalocarpus. Sce Campanula, fection **.

LEGRAD, in Geography, a town of Croatia, at the union of the Muner and Drave; 15 miles E. of Varafdin. N. lat. $46^{\circ} 30^{\prime}$. E. long. $16^{\prime} 54^{\prime}$.

LE GRAND, a confiderable river of America, in the flate of Ohio, which rifes within a few miles of the W. extremity of lake Erie, and purfuing a N.N.W. courfe for nearly, 100 miles, and then turning to the W., difcharges itfelf into lake Michigan. At its confuence with the lake it is about 250 yards wide.

LEGRENZI, Don Grovanni, in Biography, an able malter and fertile Italian compofer of the leventeenth century. He was a native of Bergamo, and produced for the different theatres of Venice fifteen operns between the years 1664 and $16 \mathrm{~S}_{4}$. He was likewife a favourite compofer of cantatas, of which he publifhed at Venice two books: one of ten, in 1674 ; and a fecord book containing fourteen, in 1679. During his youth he was fome time organitt of Santa Maria Maggiore, in his native city of Bergamo; then maeftro di cappella of the church Dello Spirito Santo, in Ferrara; and laftly of St. Mark's at Venice, and matter of the Confervatorio de Mendicanti. He was the matter likewife of the two great muficians, Lotti and Francefco Gafparini, both of whom are faid to have refided in his houfe at Venice in the year 1684, in order to receive his inftructions. He was alfo an inftrumental compofer, and among the moft early trios for two violins and a bafe, may be numbered, "Suonate per Chiefa," by Legrenzi, publifhed at Venice, 1655; "Suonate, rla Chiefa e Camna," 1656; "Una muta di Suonate," 1664 ; and "Suonate a due Violini e Violone," 1677 . Of this latt work we are in poffeffion, and upon viewing it, find, that though Legrenzi has introduced into thefe pieces fome of the belt melody of the times, and there is confiderable merit in the texture and contrivance of the parts, yet, for want of the knowledge of the bow, and the particular energies and expreffions of the violin, thefe compofitions have been long fince juftly fuperfeded and effaced by fuperior productions of the fame kind.

IEGS, the lower eatremities of the bodies of moft animrals, ferving them for fupport and motion. See Extremia:RS. See alfo references under Leg.
I. ${ }^{\text {css }, ~ i n ~ t h e ~ M a n e g e, ~ t h e ~ m e m b e r s ~ t h a t ~ f u p p o r t ~ a ~ h o r f e ' s ~}$ body, and perform the motion when he goes. Of the four Sogs, the two before have feveral parts, each of which has a peenliar name: fo that by the name of fore-legs, we commonly underitand that part of the fore-quarters that extends 1.0 m the hough to the paitern-joint, and call it the foank; the part that correfponds to this in the hind-quarters is alled the infep. But in common difcourfe we confound the Sore and the hind-quarters; and without any diftinction fay the four legs of a horfe. The French call a horfe droit fur itcs jnmbes, i. e. ftraight-membered, or ftraight upon his legs, when the fore-part of the pattern falls perpendicularly upon the coronet, and the fhank and the paftern are in a fraight live. See Straight and Long-jointed. See alfo Horse.

The horfemari's legs are likewife of fingular concern in the manege, for the action of thefe given feafonably, and with a little judgment, conftitutes one of the principal aids, which confifts in approaching more or lefs with the calf of the leg to the horfe's flank, and in bearing it more or lefs off as there is occafion. This aid a horfeman ought to give very nicely, in order to animate a horfe: and it is fo much
the finer, that it is hidden and private: for in fretching the ham he makes the horfe dread the fpur, and this aid has as much effect as the fpur itfelf. See Aid.

Legs, in Rural Economy; are the extremities that form the fupport of animals. In horfes they fhould have a due proportion to that of the body. The fore-legs are fubject to many infirmities, as being the parts that fuffer moft, and are commonly the weakeft. It is a mark of bad legs when they appear altogether ftraight, or, as if they were of one piece. A horfe is faid to be flraight upon his legs, when from the knee to the fore-part of the coronet, the knees, flank, and coronet defcend in a ftraight or plumb-line, and the paftern joint appears more, or at lealt as much advanced as the reft of the leg; fuch legs are like thofe of a goat, making a horfe apt to trip and fall; fo that in time the paftern is thrult quite forward out of its place, and the horfe becomes lame and liable to flumble.

Horfes which are Atraight upon their legs are quite contrary to thofe that are long-jointed, that is, whofe patterns are fo long and flexible, that in walking, they almoft touch the ground with them. And it is a greater imperfection than the former, becaufe fome remedy may be applied to them; but there can be none for thefe: befides it is a figa of little or no ftrength, fuch harfes not being fit for much fatigue. Some horfes, though they be long-jointed, do not bend their pafterns in walking; fuch hortes gallop and run with greater eafe to their riders than fuch as are fhort jointed.

In the language of the fable a horfe is faid to want the fifth leg when he is tired, and, bearing upon the bridle, lies heavy upon the rider's hand, fo as to produce much fatigue.

Legs of the Martinets, in a Ship, are ufed for thofe fmall ropes which are put through the bolt-ropes of the main and fore-fail, in the leech of each. They are above a foot in length, and at either end are fpliced into themfelves; they have alfo a fmall eye, into which the martinets are faftened by two nitches, and the end is feized into the flanding part of the martinets.

Legs of a Triangle. - When one fide of a triangle is taken as a bafe, the other two are called legs. See Tmangle.

LEGUEVIN, in Geograpby, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the diftrict of Touloufe; nine miles W . of it. The place contains 6689 and the canton 9549 inhabitants, on a territory of $11 / \frac{1}{2}$ kiliometres, in 10 communes.

LEGUIGNO, a town of the duchy of Parma; 18 miles S.S.E. of Parma.

LEGUME, ia Botany, legumen, the pod proper to the pea or papilionaceous tribe of piants, thence termed, by fome writes, leguminous. (See Leguminos.s.) The Latin word legumen is faid by the ancients themfelves to be derived from lego, to gather; becaufe fuch fruits are gathered or plucked from their ftaks, not reaped nor mown. They are termed in Engliih pulfe.

This fort of feed-veffel is always folitary and fimple, formed of two moftly oblong, equal, more or lefs coriaceous, parallel valves, without any diftinet longitudinal partition, and bearing the feeds along one of its margins only. The top is terminated by the remains of the ftyle, which is fhort, and placed obliqualy, or out of the axis; the bafe is fomewhat contracted towards the flalk. One of the margins, where the feeds are inferted, is generally rather fhorter than the other, and externally more furrowed, the other being often
rounded

## L E G

rounded or wavy, and more compreffed. There are, however, various flapes of legumes, fome of which are peculiar to certain genera, as the fpiral ones of different fpecies of Medicago and Scorpiurus; the cylindrical, prifmatic, or xhomboid ones of other genera. Such differ effentially from that kind of feed-veffel termed a filiqua, or pod properly fo called, in having the feeds at one margin only, whereas the filiqua has them arranged along both. The furrowed edge of the legume, which bears the feeds, is called the future.
'I'ke capfules of Helleborus, and fome other plants allied thereto, termed by Linnæus rather incorrectly multifilique, are juftly indicated by Gartner as approaching to the definition of legumes. They differ, however, in confifting each but of one valve, and in not being folitary or fingle in each flower, except the inftance of a few fpecies of Larkfpur, Delpbinium, which differ from the natural character of their genus, in having one inttead of three germens and feedveffels; but analogy here teaches the true nature of the part in queltion. We are, indeed, obliged to have recourfe to the fame guide in a few papilionaceous genera, whofe feed-veffel, otherwife a true legume, contains but one feed, as in moft fpecies of Trifolium, or whofe valves do not feparate, but become thickened and hard, as in Pterccarpus, or leathery, as in Viminaria.
When a legume is divided into feveral cells, it is either by an inflexion of its valves, as in Afragalus and Mirbelia, or by tranfverfe conftrictions, as in Vicia and Genifa, or even membranous tranfverfe partitions, as in Securidaca and Caffa. Some, however, are fill more diftinetly divided, feparating as they ripen into diftinct joints, each of which contains a fingle feed, and does not in general burft till that feed forces its way by vegetating, as in Hedyfarum, Scorpiurus, and Hippocrepis. This latter kind of legume has lately been confidered as a peculiar fort of pericarp, and called lomentum; but the gradations leading to it are fo imperceptible, that unlefs a multitude of other diftinetions were made, we do not fee the eligibility of this.

Several legumes are internally fpongy, flefhy, or pulpy, in which refpects they vary greatly in the progrefs of their growth, as the bean (Vicia Faba), the Tamarind, the Ceratonia, the Hymenaa, \&c.

Amid all the diverities of fructure in this kind of pericarp, it is moft difficult to admit as a legume the three-valved feed-veffel of Gxrtner's Moringa; our Hyperanthera.
LEGUMINOSÆ, a natural order of plants, fo called from the nature of their fruit. (See Legume.) It is the 93 d order of Juffieu's fyitem, the 11th of his I4th clafs, and embraces the Linnæan Papilionacea and Lomentacea.

For the detailed character of Juffieu's I $4^{\text {th }}$ clafs, fee Ficoides. It has two cotyledons, many petals, and ftamens inferted into fome part of the calyx.

The Leguminofe are thus defined.
Calyx of one leaf, varioully divided. Corolla of many petals, rarely either wanting or monopetalous, inferted into the upper part of the calyx, below its divifions. Petals fometimes five, rarely fewer, regular and nearly equal ; but more frequently four, and irregular, all together imitating the fhape of a butterfly, whence the term papilionaceous flower; of thefe the upper and outer one is the flandard, vexillum, half embracing the reft, and moftly exceeding them in dimenfions; the next two are the wings, ale, which are lateral ; the lower and innermoft is the keel, carina, which is either fimple or divided. Stamens ten, rarely more or fewer, inferted into the calyx under the petals, their filaments fometimes diftinct, or flightly united at their bafe, or more frequently diadelphous, (fee Diadelphia,) that is,
confilting of nine united into a tube, which is flit lengehwife under the flandard, with a tenth applied clofe to that lifure, or the whole are really monadelphous, the tube being undivided and decandrous; the anthers are diftinct, often roundifh and fmall, fometimes oblong and incumbent. Germen fimple, fuperior; ftyle one; ftgma undivided. Fruit in a few inftances capfular, of one cell, with fcarcely more than one feed, either of two valves, or not burfting at all ; in molt it is leguminous, as the name of the order implics, longifh, of two valves, (of three in Moringa, or Hyperanthera, of four in one fpecies of Mimofa, the feeds affixed to one of the lateral futures; fometines it is of a fingle cell, with one feed or feveral, fometimes of many cells feparated by tranfverfe partitions, each cell containing one feed, and all being occafionally pulpy. In the polypetalous irregular genera the radicle of the corculum or embryo inclines towards the lobes, and there is no perifperm or albumen; in thofe with more regular flowers the radicle is ftraight, and there is a perifperm, or thickifh membrane, enfolding the cmbryo ; the lobes of the feed are moftly changed into feminal leaves, according to the ufual mode of dicotyledonous vegetables, but fometimes they remain diftinct below the firlt leaves. The ftem is either herbaceous, fhrubby or arboreous, branched for the moft part in an alternate manner. Leaves furnifhed with ftipulas, alternate, in a very few inflances imperfectly oppofite, fometimes fimple, but oftener ternate, or fingered, or once or more pinnate. The flowers are variouly difpofed.
The fections are eleven.
I. Corolla regular. Legume of many cells, moflly of two valves, with tranfverfe partitions, the feeds folitary in each cell. Stamens feparate. Thefe are trees or fhrubs, with abruptly pinnate leaves. The fection contains Mimofa, Gleditfa, Gymnocladus, Macrolobium of Schreber, Ceratonia, Tamarindus, Parkinfonia, Schotia of Jacquin, and Cafia. To thefe may be added $A f z e l i a$, Smith Tranf. of Linn. Soc. v. 4. 221.
2. Corolla regular. Legume of one cell, and two valves. Stamens ten, feparate. - Trees or fhrubs, with abruptly pinnate leaves. (In Hyperanthera they have terminal leaflets, and the legume, has three valves.)
This comprehends Hyperantbera, (Moringa of Juffieu,) Profopis, Hamatoxylum, Dimorpha, of Schreber, Cubaa of the fame, Adenanthera, Poinciuna, Cafalpinia (the two laft being really one genus) and Guilandina.
3. Corolla fomewhat irregular. Stamens diftinet, or only connected at their bafe. Legume of one cell and two valves.-Trees or fhrubs, with leaves either abruptly pinnate, or merely conjugate, or quite fimple.
Here are Dipteryx: and Dimorpba of Schreber, with Cynometra, Hymenaa and Baubinia of Limnæus, and Ginannia of the former. Jufieu admits Vouapa of Aublet, which Schreber unites to Outea of the fame author, ks own Ma. crolobium; fee fect. 1.
4. Corolla irregular, papilionaceous. Stamens diltinct, or rarely connected at their bafe. Legume moftly of one cell, and two valves.-Trees or fhrubs; their leaves either fimple, or ternate, or pinnate, with an odd leaflet.
Juffieu here enumerates oilly Cercis, Rittcra of Schreber, Anagyris, Sophora, Mullera, and Coublandia of Aublet, the character of which laft is very puzzling. But to this fection belongs a numerous tribe of New Holland genera, eftablifhed by Dr. Smith, in the Annals of Botany, and in Tr. of Linn. Soc.v. 9. 245. Thefe are Puttenua, Aotus, Gompholobium, Chorozema, Daviefia, Viminaria , though the legume of this laft does not burit), $S \$:$ erolobium, Dillwynia, Mirbelia (though the legume has two cells), and Callif-
tachya.

## I. E I

tachya. To thefe, mereover, are to be aded feveral genera from the new edition of Hort. Kew. v. 3 ; Edlowardfia, Ormoffu, Thermopfis, Virsilia of Lamarck, Cyclofia, Baptifía, Podalyria, Fodolobium, Oxylobium, Brachyfema, Burconiu, Jut Rfonia. (fee the bater in its place), Ěusaxia, Sclerchoanuus, G'alIrolobium and Euchius.
5. Corolla irregular, papilionaceous. Stamens ten, diaielphous. Legume of one cell and two valves. - Shrubs or herbs; their leaves fimple or ternate, or rarely lingered; the ftipulas fometimes fcarcely difcernible, formetimes confpicuous, cither attached to the bottom of the footllalk, or diltinet from it.

This ample fection contains Ulex, A/alathus, Borbonia, Liparia, Genifa (the latter including Spartium of Linnæus), Civijus, Crotularia, Iutimus, Ononis, Arachis, Anloylits, Dalea, Pforctlect, 'Trifeium, Melllotus, Misticayo, Trigonella, Lotus,
 are to be added Platylabium, Boffrica and Peiretia of Smith in Tr.ofLim. Soc.v.9.30t, allo ì isha of Kecnig and Roxburg, and Fathas of Thunberg, with doubtlefs many more.
6. Curnlla, Stamens, and Legume as in the latt. Herbs or firruls, or frmail trees, whofe leaves are pimate with an odd leaflet. In a few the legume has two cells.

Abrus, Amortsa (remarkable for wanting both wings and keel), Pijcidia, Rotinia, Caragana, Alragalus, Phata, Biferrilha, Colutea, Gljogrrbiza, Galerga, and Indigof:ra.
7. Cor. Siam. and Legume as in the two laft.-Herbs, with pinnate, or conjugate, or fonsetimes fcarcely any, leaves, the common foottalk ending in a tendril; ttipulas diftinct from the footitalk.
Latbyrus, Pi/jum, Orobus, Vicia, Faba, Ervum, and Cicer.
8. Cor. and Stam. as in the three lait. Legume compofed of fingle-feeded joints.-Herbs or fhrubs, rarely trees; leaves fimple or ternate, or more frequently pinnate with an odd one; !tipulas diftinet from the leaf-atalk.
Scorfiurus, Ornithopus, Hippocrepis, Coronilla, Hedjyamum, Efchyrnomene, and Diphysfa. Here belongs Smilhia of Ait. Hort. Kew. ed. r.
9. Corolla as before. Stamens mofty ten, diadielphous. Ilegume capfular, of one cell, ofter not burfting, with fearcely more than one feed.-Trees or flhrubs; leaves generally pinmate with an odd one ; Atipulas ditinct from the tootftalk, foon falling.

Da.bcrgia, Amerimncn of Browne's Jamaica, Galedupa of Lamarck, Andira of the fame, Geoffraz, Degulia of Lamarck, Nijuclia, Diptery: of Schreber, Acouraa of Aublet, and Pierocargus, are the genera claffed here by Juffieu, which have all a general affinity to each other.
10. Corolla irregular (fometimes wanting). Stamens ten, diftinct. Legume capfular, of one cell, generally not burfing, containing a fingle feed.-Trees or fhrubs; leaves enther pinnate with an odd ore, or fimple; ftipulas diftinct from the footitalk, foon falling.

Crudia of Schreber, Detaxium of Juffiev, Copaifera, and Myroxylum.-Accordjng to the defintion of this fection, Fiminaria belongs to it; but is too unlike the relk, and too clofely allied in habit and character to the phants with which we have placed it in fect. 4 , to be feparated from them.

If. Juffieu concludes here with four genera, termed by him "akin to the liguminofe." Thefe are Securidaca, which Seems to belong properly to fect. 3, Browusa, Z Zysia of Browne's Jamaica, and Aruza of Schreber.

It will eafily be perceived that this arrangement requires much correction and reformaticil, in confequence of difcoverics fubfequent to its publication. The whole order is
fo matural, that its fubdivffions are proportionably dificicult to be devifed, and the fame may be faid of its generic diltinetions. If limneus was obliged, by the laws of his artificial fyftem, to officr great violence to this order, as Jufficu and others have not failed to obferve, his clafs Diadelpbia does honour to his penctration, and to the comprehentive fyftematic powers of his mind.

Leguminous Flowers. See Fiower.
Leguminous Plants, in Gardening, a term applied to all fuch as are of the pulfe kind, as thole of the pea, bean, and other timilar defcriptions.

LEHE, in Geography, a town of the duchy of Bremen; 32 miles N. of Bremen.

LEHEIM, a town of Heffe-Darmftadt; 8 miles W. of Darmitladt.

LEHI, in Scripfure Geography, a city of Paleftine, in the tribe of Dan, near Eltak or Eltaka. This was a facerdotal city, given to the fons of Cohath. Here Samfon flew a thoufand Philiftines with the jaw-bune of an afs.

Lemr, Leljigh, or Lecha, in Geography, a river of America, which rifes in Northampton county, Pennfylvania, about 21 miles E. of Wyoming Falls, in Sufquehania river, and paffing, by a circular couffe, through the Blue mountains, difcharges itfelf into Deawrare river, on the S. fide of Euiton, ir miles N.E. of Bethlehem. Its courfe is about 75 miles, and it is navigable 30 miles.
LEHMKUHLEN, a town of folitein; 8 miles S.W. of Lutkenborg.

LEHRBERG, a town of Germany, in the margravate of Anfpach, on the Unter Retzat; 5 miles N.W. of Anfpecho

LEHSO, a town of Arabia Deferta; rqo miies S. of Cathen.

LEHSTEN, or Lemesten, a town of Saxony, in the priacipality of Altenburg, celebrated for its quarries of flate; 45 miles S.S.W. of Altenburg. N. lat. $50^{\circ} 25^{\prime}$. E. long. $11^{1} 35^{-1}$.

LEHTIMAKI, a town of Sweden, in the government of Wafa; 6 万miles E.S.E. of Wafa.

LEIDEN, a towa of Auftia; io mites W.N.W. of Crems.-Alio, a town of Auftria; is miles S.W. of Crems.
Leiblingen, or Lyptingen, a town of Germany, in the lordflip of Natenberg; 6 miles E. of Tuttlingen.

LEIBNITZ, Godfrey William de, in Biograpby, an eminent German philofopher and mathematician, was born at Leipfic in the year ${ }^{1646}$. He loft his father when he was very young, and of courfe the care of his edvcation devolved or his mother. She piaced him under able mafters, who had been colleagues to his father in the univerfity, of which he had been profeffur of moral philofophy, and fecretary. The fon made a very rapid progrefs in the different branches of fcience and learning. He not only became a decp-claffic, but availed himfelf of the adrantages of a large and well chcfen library, which his father had left him, and read all the books which it contained in regular order, as the poets, orators, hiftorians, civilians, philuforiners, mathematicians, and divines. Such was his application, that he could repeat the works of the principal puets, and fo tenacious was his memery, that even in old age he could, without hefitation, run through the whole of the Eneid, without mifing a line or a word. He had a talent for making verfes, and is faid to have emmpofed three hundred in one day. When he was fifteen years of age he became a fudent in the univerfity of Leipfic, where he profecuted, with great fuccefs, the various fludies of the law, medicine, philofophy, and theology. Having finifed his fludies at Jena, theprin-
eipal objects of his attention were hifory, law, and the mathematics. He was particularly attached to the writings of Plato and Arittotle, and is faid to have fpent whole days in meditation, in a forelt near Leeipfic. He principally devoted limfelf to the Atudy of the law, and took his degree of bachelor in 1665 , and in the following year he fupplicated for his degree of doctor, which was refufed, under the pretence that he was too young, being then only in his twentieth year, but it was inagined that the real canfe was his having abandoned the tenets of Ariflote and the fehoolmen. Offended at this treatment, he went to Altolorf, where he maintained a thefis, "De calibus perplexis," and in the difputations on this occafion, he difplayed fuch uncommon abilities, that he had the degree of docter inffantly confurred upon him, and was even offered a profefforfhip extraordinary in law, which he declined. He about this period publifhed a work, entitled "Ars Combinatoria," intended to fhew in what manner univerfal arithmetic may be applied to other feiences. This was accompanied with "A mathematical Demoniltration of the Exitence of God." From Alddor§ Leibnitz went to Nuremberg, to vifit the learned men in that miverfity. He was at this place initiated in the mylleries of Alchemy. From Nivermberg he went to Mentz, and publifhed, in 1668 , " Nova Methodus Docendæ Difcendrque Juriprudentix," which gained him great applaule. He nest thewed himfalf as a politician, and wrote a treatife to induce the Poles to choofe the elector-palatine their king, which fo pleafld the electo:, that he invised the ant!or to refide at his court, which invitation he would have accepted, had he not a: the fame time obtained the offce of counfllur se the chamber of resiew in the chancery of Mentz. In 16,0 he reprinted, with a preface and notes, the treatife of Marius Nizolius de Berfello, "De veris Principiis, et vera ratione Phitofophandi contra Pfeudophilofuphos," to which he fubjóined a letter, "De Arillotele recentioribus reconciliabili." In the year 1672 , Leibnitz went to Paris, to manage fome affairs at the French court : here he became acquainted with the greateit mathematicians in that metropolis, and made further and confiderable progrefs in the fludy of mathematics and philofophy. Here alfo he met with Paical's arithmetical machine, the defects of which he foon difcovered, and to obviate thefe he invented a new one, which was highy approved by the minitter Colbert, and the Academy of suirnces. He was offered a feat in this body with a ponfion, and hat the profpect of many other advantages if he womld fetrle at Paris, but to attain this eminence he mult embrace, or be haperofed to embrace, the Catholic religion, which neithre honutes nor emolusints could induce him to do In 16,3 he came to England, and became acquainted wilh Mr. Oldenburg, the fecretary, and Mr. Collins, a diflinguifhed member of the Royal Society; from whom it was faid he received forme hints of the method of fluxions, which had been invented in 9664, or 1665 , by Mr. Ifaac Newton. Leibnitz improved thefe hints, and under the name of "calculus differentialis" the gave the fank method of analyfis with fuxions. (See Keil and Newtox:) While Mr. Leibaizz was in Eugland he loit bis patron, the elector of Mentr, and with him a penfion which that prince had allowed him. Ife retursed to France, whence he wrote to Frederic duke of Brunfwic Lunenburg, informing him of his circumitances. This prince immediately appoiated him a member of the Aulic council, with a regular falary, but he permitted him to remain at Paris, till his arithmetical machine fould be perfect. ed. When he eatered upon his office at Hanover, one of his earlieft cares was to furnifh the prince's library with the belt books in the various branches of fcience and litcrature. In 1677 he firlt meationed his mathematical invention of diffc-
rentiala to Nexton, who had previsuny to this writen to Leibuitzan account of his invention of fluxions: akout the fame period, he gave an account of fome difeoveries in uptics and mechanics, deferibing a new method of polifking glafts. Le became a conftant contributor to the "Acta Eruditorum" of Leipfic, and among other piecers he pulslifhed in this work "Thoughts on Rnowledye, Truth, and Ideas." He next undertook a hatory of the hosice of Brumfic, and to render himfelf more competent to the tafk, he travelled over Germany and Italy, collecting materials, In paffuri from Venice to Mefola, a terrible florm arofo, during which the pilot, unagining that he could not be waderftood by a German, whom, as a heretic, he regarded as the caufe of the tempett, propofed to ftrip him of his clothes and money, and throw him overboard. Leibnitz, hearing the converfation, without the leaft emotion, drew a fet of beads from his pogket, and began turning then over with great feeming devotion. The artifice fucceeded; one of the failors obferving to the pilot, that fince the man was not an heretic, he ought not to be drowned. Leibnitz returned to Hanover in 1690, where he purfued with great induftry feveral objects of very different kinds. In a theological dispute he appeared the friend of toleration, and in 1693 he publifhed a work on the law of nations, entitled "Codex Juris Gentium Diplomaticus." He next wrote his treatife "De ipfanatura, five Vi inlita," which was:mended to improve and correct the philofoplical notion of fubllance: and he likewife conceised the idea of a new fuience of forces, in which the laws of machanics, and the meafure of living forces might be clearly defiticed. This fuence he denomiwated Dynamies (which fee), and infer ed a fpecimen of it in the "Acta Eruditorum." He publihed "Thoughts on Locke's Effay on the Human Underltandiar," in which he controverted that philofopher's upinions on innate idcas, fubflance, a vacuum, and other fubjects; communicated to the world his ingeniuus invention of binary arithmetic; and wrote a reply to Bayle in defence of his doctrine of preeftablifhed harmony. Without attempting to follow our author in all his publications, which were very numerous and important, we may obferve that he fpent much time in the invention of an univerfad language; but did not live to complete his delign. In 17 io he publifhed "A Diftertation on the Goodnefs of God, the Liberty of Man, and the Origin of Evil." The writings of Laibnitz had long rendered his name famous in every part of Eurupe: he had horours beflowed upon him by feveral vother prizes, hefijes the clector: of Hanover and Brandenburg, and in 1711 he was made $A$ ulic: counfeilor to the emperor, and at the fame period the cra: Peter the Great appointed him privy counfellor pf juftice, with a penfion of a thoufand ducats. In $175+$ his patrore the elector of Hanover, was raifed to the throne of Geeat Britan, and in a thort time Leibnitz pailct over to England. where he received new marks of favour and friendfhip, and frequently made his appearance at court. It was during this vifit, that, at the detire of the princefs of Wales, afterwards queen Caroline, he engaged in a dilpute with the celebrated Dr. Samuel Clarke, upon the fubject of free will and other important metaphyfical tupics. This controverfy continued till the death of Leibnitz, which event took place in ${ }^{17} 16$. He was author of many other works befides thofe already mentioned. His intellectual abilitics and attaiaments entitle him to be ranked among thofe univerfal geniufes which at once furprize and benefit the world: With great flrength of andertianding, an excellent faculty of invention, and a moft capacious and retentive memory, he united an uncommon degree of indultry. Hence he was enabled not only to acquire much general knowledge, but to become eminent in

## L E I

## L E I

áttainments of various kinds. The improvements which he made in the higher geometry and algebra, rank him among mathematicians of the firtt clafs. He thoroughly underttood the doctrines of philofophy, both ancient and modern, and calt new light upon almolt every branch of knowledge. In theology he was well read in the writings of the Chrintian fathers, and in the controverfies of his own times. On hittory and jurifprudence he wrote in fuch a manner as might lead a reader to fuppofe that thefe fubjects were his chief or only ftudy. The philofophy of Leibnitz is a fyllem formed partly on the Cartelian, and partly in oppolition to the Newtonian theory. After the difpute refpecting the difcovery of fuxions, he became the violent. oppofer of our great philofopher. He even charged his fyltem with having an impious tendency, becaufe it afferted that the fabric of the univerfe, and the courfe of nature, would not continue for ever in its prefent flate, but would require, in procefs of time, to be re-eftablifhed, or renewed by the land of its former. According to his own principles, deduced, as he thought, from the wifdom and goodnefs of the deity, and his principle of a fufficient reafon, he concluded the univerfe to be a perfect work, or the beft that could poffibly have been made; and that other things, which are evil or incommodious, were permitted as neceffary confequences of what was beft; that the material fyltem, confidered as a perfect machine, can never fall into difforder, or require to be fet right ; and that to fuppofe that God interferes in it, is to leffen the fkill of the author, and the perfection of his work. Among many other of his notions (for an account of which fee Leibnitzian Pbilofophy) we may add this, that the ąts of the foul and body proceed by neceflary laws: the foul in its perceptions and volitions, and the body in its motions, without affecting each other; but that each is to be confidered as a feparate independent machine. The volitions of the mind are followed inflantly by the defired motions of the body, not in confequence of thofe volitions in the lealt, but of the nice and well-adjufted machinery of the body. The impreffions produced in the fenfory have no effeet on-the mind, but the correfponding idea arifes at that precife time, in confequence of a chain of caufes of a different kind. Moreri, Maclaurin, \&c. See Leibiitzian Pbilofophy.
Leibnitz, in Geography, a town of Saxony, in the margravate of Meiffen ; 4 miles $S$. of Drefden.- Alfo, a town of the duchy of Stiria, on the Sulm ; 16 miles S. of Gratz,
LEibnitzian Philosophy, or the philofophy of Leibnitz, is a fyttem of philofophy formed and publifhed by its author in the 1 th ch century, partly in emendation of the Cartefian, and partly in oppofition to the Newtonian. The bafis of Mr. Leibnitz's philofophy was that of Des Cartes; for he retained the Cartefian fubtile matter with the univerfal plenitude and vortices; and reprefented the univerfc as a machine that fhould proceed for ever, by the laws of mechanifm in the molt perfect ftate, by an abfolute inviolable neceffity, though in fome things he differs from Des Cartes. After fir Ifaac Newton's philofophy was publifhed in 1687 , he printed an efflay on the celeltial motions (Act. Erud. 1689 ), where he admits of the circulation of the ether with Des Cartes, and of gravity with fir Iraac Newton; though he has not reconciled thefe principles, nor fhewn how gravity arofe from the impulfe of this ether, nor how to account for the planetary revolutions and the laws of the planetary motions in their refpective orbits. That which he calls the harmonical circulation is the angular velocity of any one planet, which decreafes from the perihclium to the aphelium in the fame proportion as its diftance from the fun increafes;
but this law does not apply to the motions of the different planets compared together; becaufe the velocities of the planets, at their mean dittances, decreafe in the fame proportion as the fquare roots of the numbers expreffing thofe diftances. Befides, his fyftem is defective, as it does not reconcile the circulation of the ether with the free motions of the comets in all dircetions, or with the obliquity of the planes of the planetary orbits; nor refolve other objections to which the hypothefis of the plenum and vortices is liable. Soon after the period juft mentioned, the difpute commenced concerning the invention of the method of fuxiors (which fee), which led Mr. L.eibnitz to take a very decided part in oppofition to the philofophy of fir Ifaac Newton. Sec Leibnitz.
The perfection of the univerfe, by reafon of which it is capable of continuing for ever by mechanical laws in its prefent flate, led Mr. Leibnitz to diftinguifh between the quantity of motion and the force of bodies; and, whillt he owns, in oppofition to Des Cartes, that the former varies, to maintain that the quantity of force is for ever the fame in the univerfe, and to meafure the force of bodies by the fquares of their velocities. See Fonce.
This fyRem alfo requires the utter exclufion of atoms, or of any perfectly hard and inflexible bodies; the advocatés of it allege, that, according to the law of continuity, as they call a law of nature invented for the fake of the theory, ail changes in nature are produced by infenfible and infinitely fmall degrees; fo that no body can, in any cafe, pafs from motion to reft, or from refl to motion, without paffing through all poffible intermediate degrees of motion; whence they conclude that atoms or perfectly hard bodies are impoffible : becaufe if two of them fhould meet with equal motions, in contrary directions, they would neceffarily top at once, in violation of the lav of continuity.
Mr. Leibnitz propofes two principles as the foundation of all our knowledge; the firft, that it is impoffible for a thing to be, and not to be, at the fame time, which, he fays, is the foundation of fpeculative truth : the other is, that nothing is, without a fufficient reafon why it fhould be fo, rather than otherwife: and by this principle, according to him, we make a tranfition from abfltracted truths to natural philofophy. Hence, he concludes, that the mind is naturally determined, in its volitions and elections, by, the greateft apparent good, and that it is impoffible to make a choice between things perfectly like, which he calls indif. cernibles; from whence he infers, that two things perfecily like could not have been produced even by the Deity: and he rejects a vacuum, partly becaufe the patts of it mult be fuppofed perfectly like to each other. For the fame reafon alfo he rejects atoms, and all fimilar particles of matter: to each of which, though divifble in infonitum, he afcribes amonal (Act. Lipfix 1698, p. 435), or active kind of principle, endued, as he fays, with perception and appetite. The effence of fubtance he places in action or activity, or, as he expreffes it, in fomething that is between acting and the faculty of acting. He affirms abfolute reft to be impoffible, and holds motion, or a fort of $n$ ifus, to be effential to all material fubitances. Each noonad he defcribes as reprefentative of the whole univerfe from its point of fight; and after all, in one of his léters he tells us, that matter is not a fubłtance, but a fubfantiatunn, or pberomené bien fondé. (See MonAD.) He frequently urges the comparifon between the effects of oppofite motives on the mind, and of weights placed in the fcale of a balance, or of powers acting upon the fame body with contrary directions. His learned antagonilt Dr. Clarke denies that there is a finilistude betwcen a balance moved by weights, and a mind aesing

## L E I

## L E I

upon the view of certain motives ; becaufe the one is en- in this ifland, and held the natives in military fubordination. tirely paffive, and the other not only is acted upon, but As thofe conquerors marched from the fouth-eall, towards acts alfo. The mind, he owns, is purely paffive in receiv- the central and northern parts of the country, they could ing the impreffion of the motive, which is only a perception, and is not to be confounded with the power of acting after, or in confequence of, that perception. The difference between a man and a machine does not confift only in fenfation and intelligence; but in this power of acting alfo. The balance, for want of this power, cannot move at all, when the weights are equal ; but a free agent, be fays, when there appear two perfectly alike reafonable ways of acting, has ttill within itfelf a power of choofing; and it may have itrong and very good reafons not to forbear. Collection of Papers which paffed between Mr. Leibnitz and Dr. Clarke in 1715 and 1716, \&c. 8vo. 1717, p. 121. See Liberty.

The tranflator of Mofheim's Ecclefiaftical Hiftory obferves, that the progrefs of Arminianifm has declined in Germany and feveral parts of Switzerland, in confequence of the influence of the Leibnitzian and Wolfian philofophy. Leibnitz and Wolf, by attacking that liberty of indifference, which is fuppofed to imply the power of acting not only without, but againft motives, Atruck, he fays, at the very foundation of the Arminian fyftem. He adds, that the greateft poffible perfection of the univerfe, confidered as the ultimate end of creating goodnefs, removes from the doctrine of predeltination thofe arbitrary procedures and narrow views, with which the Calvinits are fuppofed to have loaded it, and gives it a néw, a more pleafing, and a more philoforhical afpect. As the Leibnitzians laid down this great end as the fupreme object of God's univerfal dominion, and the fcope to which all his difpenfations are directed ; fo they concluded, that, if this end was propofed, it mult be accomplifhed. Hence the doctrine of neceffity, to fulfil the purpofes of a predeftination founded in wifdom and goodnefs; a neceflity, phytical and mechanical, in the motions of material and inanimate things, but a receffity, moral and firitual, in the voluntary determinations of intelligent beings, in confequence of prepollent motives, which produce their effects with certainty, though thefe effects be coutingent, and by no means the offspring of an abfolute and effentially immutable fatality. Thefe principles, fays the fame writer, are evidently applicable to the main doctrines of Calvinifm; by them predeftination is confirmed, though modified with refpect to its reafons and its end ; by them irrefiftible grace (irrefifitible in a moral fenfe) is maintained upon the hypothefis of prepollent motives and a moral necefiity; the perfeverance of the faints is alfo explicable upon the fame fyttem, by a feries of moral caufes producing a feries of moral effects. Mofheim's Eccl. Hift. by Dr. Maclaine, vol. v. p. 464 . 8 vo. edit.

For an account of Leibnitz's famous doctrine of a preefablifbed Harmony, we refer to that article; and for his account of monads to Monads.

See on the fubject of this article Maclaurin's View of Sir lface Newton's Philofophical Difcoveries, \&c. book i. chap. 4. or P. 79, \&c. 4to. edit. Brucker's Hiftory of Philofophy, by Enfield, vol. ii. P. 556, \&c.

LEICESTER, commonly pronounced Lefler, in Geograpby, the county town of Leicelterhire, England, was formerly written Lege-ceatria, Legeoceiter, and in the Saxon Annals Leger-ceatter; and during part of the heptarchy it was a city. Without reffring it to a Britih origin, or eptering into a difcuffion refpecting the derivation of its name, and of its civil privileges from king Leir, it will amply fatisfy every rational enquirer to commence its hiftory at that period when the Romans had fettled themfelves
not have obtained poffeffion of this diftriet, till the intermediate places between it and the fea were fubjugated, and competent garrifons eltablifhed. Having accomplifhed this, and overpowered the Coritani, they took poffeflion of the chief town of that people. This town, or ftrong hold, was the fcite of the prefent Leicefter, and, at the time of its conqueft, was denominated Ratx in the Itineraries of Richard, Antoninus, and Ravennas ; but Ragæ in fome other writings. "The real name, therefore," fay's Mr. Whitaker, " mult be equally Ratx and Ragx; the former implying the town to be fixed upon the currents, the latter importing it to be the capital of the kingdom.". That the Romans had a permanent ftation here is unequivocally manifefted by the teffellated pavements, and other remains that have been difcovered at different periods: and, according to Antoninus, Ratz was one of their ftipendiary towns. The fofs-road in its way from Londinio, London, to Lindum, Lincoln, came by Verinonx; whence to Rate was twelve miles, and thence to Verometum thirteen miles; and thefe di:tances very nearly correfpond with thofe between Claychefter, Leicefter, and Willoughby. That this ftation was formed on the northern bank of the Soar, that an artificial channel was cut for the water to flow up to, and conflitute one boundary of the Itation, and that the Romans were fettled here for fome length of time, are circumftances eafily proved, as ample evidences remain, and are recorded in fupport of thefe inferences. Many teffellated pavements, coins, urns, and other domeflic and military relics of the Romans, have been difcovered at different times: fome of which are ftill carefully preferved as memorials of ancient art, but many of the moft interelting objects mutt have been deftroyed during the ravages of war which Leicetter experienced under the Saxons, Danes, and Normans. Of the Mofaic pavements, that which was found in a cellar nearly oppofite the town-prifon, in the year 1675 , is the moft worthy of notice. But the moft curious relic of antiquity, and one that has provoked the molt copious differtations, is the milliary, or Roman mileitone, which was difcovered in 177 I , on the fide of the Fofs-road, at the diftance of about two miles north of the town, and thence removed into the town at the expence of the corporation: by this Itone the flation of Rate is clearly defined. In different parts of the town, and at diltant periods of time, a great number of Roman coins have been found : among which were feveral with the names of Titus, Trajan, Dioclefian, Conftantine the Great, Conftantine Junior, Conltantius, Hadrian, Theodofius, Honorius, \&c: Here is alfo a curious fragment of Roman architecture, commonly called the Jewry wall; confifing of a mafs of brick-work, ftones, and rubbifh, with dilapidated arches turned entirely of tiles, bound together by a large quantity of mortar. About a quarter of a mile fouth of the Infirmary are fome artificial banks, known by the name of radykes, or rawdykes: thefe were formerly about four yards in height, and confifted of two parallel mounds of earth, extending 67 yards in length, at the ditance of fifteen yards from each other. If thefe remains are not peculiarly worthy notice as works of art, they are curious as veltiges of remote times, and of a particular people.

The hiftory of Leiceiter, during the Saxon heptarchy, is very vague and uncertain, though, from the concurrent teftimony of all writers, it was certainly a place of confiderable note from the departure of the Romans to the time of the Norman conqueft. According to Godwin, a bifhop's fee was transferred from Sidnacefter to Leicefter in the year
737. At this period the Saxon kingdom of Mercia hard, azcolding to fonce authors, three epilicopal fees: Lichfield, Dorchefter, and Leicefter. From the Saxon annals, it appears that Ethelfrid, king of Northumberland, being an avowed enemy to Chritianity, marched an army to Leicefter, where he made a great flaughter of the inhabitants. Jowallenfis relates that Ethelred, king of Mercia, and his queen Elfreda, who was danghter of Alfred the Great, repaired the town about the year got, and rebuilt and collarged the walls, which were now made to inclofe the cafle; previous to that period the caltle appears to have been on the outlide of the town. On the conquett of England by William the Norman, Leicelter foon besane part of the royal demefne, and a caftle was either newly ereeted, or enlarged and ftrengthened to enfure the fubmiffion of the inlabitants, and thofe of the furrounding country. On the death of the conqueror, Leicefter citadel, being held by the adherents of duke Robert, was nearly demolifhed by the fucceffful partizans of William Rufus. In the reign of Henry I. Robert, earl of Leicetter, repaired, enlarged, and fortified the caltle, which he made his primcipal relidence. He was very liberal to the town; as was allo his fon Robert Boffu; but the arrogant behaviour of the latter to the king involved this place in broils and war; it being the practice in thofe times for fovereigns to revenge themfelves, for the offences of the nobles, on the people and places immediately under the patronage of the offenders. This was fatally experienced in the reign of Henry II. when earl Robert Blanchmains, leazuing with the king's fon in his unnatural rebellion, Leicefter, the chief refort of the difaffected, was, after a lont fiege, almolt dettroyed, and the cattle reduced to a heap of ruins. Scarcely any thing now remains of the latter building, but an artificial mound, or the earth work of the keep, near which is a part of the town with fome ancient buildings, called "the Newark," or New-work. This name appears to have been given to dittinguilh it from the caltle with its criginal buildings, which was confidered as the old works. The Newark is faid to have been founded by Henry, third earl of Lancafter, and his fon Henry, the firt duke of that name. By thefe two noblemen fome large buildings were crected here; and John of Gaunt, who was earl of Leicefter, added confiderably to the pile. When completed, the whole mult have formed a griand difplay; but nearly all of thefe have falien beneath the de, uftating hand of man, and the flowly devouring tooth of time. From the remains of the ferrounding wails, it is prefumed that the Newark was an inclofed area, bounded on the north by the caftle, on the fouth by fielces, to the well by a branch of the river Soar, and to the eaft by a fereet of the fuburbs. At this fide is atll remaining a large eallellated gateway, called the magazine, which name it obtained in 1682, when it was purchaied by the conunty, and applied to the ufe of the train bands. Throfby fays it "was built with the New-works, by the founder of the hofpital and collegiate church." This gateway has a large pointed arched entrance with a fmall poftern door way, and communicates with an area nearly furrounded with buildings.?

Among the ancient religious houfes and foundations of this town, the abbey was formerly of great local importance; but its buildings are nearly levelled with the earth which covers the afhes of its inhabitants. It is faid to have been founded in the year 1143 by Robert Boflin, earl of Leicefter, who became one of the regular canons on his own foundation. The abbey foon acquired celebrity, and obtained numerous privileges. It was poffefted of lands in thirty-fix parimes in and about Leiceller, and in moft of the manors in this and many other counties. Several kings
of England, and other diftinguifhed perfonages, were entertained and lodged at this houfe in a grand and fumptuous Atyle. The once great and magnificent cardinal Wolfey died at this abbey, November 29th, 1530 .

In this town was formerly a mintage; and the feries of coins that have been collected, prove that at the Leicenter mint, a regular fucceffion of coinage has been produced from the reign of the Saxon king Atheltan dowa to Henry II. This feries has been engraved in Mr. Nichols's valuable hiftory of this town.

The firt charter granted to Leicefter was by king Joha in the firlt year of his reign ; and at the fame time Rotert Fitz-Parnel, earl of Leiceiter, invefted the burge ffes with the power of buying and felling lands, \&c. A charter, granted in the following reign by carl Simon de Montfort, fhews the peculiar intolerance of the times; it fpecilies that "no Jevo, or Jcruefs, in my time, or in the time of any of my heirs, to the end of the world, fhall inhabit, or remain in" the town of Leicelter. Henry VII. by charter dated 1504, confirmed all the previous privileges, and empowered the juftices to take cognizance of trealons, murders, felonics, \&cc. A charter by queen Elizabeth fpecifies that the borough of Leicefter is very ancient and populous, and from remote times has been a borough incorporate; and the former liberties and immunities are fpecified and extended. The corporation are thereby empowered, among other privileges, to refufe the building of malt-kilns within the diftance of thinty yards from any other building. This charter alfo grants a market for wool-yarn and norted, and for other conmoditics. All fines and ansercements were ordired to be applied to the ufe of the poor. The corporation confifts of a mayor, recorder, theward, bailifs, twenty-four aldermen, forty-eight common-councilmen, and a town clerk; the freemen are toll-free of all the markets and fairs in England. As a parliamentary borough, Leicefter has returned two members to the national councils from the time of Edward I. One of the reprefentatives was formerly elected by the " mayor and his brethren," and the other by the commonalty. This mode having excifed much popular difturbance, Henry VII. ordained that "the mayor and his brethren flould choofe forty-eight of the molt difereet inhabitants of the town," who fhould elcet all officers for the borough, and members of parliament. Thus it continued till the reign of Charles II. ; from which time the right of election has been vefted in "the freemen, not receiving alms, and in the inhabitants paying foot and lot." The number of voters is about 2000.

At the time of the Norman conqueft, there appear to have been fix churches in this town; and it would be highly interefting to the architectural antiquary to afcertain if eirher of the prefent ftructures contains any part of the building then ftanding. Of the religious edifices now remaining, St . Nicholas's church is efteemed the molt ancicut. It ftands contiguous to the Jewry wall, and appears to have been partly conftructed with the bricks, tiles, \&ec. taken from the fallen parts of that building; whence fone antiquaries have thought that they are both parts of the fame ftructure, or built about the fame period. The church of St. Mary, diltinguifhed by the addition of infica or juxta caltrum, is a large pile of irregular building, compoted of various fpecimens, or ftyles of architecture, from a very early period to a late one, when all ityles were difregarded. Thefe varieties tend to mark "the difaters of violence, accident, and time," and prove that the neighbourhood of the calle, within the outer ballimm, or precinct of which it ftood, was often moft dangerous. That there was a church on this fpot in the Saxon times feems almoit certain, from fome bricks,
apparenty

## I. E I

## 1. E I

apparently the workmanniip of that people, found in the clancel; and the chevron work round the windows of the chancel proves that the firt ivorman earl of Leicenter, Robert de Bellomont, conltructed a church on a plan nearly like the prefent, and adorned it with the architecture of his time. The interior of this church is fpacious; and on the fouth fide of the nave is a dingularly large femicircular arch, laving a fpan of thirty-nine feet. The fouth aitle is faid by Mr. Care to have been built by John of Gaunt. At the eaft end of this aifle was a chapel, or choir, held by guild, or fraternity, called the Trinity guild. This was founjed, in H.ary VIIth's reign, by fir Richard Sacheverele, and the good lady Hungerford. Refpecting this guild, the following litt of articles, bought in for the year $1 ; 08$, will ferve to fhew the value of money, and prices of provilions at that period. "A dozen of ale, 20\%.; a fat wether; 25.4 d. ; Seven lambs, 7 s .; fourteen gollings, 4 s .8 d . ; fifteen capons, 5s.; half a quarter of malt, 2 2s. : $^{\text {f }}$ four gallons of milk, 4 d . ; a pir, $5 d$." At the weft end of the church is a handiome tower, furmounted by a lofty and elegant fpire. The latter has twice fuffered from ftorms. Near the north door of this church is a paffage leading under an old building which forms a gateway to an area called the caftle yard. Oppofite this gateway is a building, partly ancient, partly modern, within which is a large hall feventy-eight feet in length, liftyone in width, and twenty-four feet high. This hall, during the reign of Lancaltrian princes, was the fcene of frequent parliaments ; at prefent it is ufed only for hulding the allizes and other county meetings. The church of All Saints is a fmall modern ftructure, confifting of a nave and two ailes, all nearly of the fame length. The church of St. Martin, formerly called $S$.. Croffi, is a large old building, confiting cf a nave, tluree aifes, and a tower, with a lofty crocketted fpire. This church, being the largelt in the town, and even in the whole county, is ufed at all the public meetings of the diltrict for the bifhop, judges, \&c. The churchwardens' accounts refpecting this ciurch and parifh are copious and well preferved. They begin in 1544 , and contain many curious notices, defcriptive of the peculiar manners and cuftoms of the different times. In this church was held St . George's guild, a fraternity which was inveled with peculiar privileges, and annuaily ordained a fort of juzblice in the town, called "the Riding of St. George." It contained alfo another guild called Corpus Chritti, which Mr. Throlfy fays, "was the moft ancient and principal in Leicefter." $T$ The regiller of this parifh records the calamitous effects of a plague which raged here in the years 1610 and 1611, during which period 266 perions were buried. In the marriage regilter is an entry of the names of Thomas Tilfey and Urfula Ruffel, the firlt of whom being "deofe and alfo dombe, it was agreed by the bihop, mayor, and gentlemen of the town, that certain ligns and actions of the bridegroom fhould be admitted inftead of the neceffary words. ${ }^{-1}$ St. Margaret's church, according to Leland's account, is "the fairelt church in that place, which once was a cathedral cliurch, and near which the bifhop of Lincolne hath a palace, whereof little yet flandeth." This edifice conitits of a nare, fide ailes, chancel, and a handfome tower, and was annexed as a preteod to the college of Lincoln by the bifhop of that diocele, at the time when the other churches were given to the abbcy. Befides thefe churcbes, here are chapels or mecting-houfes for different feets of diffenters, preßyierians, independents, and baptifts. The county gaul, erected in the year 1591, at the expence of fix thoufand pounds, occupies the fcite of an old prifon, and is built after the plan recommended by Mr. Howard, with folitary cells, \&c. The town gaol is a commodious fone building, de-
figned by Mr. Johnfon, a native of this town, and executed by Mr. Firmadge in 1592. The other public buildings are a free granamar fchool of great antiquity ; feveral charity fchools; various hofpitals; an afylum for indigent lunatics; an exchange for public bufinefs; the hotel, now ufed as affembly rooms; and a commodious theatre. Among the curiolities of the town, is the old wo den bedtead faid to have belonged to king Richard, and on which he flept, or rather reclined, the sight preceding the battle of Bolworth.

The principal, and almon only article of manufacture in Leicefter, is that of flockings, which has been an cltablifhed and Itaple commodity here for above two centuries. It finds employment for a great number of perfons, as holiers, ftocking-makers, wool-combers, dyers, frame-fmiths, combmakers, winders, fizers, feamers, fy inners, hobbincers, finkermakers, thosking-needle-makers, \&ic. \&ec. Mr. Throfy ftates that in Leicelter there were "upwards of feventy manufacturers, called holiers, who, it is computed, employ 3000 frames; including the wrought goods they individually purchafe; about 6000 perfons being dircetly or indirectly employed in this great bufinefs." This town and its vicinity, with Nottingham and its neighbourhood, are the principal places in England for the manufacture of flockings : the latter is the molt noted for filk, and the finer fort of goods, while the former is chiefly devoted to the coarfer articles, of which a very large quantity is annually made. The trade at prefent is very flourihing, and in the "Wa:k through Leicefter" it is ftated "that 15,000 dozen per week" of tuckings are made on an average. (See Srocknags.) Leicefter is 97 miles diltant from London: the market is held on Saturdays; and feven fairs anhually ; all on a very large fcale. 'This town was returned to parliament in the year 1801 as containing 3290 houfes, and 16,953 inhabitants.

Among the natives of this town, of literary eminence, is 1)r. Richard Farmer, who was born ia 1735 , and died in 1797. Nichols's Hithory and Antiquities of Leiceflerßire, feven vols. folio. A Walk through Leicelter, 12 mo . is an interetting and well written topographical work.

Leicester, a townhip of America, in Addifon counts, Vermont, fituated on the ealt fide of O:ter creek, containing 522 inhabitants.

Leicester, called by the Indian natives Tozutuil, a confiderable polt-town in Worcefter county, Maffachufetts, containing 1103 inhabitants; fituated upon the poft-road from Boiton to Hartford, New York, and Philadelphia: 6 miles W. of Worcifter, and 5.4 W . by S. of Böflon; fettled in 1703, and incorporated in 1720 or 1721 . It has three meetung-houfes for Congregationalits, Anabaptills, and Quakers; and an academy incorporated in 178 4 , and well endowed. Wool-cards are manufactured in this turn.

LEICESTERSHIRE, called in the Domelday Survey Ledacefteffire, is an inland county, fitmated nearly in the middie of England, and environed by the counties of Rutland and Lincoin to the eaf, Nottingham and Derby on the north, Staffordhire and Warwickfire to the weft, whilt part of the latter county and Northamptonflize attach to the fouthern border. A part of the great Roman road, called Watling-itrect, appears to have formed a regular. divilion between Leicefterf(nire and Warwick/hire. The ditrict included within thefe boundaries was, at an eariy period, a part of the territory belonging to the Coritani. After the Romans had fubjugated the Britons, and had eftablifhed colonies in diferent parts of the inand, this county was included within the province of Flavia Cafarienfis, and had military flations eltablifhed at Ratr. (Leicefter); Verno-
metum,

## LEICESTERSHIRE.

metum, on the northern border of the county; Benonæ, near High-Crofs; and Manduelfedum, at Manceter. Thefe ftations were connected by regular artificiel roads, or military ways, known by the names of Watling-Street, Foffe-Way, and Via Devana. The firft enters this county at Dowbridge or Dovebridge, on the Northamptonfhire border, where the ftation called 'Tripontium was fixed: hence to Mandueftedum it paffed nearly in a ftraight line, having the fmall Itation of Benonex on its courfe. Near this place the Foffe-Way interfects it at right angles, and palles on to Ratic; whence it continues in a northerly direction to Ver. nometum, and thence on to Margidunum, a fation near Eaft Britford, in Nottinghamfhire. After the Romans had evacuated the illand, this diftrict became part of the kingdom of Mercia; and when the fubdivifon of the Anglo-Saxon provinces into counties was eftablifhed, and bifhops' fees crected, the town of Leicefter was conftituted the feat of the diocefan. The Mercian kingdom was divided into fouthern and northern: and the inhabitants of Leicefterfire were denominated Mediterranæ, or Middle Angles. They were frequently harafled by the invading Danes, who entering the diftrict from the eaftern coaft, laid the whole country under contribution between the German ocean and Leicelter; and having conquered this place, eftablifhed themfelves here for fome length of time: indeed, Leicefter was conlidered as one of their five chief cities in the ifland. After the Norman invafion in 1066 , Leicefterfhire experienced a complete revolution in its civil and manorial privileges; as the conqueror divided it among his relations and adherents. Two hundred and twenty-eight lordhips, the chief parts of the county, were allotted and parcelled out to different Norman chiefs; who again regranted various allotments to their followers and dependants, to be held of them by kuight's fervice. The king, the archbifhop of York, and the bifhops of Lincoln and Conftance, were alfo poffeffed of landed property in the county; and fome was annexed to the abbies of Peterborough, Coventry, and Croyland. The Norman chiefs, in order to fecure their newly-acquired poffeffions, foon built, on their refpective eftates, ftrong and magnificent caftles, which might at once fecure themfelves, and keep the conquered Englifh in awe. The feveral townfhips, in which fuch caltles are known to have been erected, with the names of the founders, are Leicefter, Mount Sorel, Whitwick, and Shilton, founded by the earls of Lcicefler; Groby and Hinckley, by Huģo de Grentemaifnell; Donington, by Euftace baron of Halton; Melton, by Roger lord Mowbray; Ravenfton, by Goesfrid Hanfelin; Sauvey, by lord Baffet of Weldon; and Thorpe, by Ernald de Bois. Moit of thefe calles, during the unquiet reigns of Henry II., John, and Henry III., being held by the rebellioue barons, and rendered receptacles of thieves and freebooters, were, by command of the latter king, utterly demolifhed; and though fome of them were afterwards rebuilt, yet it this day there is not one of them remaining entire, and even the ruins of mof of them are entirely defaced. The Norman chiefs, after fettling their poffeffions, and fortifying themlelves within their refpective domains, next directed their atzention to the religious habits and prejudices of the times; ss to fecure the favour and influence of the monks, in an age when they were almolt omnipotent, or at leaft could command and intimidate the whole community, was a neceffary branch of military policy, which the provincial barons neither overlooked nor neglected. Accordingly, part of their eftates were appropriated to the foundation of abbies, priories, nunneries, and other monaftic eftablifhments. In this county were founded four abbies, at Croxton, Garendon, Leicelter, and Olveiton; twelve priories, at Belvoir,

Bradley, Bredon, Charley, Hinckley, Kirkby Beler, Laund; at Leicefter were four, for Eremites, Black Friars, Grey Friars, and Auftin Friars; and Ulvefton; two nunneries at Gracedicu and Langley; two collegiate churches in Leicefter; and various free chapels, hofpitals, preceptories, and chantries, in different parts of the county.

At the time of compiling that great national work, the Domelday Survey, Leicelterfhire was divided into four wapentakes or hundreds ; Framland, Guthlaxton, Gartre, and Gofcote : and thus it continued till the 20th of Edward III., when an additional hundred, Sparkenhoe, was taken out of Guthlaxton; and aftewards Gofcote was divided into two, denominated, from their fituations, Eaft and Weft Gofcote. In thefe fix hundreds are 196 parifhes, and $1_{2}$ markettowns, viz. Leicefter, Ahby de la Zouch, Bofworth, Hallaton, Harborough, Lutterworth, Melton Mowbray, Mount Sorel, Billefdon, Hinckley, Loughborough, and Waltham on the Wold. The whole county is within the ecclefiaftical jurifdiction of the fee of Lincoln, and in the province of Canterbury; under one archdeacon, and fix deaneries. Mr. Nichols ftates, from the Domefday Survey, that the whole county, at the time that record was compiled, contained 34,000 inhabitants. The number returned to parliament, under the population act of the year 1800 , was 130,081 ; of whom 23,823 are ftated to be employed in agriculture, and 42,036 in trade and manufactures: the number of houfes being $26,734^{\circ}$. The reprefentatives in parliament are but four: two for the county, and two for the borough of Leicefter. The circumference and extent of the county have not been fatisfactorily defined. Mr. Nichols ftates the former to be "about 150 miles ;" whilft Mr. Monk fets the fame down at "about 96 miles." The fuperficial contents are eftimated at about 540,000 acres.

This county has not any rivers of importance ; but thofe which pals through it are convenient and ornamental. The chief are the Soar, the Swift, the Welland, the A von, the Wreke; and the Anchor. The Soar, anciently called Leire, which is the largeft of thefe, rifes from two heads or fources in the fouth-weftern part of the county, and, after receiving a fmall tributary fream near Whetftone, paffes by the weft and north fides of the town of Leicefter.
Leicefterfhire being more an agricultural than a commercial diftrict, and deprived of any particular mines, has uot equally participated with many other Englifh counties in canal navigation. Some plans for this purpofe have been projected at different periods, and a few have been executed. In 1782, a bill was brought into parliament for making a navigable canal from Chilver's Coton in Warwickfhire, to pafs through a great part of Leicefterfhire; but being oppofed by a variety of interelts, it failed of fuccefs. In i 780 , another bill was introduced for opening a canal com. munication between Loughborough and Leicefter; but it was thrown out on the fecond reading. In 1791, another application was made with better fuccefs; and an act was obtained for making the faid communication: the proprietors are ftyled in this act, "the company and proprietors of the Leicefter Navigation" In the fame year, another act was obtained for makiug navigable the rivers Wreke and Eye: and in 1793 , a bill was paffed for making the "Oakham Canal," from a town of that name in Rutlandfhire, to Melton Mowbray.

The whole of Leicefterfhire prefents nearly a flat furface, and is chiefly appropriated to the grazing fyftem. It has obtained peculiar celebrity, among agriculturifts, for a breed of theep, diftinguifhed by the name of the fhire: and the late Robert Bakewell of Difhley, acquircd for himfelf and the county much popularity, by the experiments

## LEI

L E I
and improvments he made in the breed of cattle and fheep. Among the different breeds of fheep in the county, the Old Leicelter, the Foref, and the New Leiceiter, or Difhley, conftitute the principal forts, and of them the latter is in the higheft repute. The extraordinary price for which many -of the New-Leicefter-fheep have been fold at public auctions, and the large fums for which fome of the rams and bulls have been let out for the feafon, ferve at once to fhew their eftimation in public opinion, and the laudable zeal that prevails for improving the breeds of cattle, \&c. At an auction of ewes, belonging to Thomas Pagett, efq., in the year 1793, the following fums were given :-Five ewes, at 62 guineas each; five, at 52 guineas each; fivc, at 45 guineas each; ten, at 30 guineas; and feveral at 25,20 , and 16 guineas each. One of thefe fheep, which was killed at Walgrave in Northamptonfhire, was of the following weight: the carcafe 144 lb ., blood 5 lb ., fat $16 \frac{5}{2} \mathrm{lb}$., head and entrails 12 lb ., Kkin 181 b . ; making in the whole $195 \frac{1}{2} \mathrm{lb}$. It is no uncommon thing to falt down the mutton as a fubflitute for bacon. In the year 1/93, Mr. Pagett fold feveral bulls, heifers, cows, and calves, by public auction, when fome were bought at the following very extravagant prices: a bull, called "Shakfpeare," defcribed in the catalogue as " (bred by the late Mr. Fowler) by Shakfpeare, off young Nell. Whoever buys this lot, the feller makes it a condition, that he fhall have the privilege of having two cows bulled by him yearly"-Four bundred guineas: a bull calf $3^{1}$ guineas ; a three years old heifer 70 guineas; others at 35 and 32 guineas each; a two years old heifer at 84 , and another at 60 guineas.

It will be difficult to define the foils of the whole county. Very little of the land can with propriety be called a mere fand or gravelly foil; nor is there any great quantity that may properly be called clay. The bett foil is upon the hills; and the worft, or neareft approaching to the clay or cold lands, in the vallies; though there are many exceptions to this rule. The foil, or what the farmers generally call mould, is generally deep, which makes it very proper for grafs; fuch deep foils not being very foon affected by dry weather. About Lutterworth, fome part is a light rich loam, excellent for turnips and barley; a part fliff, inclining to marle, or rich clay; the remainder, chiefly a fort of medium between both, with a fubfoil inclining to marle, bearing excellent crops of oats and wheat, and good turnips alfo, though not fo well adapted for being eat off the land by fheep. Moft of the land round Hinckley is a good mixed foil, bearing good crops of grafs. Afthby-de-la-Zouch, and the northern parts of the county, exhibit various foils, fand, gravel, loam, and clay. In Melton Mowbray the foil is in general a heavy loam ; and immediately underneath a very ftiff impervious clay, mixed with fmall pieces of lime-itone. Thefe lands are very wet in winter, and the turf fo tender, as fcarcely to be able to bear the treading of fheep, without injury. At Market Harborough the foil is in general a very itrong clay, chiefly in grafs.

Since the commencement of the laft century, cheefe has become an article of fome importance to the Leicefterfhire farmers; and a large cheefe-fair is annually held in the county-town. Among the different forts manufactured in the county, that called Stilton cheefe is deemed the fineft, and confequently obtains the higheft price. It acquired the title of Stilton from a place of that name, on the great North road in Huntingdonfhire, where it is well known to have been firft publicly fold by retail. This cheefe is fometimes called the Parmefan of England, and is ufually formed in fquare vats. The cheefes feldom weigh more than twelve Vol. XX.
pounds each, and from that to fix pounds is the general average weight. They are fometimes moulded in nets, but this mode is not deemed fo eligible as that of the vat. A confiderable quantity of this cheefe is made on the farms about Melton Mowbray.

Leicefterfhire is defcribed by Mr. Marfhall, in his "Rural Economy," as a very fertile diftriet; and the only parts which are not abfolutely in good cultivation, are Charn-wood-Foref, alfo a tract of land in the northern part of the county, called the Wolds or Woulds, and another fimilar tract on the fouthern fide. Nichols's Hiftory and Antiquities of Leicefterflire, 7 vols. folio.

LEIDENSDORF, a town of Bohemia, in the circle of Leitmeritz; 20 miles W. of Leitmeritz.

LE JEUNE, in Biography. See Claude.
Leige. See Liege.
LEIGH, Sir Edward, in Biograpby, was born at Shadwell, in Leicefter/hire, in the year 1602. He received the rudiments of learning at Walfal, in Staffordfhire, and in 1616 was entered a commoner of Magdalen-hall, in the univerfity of Oxford. From the univerfity, he went to ftudy the common law in the Middle Temple. When the plague broke out in 1625, he went into France for a fhort time, and returning thence, he applied himfelf moft feduloufly to his ftudies, which comprized not only the law, but divinity, hiftory, and the learned languages. During the civil wars he was chofen member of parliament for the town of Stafford, and was one of the perfons appointed to fit in the affembly of divines. He was greatly diftinguifhed for the talents and learning which he difplayed in the debates of that affembly. In the year 1648, when the Prefbyterian party was excluded from the houfe by the army, he was in the number of profcribed nembers, and was for fome time kept in confinement. From the period of his liberation till the reftoration, he chiefly employed himfelf in profecuting his literary ftudies, and in publifhing various works, which difcover profound erudition and general knowledge. He died in 167 r , at the age of 69 . He was author of "Selected and choice Oblervations concerning the twelve Cefars ;" "Analecta Cæfarum Romanorum;" "A Treatife of divine Promifes;" "Critica Sacra," in 2 vols. 4to; "Annotations on all the Books of the New Teitament;" "A Philological Commentary, or an Illuftration of the moit obvious and ufeful Words in the Law;" "A Syftem of Divinity;" "Annotations on the five poetical Books of the Old Teftament, viz. Job, Pfalms, Proverbs, Ecclefiaftes, and Canticles;" "Choice Obfervations on all the Kings of England, from the Saxons to the Death of King Charles I." Gen. Biog.
Leigh, Charles, a phyfician of the feventeenth century, was born at Grange, in Lancafhire. He graduated at Cambridge, and afterwards practifed in London with confiderable reputation. He was admitted a member of the Royal Society in May 1685. He left the following works: "The Natural Hiftory of the Counties of Lancafhire, Chefhire, and Derbyfhire, \&c." Oxford, 1630, folio. London, 1700, with plates. "Phthifiologia Lancaftrienfis, cum tentamine philofophico de Mineralibus Aquis in eodem comitatu obfervatis," London, 1694, 8vo. "Exercitationes quinque de Aquis Mineralibus, Thermis calidis, Morbis acutis, Morbis intermittentibus, Hydrope,'" ibid. 1697. "Hiftory of Virginia," drawn up from obfervations made during a refidence in that country, London, 1705, 12 mo .
Leigh, $W$ eft, in Geography, a market town in the hundred of Wefl Derby, Lancafhire, England, is fituated fix miles from Wigan, and 198 from London. The church 3 S

is a handfome ftructure, with a fquare tower ; the body being fupported by two rows of pillars. Leigh has a conGderable manufactare of fuitian and other cotton ftuffs; and by its canal navigation, which communicates with the rivers Merfey, Dee, Ribble, Oufe, Severn, Humber, Thames, Avon, \&c. it carries on an extenfive traffic. Coals are abundant; and the dairies round the town produce excellent cheefe. The town, according to the official report in 180 r , contained 277 houfes, and 1429 inhabitants. A weekly market is held on Saturdays; and a fair on the 26th of April. The parifh is of great extent, and contains the townhips of Aftley, Bedford, Pennington, and Tyldefley, the hamlet of Shackefley, and the chapelry of Chowbent, inhabited altogether by nearly 13,000 perfons.

The chapelry of Chowbent has greatly increafed in houfes and population within the laft 20 years. Its chapel, though regularly confecrated by the bifhop of Sodor and Man, is exempt from epifcopal jurifdiction, and the patronage is velted in the proprietor of Atherton Hall, which formerly was the feat of a family of that name, but is now the property of the Hon. T. Powis. The houfe, which was built by Gibbs, is large, and has a fpacious cubical entrance hall. A plan of this manfion is given in the "Vitruvius Brittanicus."

The townfhip of 'I'yldefley has grown up with the manufactures of the county. A family of that name was feated here fo early as the reign of Henry III. Of this family was fir Thomas 'Tyldelley, who fignalized himfelf during the troubles of Charles I.'s reign, and fell in the battle of Wigan lane, Auguft 25, 1650. He was buried in Leigh church; and on a pillar near Wigan is fixed a brafs plate, with an infcription to perpetuate his memory. Beauties of England, vol. ix.

Leigh's Ifand. See Cocoa-nut Ifland.
LEIGHLIN, a bifhopric of Ireland, in the province of Dublin, founded in 632, and united with Ferns in 1603 . The united bifhopric comprifes the whole counties of Carlow and Wexford, with part of the Queen's county, Wicklow, and Kilkenny. There are 232 parifhes in the union, forming 79 benefices, in which are 75 churches and fix glebe houfes. The cathedrals are fmall, and ferve for parifh churches. The relidence of the bifhop is at Ferns.

Leighlin, Old, a village of Ireland, near the river Barrow, and in the county of Carlow, $2 \frac{1}{4}$ miles W. by N. from Leighlin bridge. It was incorporated in the year 1216, and continued to fend members to parliament till the Union; and is ftill the feat of the cathedral church of the diocefe.

Leighlin Bridge, a polt-town of Ireland, in the county of Carlow, on the river Barrow, over which it has a bridge, firt built in the year 1320. It originated in a monaltery, which, on the fuppreffion of religious houfes, was converted into a fort to proted the bridge; and lately, on account of the navigation of the Barrow, it has confiderably increafed, being now a thriving town. It is 45 miles S.S.W. from Dublin, on the Great Southern road, and fix miles from Carlow.

LEIGHTON, Alexander, in Biography, a Scotch preßyterian divine, was born at Edinburgh in 1587 . He became noted for the fufferings which he endured in the reign of Charles I., on account of a work which he publifhed, entitled "An Appeal to the Parliament ; or Zion's Plea againtt Prelacy." For this he was tried in the high-commiffion court, and being convicted, which, in thole days, and in that court, was but another term for being accufed, he was condemned to be imprifoned for life, and pay a fine
of 10,000 l: he was to be fet in the pillory twice, and to be whipt, have one of his ears cut off, one fide of his nofe flit, and be branded in the face with a double S.S as a fower of fedition. When this favage fentence was paffed on him, the cruel Laud exhibited figns of the molt indecent joy, and publicly gave God thanks for it. Excepting the imprifonment for life, and the fine, the fentence was put into execution to the full extent. He was releafed by the Long Parliament after an imprifonment of ten years. His confinement and cruel ufage had fo impaired his health, that when he was releafed he had fcarcely the power of walking, or feeing, or hearing. As a fort of remuneration for his troubles the parliament appointed him keeper of Lambeth palace, at that time converted into a prifon. He died in 1644, infane. Toulmin's Neale's Hit. vol. ii.

Leighton, Robert, a Scotch prelate in the feventeenth century, was fon of the preceding. He was educated in Scotland, where he diftinguifhed himfelf above his contemporaries, in all the branches of ufeful learning, particularly in the ftudy of the fcriptures. Having finifhed his courfe of academical ftudies he went to the continent for improvement, and fpent fome years in France. On his return he obtained Prelbyterian ordination, and was chofen to a congregation at Newbottle, near Edinburgh. Very foon after his fettlement at this place he conceived a difike to the Prefbyterian form and manner of church difcipline, and chofe rather a life of retirement than to attend at the prefbytery. His main object was to inftruct his flock in the principles and duties of religion and morality, urging them not to trouble themfelves with religious and political difputes. In the year 1648, he declared himfelf for the engagement for the king, on account of which he would have expofed himfelf to much trouble, had not the earl of Lothian, who lived in his parifh, proved his friend, and prevailed with the men in power not to moleft him. At length, finding that he could no longer fubmit to the ecclefiaftical impofitions of the Prefbyterians, and being unwilling to live in ftrife and contention, he refigned his parifh in filence, and withdrew into retirement. Shortly after, he was chofen principal of the college of Edinburgh, the duties of which office he performed with great reputation during ten years. Upon the reftoration, when it was determined to eftablifh epifcopacy in Scotland, Leighton was fixed on as a proper perfon for the mitre. He was confecrated, with other bifhops, at Weftminfter ; he would now gladly have promoted fome plan for uniting the Prefbyterians and Epifcopalians, but was thwarted in all views on this fubject. When he found that the government was determined to enforce conformity on the Prefbyterians by the moft rigorous meafures, he laboured with all zeal to thew the impolicy of fuch proceedings: but he Itruggled ineffectually againlt the current, and all that he could do was to practife, in his own diocefe, the moderation which he had recommended generally, and to fet an edifying example to the reft of his dignified brethren. Thefe, however, profited but little either from his advice or from the exemplary conduct which he manifelted. He remonftrated with the king refpecting the arbitrary proceedings of the ecclefiattical high-commiffion court, and more lenient meafures were promifed to be purfued with refpect to Scotland. He begged permiffion to refign his fee; but the king, fo far from litening to the prayer of his petition, urged him to accept of the diocefe of Glafgow, which was a more important bifhopric, and one in which he might be more ufeful. To induce him to accept of this preferment, he was promifed the affittance of the court in bringing about his favourite fcheme of a comprehenfion of the Prebyterians. He accepted the fee, but after a fhort time found
himfelf wholly unable to carry on his great defigns of healing the divifions, and reforming the abufes in the church, and begged permifion to retire into private life, which was at length granted him. He went to live in Suffex, where he occupied himfelf in doing all the good in his power. He died in $168_{4}$, at about the age of eighty. He was author of "Prelectiones Theologicæ:" "A Commentary on the firtt and fecond Chapters of the firt Epiltle of St. Peter;" and of "Sermons," including other pieces: to the volume of fermons, publifhed in 1758 , is prefixed a life of the author, to which the reader is referred for ample particulars of this excellent divine.

Leighton, Sir William, knight, one of the honourable pentioners, who feems to have been a dilettante of confiderable erudution in mufic; he publifhed, in 1614, "The Tears or Lamentations of a forrowful Soul,", compofed with mufical airs and fongs, both for voices and divers inftruments. The belt compofers of the time contributed to this publication. See Lamentations.

Leiguton-Buzzard, or Beaudefert, in Geography, a market town and parifh in the hundred of Manhead and county of Bedford, England, is fituated on the banks of the river Oufe, 41 miles from London, and contained, according to the return made in 1800 to parliament, 387 houfes and 1963 inhabitants, of whom 1014 were ftated to be employed in trades and manufactures. The market, which is held on Tuefdays, is one of the moft ancient in the county; the tolls were valued at $\%$ l. per annum at the time of the Norman furvey. Here are fix annual fairs, of which two were granted in the year 1447. The priucipal antiquity in the town is a beautiful pentangular crofs, built of fone, and fituated in an open area near the market-houfe: it is fuppofed to have been erected about the beginning of the fourteenth century. It confifts of two flories; and the whole height is thirty-eight feet. (For a particular defcription, with an engraving, fee Britton's Architectural Antiquities of Great Britain, vol. i.) The church is a large antique building, which, from the various grotefque carvings, appears to have been built about the. fame time as the crofs; and is conftructed with the fame fort of fone. It has a fquare tower, furmounted by a fpire, the whole being 193 feet in height. A priory of foreign monks was eftablifhed in the reign of Henry 1I. at a place called Grovebury, within this parifh: and here was alfo a houfe of Citercian monks, which was a cell to Woburn abbey. About half a mile from the town are the remains of a Roman encampment; from which, and other corroborating circumftances, Leighton-Buzzard is fuppofed to be the Lygeanburg of the Saxon Chronicle, which, with feveral more towns, was taken from the Britons by Cuthwulph, A.D. 571. Lyfons's Magna Brittannia, vol. i. to.

LEIGNE'-sur-Usseau, a town of France, in the department of the Vienne, and chief place of a cantor, in the diftrict of Chatellerault. The place contains 311, and the canton 5127 inhabitants, on a territory of $142 \frac{1}{2}$ kiliometres, in 13 communes.

LEILAM, or Lexlam, a town of the Arabian Irak; 30 miles N. of Bagdad.

LEIMA, a river of Ruffia, which runs into the Irtifch; 24 miles N. of Tobolk.
LEINA, or Leine, a river of Weftphalia, which rifes in the territory of Eichfeld, paffes by Heiligenfladt, Gottingen, Hanover, \&c. and joins the Aller about two miles below Zelle.
Leina, a town of Germany, in the principality of Gotha; 4 miles S.S.W. of Gotba.

LEINE, a river of Germany, which runs into the Neffa, 4 miles N. of Gotha.

LEINEN Zem, a town of Pruffia, in the palatinate of Culm ; 9 miles E. of Thorn.

Leiningen, or Linange, lately a county of Germany, bordering on the bihoprics of Worms and Spire, and almoft furrounded by the palatinate. The foil is fertile in corn, fruit, and wine; the foreft abounds with game, and it has alfo mines of copper and iron, and quarries of fone. By the peace of Luneville it was annexed to France.
Leinisgen, a town of France, in the deparment of Mont Tonnerre, the caftle of which was demolifhed by the French; 11 miles S.W. of Worms. N. lat. $493 \mathrm{c}^{\circ}$. E. long. $84^{\prime}$.
LEINLETTER, a town of Bavaria; 10 miles S.E. of Bamberg.

LEINSTER, the eaftern province of Ireland, comprifing twelve counties, viz._Louth, Dublin, Wicklow, and Wexford on the fea-coaft; Meath, Weftmeath, Longford, King's county, Queen's county, Kildare, Carlow, and Kilkenny. This was originally one of the kingdoms into which Ireland was divided at the time of the Englifh invafien, and it was the fovereign of it who facilitated the con* queft by foliciting aid from Henry II. and giving his daughter in marriage to earl Strongbow. The Englifh pale was entirely within this province, and it is, on the whoke, that which is moft populous and beft cultivated.
LEIOBATUS, in Ichthyology, a name given by Ariftotle and Athenxus to a fpecies of the ray-fifh, called by many of the old authors bos marinus, and by the later authors laviraia, or raia oxyrynchus; which fee.
L. EIOPODES, formed of $\lambda$ ebs; light, and $\pi e \xi$, foot, an epithet ufed by the old medical writers to exprefs fuch perfons who had feet perfectly fmooth and even at the bottom, without the ufual hollow between the heel and the fore part of the foot.

LEIPHEIM, in Geography, a town of Bavaria, in the territory of Ulm, on the S. fide of the Danube; II miles N.E. of Ulm.

LEIPNIK, a town of Moravia, in the circle of Prerau; 6 miles N.E. of Prerau. N. lat. $49^{\circ}$ 28. E. long. $177^{\circ}$.

LEIPODERMOS, from $\lambda \varepsilon$ sias, to be deficient, and ief $\mu \alpha$, the finin, one who has loft the prepuce.
LEIPSICK, or Leipzig, in Geograpby, a city of Saxony, and capital of a circle of the fame name. This is one of the molt celebrated towns in Germany, pleafantly dituated in a fertile plain, on the river Pleife. Its circuit is eftimated at $S_{954}$ paces; and its fuburbs are extenfive, and confift of good buildings and gardens, being feparated from the town by a fine walk of lime trees, which runs round the town, and in the town ditches are planted mulberry trees. Its univerfity, which is famous, was founded in 1409 , and contains fix colleges, two good Latin fchools, and two celebrated focieties, viz. a German fociety, and another for the encouragement of the liberal arts. Leipfick is one of the principal trading towns in Germany, and it is in a peculiar degree the mart of German literature. Befides its foreign commerce, it has three celebrated fairs, at Eafter, Michaelmas, and the beginning of the year, at which foreign and domeftic wares afford an extenfive trade. It has allo a diftinguighing privilege, confifting in the right of having all itaple commodities, imported within the circuit of 60 miles, uuladen here, and at leaft for three days offered for fale to the burghers of the place, and then carried asway without being unladen any where elfe. In the citadel, called Pleiffenburg, fituated on the Pleiffe, are a mint, founded in
${ }_{3} \mathrm{~S}_{2}$
1732:

## LEI

1752 ; and a chapel for the Roman Catholic worfhip. The market place, which is fpacious, and the council-houfe, ftand in the centre of the town. The exchange is a good building, and the roof of its hall is well painted. The city contains eight parifh churches for Lutherans, and alfo a place of worfhip for Calvinilts. The manufactures are various; confifting of gold, filver, filk, wool, and linen yarn, which are wrought here ; and alfo of ituffs, velvets, itockings, cloths, and linen. Here are alfo houfes for the dyeing of filk, the printing of cotton, and the making of tapeftry. Leather, Pruffian bluc, \&c. are prepared here, and the Orphan-houfe is appropriated to the culture of filk. In Leipfick are fuppofed to be 20 book Fellers, 50 French and Italian merchants and tradefmen, 150 wholefale dealers, 250 retailers, and many dealers in cloth. According to Dithmar, in his Chronicle, this place fubfifted, as a town, as long ago as the year 1015. The circle of Leipfick contains 33 towns, and more than 1000 villages. The city is 56 miles W.N.W. of Drefden. N. lat. $51^{\circ} 13^{\prime}$. E. long. $12^{\circ} 19^{\prime}$.

Leipfick, as well as Drefden and the whole of Saxony, keep accounts in rix-dollars of 24 good grofchen; each grofche being divided into 13 pfenings current. A fpecie rix-dollar is reckoned at $\mathrm{I}_{\frac{\pi}{3}}$ rix-dollar current, or 32 good grofchen. For the coins, fee Saxony. Bills of exchange are paid at Leipfick, fince 1786 , in Saxon currency, or in Auguft d'ors, Carl d'ors, Fredericks, \&c. reckoned at five rix-dollars. The time of payment of bills of exchange, prefented for acceptance during the four firtt days of the fair, is during the five firft days after the clofe of the fair is proclaimed; in default of which the bills mult be protefted before 10 o'clock at night, or the drawer is not liable.

During the fair, when Drefden was in its glory, ferious operas were frequently performed at Leipfick by the beft muficians, vocal and inftrumental; and to the greatelt perfonages in Germany. In 1774, the comic operas of M. Hiller, in the language of the country and without recitative, were the favourite amufements of that flourifhing city. Every part of Europe, except Italy, feems unanimous in banifhing recitative from their comic operas, indeed every nation has melodies of its own; but there is no recitative, except the Italian, which is fit for dramatic purpofes.
LEISZNIG, a town 'of Saxony, in the circle of Leipfick, on the Mulda, containing two churches, and having manufactures of cloth, lace, ftockings, \&c. It has a citadel, called Mildenftein ; 24 miles E.S.E. of Leipfick. N. lat. $51^{\circ} 7^{\prime}$. E. long. $12^{\circ} 50^{\prime}$.

Leita, or Leytha, a river that rifes in the S.W. part of Auftria, and joins the Raab at Raab in Hungary ; and afterwards, the united ftream runs into a branch of the Danube; nine miles W, of Comorn.

LEITH, a fea-port town and burgh of barony, fituated on the Frith of Forth, in the county of Midlothian, Scotland. It is about two miles'diftant from Edinburgh, and may not improperly be called the harbour of that northern metropolis. This town was originallyidenominated Inverleith; the word inver, prefixed to the name of a river, being a frequent appellation in Scotland, and implies a town near the mouth of that river, or its confluence with another. The etymology of this term is very uncertain, fome alleging it to be of French, and others of Gaelic derivation.

The period at which Leith was firt founded is unknown, but it is undoubtedly a place of great antiquity. It is mentioned by the name of Inverleith in the charter for erecting the abbey of Holyrood, which was built by David I. in the

## L E I

year 1128. About a century afterwards the harbour of Leith and its mills were granted to the magillrates of Edinburgh by Robert I., and in 1398 they acquired all the other rights and privileges of it , with the exception of the fuperiority from Logan of Reltadrig. Mary of Guife, queen regent of Scotland, conttituted this town a burgh of barony in the year 1549. At this time the inhabitants of Leith were divided into four clafies, or corporations; the mariners, maltmen, tradefmen, and traffickers, each of which ftill retains its original charters. In the fanc reign, the citizens purchafed the fuperiority of their town from the defcendant's of Logan, but after the death of the queen, Francis and Mary, in violation of the private rights of the people, fold the fuperiority of the burgh to the magiltrates of Edinburgh, to whom it has fince been confirmed by feveral fucceflive charters. Leith fuffered confiderably when the earl of Hartford invaded Scotland in the year 1541, being on that oceafion pillaged and burnt by the Englifh foldiers. After this, however, Leith was rebuilt and fortified anew, but foon after the expulfion of the French in 1560, the council of the kingdom, to prevent the danger arifing to the liberties of the country, from the introduction of foreign troops, ordered the fortifications to be demolifled. Oliver Cromwell once more raifed fortifications for its defence. The citadel, which ftill remains, was built by that ufurper. It then confifted of five baftions, but two of them were entirely demolifhed at the reftoration of the Englifh monarchy, and the fcite of the whole given to the duke of Lauderdale, then prime minitter for Scotland, from whom the magiftrates of Edinburgh were compelled to purchafe it, at the enormous fum of $6000 \%$. fterling. Since the alarm, excited by the appearance of Paul Jones in the Frith of Forth, a battery of nine guns has been erected a little to the weftward of the citadel, for the defence of the port and fhipping. A party of artillery conftantly refide at this battery, which is kept in excellent order; and of late a confiderahle park of artillery has likewife been flationed here.

Leith is divided into two parifhes by the river from which it derives its name. Thefe are diftinguifhed by the appellations of North and South Leith, and communicate with each other by means of two drawbridges, one of which has been very lately erected. The greater part of the town is fituated in the parifh of South Leith, which alfo extends over a confiderable country diftrict, and includes the ancient parifh of Reftalrig. North Leith is a much fmaller parin, and confifts of only about 170 acres. Both on the fouth and north fide of the river, the ftreets of this town are extremely irregular, and of mean appearance. In the fuburbs of South Leith, however, a number of refpectable houfes have been erected by the more opulent merchants, and may be faid to vie, in internal accommodation and exterior appearance, with thofe of Edinburgh.

Prior to the year 177 1, $^{2}$, Leith was ill fupplied with water, and the ftreets were neither properly cleaned nor lighted; in that year, however, an act of parliament was obtained to remedy thefe defects; and the great change which has taken place fince that period fhews the good effect of the act, and that it had been judicioufly prepared and was carefully executed. At Reftalrig are ftill extant fome ruins of the old or mother church. This place is about a mile eaftward of Edinburgh. The church was founded by king James III,, and endowed by the three fucceeding monarchs. It was highly ornamented with Itatuary and fculpture, reprefenting many objects of religious worfhip. In 1650, the general aflembly, in their zeal againft Popery, ordered this church, as a monument of idolatry, to be pulled down and entirely demolifhed. In confequence of this mandate, the inhabitants of South

Leith reforted for divine worflip to the chapel of St. Mary, which was afterwards declared by aurhoricy of parliament to be the parifh church of the diftrict. It is a handfome fpacious building; but being found infufficient to contain the inhabitants, it chapel of eafe was erected in 1772. Here is alfo an epifcopal chapel; and, as in all towns of any confequence in Scotland, fome meetings of Prefbyterian diffenters.

The civil government of Leith is vefted in a magiftrate fent from Edinburgh, having the power and title of admiral of Leith, and in two refiding bailiffs, who are elected from the inhabitants of Leith by the town-council of Edinburgh.
The harbour of Leith, which is the chief fource of wealth to the place, is formed by the conflux of the water of Leith with the fea. The depth of the water at the mouth of the harbour is at neap tides about nine feet, but in high foring tides about fixteen. It is entirely a tide harbour ; the water in the river being too trifling to give any important aid towards the navigation. About the beginning of the laft century, the magiftrates of Edinburgh improved the harbour at a great expence, by extending a tone pier to a confiderable diftance into the fea. In the year 1777, they further improved it by erecting an additional ftone quay towards its weft fide. It is accommodated with wet and dry docks, and other conveniences for fhip-building, which is carried on to a confiderable extent; and veffels come hither to be repaired from various parts of the eaitern coaft of Scotland. It has been thought advantageous to exrend the harbour further into North Leith; and very confiderable works arenow carrying on for that purpofe; which, when completed, will render it a very capacious, as well as a fafe and convenient ftation for trading veffels of almolt any burthen. Ships, indeed, can only enter at full tide; but the roads of Leith, which are about a mile from the mouth of the harbour, afford moft excellent anchorage at all times.

Leith carries on a very confiderable trade; the impprts from the fouthern parts of Europe are wines, brandy, and fruits; from the Weft Indies and America, rice, fugar, rum, and dye-ftuffs; but the principal traffic is with the Baltic, for which it is peculiarly well fituated. The fhipping of Leith caufes a great demand for ropes and fail-cloth; of which articles here are feveral manufacturing companies. Two glafs manufactories are eftablifhed here, which, in the year 1790, wrought above nine million pounds weight of that article. The manufactures of foap and candles are alfo carried on to a very great extent; here are alfo a confíderable carpet manufactory, and feveral iron forges. In 1784, the trade of Leith was eftimated at half a million fterling, exclufive of glafs-works and fhip-building ; and there is every reafon to believe that, fince that period, the'ameunt has been doubled. In the year 1791 the population of North Leith was 3409 , and of South Leith $11,+32$; total ${ }_{1} 3,841$, which was an increafe of 4436 fince the year 1755 . Beauties of Scotland, vol. i. Picture of Edinburgh.

Lerti Water, a river of Scotland, which runs into the Forth at Leith.

LEITHEN, a river of Scotland, which runs into the Tweed at Inverleithen.

LEITMERITZ, a city of Bohemia, in a circle of the fame name, feated on the Elbe, well built, and populous; the fee of a bifhop, fuffragan of Prague.
The circle, diftinguifhed by its beauty and fertility, is called the "Bohemian Paradife ;" and, independently of its own refources, it has ample fupplies, by means of the Elbe, from other countries. It is famous for the wines, produced near Aufti, and called "Podfkallky," and for the
falubrious mincral waters of Topolitz. In this circle, which comprehends 89 feignories, eftates, and feats, are tin and precious ftones; 28 miles N.N.W. of Prague. N. lat. $50^{\circ} 31^{\prime \prime}$. E. long. $1^{\circ}{ }^{1} 5^{\prime}$.

LEI RIM, a county of Ireland, in the province of Connautht, which is bounded on the north by Donegal and Fermanagh ; on the eaft by Cavan; on the fouth by Cavan, Longford, and Rofcommon, and on the welt by Sligo. In form fomewhat like an hour-glafs, it varies greatly in breadth, being in the wideft parts 16 , and in the narrowef only fix miles acrofs. Its length is 41 Lrifh, or 52 Englifh miles. It contains 255,950 acres, or about 400 fquare miles ( 407,260 acres, or 652 fquare miles in Englifh meafure.) The parifhes are 17 in number, partly in the diocefe of Kilmore, and partly in that of Ardagh. There are very few unions, and a church in almoft every parifh. When Dr. Beaufort wrote, the number of houfes was rated at 10,026 , from which he eftimated the population at upwards of 50,000 ; but Mr. Robertfon in 1806 , on what authority he has not ftated, rates it at 76,630 . Of the five baronies into which Leitrim is divided, the two northern are not as populous as the other three. Towards the fea there is an affemblage of wild and lofty mountains, which are divided from one another by deep vallics. Thefe are the mountains of Sliebh-anewr and Dartry, the latter of which towers to an immenfe height above the level of the fea. Near the interior, the immenfe Sliebh an-Erin divides the mountainous from the level parts of the country. Thefe great hills are far from unprofitable, for producing abundance of coarfe grafs, they annually pour forth immenfe droves of young cattle. The fouthern baronies are level. Few counties are fo plentifully watered as this. The Shannon rifes in a plain at the bafe of Quilca mountain, forming Lough Clean, a fmall lake, which is confidered as the fountain of that noble river; from this it flows to Lough Allen, nearly in the centre of the county, which is 7 miles long and about 30 in circumference; and then, curling in a variety of forms, it glides by Carrick on Shannon, where it leaves the county, taking a fouthern direction. There are feveral other lakes and fmall ftreams, which are ftored with trout, pike, eel, perch, and bream. The natural wants of this county feem abundantly outweighed by its numerous minerals. Iron ore is contained in great quantities in the high grounds. Deep and rich beds of it are alfo found on the lower grounds; and a vigorous fearch would undoubtedly difcover it in almolt every fituation. Copper and lead are alfo met with, but not in fuch quantities. Coal in deep and rich flrata is vifible in many places. A variety of clays and plenty of limeftone gravel are likewife found. The foil is exceedingly diverfified. A rich dark foil on a limettone bottom, a ferruginous loam on the mountains, and an argillaceous ftratum, are its chief characteriftics. Great quantities of bog and moor tend to interrupt the general fertility of the county. The mode of agriculture adopted by the farmers is injudicious in many particulars. Potatoes, barley, rye, and wheat, are reared in fmall quantities; oats in abundance for home confumption. A confiderable portion of the land is pafturage. The farms are fmall, and generally occupied in common by a number of tenantry. Draining is greatly neglected. Manufactures are rapidly improving, particularly that of linen. There are feveral bleach-greens. Potteries are numerous about Leitrim and Dromahare. The traveller who is anxious for variety, will no where find it in greater perfection than in Leitrim. Extenfive tracts of walte may be contrafted with rich lands. The uniform and regular improvements of art are loft in the wild grandeur of picturefque natural diforder. The dale is frequently terminated by the ftupendous moun-

## L E L

tain, and the beauties of the rich luxuriant woods on the demefnes, are enriched by the vicinity of beautiful fhects of water. Near a century ago, the county was a continued foreft. Immenfe heaps of charred timber are feen at Dromthambo. A confiderable time ago, great exertions were made to plant woods, and it now abounds with almoft every variety which the nurfery can afford. No town of any fize ornaments the county. Carrick on Shannon is the flire town, but does not contain above 100 houfes.
"The obitacles," fays Mr. Robertion, "which have fo long retarded the improvement of Leitrim, have been occafioned by the inhabitants, not by nature; fhe has made ample flore for the exertions of their induftry, by beftowing on them valuable minerals. Thefe, however, have not been wrought with fufficient activity, and the public have as yet received little benefit from them. The want of watercarriage has likewife had a great effect; but this promifes to be fpeedily obviated. Pafturage being purfued to a confiderabie extent, has in a great degree impeded the general improvement. The confequent want of population has retarded the cultivation of the bog and other watte land. But when the true interelt of the people fhall be fufficiently underftood, the minerals will be wrought, palturage will be fupplanted by tillage, the bogs and moors will be covered with luxuriant crops, and in the end Leitrim will become one of the moft wealthy counties in Ireland." Beaufort's Memoir ; Robertfon's Traveller's Guide.

Leitrin, a fmall town of Ireland, which gives name to the county, but is not confiderable enough to be a pofttown. It is three miles N. by E. from Carrick on Shannon, and fituated on the river Shannon.

LEITSHACH, a town of the duchy of Stiria; 13 miles N.W. of Marburg.

LEITURGI, AElvejion, among the Athenians, perfons of confiderable eftates; who, by their own tribe, or the whole people, were ordered to perform fome public duty, or fupply the commonwealth with neceffaries at their own expences.

LEITZKO, in Geography, a town of the Middle Mark of Brandenburg, infulated in the duchy of Magdeburg ; 14 miles E.S.E. of Magdeburg.

LEIXLIP, a poft-town of the county of Kildare, Ire: land. It is beautifully fituated on the banks of the river Liffey, and near it is a fine waterfall, called the Salmon Leap. It is eight miles W. from Dublin.

LEKEO, one of the Japan inlands, about 120 miles in circumference; 20 miles S. of Ximo. N. lat. $31^{\circ} 20^{\prime}$. E. long, $15^{\circ} 4^{\circ}$.

LEKINPOUR, a town of Hindooftan, in the circar of Cattack; 12 miles N.E. of Cattack.
LEKNO, a town of the duchy of Warfaw ; 28 miles N.N.W. of Gnefna.

LEKSAND, a town of Sweden, in Dalecarlia; 20 miles N.W. of Falun.

LELAND, John, in Biography, was born in London about the end of Henry VIIth's reign, and was educated at St. Paul's fchool, under William Lily, from whence he was fent to Chrift's college, Cambridge. He removed from this univerfity to All-fouls, Oxford; and for farther improvement, efpecially in the Greek language, he went to Paris, cultivated an acquaintance with the principal fcholars of the age, and acquired a knowledge of feveral modern languages. Upon his return he took orders, and was appointed one of Henry VIIIth's chaplains. The king conferred upon him the office of keeper of his library, and gave him the title of royal antiquary, which no other perfon in this kingdom before or after poffeffed. To the title was annexed a commif-
fion, empowering him to fearch after all objects of antiquity in the libraries of all cathedrals, abbies, priories, colleges, \&c. He fpent much time in travelling through England, and in vititing all the remains of ancient buildings and monuments of every kind, with the view of collecting every thing that could illuftrate the hiftory and antiquitirs of this nation. At the diffolution of the monafteries he made application to fecretary Cromwell to get the MSS, which they contained conveyed to the king's library. He obtained confiderable preferment in the church, the duties of which did not require much active fervice; he accordingly retired with his collections to his houfe in London, for the purpofe of digefting them and preparing the publications he had promifed the world; but either intenfe application, or fome other caufe, brought upon him a derangement of mind in the year 1550, from which he never recovered. He died in 1552. During his life, he publifhed feveral Latin poems, and fome tracts on antiquarian fubjects. His MS. collections, after paffing through many hands, came into the Bodleian library, furnilhing very valuable materials to Camden, Dugdale, Burton, and others. After his deceafe in 1589, a volume of his fmall Latin poems was publifhed by Mr. Thomas Newton of Chemire, under the title of "Principum et illuftrium aliquot et eruditorum in Anglia virorum Encomix." From his collections, Anthony Hall publifhed, in 1709, "Commentarii de Scriptoribus Britannicis." "The Itinerary of John Leland, the Antiquary," was publifhed by Hearne at Oxford, in nine vols. 8vo. The fame editor publifhed "Joannis Lelandi Antiquarii de rebus Britannicis Collectanea ;" fix vols. Biog. Brit.

Leland, John, a diffenting minifter, was born at Wigan, in Lancafhire, in the year 1691. While he was very young his father removed with his family to. Dublin, where the fon was feized with the fmall-pox of fo malignant a nature, that it entirely deprived him of his underftanding and memory. In this melancholy condition he remained twelve months, but after his recovery, he recommended himfelf to much notice by the quicknefs of his parts, and by the proficiency which he made in his learning. He was therefore educated for the Chriftian miniftry among the Diffenters; and was, in due time, invited to become joint-paltor with the Rev. Mr . Weld, to which office he was ordained in 1716. He firt appeared as an author in 1733, by publifhing " An Anfwer to a late Book, entitled' Chriftianity as old as the Creation \&c." in two volumes." In 1737, he embarked in a controverfy with Dr. Morgan, by publifhing "The divine Authority of the Old and New Teftament afferted againlt the unjult A fperfions and falfe Reafonings of a Book, entitled The Moral Philofopher." The learning and abilities difplayed by Mr. Leland in thefe publications, and the fervice which he rendered by them to the Chriftian caufe, procured him many marks of refpect and efteem from perfons of the higheft rank in the eftablifhed church, as well as from the moft eminent of his diffenting brethren; and from the univerfity of Aberdeen he received, in the mof honourable manner, the degree of doctor of divinity. In the year ${ }^{1742}$, Dr. Leland publifhed an anfver to a pamphlet, entitled "Chriftianity not founded on Argument;" and in 1753, he diltinguifhed himfelf ftill further as an advocate in behalf of Chritianity, by publifhing "Reflections on the late Lord Bolingbroke's Letters on the Study and Ufe of Hiftory; efpecially fo far as they relate to Chriftianity and the Holy Scriptures." Dr. Lelaid was now juftly confidered a matter in this branch of controverfy, and at the defire of fome valuable friends he fent to the prefs, in 1754, "A View of the principal deiftical Writers that have appeared in England, in the laft and prefent Century, with Ob.

## L E L

fervations, \&c." The defign of this work was to give fome idea of the productions of the deitical writers, and of the feveral fchemes which they have advanced, as far as the caufe of revealed religion is concerned. In this work, the author ably maintained the reputation which he had acquired by his former producions, and i: met with a very £avourable reception. He afterwards publifhed a fupplement relating to the works of Mr. Hume and lord Bolingbroke, and this was followed by a third volume, comprehending the author's additions and illuftrations, with a new edition of his "Reflections upon Lord Bolingbroke's Letters, \&c." The whole of this work is now comprifed in three volumes; it fecured the author general public approbation, and encouraged him to continue his exertions to a very advanced age. Accordingly, when he was upwards of feventy years old he publifhed, in two volumes 4to."The Advantage and Neceffity of the Chriftian Revelation, fhewn from the State of Religion in the ancient heathen World, efpecially with refpect to the Knowledge and Worhip of the one true God; a Rule of moral Duty, and a State of future Rewards and Punifhments, \&c." This work was afterwards reprinted in two volumes, 8vo. Dr. Leland died in his feventy-fifth year, on the 16 th of January 1766 ; he was diftinguifhed by confiderable abilities, and very extenfive learning; he had a memory fo tenacious, that he was often called the "walking library," After his death a collection of his fermons was publifhed in four volumes octavo, with a preface containing fome account of the life, character, and writings of the author, to which our readers are referred for farth information refpecting him.

Leland, Dr. Thomas, a divine of the church of England, was born at Dublin about the year 1703. Having received the elements of a good education, he was admitted a ftudent, and afterwards became fellosv of Trinity College, Dublin. He was author of "A Hiftory of Ireland," 4to.; "The Life of Philip of Macedon;" and "The Principles of human Eloquence." He alfo tranlated the orations of Demothenes, in two volumes, 8 ro., which came out feparately, and were well received by the public. Dr. Leland died in ${ }_{17} 85$, at the age of eighty-three.

LELCZA, in Geography, a town of Ruffian Poland, in the palatinate of Volhynia; 60 miles N . of $Z$ ytomiers.

LELEGES, in Ancient Geograpby, a collection of people from different nations, as the fuppofed etymology of their name, derived from $\lambda_{\text {evis, }}$ I affemble, imports. They anciently occupied the territory adjoining to that of the people called by Homer Cilices or Cilicians; and when Achilles ravaged their country, which lay north-weft of the gulf of Adramyttium, they paffed over into Caria, and took poffeffion of the environs of Halicarnaflus. Their town was the metropolis of Caria, near Myfia. They were a kind of robbers and vagabonds, who refembled the Cilicians in their difpofition and manners. The firit king of Laconia, according to Paufanias, was Lelex; and the country took the name of Lelegia from thefe people.

LELIAN, in Geograpby, a town on the north coaft of the ifland of Bouro.

## Lelit Pattan. See Pattan.

LELOW, a town of Auftrian Poland, in the palatinate of Cracow: 32 miles N.W. of Cracow.

LELUNDA, a river of Africa, which joins the Zaire, about 60 miles from its mouth.-Alfo, a town of Africa, in the kingdom of Congo, on the fore-mentioned river; 35 miles E. of St. Salvador.

LELY, Sir Peter, in Biography, the mof excellent portrait-painter this country poffefled, after the death of

## L E NI

Vandyke. Many of his works continue to be held in mok deferved eftimation, and to be ranked amongft the claffics of the art. He was born at Soeft, in Welfphalia, in $161 \%$. His family name was Vander Vaas; but from the circunftance of his father, who was a captain of foot, being borr in a perfumer's thop, whofe fign was a lily, and receiving the appellation of captain Du Lys, or Lely, our artift obtained it as a proper name.

He was firft inftructed in the art by Peter Grebber at Haerlem; and having acquired a knowledge of its principles, and a very confiderable degree of fkill in execution, he came to England in 1641 , and commenced portraitpainter. After the kingdom had fuftained the irreparable lofs of Vandyke, and the reftoration was completed, he was appointed ftate-painter to Charles II., and continued to hold that office with great reputation till his death, which happened in 1680. He was feized by an aooplexy, while painting a portrait of the duchefs of Somerfer, and died inftantly, at the age of fixty-three.

Though Lely's talents, as an artift, do not entitle him to hold a rank equal to that filled by his great predeceffor; yet they jufly claim very great refpect and admiration. He fell thort of Vandyke in two very effential parts of portraiture, viz. tafte and expreffion. Of the former it mult be acknowledged that he fometimes caught a glimpfe; and, in the difpofal of a piece of loofe drapery, exhibited it with an enchanting ftyle : but that high clafs of tafte, which evidently fways the artift's mind who arranges, without apparent ftudy, all the parts of a compofition in an agreeable and effective manner, he does not appear ever to have felt or underftood. It is in parts only that he wrought with tafte: in the ringlets of the hair, for inftance; feldom in the actions of his figures, and fcarcely ever in the tout-enfemble of his pietures. As to the expreffion of his portraits, it is almoft entirely defcribed, at leaft in thofe of his females, by what the poet has faid, that he

> " - on animated canvas ftole The fleepy eye that fpoke the melting foul."
The confequence is, that individual expreffion, the very effence of portrait-painting, is loft fight of; and a certain air of general refemblance is feen in them all.
Yet in fpite of thefe great deficiencies, Lely's pictures, by the maftery of his execution, and his fkill of imitation, where he pleafed to employ it, will ever command admiration. He poffeffed the art of flattery more than moft artifts; and no doubt by that fecured the approbation of his contemporaries, and confequently great practice. He paioted drapery in a ftyle peculiarly his own, with great richnefs and fulnefs of effect; and he underitood fully the union of folds, though he did not always difpofe them in juft or agreeable fhapcs. His pencil is broad and full, and the markings of forms and features are free and decided in his pictures, which are to be found in almoft every noble manfion in the kingdom; fo great were the encouragement and employment he enjoyed.

By it he acquired a very confiderable fortune, of which he employed a large portion to furnifh himfelf with a collection of pictures and drawings. Thefe, at his death, were fold by auction, and were fo numerous, that forty days were confumed in the fale; and the product amounted to 26,000l.; belides which, he left an eftate he had purchafed, of 900 l . per annum.

LEMA, in Geography, a fmall ifland in the Chinefe fea. N. lat. $22^{\circ}$. E. long. $114^{\circ} 17^{\prime}$.

Lema Ifands, a clufter of fmall iflands in the Eaft Indian fea,

## L E M

fea, near the weft coalt of the inland of Borneo. S. lat. $\mathrm{I}^{\circ}$ 10'. E. long. $108^{\circ}+8^{\prime}$.

LEMAIRE, in Biography, is now generally fuppofed to have added, about the middle of the feventeenth century, the fyllable $\sqrt{2}$ to the hexachord, in order to furnifh a name, in folmifation, to the fharp 7 th of the key, and eafe the ftudents in finging of the embarraffments of the mutations. Many volumes have been written for and againft the mutations. We believe that in the confervatorios at Naples and Venice they are tlill preferved, and by the organifts of our cathedrals who teach the choritters; but in many other parts of Europe, befides France, the $\sqrt[f i]{ }$ has been adopted. Though much has already been faid on both fides the queftion, much itill remains to be faid by the champions of both methods. See Mutation, Solmisation, Hexachord, and the fyllable $\mathrm{Si}_{1}$, in their feveral places.

Leman Lake, in Geography. See Geneva and Lake.

Leman, Department of, one of the eleven departments of the eaftern region of France, compofed of Gex and Geneva, and the north part of Savoy, in N. lat. $46^{\circ} 10^{\prime}$, on the frontier of Switzerland, and fo called from lake Leman. It is bounded on the north by the lake, Switzerland, and the department of Jura; on the eaft by the Valais, and the departments of the Doria and Mont Blanc ; on the fouth by the department of Mont Blanc; and on the welt by the departments of the, A in and Mont Blanc. Its chief towns are Geneva, Thonon, and Bonneville. It contains 197 fquare leagues, and 215,884 inhabitants; and is divided into three circles or diftricts, including 23 cantons, and 276 communes; viz. Geneva, comprehending 103,550 inhabitants; Thonon, the inhabitants of which are 39,465 ; and Bonneville, including ${ }^{72}, 869$ inhabitants. Its contributions amouut to 906,632 francs, and its expences to 200,427 francs, 66 cents. This department confifts of hills, vallies, and plains; producing grain, wine, fruits, and paftures. It has forefts and iron-mines.

LEMAVI, in Ancient Geograpby, a people of Spain, in the Tarragonenfis. Their capital was Dactonium, according to Ptolemy.

LEMBA, a town of Afia, which Jofephus claffes in the number of thofe which the Jews poffeffed in the country of the Moabites.

Lemba, in Geography, a town of Africa, in the kingdom of Congo.-Alfo, a town on the welt coalt of the inland of Celebes. S. lat. $3^{\circ} 15^{\prime}$. E. long. I $19^{\circ} 5^{\prime}$.

LEMBACH, a town of Auitria; 9 miles S. of Aigen.
LEMBEECK, a town of France, in the department of the Scheldt; 8 miles S. of Ghent.

LEMBIGE, or Lembaye, a town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the diftrict of Pau; 15 miles N.E. of Pau. The place contains 960, and the canton 11,626 inhabitants, on a territory of $217 \frac{1}{2}$ kiliometres, in 47 communes.

LEMBERG, or Leopold, a city of Auftrian Poland, and capital of Galicia, large and opulent, and well fortified with timber. It lies low on the banks of the river Peltew, which foon after joins the Berg; being furrounded with hills and mountains which command the town. It is the fee of a Popifh archbifhop, and alfo of a Ruffian and Armenian bifhop. It has two caftles, one within and another without its walls; the latter ftanding on a high hill, and having the Carmelite monaftery, which is fortified, for a citadel: and it carres on a confiderable trade. Lemberg has a magnificent cathedral, feveral other churches, a gymnalium or feminary, an arfenal, a public granary, two Jewinh fchools,
\&c. A provincial diet and court of judicature are held in this town. It is inhabited by a mixed people of different nations; but no Proteltants are tolerated; 72 miles S.S.E. of Chelm. N. lat. $49^{\circ} 51^{\prime}$. E. long. $23^{\circ} 59^{\prime}$.

LEMBO, a town of Africa, in Congo, on the Zaire ; 40 miles S.W. of Etrona.

LEMERY, Nicholas, in Biography, an eminent French chemitt, was born at Rouen, in November 1645. His father, Julian Lemery, was a procureur in the parliament of Normandy, and of the Calvinit perfuafion. Nicholas was brought up to the bufinefs of pharmacy, under an apothecary of Rouen ; and he went to Paris in $\mathbf{x} 666$, with the view of obtaining farther improvement, efpecially in the art of chemittry, which he perceived to be the bafis of correetnefs in the proceffes of pharmacy. Here he fludied under Glafer, demonftrator of chemiftry in the royal garden; and afterwards fpent fix years in travelling, for the purpofe of adding to his knowledge. He refided a confiderable time at Montpellier, then famous for its apothecaries; and brought with him to Paris, where he fettled in that capacity in 1672, all the knowledge in his department of the art which the kingdom at that time afforded. In order to give public proofs of his information and fkill, he announced a courfe of lectures on chemiltry, which his friend, M. Martin, apothecary to the prince of Condé, allowed him to deliver in his laboratory, at the hotel of that prince. He afterwards procured a laboratory of his own, which, though little better than a dark cellar, foon became the centre of attraction, not only to the firft Ccientific characters in Paris, but to ladies, who reforted thither partly from a love of knowledge, and partly from fafhion. Chemiftry was then indeed coming into great rogue in that metropolis; and Lemery contributed greatly to its ad:ancement, by treating it in a fimple and perfpicuous manner, đivelting it of the jargon of myfticifm in which it had been hitherto obfcured, and, by the dexterity of his experiments, exhibiting the facts which it difclofes to the comprehenfion of every underftanding. By thefe means, Lemery eftablifhed fuch a character for fuperior chemical fkill, as enabled him to make a fortune by the fale of his preparations, which were in great requelt both in Paris and the provinces. One article in particular was the fource of great profit, namely, the oxyd, or, as it was then called, the magittery of bilmuth, and known as a coimetic by the name of Spani/b white, which no other perfon in Paris knew how to prepare. In 1675 he publifhed his "Cours de Chymie," which was received with general approbation and applaufe, and paffed through numerous editions: indeed feldom has a work on a fubject of fcience been fo popular. It fold, fays Fontenelle, like a novel or a fatire : new editions followed year after year; and it was tranflated into Latin, and into various modern languages. Its chief value confilted in the clearnefs and accuracy with which the proceffes and operations were detailed: the fcience was not yet fufficiently advanced for a rational theory of them. Indeed he feems to have worked rather with the view of directing apothecaries how to multiply their preparations, than as a philofophical chemift ; and his materials are not arranged in the moft favourable manner for the inftruction of beginners in the fcience. Nor did he divulge the whole of his pharmaceutical knowledge in this treatife : he kept the preparation of feveral of his chemical remedies fecret, in order to obtain the greater profit by their fale.

Hitherto our chemift, though openly profeffing Calvinitic. principles, had not been interrupted by the fpirit of perfecution, which difgraced the latter part of the reign of Louis XV. ; but in 1681 ; he received an order to difcon-

## L E M

tinue his public lectures within a limited time. While under this interdiction, he was invited to Berlin by the elector of Brandenburg; but he preferred removing to England, where he was favourably received by Charles II., who had an attachment to chemical purfuits. Circumiltances, however, did not accord with his expectations; and he returned to his own country, and took the degree of doctor of phylic at Caen, with the hope of thus protecting himfelf from farther perfecution. He actually acquired confiderable employmeit in his new character at Paris; but the rewocation of the edict of Nantes, in 1685 , by which the practice of phyfic was interdicted to Proteltants, deprived hint of his means of fubfiftence, and reduced him to fuch difficulties, that his conflancy at length gave way, and, in the following year, he with his family was reconciled to the Catholic church. He then readily obtained letters patent, allowing him to refume his practice, and his office of public teacher; and the agam derived confiderable emolument from the fale of his medicines. In 1697 and 1698 he publifhed two werks of confiderable value, but not without many imperfections. Thefe were, I. "Pharmacopée univerfel'e," containing a collection of the formulx given in all the reputable difpenfatories ill Europe, with corrections ànd improvements. Like the pharmaceutic works of that time, it was overloaded with articles, but was fuperior to its contemporaries. 2. His "Dictionuaire univerfel des Drogues Simples;" which was a itill more ufeful work than the former.

On the re eltablifhment of the Academy of Sciences in 1699 , Lemery was appointed affociate-chemift, and fucceeded to the office of penfionary, on the death of Bourdin. He then read before that body the papers on the fubject of antimony, which were printed in' 1707, under the title of "Traité de l'Antimoine." Upon this fubject he had a controver!y with an anonymous critic, in which he was conGidered as not very fucceffful. He was now advancing in years, and found the infirmities of age increafing upon him, when his life was fuddenly terminated by a fit of apoplexy, on the $19^{\text {th }}$ of June 1715 . Lemery was one of the ableft chemilts of his time, and indefatigable in his refearches; having \{per:: his life in his laboratory, or ftudy, at the bed-fide of the fick, or in the Academy. He was a man of great fimplicity of mauners, fincere in his friendfhips, and of the fricteft integrity in the commerce of life. Eloy Dica. Hift de la Med. Gen. Biog.

Lemeay, Louis, fon of the preceding, was born at Paris in January $\mathbf{1 6 7 7}_{7}$, and obtained a reputation for knowledge in chemittry and medicine worthy of his name. He was intended for the profeffion of the law; but he had im. bibed from the purfuits of his father fo great a talte for thofe fciences, that he entered the faculty of medicine of his native city, and received the degree of doctur in 1698. Two years afterwards he was admitted into the Academy of Sciences, and in 1 y08 he delivered lectures on chemitry in the royal garden. In 1710 he was appointed phylician to the Hotel-Dien, a polt which he occupied during the re. mainder of his life. In 1712 he obtained the rajk of afociate in the Academy, and fucceeded his father in that of penfionary in 1715 . He purchafed the office of king's phyfician in 1722 ; and in that capacity he accompanied the infanta of Spain on her return from France, whither fle had gone with the view of being married to Louis XV. Soon after his return to Paris, he was honoured by the queen of Spain with the title of her confulting phyfician. In 1731 he was appointed profeffor of chemittry in the royal garden, in the place of Geoffroy. At a fubfequent period, he became particularly attached to the eftablifhment of the duchefs of Brunfwick, whom he frequently vifited in the palace of

Vol. XX.

## I. L M

Luxembourg; and he likewife obtained the patronage of the princefs of Conti, in whofe hotel he regularly paffed a part of every day, and there compofed feveral of the chemical papers which he read before the Academy of Sciences. Thefe papers treat of the fubjects of iron, of ritre, and fome other falts, of vegetable and animal analyfes, of the origin and formation of montters, \&ce. Louis Lemery died on the $9^{\text {th }}$ of June 1743, and the lofs of him was much regretted; for to the mild and polifhed manners of the gentleman, he united great fincerity and conffancy in his aftachments, and fentiments of liberality and generolity in all his pro.
ceedincr. ceedings.

In addition to the papers publifhed in the Memoirs of the Academy, he left the following works: 1. "Traté des Alimens," Paris, 1702, which was frequently reprinted, and greatly augmented by Bruhicr in the edition of 1755 , 2 vols. 12mo, 2. "Differtation fur le Nourriture des Os," Paris, $1704,12 m 0$. In this work he maintains that the bones are nourimed by a peculiar gelatinous fluid, depofited in their fubltance by the fmall arteries, and not by the marrow, as had been fuppofed hy fome. He likewife publinhed three letters, on the gencration of worms in the human body, in oppofition to the treatife of Andry, with whom a Tharp controverfy was carried on upon this topic. Eloy Dict. Hitt. Gen. Biog.

LEMEYBAMBA, in Geography, a town of Peru, iu the diocefe of Truxillo; 22 miles S.W. of Chacapoya.

LEMGO, or Lemgow, a town of Weftphalia, in the county of Lippe, on a fenall river, near the Werra, divided into the Old and New Town, each of which has its own magiffrates; formerly one of the Hanfe towns; 17 miles S.S.W. of Minden. N. lat. $52^{2} 2^{\prime}$ E. long. $8^{\prime} 44^{\prime}$.

LEMIA, a fmall ifland in the Pacific ecean, near the coaft of Chili. S. lat. $44^{\circ} 6^{\prime}$.

LEMINGTON, a polt-town of America, in York county, Maine; 610 miles N.E. from Wafhington. - Alfo, a townfhip in Effex county, Vermont, on the W. bank of Connecticut river, and near the N.E. corner of the flate. It contains 52 inhabitants.

LEMLANT, a fnall inand in the Baltic, near the S.E. of Aland; about 20 miles in circumference. N. lat. $60^{3}$ $4^{\prime}$. E. long. $19^{\circ} 5^{\prime}$.

LEMLEM, a country of Africa, in the interior part of Negroland; 500 miles E.S.E. from Tombuctoo.
LEMLUM, a town of the Arabian Irak; 33 miles S.E. of Hellah. N. lat. $31^{\circ} 43^{\prime}$.

LEMMA, in Botany, a name borrowed from the ancient Greek writers, whofe $\lambda \varepsilon \mu \mu$, is fuppofed to have been fo called from $\lambda$ ents, a fcale, bark, or membrane, and to have been either our Duckweeds, fee Lemsia; or fome other aquatic production, whether of the vegetable or the corol. line kind, that adhered to fhells. Juff. 16. - This name was given by Bernard de Juffieu to the proper Marfflea of Lin. næus, for which it feems difficult to give a good reafou. We may indeed affent to the feparation of Micheli's Salvinia from that genus (fee Juffieu); but this does not oblige us to ábrogate a name long dettined to commemorate a meritorious naturalit. See Marsilea.

Lemma, A $\uparrow \mu \mu x$, of $\lambda \mu \mu b \alpha v a$, I afjume, in Mathematics, denotes a previous propofition, laid down in order to clear the way for fome following demonitration; and prefixed either to theorems, in order to render the demonfration of them lefs perplexed and intricate; or to problems, to make the refolutions of them more eafy and fhort. . Thus, to pro\%e a pyramid one-third of a prifm, or paralielopiped, of the fame bafe and height with it, the demonftration of which, in the ordinary way, is dificult and troublefome, this lemma may

## L E M

be premifed, which is proved by the rules of progreffion, that the fum of the feries of the fquares, in numbers in arithmetical progreffion, beginning from 0 , and going on, $\mathbf{1}, 4,9,16,25,36, \& \mathrm{c}$. is always fubtriple of the fum of as many terms, each equal to the greatelt ; or is always onethird of the greateft term multiplied by the number of terms. Thus, to find the inflection of a curve line, this lemma is firt premifed, that a tangent may be drawn to the given curve, in a given point.

So, in pliyfics, to the demonflation of moft propofitions, fuch lemmata as thefe are neceflary firlt to be allowed: that there is no penetration of dimenfions; that all matter is divifible; and the like. As alfo in the theory of medicine, that where the blood circulates, there is life, \&c.

Lemma, in the Ancient Mufic, a reft or paufe of a Joort fyllable in the catalectic rhythm. See Rhythm.

Lemma, $\lambda s \mu \mu \alpha$, in Pbarmacy, a term ufed to exprefs the hufk or fhell of certain fruits, as the almond and the like; and, in general, whatever is taken off in decortication: thus, the hufks of oats, barley, \&c. are the lemmata of thofe feeds.

LEMMER, Tue, in Geography, a fea-port of Friefland, near the Zuyder fea; 20 miles S. of Lewarden. N. lat. $52^{\circ} 52^{\prime}$. E. long. $5^{\circ} .3^{\prime}$.

Lemmer, or Lemming, in Zoology. See Sable Mouse.
LEMNA, in Botany, $\lambda s \mu v \alpha$ or $\lambda s \mu \mu \alpha$ of the Greeks; fee Lemma. Duckweed or Duck's meat. Limn. Gen. 478 . Schreb. 620. Willd. Sp. Pl. v. 4. 193. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 956. Wiggerf. 66. Ehrh. Beitr. falc. 1. 43. Brown Prodr. Nov. Holl. v. I. $345^{\circ}$ Lamarck Illuftr. t. 747. (Lenticula; Juff. 19. Mich. Gent 15. t. II. Dill. Gen. II8. t. 6.)-Clafs and order, Diandria Monogynia. Nat. Ord. Mifcellanex, Linn. Nä̈ades, Juff. Hydrocharidee, Brown.

Gen. Ch. Cal. Perianth inferior, of one leaf, roundifh, obtufe, oblcurely two-lobed, foon difappearing. Cor. none. Stam. Filaments two, awl-fhaped, fpreading, more or lefs unequal, longer than the calyx ; anthers terminal, of two round lobes. Pif. Germen fuperior, ovate; ftyle columnar, florter than the ftamens; Atigma fimple, or flightly notched. Peric. Capfule roundifh, of one cell, not burfting. Seeds few, oblong, itriated, pointed at each end, vertical, ranged in a fimple circular row.

Eff. Ch. Calys of one leaf, inferior. Corolla none. Capfule of one cell, without valves. Seeds fèw, oblong.

Obf. The firlt perfon who ever obferved the fructufication of a Lemna appears to have been Valifneri, whofe effay on the fubject, defcribing the flowers of L. minor, is publifhed in the Ephenerides Naturs Curioforum, and in the Italian folio edition of his works, v. 2. Sr. t. It, 15. His figure of the flower is borrowed by Dillenius, in the appendix to his Plante Giffen/es, cited above. Micheli, feveral years after, publifhed excellent reprefentations of the flowers and fruit, obferved in two or three fpecies, to which he applied the generic name Lenticula; calling by that of Leniculuria fuch as he could not meet with in a flowering flate. This is a didtinction without a difference, and of the latter $L$. trifulca has fince been found in perfection by Mr. Dawfon Turner of Yarmouth, in June, 1801. Willdenow fays it has been found by Wolf. Ehrhart, in his German Beitrage, Ffic. I. 43, has given an entertaining account of his examination of L. gibba in flower at Hanover, July $13,1779$. This was found near Lewes in Suffex, by Mr. W. Borrer in June 1803, as was minor by the fame gentleman in 1802 , fo that three fpecies being now diftinctly figured in fructification, in Engl. Bot. t. 926,1095 and 1233 , we are no
longer in the dark on the fubject, and we venture to remore
the genus from Mronoecia to Diandria, as fuggefted in Fl . Brit. 958. and Prodr. Fl. Grec. v. I. 11. One Britifh fpecies (till remains, the polyrrbiza, whofe flowers appear to have been feen by one perfon only, Grauer, a young friend of Wiggers, at Kiel, about ${ }_{1780}$.

The calyx feems to be variable in this genus, and is probably foon evanefcent. Some flowcrs allo occafionally want the complete germen, but this is accidental, and they appear to be, in no fpecies, truly monoecious, nor regularly polygamous.

1. L. trifulca. Ivy-leaved Duck-weed. Linn. Sp. P1. 1376. Engl. Bot. t. 926. (Hederula aquatica; Lob, Ic. v. 2. 36." Ger. em. 830.)-Leaves ftalked, lanceolate, proliferous.-Found throughout Europe, floating in clear ftill pools and ditches. Mr. R. Brown has obferved it in New Holland. It is a pale-green, fmooth, pellucid, annual herb, floating in frefh water, near or upon the furface, and confilts of feveral lanceolate, ribbed, entire, fometimcs waved or toothed, leaves, each, with its falk, about an inch long. Each leaf throws out from its centre underneath a folitary fimple root, defeending, to more than the length of an inch, into the water, and tipped with a membranous ’heath. From the fame point whence the root originates, fpring a pair of young divaricated flat leaves, looking like lobes of the old one. The flowers proceed folitarily from a marginal chink, at one or both fides of a leaf, and are fcarcely perceptible but by their prominent yellowih anthers. Wolf, the author of a differtation on Lemna, publifhed at Altorf in 1801, and quoted by Willdenow, appears to have been the firit who ever found the flowers of this 追ecies.
2. L. minor. Leffer Duck-weed. Linn. Sp. Pl. 1376. Engl. Bot. t. 1095 . Michaux Boreali-Amer. v. 2. 163. (Lens paluftris; Camer. Epit. 852. Ger. em. 829.)Leaves feffile, nearly flat on both fides. Røots folitary.Common and abundant in fummer time, on the furface of flagnant pools throughout Europe. Michaux has alfo obferved it in Carolina, and Brown in New Holland. This being the common fpecies in Greece, Dr. Sibthorp juftly
 corides; not that we would fuppofe this ancient fage accurate or attentive enough to have diftinguifhed it from the two or three following, which may polibly grow likewife in the country he inveltigated. The leaves are obovate or elliptical, entire, flightly convex beneath, in confequence of the formation of air within, by which they become buoyant, and float in denfe mafies over the whole furface of the water, being much fmaller and more crowded than in the former. They are, like that, in fome meafure proliferous. The roots are folitary from the centre of each beneath, and are temporary, not perennial, nor forming offsets. Flowers from marginal chinks, always, as far as we havs feen, furnifhed with both ftamens and pittil, and their calyx is more ample, as well ats more evidently two-lobed, than in the above. The feeds when ripe doubtlefs defcend, and take root in the mud, as Valifneri obferved the young plants afcend in the form of a green foft pul?, full of air-bubbles, from the bottom to the furface, carly in the fpring, and foon after the waters were mantled with an entirely green covering of the perfect leaves, lying over each other.

Micheli's Lenticularia media, t. 11. f. 2, and minor, f. 3, both perhaps belong to this fpecies.
3. L. gibba. Gibbous Duckoweed. Linn. Sp. Pl. $137 \%$ Engl. Bot. t. 1233. (Lenticula paluftris najor, \&c.; Mich. Gen. 15. t. 11. f. 1, not 2.) - Leaves feffile ; flightly convex above; hemifpherical beneath- Roots folitary -Lefs frequent by far than the latt, in ftill pools of various parts of Europe. Hudfon confidered this as a variety only, but it

## LEM

differs in being larger than minor, remarkably tumid, fucculent, and vafcular. Its upper furface is convex, ufually of a fine green, but often purplifh; the lower almoft hemifpherical, and paler. Roots generally folitary, fometimes in pairs. Micheli fays the calys foon difappears; and Mr. Borrer's fpecimens were too far advanced to fhew it, though the faamens and fylye were in perfection.
4. L. polyrrhiza. Greater Duck-weed. Linn. Sp. P1. 1377. (Lenticularia major polyrrhiza, infernè atro-purpurea; Mich. Gen. 16. t. 11. f. 1.)-Leaves feffile, obovate, convex beneath. Roots cluftered. - Native of ditches and pools in Europe; and Willdenow fays of North America alfo. It is annual, flowering in July and Auguft, but though the leaves are twice or thrice the fize of the two laft, the flozvers have not been detected, except by the Danifh naturalift Grauer above-mentioned, who accounts for this by bis defcription of their fituation. He fays they are to be found at each fide where one leaf is joined with the other, under the folding of its edge, and that the fruit agrees with that of gibba, except in being larger; and more flattened. The leaves are rounder and blunter; convex, and ufually dark purple, underneath. The roots fpring numeroufly in clufters from the centre of each.
5. L. obcordata. Heart-flhaped Duck-weed. Vahl. Symb. vo 2. 95. Willd. n. 5.-" Leaves feffile, inverfely heartfhaped. Routs cluitered."-Native of waters in the Eaft Indies. Vahl, from whom alone we have any knowledge of this, fays "the leaves are fcarcely fo long as the nail, of a bright green at the fore part of their upper fide; purplifh in the hinder part and underneath, as well as the roots. A longitudinal furrow runs along the leaf, fending off a branch to each lobe, which divides each nearly in two, to the extremity.". It dees not appear why Willdenow defnes the leaves as "proliferous at the apex."
6. L. arrbiza. Rootlefs Duck-weed. Linn. Mant. 294. (Lenticularia omnium minima, arrhiza; Mich. Gen. 16. t. 11. f. 4.)-Leaves in pairs, without roots.-Obferved by Micheli in filh-ponds near Florence. Duchefne found it in France; and we have fpecimens, both dried and in fpirits, collected at Fontainbleau by the late Mr. Stephen de Leffert. This minute fpecies is not bigger than an ordinary pin's head, and each plant confifts of one larger leaf and one fmaller, joined by their extremities; the former being elliptical, flattifh on the upper fide, very turgid below ; the other nearly globofe. No roots are difcoverable, nor is any thing known of the fructification.

Micheli's Lenticula media, t. 11. f. 2, and minima, f. 3, remain undetermined by following writers. We venture to characterize them as follows.
7. L. difperma. Two-feeded Duck-weed. (Lenticula paluftriз media, pallidè virens, infernè minùs convexa, radicibus longiffimis fructu difpermo; Mich. Gen. 15. t. II. f. 2.) -Leaves feffile, obovate, convex beneath. Roots folitary, very long. Capfule with two feeds.-FFound by Micheli in a place called the Beccacivette near Florence. He delineates the leaves about half the fize of L. gibba, as well as much lefs convex beneath, and the feeds as but two in each capfule, whereas in gibba they are four, five, or fix.
8. L. atro-virens. Dark-green Duck-weed. (Lenticula paIuftris minima atro-virens, utrinque penè convexa; Mich. Gen. 15. t. II. f.3.)-Leaves feffile, elliptic-oblong, convex on both fides. Roots folitary.-Found by the fame auther near Florence. This appears to be fmaller than L. minor, with more oblong and darker leaves, whofe upper fide is as convex as the under one.

LEMNIAN EARTH, Lemnia terra, comprehends feveral
rarietics of clay, moftly red and ferruginons, formerly prom ferved under this name, and employed in medicinc. Thefe were diftinguifhed into the white, the yellow, and the red. They were brought from the Levant, moftly in the fape of fmall cakes, bearing the impreffion of a feal, whence the name of Terra Sigillata. Several of them are to be referred to Bole; which fee. The whitifh kind, which appears to be the true Lemnian earth, and fo highly valued by the ancients, on account of the alexipharmic virtues which they afcribed to jt , is defcribed under the asticle Flller's Earth.
The red earth is dug in a hill in the ifland of Lemnos, and in no other place, fo far as is yet known; and the line and true earth only in one pit, which ufed to be opened once every year, and no oftener, with great folemnity; and the earth, fuppofed fufficient for the year's demand, was taken out and fold to the merchants; fome fealed with various figures, other quantities unfealed; but what was there bought unfealed, was generally formed into fmall maffes, and fcaled before it was offered to fale in Europe, the druggilts always expecting to find Lemnian earth fealed.
This earth, to which imaginary virtues were attributed, was too often adulterated, frequently by the Turks upon the fpot, either by mixing it with other earths, or another earth alone being fold in its place; but more frequently in Europe, where every wholefale dealer knew how to make a compofition of our own clays, and properly tinge them with ochre, and afterwards give an impreffion refembling that of the genuine.
This earth, was celebrated by the ancients as a fovereign remedy againf poifons and the bites of reptiles: the Turks and Greeks till retain that notion, for the cups out of which the grand feignior drinks are made of this red earth, fo that it is referved chiefly for the fultan's ufe. But the alexipharmic and aftringent property of this and the other boles is now in little or no efteem. (See BoLE.) It is alfo dug in the illand of Lemnos, and was ufed in the German fhops as an aftringent and fucorific, and faid to be of great efficacy in dyfenteries, hemorrhages, and malignant fevers. The ancients knew this kind, but never ufed it in medicine, efteeming the other fuperior, but they employed it as the cimolia in cleaning linen and woollen cloths.

The yellow Lemnian earth is counterfeited two ways; the one by a yellow ochre, which may be difcovered by its ftaining the hands, and the other by a yellow clay; but this is eafily known by its want of the true florid colour, and hasing all the characters of a clay, not a bole. The genuine is found only in the ifland of Lemnos, and is the itratum next abose the red. It was formerly efteemed a fudorinic, aftringent, and rulnerary. Da Cofta's Hift. of Foffils, P. I. 14. and 2.2.

LEMNIS, in Ancient Geograpby, an ifland of Africa, in Mauritania Cxfarienfis, E.N.E. of the mouth of the river Malva.

LEMNISCATE, in the Higher Geometry, is the name of curve which has the form of the figure of 8. If we cal A P, $x$, , (Plate XI. Analy fis, fig. 1.), and P M, $y$, and the conftant line BC, a, the equation of the curve will be $a y=x \sqrt{a}-x^{2}$, or $a^{2} y y=a^{2} x^{2}-x^{2}$, which is an equation of the fourth degree: it is alfo evident that a right line which paffes through the double point $A$ will cut this curve in four points, the double point being reckoned equal to two. See Curve.

LEMNISCIA, in Botary, fo called by Schreber, from خnpuvisoos, a bandage, or fillet, in allution to the fhepe of its petals. Schreb. 358 . Willd. Sp. Pl. v. 2. 1172 . Mart.

Mill

## L E M

Mill. Dict. v. 3. (Vantanea; Aubl. Guian. vo r. 572. t. 229 : Juff. 434. Namarck. Illufte. t. 475 .) -Clafs and order, Polyandria MTonogynia. Nat. Ord, uncertain.

Gen. Ch. Cal. Perianth inferior, of one leaf, five-toothed, acute, fhort. Cor. I'etals five, lincar, long, acute, recurved, adhering to the cup-flaped, flefly, thort neetary which encompafies the germen. Stam. Filaments numerous, from feventy to cighty, capillary, longer than the corolla, inferted into the nectary; authers roundith, fmall. $P$ iff. Cermen fuperior, roundif, immerfed in the nectary ; ftyle thread-fhaped, the length of the Itamens; Atigma obtufc. Pcric. Capfule of five cells. Sechs folitary.

Eff. Ch. Calyx five-toothed. Corolla of tive petals. Nectary cup-fhaped, bearing the ftamens. Capfule fivecelled, with a feed in each cell.
I. L. foribunda. Willd. (Vantanea guianenfis; Aubl. Guian. t. 229.) -Found at Guiana, where it is called Jouantan, whence Aublet derived his barbarous appellation Vantanea. It flowers in Augult. The trank. of this tree rife, to the height of about tifteen or twenty feet, and is much branched. Bark brown and fmooth. Wood whitifh and compact. Leaves alternate, on fhort footftalks, fmooth, oval, pointed, the larger ones about five inches long. Flowers forming large, handfome bunches at the extremity of the branches, of a red, coral colour. Stamens fituated upon a yellow, flefhy difk, in the form of a cup, which almolt covers the germen.

Obf. The long narrow petals of this plant greatly remind us of thofe in the neighbouring genus Alangium.

LEMNIUS, or Lemaens, Lifívin, in Biography, was born at Zirickfee, in Zealand, in May, 1505. He ltudied at Louvain, and by the advice of his iriends applied both to medicine and theology. He principally diftinguifhed himfelf, however, in the former of thefe fciences, and practifed the profeffion for upwards of furty ycars, chiefly in his native place, where he fettled in 1527. He ubtaincd the full confidence of his patients by his knowledge and eloquence, and efpecially by a mild and humane exprefficn of countenance and manner, which never failed to intereft the fick. After the death of his wife, Lemnius became a prieft, and was made a canon of the church of St. Lieven, at Zirickfee, where he died in July 1568. He was the author of feveral works, the ftyle of which has fome force and even elegance. Thefe are; "De Aftrologia Liber unus, \&c.: De termino vita Liber. De honelto animi et corporis oblectamento, \&c. \&c." Antwerp, 1554-一" De occultis naturx miraculis Libri duo," ibid. ${ }^{1559 .}$ "De occultis naturæ miraculis Libri quatuor," ibid. 1564 . Thefe tworks contain many obfervations relative to natural philofophy, botany, phyfiology, and medicine, and efpecially concerning gencration and monlters; but they alfo contain many fables. "De Habitu et Conltitutione corporis, quam triviales complexionem vocant, Libri duo," ibid. $156^{\circ}$, and feveral fubfequent editions. "Similitudinum et parabolarum, qux in Bibliis ex herbis atque arboribus defumuntur ditucida explicatio," ibid. 3569 ; many times reprinted and tranflated. "De Zelandis fuis Commentariolus," Leydén $\mathbf{r} 6 \mathrm{II}$. Eloy Dict. Hirt.

LEMNOS, in Ancient Geography, an ifland fituated in the E'gean fea. 'This intand 'was confecrated to Vulcan in the time of Homer, probably on account of two volcanoes, which were here costinually calting forth flames, and which were confidered as the forges of the hulband of Venus. No veltiges of thefe volcanoes now remain: but Sonnini thinks it probable that interior fires are ftill burning here; for he met with a foring of hot water, which bas been brought to
fupply bathe, and another of aluminous water. Lemmos was celebrated amonglt the ancients, on account of the fuccour which it afforded to the Argonauts; of which Apollonius Rhodius has given a particular account. As it was near Alia, it was althof always dependent on that province. 'The pricfte of Lemnos were reckoned famous for the cure of wounds. For this reafon the Greeks, who went to the Hege of Troy, left here Pliloctetus, after he had been wounded in the foot by one of the arrows of Hercules. The efficacy of their fisill depended, as it has beenfaid, upon the quality of that bole under the denomination of Lemilan carbl) : which fee. It is alfo faid, that Galen made a voyage to Lemnos on purpofe for afcertaining the virtues of this earth; and that he found a perfon who had avaled himfelf of it as an antidote to the bites of reptiles, and to poifon. The firlt inhabitants of this inland were the Pelafgi, who expelled the defcendants of the Argonauts, by whom it was previounly occupied, and took poffeflion of it about 1860 years before the vulgar era. This ifland retained the name of Lemnos, by which it is ever now known; but navigators have given it the name of Stalimene. The ifland is hilly, but extremely fertile : it yields corn, cotton, oil, and filk, with which a few light ituffs are manufactured. To be flourifling, fays Sonnini, Lemnos wants only to be delivered from its oppreffors. Nature has dune every thing for it, and we lament the tate of languor and wretchednefs to which its deftiny has reduced it. Its inhabitants were formerly much given to navigation, or at leafl to the carry-ing-trade ; they are fill trading mariners, becaufe this kind of indultry cfcapes more eafily the cupidity of tyrants than affluence produced only by agriculture, or by a fedentary traffic. Some of its women are extremely beautiful. The whole eaft coalt is inaccefibib, on account of a fhoal, which extends four leagues into the offing: the weft coaft affords to fhips a few places of fhelter againit northerly winds. To the north is a large road: but there are no real harbours cxcept on the fouth part, where are to be found two, at no great diftance from each other, viz. Port Cadia and Port Sant Antonio. Sonnini's Travels in Greece and Turkey.

LEMO, in Geography, a town of Sweden, in the government of Abo; 12 miles N.W. of Abo.
LEMON, or Limon, in Botany, Gardening, \&c. See Citrus and Citric Acid.

Lemon-tree. See Citrus Medica, The name is fometimes given by the Welfh to Pyrus Aria of Fl: Brit., the White Beam-tree, whence certain travellers have reported the lemon to be a native of the bleak cliffs of Penmaenmaur!

## Lemon, in the Materia Medica.

Lemons are cooling and grateful to the ftomach, quenching thirft and increafing appetite; ufeful in fevers, as well common as malignant and peltilential ; they alfo provoke urine. The juice, which is more acid than that of the orange, poffelfes fimilar medical virtues. (See Orange.) This juice, however, is always preferred, where a ttrong vegetable acid is required. Saturated with the fixed vegetable alkali, it is in frequent extemporanecus ufe in febrile difeafes; and by promoting the fecretions, efpecially that of the furface, proves of confiderable fervice in abating the violence of pyrexia. Mixed with falt of wormwood, it is ain excellent medicine to fop vomiting, and to ftrengthen the ftomach. As an antifcorbutic, lemon juice is very generally taken on board fhips, deftined for long voyages. See Citrus, and Cirric Acid.

Whytt found the juice of lemons to allay hyfterical palpitations of the heart, when various other medicines had

## l. E M

proved ineffetual; and this juice, or that of orange, taken to the quantity of four or lix ounces a day, has fometimes been found a remedy in the jaundice. (See Saunders's Elem. of the Practice of Phylic, p. 170.) The yellow rind is a grateful aromatic, and commonly ufed in ftomachic tinctures and infutions, and for rendering other medicines acceptable to the palate and tomach. The lemon peel, though lefs warm than that of the orange, poffeffes fimilar qualities, and is ufed with the fame intentions. It is fometimes ordered to be candied. In diftillation it yieids an effential oil, extremely light, almolt colourlefs, frequently employed as a perfume, and brought to us from the fouthern parts of Europe, under the name of "effence of lemons." Tliis oil is an ingredient in the fpiritus ammonix compofita, or aromatic fpirit of ammonia, and in other formulx. A mixture made by faturating fix drams of the juice of lemons with about balf a dram of fixed alkaline falt, with the addition of a fmall quantity of fome grateful aromatic water or tincture, as fimple cinnamon water, is given in cafes of naufea and reachings, and generally abates, in a little time, the fevere vomitings that happen in fevers, when molt other liquors and medicines are thrown up as foon as taken. It is allo ufed as a faline aperient in iCterical, hydrepical, inflammatory, and other diforders. A fyrnp made by diffolving fifty ounces of fine fugar in a quart or two pounds and a half of the depurated juice, is mixed occafonally with draughts and juleps, as a mild antiphlogitic, and fometimes ufed in gargarifms for inflammations of the mouth and tonfils. Lewis Mat. Med. Woodv. Med. Bot.

LEMONADE, a drink prepared of water, fugar, and citron, or lemon-juice.

This factitious liquor has been fo popular in Paris, that it has given its name to a new eltablifhed company called lemonadiers.

LE MONNIER, Peter Ciarles, in Biograpby, a French aftroncmer, member of the Academy of Sciences, and of the National Inftitute, was born at Paris in 1715 , and accompanied Maupertuis in his tour to the north pole, for meafuring a degree of the meridian. His principal works are: "Aftronomical Inftitutions;" " Lunar Nautical Aftronomy ;" "Tables of the Sun, and Corrections' of thofe of the Moon." He died in 1790. He had a brother, Lewis William, a very able experimental philofopher, who died in 1799. But neither of thefe is to be confounded with an abbe of that name, who tranflated Terence and Perfius into French, and was author of fables, tales, and epifles. He died in 1796.

LEMOS, in Geography, a diftrict of Spain, in Galicia, E. of Minho; the chief place is Montforte de Lemos.

LEMOSANO, a town of Naples, in the county of Molife; 8 miles N.E. of Molife.

LEMVIG, a town of Dennark, in North Jutland, fituated on the Lime-Fiord, or Lympfurt; $8_{+}$milles N . of Ripen. N. lat. $\mathrm{g}^{6} 44^{\prime} .{ }^{\prime}$ E. long. $8^{\prime}$ 18'。 $^{\prime}$

LEMUR, in Zoology, a genus of Primates. The foreteeth in the upper jaw amount to four in number, the intermediate ones remote; thofe in the lower javs to fix, their form more elongated, extended, compreffed, parailel, and approximate : grinders many, fomewhat lobate, the foremott longer, and fharper.

The animals of the lemur genus approach the monkey tribe in the form of their feet, which in feveral of the fpecies are furnifhed with flat and broad nails, refembling thofe of the human hand, excepting generally that of the firlt finger next the thumb, which is long and incurvated; they have either two or four teats, and fome of the fpecies have the tail of confiderable length, while others have none. Notwithflanding the refemblance thefe animals bear to the monkey race, they have nothing of the mifchievous and petulant difpofition of thofe creatures; they are mild and peaceable in their manners, at lealt when domefticated, and there are few fpecies of the tribe that cannot readily be reduced to that ftate of docility by proper treatment. Some of the fpecies feed on fruits, eggs, and fmall birds, others fubfift entirely on the former. They inhabit chiefly the Indian illands, and the continent of South America.

## Species.

Tardigrades. Tail none; body fomewhat tawny afha Gmel. Lcrnur tardigradus, Erxleben. Le loris grêle, Andebert. Slozv lemur, or loris.

Under the Linmean fpecific name of tardigradus, the beite authors appear to have confounded two, if, not a greater number of diftinct fpecies. The little animal defcribed by Erxleben under that title, is remarkable for the peculiar elegance of its figure, and the fingularity of its conformation. The head is roundifh; the muzzle projecuing; the eyes extremely large and contiguous to each other; the ears large and round; inftead of a tail a tubercle is fituated in that part; and the whole body is covered with fine hair of a reddin-grey colour. The fexual organs of the female, according to the obfervations of Daubenton, prefent fome curious particulars of intereft to the comparative anatomift. This fecies inhabits Ceylon, is remarkable for its agility, is quick of hearing, and correfponds with the fquirrel.

Ecaudatus. Tail none; a dark-rufty line along the middle of the back from the rump to the forehead; orbits

## L EMUR.

furrounded by a blackinh line. Lemur ecaudatus, Linn. Gmel. Loris tardigradus, Audebert. Parefeux pentadactyle de Bengale, Volmacr. Le loris de Bengule, Bult.

The diftinction between this and the preceding Ipecies has not been regarded with fufficient attention by all writers, and hence we fometimes find the defcription and hiftory of one applied to and blended with the other. The latter is about thirteen inches in length, the head almoft round, the muzzle very little pointed. The ears are fmall, oval, and ftraight, and almoft entirely concealed under the woolly hair. The eyes are placed in front inmediately above the nofe, and are very clofe to each other; their form perfectly orbicular, their fize remarkably large in proportion to the body, and of a brown colour. The nofe is fmall, flat, and open at the fides; the teeth of the fame form and number as in the former animal. The hair of the fur is long, fine, and woolly, but rough to the touch; the colour in general grey, or yel-lowifh-ath, inclining rather more to reddifh upon the flanks and limbs.

Indn. Taillefs, black; beneath greyifh; rump whitifh. Lemur indri, Gmel. Indri, Sonnerat. Indri macauco, Pemn.

This is a very large fpecies; the colour entirely black, except on the face and beneath, which is greyif ; and the fpace of white on the rump, or fometimes the face, is white. The muzzle is lengthened as in the dog tribe, the ears fhortifh and flightly tufted; the hair filky, thick, and in fome parts curly. According to Sonnerat, its firlt defcriber, the height of this animal is three feet and a half; the tufks in each jaw are eight, the fore-teeth above two, beneath four ; the feet five toed ; nails flat and acute, thofe of the great toe large; the rudiment of a tail is fenfible to the touch. It is faid to be a gentle, docile animal, capable, like the dog, of keing trained when young to the chafe, and is commonly employed in hunting by the natives of Madagafcar, the country it inhabits: its voice refembles the crying of an infant. At Madagafcar it is known by the name of indri, which fignifies the man of the wood. Geoffroy obferves, that the cutting teeth in the upper jaw are four in number, inflead of two, as mentioned by Sonnerat.

Rufus. Yellowifh-red; head at the fummit, temples, checks, and tail beneath whitifl. Lemur rufus, Audebert. Maki-roux, Defm.

This refembles the mongoz in fize, and various other refpects; it neverthelefs differs in having the ears fhorter, the tail longer, the hair in general fhorter, and the colour of the fur yellowifh-red inftead of brown-grey; upon the fummit of the head is a black line, and the tail at the extremity is brown. Whether allied to the following fpecies or not feems difficult to determine.

Laxiger. Tailed; above reddifh-yellow, beneath white; tail uniformly tawny-brown. Gmel. Alaquis à bourres, Sonn. Flocky lemur, Shaw.

A native of Madagafcar; the length twenty-one inches; hair foft, curled, about the loins reddifh-tawny; face black; ears fmall; eyes large and greenilh-grey; in the upper-jaw two fore-teeth, in the lower four; tail nine inches long; feet five-toed; nails long, great toe-nail rounded. There are two or three fuppofed varieties of this Ipecies.

Potro. Sub-ferruginous; tail fame colour. Gmel. Potto, Bofman.

Inhabits Guinea. An obfcurely defcribed fpecies, concrived to differ from the indri only in the length of the tail. Bofman, who relates the fuppofed hittory of this animal, on the authority of the negroes (in his account of Guinea), attributes to it nearly the fame manners as thofe of the European 』oth.

Mongoz. Tailed, fufcous-grey, the tail of the fame colour. Linn. Erxleb. Mongooz, Edw. Maki.mongozes, Defm. Mongous, Buff. Woolly macauco, Penn. Miongoz lemur.

The mongoz is a larger fpecies than the ring-tailed lemur, the fize about that of the common or domeftic cat; the upper part of an uniform dufky-brown colour, with the breaft and belly whitifh. The fur confifts of filky curling hair. The nofe is larger than in the ring-tailed lemur, and much refembling that of Iemur macao, the colour black; the eyes are yellow, or orange, remarkably vivid, and are nearly furrounded by a circle of black placed at a fmall diftance above and beneath each eye, then uniting between them, and paffing down the middle of the fnout to the nofe; the hands and fect are naked and dufky; the nails flat, except on the interior toe of the hind feet next the thumb, which is furnifhed with a fharp claw ; and the tail, which is very long, covered with a thick fur.

No lefs than feven fuppofed varieties of this fpecies are defcribed by writers; in one kind the body is grey or brown, with the face and hands black; in another grey or black, with a black fpot near the eyes; and in a third the body is brown, with the nofe and hands white ; the face is alfo fometimes black, the hands yellow, or varying from that to deep tawny, and the body grey; and again, others occur that are uniformly brown.

This animal is a native of Madagafcar and fome other Indian inlands: it is an active animal, filthy in its difpolitions, and feeding en fruits and leaves of trees; it conftantly refides in woods : like fome other animals, which nature has furnimed with a tail of great length, it is obferved occafionally to amufe itfelf by nibbling and biting the end of the tail, and is on this account fometimes found with that part deftitute of the four or five extreme vertebra.
The individual defcribed by Buffon was neither of a gentle nor fportive difpofition, and was neceffarily confined by means of a chain to prevent its doing mifchief; fruits, fugar, and comfits it devoured with apparent eagernefs and fatisfaction, befides which it was fed on bread; it almoft inceffantly uttered a low grunting noife, or when tired of being alone, croaked in the manner of the frog, and fo loud as to be heard at a great diftance. The tongue was rough like that of the cat ; and Buffon obferves, that when permitted it would lick a perfon's hand till the $\mathbb{K k i n}$ became inflamed; its careffes, ufually concluding wiha a bite of its teeth upon withdrawing the hand from him. This individual was a male, and from its partiality to cats it was fufpected its attachment might have been productive of an liybrid offfpring; but thefe expectations were never realized.
Macao. Tailed, black ; collar bearded with a kind of ruff. Lemur macao, Linn. Erxleb. Vari, Buff. Makivari, Defm. Black macauco, Edw. Ruffed macauco, Penn. Ruffed lemur, Shaw.
$A_{n}$ inhabitant of Madagafcar, and the adjacent iflands : its fize exceeds that of the mongoz, and in the ferocity of its manners it very far furpaffes that fpecies. Travellers defcribe it as being fcarcely lefs furious than the tiger; it is dangerous even to be met in the woods by two together, or even one, and yet they fometimes affemble to the amount of a hundred in company, when nothing can refift their, attacks. Edwards is the only writer who fpeaks of it as an inoffenfive creature, and the individual he mentions was in a ftate of captivity; he mentions it as "a very fociable, gentle, harmlefs-natured animal, not having the cunning, mifchievoufnefs, or malice of the monkey kind." The colours of this animal vary much in different individuals, yet

## LEMUR.

are in general diverfified with patches of black and white, though fumetimes it appears they are totally white or brown. The voice of this animal is loud and terrible, and is by fome compared with the roaring of the lion, or rather its cries refemble thofe of the howling-monkey of Brafil and Guiana; it delights in fun-fhine, and fleeps in dark places. The fur of this animal is long, the muzzle large and rather long, the ears fhort and fringed with long hairs; and the eyes of futch a deep orange as to appear of a fiery rednefs. The ruff, or cravat-like ring of long fur that furrounds the neck, is peculiarly ftriking in its appearance, and ferves principally to characterize this Ipecies; befides which it may be obferved, that the great hind-toes are almolt fubulate. It refures eggs, flefh, and fifh.

Catta. Tail aunulated with black and white. Linn. Erxleb. Moococo, Buff. MIaki-mocaco, or maucoco, Defm. Maucauco, Edw. Ring-tailed macauco, Penn. Ring-tailed lemur, Shaw. Lev. Muf.

The mococo, fays Buffon, is a beautiful animal, with a fine countenance. Its fize is rather fimaller than that of the full-grown cat, the fhape more flender; its colour above and on the outfide of the limbs fomewhat ferruginous, the under parts whitifh, and the fur throughout remarkable for its luftre. The eyes are large, of a bright orange, inclining to hazel, and are furrounded by a diltinct circie of black; the muzzle is black, and the hands and feet of the fame colour; the fingers and toes furnifhed with round nails, the mails of the great toes not being longer or fubulate as in molt other fpecies. The tail, which it always carries erect in a graceful pofition, is very long; the hair upon it longer than the reft of the fur, and marked with about thirty equi-diftant or regular diftinet circles of black and white.

The manners of this fpecies are gentle and lively, in various refpects refembling thofe of the monkey, tribe, without its petulance and malice; when pleafed it purrs like a cat. In a fate of liberty thefe animals live in focieties of thirty or forty together in the woods; in afcending trees they climb with all their feet like the ape ; their food confifts of fruits, herbs, and roots, and it is alfo afferted they will eat animal food; like the fquirrel they fometimes feed fitting upright, and often extending their hands forwards, and in the fame manner, when in a Itate of captivity, take their ftation before a fire to warm themfelves. This fpecies inhabits Madagafcar.

Bicolor. Blackifh, beneath and heart-fhaped fpot on the forehead white; tail long. Lemur licolor, Gmel. Lemur albifrons, Audebert. Heart-marked maucauco, Penn. Heart-marked lemur, Shaw. Gen. Zool.

Suppofed to inhabit South America; the head is obtufe ; nails fubulate; toes white.

Pusillus. Grey ; eyes large and brown. Lemur pufillus, Audebert. Rat de Madagafcar, Buff. Maki-nain, Derm.

This fpecies inhabits Madagafcar ; its length is five inches and a half from the tip of the nofe to the bafe of the tail; the muzzle fhorter than in moft other fpecies. An individual of this kind brought from its native country was preferved alive in France for fome years. It evinced a remarkable degree of activity in its motions; its cry was feeble like that of the fquirrel; and its foed conffited of fruits and almonds. The hiftory of this curious little fpecies, as related by Buffon (under the title of rat de Madagafcar), is erroneoully placed by Mr. Pennant, in his work on quadrupeds, under the defcription of his Murine maucauco, by which means the two fpecies are confounded together. Dr. Shaw, from his adherence to this writer, has alfo fallen into the fame opinion in his General Zoology.

Murinuse Cincreous; tail tawny. Gmel. Lemur gris feus, Audebert. Grifto ATaki-gris, Defm.

This beautiful little animal is a native of Madagafcar. The whole body, except the face, feet, and hands, are covered with greyifh woolly hair; the tail is very long, and covered with fhort woolly hairs, lake the reft of the body. It much refembles the lemur catta in its general appearance; the pofterior limbs are much higher than thofe before.
Galago. Tailed; whitifh, bencath grey; tail ferruginous. Galago, Geoff. Adanion, \&c. Galazo fenegalenfis, Audebert.

One of the fmaller fpecies of the tribe, meafuring fix or feven inches from the nofe to the tail, the latter cight inches. 'The cars are very large, thin, upright, and rounded at the tip; the hind legs much longcr than the anterior ones; the nails of the hands rounded, except that of the fore-finger of each, which confitts of a tharp clave. Thefe animals, according to Adanfon, are of a peaceable difpofition; they feed on infects, and live in trees. The negroes of Galam hunt them for the fake of their flefh, the flavour of which is, however, very indifferent.
Psilodactylus. Rulty cinereous; tail extremely villofe; middle finger of the fure-feet very long and naked. Lemur pfilodacylus, Schreber Suppl. Aye-aje, Sonnerat. Aye-aye Squirrel, Penn.
This is a fpecies allied fo nearly to the fquirrel tribe, to which it is referred by Gmelin, that it admits of doubt whether Schreber is entirely correct in configning it to the lemur tribe ; and it alfo approaches very clofely the family of monkies. Its length is eighteen inches, the colour pale ferruginous grey, with a blackifh caft on the back and limbs; the tail entirely black, fides of the head, neck, lower jaw, and belly greyifh. The head is fhaped like that of the fquirrel; the ears large, round, and naked, their colour black; and in front of each jaw are two cutting teeth; the feet long; the interior tues of the hind feet fhort, and furnilhed with flat round nails. All the claws on the fore-feet fharp and crooked, the two middle ones in particular very long, extremely thin and naked, except at their bafe. It is a timid animal, uncommonly flow in its morements, and of a mild difpofition. M. Sonnerat obferves, that its eyes were of an ochre-colour, and refembled thofe of the owl, and like that bird the animal can fcarce fee diftinclly by day. The individuals kept by Sonnerat lived only about two months; they flept almoft continually, and were fcarcely to be awakened but by fhaking two or three times. Their nourifhment confifted of boiled rice whick they took up with their long fore-toes, in the manner that the Chinefe ufe their eating ftucks. It is a native of Madagafcar, where it is rare. Fruits and infects appear to be its ufual food.

Some indecifion prevails among naturalifs refpecting the lemur genus, and its immediate affinities; the Limnæan and Gmelinian charater is not altogether fufficiently precife, and thus embraces more than one diftinet natural genus, of which the galeopithecus (lemur volans, Linn.) is a prominent example. . Thie number of genera into which Geoffroy divides the lemures is confiderable, amounting (independently of the galeopithecii) to no lefs than five, namely, lemur, indri, loris, galago, and tarfus. This dilfribution, with fome night occafional deviations, is adopted by the lateft French writers. The genus Lemur (maki) is characterized as having the muzzle very long; four incifive teeth in the upper jav, beneath fix; inclining forwards; grinders tuberculated; ears flrort, or fhortifh; tail very long. Under this are retained the Linnzan lemur cata, mongoz, and macaco ; lemur rufus of Audebert; lenur
bicolos.

## L E M

bicolor (albifrons, Geoff.) and the two little fpecies, called by Geoffroy grifeus and pufillus. Indri, the fecond new genus, confilts at prefent but of two fpecies, the Linnzean lemur indri and laniger; the former of which is indri brevicaudatus of Geoffroy; and the latter indri longicaudatus of the fameauthor. Thefe have the muzzle very long; in each jaw four incilive teeth; the upper ones ftanding diltant in pairs; and grinders tuberculated; in other refpeets they retemble the lemur. In the genus Loris the head is rounded, the muzzle fhort; incifive tecth in cach jaw four, the lower ones directed forwards; eyes very open; cars moderate; noftrils fituated on the fides of the nofe; no tail, but in its place a tubercle; pectoral teats four; this confits of two fpecies, lemur tardigradus, Linn.; and lemur gracilis, Geoff. Galago, the fourth genus, is diltinguified by the rounded form of the head, fhort muzzle, two incifive teeth in the upper jaw, very remote; in the lower one fix ; grinders with pointed tubercles; noffrils placed at the fides of the nofe; ears naked, fometimes very large; anterior legs fhort, polterior ones elongated; fecond finger of the hind feet fhorter than the reft; tail longer than the body, and hairy; fcrotum very large. This comprehends galago fenegalenfis of Geoffroy, and le petit galago, (lemur minutus, Cuvier.) Tarsius is the laft of thefe new genera; its character confifts in having the head rounded; muzzle a little prolongated; in the upper jaw four incifive teeth, in the lower only two; canine teeth feveral, and fhorter than the incifive ones; the grinders with pointed tubercles; pofterior thanks uncommonly long; tail long and tufted; ears large and naked. This genus, which can fcarcely, perhaps with propriety, be referred to the Gmelinian lemur, althongh partially affented to by fome authors, comprifes tarfus daubentonii of Geoffroy (lemur tarlius, Pallas), and didelphis macrotarfus, Gmel. ; with two others, one lemur fpectrum of Pallas, the other tarfus Fifcherii, Nob.; a fpecies very recently defcribed, and named Fifcherii after profeffor Fifher, by whom it was firit introduced to general oblervation.

LEMURES, in Antiquity, fprites or bobroblins ; reflefs 'ghofts of departed perfons, who return to terrify and torment the living.

Thefe are the fame with larvx, which the ancients imagined to warder round the world to frighten good people, and plague the bad. For which reafon, at Rome they had Lemuria, or feaits inftituted to appeafe the manes of the defunct. Sce Lares.

Apuleius explains the ancient notion of manes thus: the fouls of men, releafed from the bands of the body, and freed from performing their bodily functions, become a kind of dæmons or genii, formerly called lemures. Of thefe lemures, thofe that were kind to their families, were called lares familiares; but thofe who, for their crimes, were condemned to 'wander continually, without meeting with any place of relt, and terrified good men, and hurt the bad, are vulgarly called larva.

An ancient commentator on Horace mentions, that the Romans wrote lemures for remures; which laft word was formed from Remus, who was killed by his brother Romulus, and who returned to earth to torment him.

But Apuleius obferves, that in the ancient Latin tongue lemures fignifies the foul of a man feparated from the body by death.

LEMURIA, or Lemuralia, a feaft folemnized at Rome on the ninth of May; to pacify the manes of the dead, or in honour of the lemures.

The inftitution of this feaft is afcribed to Romulus, who, to rid himfelf of the phantom of his brother Remus (whom

## LE N

he had ordered to be murdered) appcaring always before him, ordained a featt, called after his name Remuria, or Lemuria.

In the Lemuria, they offered facrifices for three nights together, duringall which time all the temples of the gods were fhut up, nor were any marriages permitted. There were many ceremonies in this fealt, chiefly intended to exorcife the lemures, and prevent their appearing, or giving any difturbance to the living.

LENA, in Geography, the greateft river of Eaftern Siberia. It takes its origin on the north-weftern fide of the Baikal, in a morafs; runs at firlt wettwards, then to the diftrict of Yakuthk caftwards, and laflly towards the north, where, after having divided itfelf into five great branches at its mouth, and thereby formed four confiderable ifands, it flows into the Frozen ocean. Its courfe is computed to be 5000 verts. Its fource is in N. lat. $52^{\circ} 30^{\prime}$, its mouth in $73^{\circ}$ lat., and the eaftern arm in 153, and the weftern in $143^{\circ}$ of longitude. This river has in general a very gentle current; its botiom is moftly fandy, and the fhore only in the upper regions befet with hills and cliffs. Of the numerous rivers which it takes up in its courfe, the largeft are the Vitim, the Olekma, the Viluy, and the Aldan. Out of the Lena travellers pafs into the Aldan, from that into the Maia, from the Maia into the Yadona, and from this they have but a fhort route to make by land to Okhotk: Tooke's Ruff. Emp. vol. i.

Lena, a harbour on the W. coaft of Mindanao. N. lat: $6^{\circ} 4^{2}$. E long. $122^{\circ} 12$.

LENEA, Arvasa, in Antiquity, a fẹtival of Bacchns, furnamed Lenaus, from $\lambda$ nvo:, i. e. a wine.prefs. Befides the ufual ceremonies at feafts* facred to this god, it was remarkable for poetical contentions, and tragedies acted at this time. Putter's Archrool. lib. ii, cap. 20. tom. i.' p. 412.

LENATO, in Geography, a town of Italy, in the department of the Olona ; 5 miles S . of Milan.

Lenberan, a town of Perfian Armenia; 168 miles E. of Erivan.

LENCLOISTRE, a town of France, in the department of the Vienne, and chief place of a cantom, in the dittrict of Chateilerault; it miles N. of Poitiers. The place contains 2114 , and the canton 7350 inhabitants, on a territory of $182 \frac{1}{2}$ kiliometres, in mine communes.

LeNCLOS, AnNe, or Ninon de, in Biography, an ilIuftrious woman, born at Paris in 1616, was daughter of the fieur De l'Enclos, a gentleman of Touraine, who had ferved with reputation in the army: her mother was a devotee. She loft both her parents at the age of fifteen, and being left miftrefs of a large fortune without any one to controul her, fhe determined to adopt a mode of life fuited to ber inclinations. She had already derived her philofophy from the works of Charron and Montagne: The was beautiful, and by much attention became very accomplifhed, and qualified for the company of the moff cultivated perfons of her time. Amorous in her conftitution, and licentious by principle, fhe refolved to give free indulgence to the tender paffion, without the fhackles of a ferious engagement. She never fold her favours ; and her attachments feem partly to have been prompted by perfonal attractions, and partly by vanity, as they included perfons of high rank and reputation, as well as men of gallantry and fafhion. She was complimented and confulted by the moft eminent writers of that time, and her friendifip was fought by fome of the molt refpectable of her own fex. She was intimate with madame de Maintenon, when the wife and widow of Scarron, who wihhed to engage Ninon

## L E N

to live with her, when a partner in the throne, to difpel the dreadful ennui which was the price of her clevation. Ninon preferred her liberty to the prifon of a palace, and as fhe retained her perfonal charms to a late period, and her mental attractions to the clofe of life, fhe was very long the object of admiration, and had the honour of forning more than one generation of young men of faflion. Mothers, fo licentious was the agc, were pleafed to fee their fons in her train, as fle always promoted decorum, and the air of good company ; and it was univerfally admitted that the was capable of difinterelted friendihip to thofe who confided in her. If fhe were all object of envy to bye-ftanders, the was, at the fame time, confcious of having miltaken the way to true happinefs; zior in one of her letters to St. Evremond, fie fays, "Every one tells me that I have lefs to complain of time, than any other perfon. Howerer that may be, if fuch a life, as I have fpent, had been propoled to me as my lot, I would have hanged myfelf rather than have pafted through it." She died at the age of eighty. She is reputed to have been the author of a fet of letters to the marquis de Sevigne. Some of her real ones are contained in the works of St. Evremond. Moreri.

LENCZICZ, or Levtscuitz, in Geography, a town of the duchy of Warlaw, formerly capital of a palatinate of the fame name in Poland; furrounded with a wall and moat, and defended by a cattle placed on a rock. A provincial diet, a court of judicature, and provincial fynods of the clergy, are held in this town; 60 miles W.S.W. of Warfanv. N. lat. $51^{\circ} 52^{\prime}$. E. long. $19^{\circ} 17^{\prime}$.

LENCZNA, a town of Poland, in the palatinate of Lublin; 16 miles N.E. of Lublin.

LENDAR, a town of Iftria; 19 miles E. of Capo d'Ifria.

LENDENARA, a town of Ttaly, in the Polefe di Rovigo; containing two churches and four convents; 8 miles W. of Rovigo.

LENDORA, a town of Ruffia, in the government of Olonetz; 100 miles W.N.W. of Povenetz.

LENE Lougri, a lake of Ireland, in the county of Weltmeath, near the fmall town of Fore.

LENES, a fmall ifland in the North fea, near the coalt of Norway. N. lat. $67^{\circ} 40^{\prime}$.

L'ENFANT, David, in Biography; a French Dominican friar, was born at Paris in the year 1603 . He embraced the ecclefialtical life at the age of feventeen, and manifefled a moft ardent thirft for knowledge, together with very uncommon literary induftry. He died in the year s688, at the age of eighty-five. His principal work is "A General Hiftory of all Ages," in three vols.; which was afterwards extended to fix volumes. He alfo publifhed "Sancti Bernardi Abbatis Biblia," containing a collection of all the illuftrations of texts of fcripture difperied throughout the works of that author; and fimilar works refpecting biblical illuftrations of St. Auguftiné, and St. Thomas Aquinas. Moreri.

L'Enfant; Jamies, an eloquent as well as very learned French Proteitant divine, was born at Bazoche in the year ${ }^{1661}$. He purfued his theological ftudies at Saumur, under Lewis Cappel, profeffor of Hebrew, and afterwards at Geneva. In 1683 he left Geneva, and was admitted in the following year to the exercife of the miniltry at Heidelberg, and ordained paftor of the French church in that place. Owing to his fuperior pulpit talents he was appointed chaplain to the dowager electrefs palatine. In 1688, on the in.vafion of the palatinate, he removed to Berlin, and was appoiated paftor of one of the churches. He was in a fhort

Vol XX.

## I. E N

time nominated preacher to the queen of Pruflia. In 1707 we find him in England, and nomisated one of the chaplains to queen Anne, an honour which he declined on account of his great attachment to Berlin. He died in 1728, at the are of fixty-feven. His publications were numerous in divinity, eculefiaftical hinory, criticifm, and polite literature. Thofe which are held in the highelt eftimation are his "Hiftories of the Councils of Pifa, Confance, and Bafil." Thefe hifories are written with great ability and impartiality, and they abound with intereffing facts and curious refearches. "'Enfant, in conjunction with M. Beaufobre, publifhed "The New Teftament tranfated from the original Greck into French," in two volumes 4 to. with notes, and a general preface, or introduction to the reading of the holy fcriptures, u'eful for ftudents in divinity. He is known alfo by his "De Inquirenda Veritate," which is a tramflation of Malebranche"s "Scarch after Truth;" "The Hittory of Pope Joan ;" "Poggiana, or the Life, Charatter, Opinions, \&c. of Poggio, the Florentine, with the Hitory of the Republic of ${ }^{\text {Florence," and other works. Moreri. }}$

LenGa de Bazasa, in Geography, a province on the coaft of Caramania. N. lat. $36^{\circ} 33^{\prime}$. E. long. $34^{\circ} 11^{\prime}$.

LENGEFELD, a town of Saxony, in the circle of Erzgcburg; 12 miles S.E. of Chemnitz. N. lat. $50^{\circ} 40^{\prime}$. E. long. $3^{\circ} 7^{\prime}$.

Lengefeld, or Lengenfeld, a town of Saxoriy, in the Vogtland; 10 miles S.s.W. of Zwickaw. N. lat. $50^{\circ} 27^{\prime}$. E. long. $12^{\circ} 22^{\prime}$.

LENGER, a town of Perfia, in Khorafan; 162 miles N.N.W. of Herat.

Lenger Kuran, a town of Perfia, in Ghilan; 120 miles N.W. of Refhd.

LENGFURT, a town of Germany, in the county of Wertheim; 12 miles S.S.W. of Wertheim.

LENGHIER, a town of Perfia, in Khorafan; 7o miles E. of Herat.

LENGIUM, a town of Sweden, in Welt Gothland; 42 miles E . of Gothenburg.

LENGLET, du Freskox, Nicholas, in Biograpby, was born at Beauvois in 1674 . He applied himfelf particularly to the ftudy of theology, and compofed feveral works in a ftrain of freedom, which attracted the cenfure of the Sorbonne, and other eftablifhed bodies. Difgufted with the oppofition which he met with, he quitted divinity for politics, and in 1705 was fent by Torcy, minifter for foreigr affairs, to refide at the court of the elector of Cologne, as fecretary for the Greek and Latin languages. He was entrufted with the management of the foreign correfpondence with Bruffels and Holland, by means of which he became acquainted with various plots againft the French interelt. Lenglet returned to France at the conclufion of the war, and employed himfelf in many literary works. In $y^{21}$ he went to Vienna, and was appointed librarian to prince Eugene, a polt which he did not long retain, on account of fome mifconduct. Owing to this circumftance, he always remained in indigence, though he had friends that would have raifed him to a better condition. Some of his writings were compoled in fo free a fyle as to caufe the author to be imprifoned feveral times in the Baltile. He was accidentally burnt to death in the year 1755 , in his eighty-fecond year: Of his various works we may notice thofe which are moft efteemed, viz. "Méthode pour étudier l'Hiftoire, avec un Catalogue des principaux Hîtoriens," 12 vols.; "Méthode pour étudier la Géographie," with maps; "Hiftoire de la Philofophie Hermetique,", and "Tablettes Chronologiques de l'Hitoire Univerfelle," two vols. 1744. An enlarged
edition of this wark was publifbed in 1777 , by Bruyere, 10 which we have been indebted in the courfe of our inquiries. Muscri.

I, ENGO Spracimno, in Geomerosep, a town of Africa, in Congo: +5 miles S.S.WV. of Bombi.
 oon: liasts, is to make him ges round in two treads, at a walk or tro, "ppon a fpot of ground fonarow, that the horfe's homelnesbeing in the centre of the volt, bis own Iougth is much about the femidiameter of the volt; the horfe thll whank between the two bels, without putting out his croub, or going at lalt faller or flower than at lirlt

LENGIHENANG, in $\boldsymbol{N}^{*}$ aral Aicbitalure, is the onesation of feparatins a thip athwart the midhips, and adeing a certain portion to low length. It is performed by clearing all the fallenings near the butes of thofe planks as may be retaned, and the orhers are cot afmender. 'The after end is then drawn or lumehed apart to the required diflance. The kee! is then madc good, and a fuficient rymber of floors cro fed, and timbers raifed to fill up the vacaney froduced by the feparation. The keelfon is then replaced to give good thift to the fearfs of the keel. The planks on the outfide are then replaced with a proner Rhift, alfo the clamps and footwaling infide. As maty beams ats are neceffary are next placed athwart and kneed, the decks made good, and the fhip completed in all refpects as before. Sometimes fhips are fhortened in a fimilar manner.

LENGUR, in Gcograply, a town of Perfia, in the province of Mazanderan; 15 miles N.W. of Amol.

LENHOFDA, a town of Sweden, in the province of Smaland; 30 miles N.W. of Calmar.

LENIOR, a county of America, in Newbern diftrict, North Carolina, furrounded by Glafgow, Craven, Jones, and Dauphin; containing 3898 free inhabitants, and 1457 flaves. The chief town is Kingtton.

LENIS Spibites, in Profody. See Spirit:
LENITIVE, in $P b_{y} / i f$, fometimes denotes a foftening, reflutive remedy, that moittens the parts difeafed, and difilpaes any fharp humour collected there.

Levirive is more frequently ufed for laxative.
Lexitive Elftuary is more peculiarly ufed for a gentle pargincelectury. See Erectuany of Sonna.

LENKERAN, in Gcograply, a town of Perfia, in the province of Ghilan, near the Calpian fea. N. lat. $28^{\circ} 40^{\prime}$. E. long. $49^{\circ}$.

LENNAN, LA, a town of Teru, in the diocefe of La Paz; 27 miles N. óf Potedi.

LENNEP, a town of the dur hy of Berg, inhabited for the moit part by Lutherans; 20 n iles E.S.E. of Duffeldorf. N. lat. $5 I^{\prime} 9^{\prime}$ E. Iong. $7{ }^{\circ} 1 \mathrm{~S}^{\prime}$.

LENO, a harbour on the W. coaft of the inand of Mindamao.

LENNICK-SAint-MARTIN, a town of France, in the department of the $D y l e$, and chief place of a canton, in the ditrict of Bruffels. The place contains 5559, and the canton 10,606 inhabitants, on a territory of 120 kiliometres, in 12 cummunes.

LENOS, in Hippocrates, denotes an old machine for reducing fractures and diffocations.

LENOX, in B:ografly, See Ricminnd, Duke of.
Levan, in Gcografley, an ifland in the Mergui Archipelago, about five miles in circumference. N. lat. $)^{\circ} 2^{\prime}$.

Lexox, the fhire town of Berkihire county, Maffachusetts; it is a pleafant and thriving town, and has a court houfe and a ranal. The river Houfatonick traverfes the town; 145 miles $N$. of Bofton. The number of inhabitants is 1041 .

Lrwox Cafle, a polt-town of Duckingham county, North Caroliata: 390 miles from Wafhingeon.

LENS, in Diopsies, properly fignibies a fmall, roundifa ghafs, of the ligure of a lentil; but is extended to any detached portion of a tranfparent fubltance, of which the oppofite fides are regular polithed furfaces of fuch forms as may be deferibed by lines revolving round a common axis; or to any optic glafs, not very thick, which either collects the rays of light into a point, in their paflage through it, or difperfes them farther apart, according to the laws of refraction. A lens is generally fuppofed, in fimple calcuiations, to be infinitely thin, and to be denfer than the furrounding medium.

Lenfes have various figures; that is, are terminated by various furfaces, from which they acquire various names.' The lines that form them may be portions of circles, of cllipfes, of hyperbolas, or of any other curves, or they may be right lines. But, in general, one of the fides is a portion of a fpherical furface, and the other either a portion of a fpherical furface or a plane. Hence fome are plane on one fide, and convex on the other; others convex on both fides; both which are ordinarily called convex lenfes; though, when we fpeak accurately, the former are called plano-convex, and the latter, double convex. Again, fome are plane on one fide, and concave on the other; and others are concave on both fides, which are both ufually ranked among the concave lenfes; though, when diltinguifhed, the former is called a plano-concave, and the latter, a double concave. Others, again, are concave on one fide, and convex on the other; which are called sonveso-concave, or concavo-convex lenles. The figures of all thefe are fufficiently defcribed by their names (fee alfo Plate VI. Optics, fig. 5.); except that the term menifcus, which properly implies a litale moon or crefcent, is applied in general to all kentes which are convex on the one fide, and concave on the other, although they may be thicker at the edges than in the middle. Sometimes, however, a lens of this kind is diltinguifhed by the term con-cavo-convex. See Mexiscus.

When the particular figure is not confidered, a lens that is thickeft in the middle is called a convex lens; and that which is thinnelt in the middle is called a concave lens, withon farther diltinction.

It is to be here obferved, that in every lens terminated in any of the forementioned manners, a right line perpendicular to the two furfaces is called the axis of the lens; which axis, when both furfaces are fpherical, paffes through both their centres ; hence it is manifelt, that no lens, except the fphere, can have but one axis; and therefore all pencils of rays are oblique, excepting thofe whofe foci are in the asis of the lens: but if one of them be plane, it falls perpendicularly upon that, and soes through the centre of the other. The points where the axis cuts the furface are called the vertices of the lens, and the middle point between them is called the centre. 'Ihis is the cafe, when the lenfes are thin, as they are ufually fuppofed to be; but when the lens is pretty thick, and its furfaces of unequal curvatures, then the centre of the lens is nearer to one vertex than to the other; by as much as the radius of curvature of the former furface is lefs than that of the other.

For the explanation of other terms that pertain to lenfes, and of their general effect, it is obvious, that if a ray of light falls perpendicularly upon the vertex of a lens, or coincides with its axis, it mult pafs flraight through the lens without fuffering any refraction; but when it falls obliquely upon it, it mult emerge out of the lens in a direction inclined to its former direction. Thus, if the rays of light, which,
infuing from the luminous point A, (Plate VI. Optics, fig, 6.) fall upon the lens 1 E , the ray A C , which proceeds in the dircction of the axis of the ms, mult pafs ftraight through it ; but the ray A B, falling obliquely upon the furface of the lens, mult be refracted, or bent, and if the lens be a plano-convex, or double convex, that ray muft be bent inwardly, that is, towards the axis; confequently it mult interfect the axis in fome point, as $l$. This pent $F$ is cailed the refrafced focus of that ray, or rather of the rays A 13 , A E, Sec. which fall upon the iens at equal diftances from the axis A C, and whish all mect and crofs at the fame point F ; but the point A from which they iffue, is called the raduant point, or the focus of incid.nt rajs; and both thefe points, in reference to cach other, are cailed the conjugate foci. If a lens be concave, as in fig 7 , then the oblicque rays A B, A E, \&ce will be bent outwardly, or from the axis; in which if the refracted rays be fuppofed to be continued backwards until they meet the asis as at $F$, then the point $F$ is called the rirtual forus of the refrated rays, being in fact the centre of divergency of the rays. In this cafe the conjurgate foci are both on the fame fide of the lens; riz. the real focus of incident rays, and the virtual focus $F$ of the refracted rays $\mathrm{B} \mathrm{G}, \mathrm{D}$, ES. It is to be obferved, that all the rays which fall upen the furface of a lens, whether it be convex or concave, will not meet at one and the fame point when the lens is consex, nor have a common sirtual focus when it is concave; but thofe rays which are more dittant from the axis, after the refraction, meet fooner than thofe which are nearer to the axia; and this efficet is greater in proportion as the furfaces of the lens are farther from each other, and confit of larger fpherical fegments. Hence a glafs globe renders the above-mentioned effect very confpicuous; and hence the lenfes are made as thin as poffible: but in all cafes, a lens which contifts of fpherical furfaces, does never refract the rays which fall from a luminous point, precifely to the fame focus. The rays which fall upon the edge of the lens have their refracted focus not only nearer to the lens, but alfo farthert from the axis, viz. on one fide of it. Lines drawn through the refracted foci of the rays, which belong to one luminous or radiant point, form two curves, which make an anyle with each other at the axis, or principal focus, and are calied "caultics by refraction" (fee Caustic); which are real in convex lenfes, but imaginary in thofe that are concave. When the lenfes are thin, and their fophericity not very great, thefe caultics are fo trilling that the eye does not perceive them; but lenfes that are thick and of great convexity produce a confiderable aberration of the rays, and an evident difortion of the object to an eye that looks through them. This aberration may be exhibited experimentally by covering one fide of a glafs globe or thick lens with a circular piece of brown paper, having a row of equidiltant pin-holes in its diameter. Let the light which paffes through thefe holes, and through the lens, fall upon a piece of whine paper held perpendicular to the rays of light, and you will find that when the paper is held near to the globe or lens, the fpots of light upon it are at equal diltances from one another fucceffively; but if the paper be gradually withdrawn from the lens, the intervals between the exterior fpots grow lefs than the intervals between the interior, and foon unite. If the fame operation be performed with a thick concave lens, the intervals between the exterior fpots will be found to grow larger than the interior, \&c. There is another aberration, refulting from the different refrangibility of the rays of light; and which caufes a much greater imperfection in lenfes. For an account of both, fee Abrhimios. Notwithltanding thefe
aberrations, siafs lenfes, that are not very thick, are reckoned to have a determinate focus of refracted rays, onginally iffuing from a fumgle radiant point; and the diftanco of that focus from the furfuce of the lens is called the focal diffance of thefe rays. In order to preparc the way for determining their focal diflance, it may be confidered, that about the middle of the furface of every lens there is a point, upon which, if a ray falls and pafies through the lens, the emergent part will be parallel to the incident ; for the point of incidence and the point of emergence may be fo tituateri, that if two planes touch the furfaces at thefe points, they may be parallel to each other. That ray or part of a pencil of light, which ahus paffes through the lens, without benng bent, is called the axis of that percil, and this axis palth3 through the center of the lens. When rays of light falt upon the fame lens with different inclinations, it is eviderit that after the refraction, they mult have their foci at different diflances from the lens. When rays of light come parallel to each other, fuch as thofe which come from a point of the fun's furface, or from any other ditant point, and fall perpendicularly, or nearly fo, upon the furface of a lens; then the focus of thefe rays, after refraction, is called the grometrical focus, or the principal focus of that lens, and its diltance from the lens the principal focal diltance of that lens. The principal focus of a lens may be found either experimentally or by computation. In a plano-convex, dou-ble-convex, or menifcus, the principal focus is real ; in the other lenfes the focus is virtual. See the Thcory of Lenfs demonffoted under Rarractios and Dioptrics, ard the application thereof under Mícroscope, Telescore, Buks-ixg-glass, and Focus.
Some confine lenfes within the diameter of five or fix lines, and will have fuch as exceed that diameter cailed lenticular glafes.

Lenfes are diftinguifhed, with regard to the manner of their preparation, into ground and blocun.

Lexses, Blown, are little globules of glafs, melted in the fame of a lamp, or taper. See Microscope.
Lenses, Manner of grinding. A. little piece of copper is cemented to the end of the arbor of a lathe, and turned till it form a aifh , or bafon, of the diameter of the lens required. Then a piece of clear glafs is cemented, on one of its flat fides, to the end of a little maundrel, with black Spanifh wax ; and thus ground, on the fide not cemented, on a grinditone, with water, till it hath nearly acquired a convex figure. It is finithed in the lathe, by turning it in the bafon, with fine wet fand, grit-ltone, or emery. The grit mult be often repeated freh till the lens appear very round; when it is come to that point, they ceafe to take any frefh ftone, but continue to turn it in the bafon, till the remains of the fand are become fo fine as to have polifhed it. This they perceive, when, upon wiping it, the image of the window of the place is feen painted on its furface; if it does not, it is wetted in water without any fand, and turned till it hath got a polifh. The bafon is then covered, withinfide, with two or three folds of linen, and the polifh finifhed with putty, or tripoly of Venice fteeped in water. It is known to be perfectly polifhed, when, viewing it with a magnifier, there appear no fcratches of the fand. The cement is then broken off, and the fide polifhed cemented, to work and grind the other, as before, till the edges of the lens be become fhapp, and it be perfectly polifhed on either fide. When finifhed, it is wafhed in fpirit of wine, to take off all remains of the wax.

According to the mode now generally practifed, optical glafes are fixed on blocks by means of a cement, and ground with emery by a tool of proper convexity or con.

## LENS.

cavity; if they are fmall, a large number is fixed on the blocks at the fame time. The tool is fometimes firlt turned round its axis by maehinery, and when the lenfes are to be finihed, a compound motion is given to it by means of a crank; and in order to make it more fmooth, the wheels turn each other by brufhes inllead of cogs. The point of the lens where its two furfaces are parallel, is determined by looking through it at a minute object, while it is lixed on a wheel with a tubular axis, and fhifting it, until the object appears no longer to move; a circle is then defcribed, as it revolves, in order to mark its outline. The difhes in which lenfes are fometimes ground are of bell metal; and the emery is prepared by clutriation.

In the Philofophical Tranfactions we have the figure of a machine for grinding lenfes fpherically: It is a contrivance to turn a Sphere at one and the fame time on two axes, interfecting each other at right aingles, with an equal velocity and preffure on each. See the Tranfactions, $\mathrm{N}^{\circ} 459$. feet. I. See Grinding of Optic Glaffes.

Lenses, for conver, the laws of their refraction, and their effects depending thereon, are as follow.-I. A ray of light, E G, near the axis (Plate VI. Optics, fy. 8.), and parallel to it, ftriking on the plase furface of a plano-convex lens, directly oppolite to the luminous body, after refraction concurs with the axis in the point F : and if C be the centre of the convexity, C F will be to FL , that is, the diltance of the centre from the point of concourfe, or focus, will be to the diltance of the centre, from the convex furface, in the ratio of the refraction.

For the plane furface being direcly oppofed to the luminous body, the ray $\mathrm{E} G$ is perpendicular to $\mathrm{A} B$, and therefore will pafs unrefracted to H : thus it ftrikes on AHB , ftill parallel to the axis; and therefore coming out of a denfer medium into a rarer, it will meet with the axis of the lens in F: and fo as that C F will be to FL in the ratio of the fine of the refracted angle to the fine of the angle of incidence: as will be demoniftrated under the head Refraction.

And, therefore, C F - FL, or CL is to FL as the difference of thele fines is to the fine of the angle of incidence; and CF-FL, or C L is to C F as the fame difference is to the fine of the refracted angle.

If then the refraction be out of a glafs lens into air, C F: FL: : $3: 2$, or C L : FL:: $1: 2$, and CL:CF:: $1:$ 3 ; and therefore $\mathrm{FL}=2 \mathrm{CL}$; that is, parallel rays, near the axis, will concur with it at the diftance of the diameter. Moreover, if parallel rays pafs out of air into glafs, it will be CF:FL::2:3, and CL:FL:: $1: 3$, and C L: CF:: I:2. It is evident from hence, that if C L be diminifhed, without any variation in the refracting power, FL would alfo be diminifhed. Again, if the refraction were out of a water lens, i.e. out of a plano-convex lens filled with water, CF:FL::4:3, or CL:FL::1:3; and therefore $\mathrm{FL}=3 \mathrm{C} \mathrm{L}$; i.e. parallel rays, near the axis, will concur with it at the diftance of a diameter and a half. It is eafy to deduce the effect of refraction out of air into water. So that if a lighted candle be placed in the focus of a planoconvex lens, that is, in the point F, diftant from the furface of the lens A L B , by the length of the diameter; and from the furface of the water lens by a diameter and a half, its rays, after refraction, will become parallel.
2. If the ray K I, (Plate VI. Optics, fig. 9.) near the axis of a plano-convex lens, and parallel to it, Atrike on its convex furface A HB, after a double refra ion, it will meet the axis in F ; fo as that H G will be to G C, and $G \mathrm{D}$ to FD , in the ratio of the refraction.

For the ray K I, parallel to the axis E G, by virtue of
the firft refraction in I, will tend to the point G, fo that G H will be to GC in the ratio of the fine of the angle of incidence to the fine of the roracted angle : therefore, by virtue of the fecond refraction in L, it will concur with the axis in F; fo that GD will be to FD in the ratio of the fine of the refracted angle, to the fine of the angle of incidence. Sce Remiaction.

So that the femidiameter, and thicknefs of the planoconvex lens, with the ratio of refraction, being given, we Thall have a method of determining the focus of parallel rays ftriking on the convex furface. For, if the ratio of refraction be expreffed by $n: m, \mathrm{H} G: \mathrm{GC}:: n: m$; therefore $n-n: n:: \mathrm{HC}: \mathrm{HG}$; and $\mathrm{HG}=\frac{n}{n-m}$ $\times \mathrm{HC}$ : from which fubtracting the thicknefs of the lens, DH , and $\mathrm{GD}=\frac{n}{n-m} \times \mathrm{HC}-\mathrm{HD}$. Then fince the ratio of GD to FD is the given ratio of refinction, $\mathrm{FD}=\frac{n}{n-m} \mathrm{CH}-\frac{m}{n} \mathrm{HD}=$ (rejecting the quantity $\frac{m}{n} \mathrm{HD}$ as very fmall) $\frac{m}{n-m} \mathrm{CH}$.

Hence, if the lens be glafs, FD $=2 \mathrm{CH}-\frac{2}{3} \mathrm{HD}$. So that if two thirds of the thicknefs of the lens be inconfiderable, (as in practice it ufuaily happens,) paraliel rays meet with the axis at the diftance of the diameter from the lens, even when they itrike at a convex furface.

So that, as to the place of the focus, it is the fame thing whether the plane furface, or the convex one, be turned to a luminary of parallel rays; though it appears, both from experience and trigonometrical calculations, that there are more rays united in a lefs fpace, if the convex furface, than if the plane one, be turned towards the fun.

If the lens were full of water, $\mathrm{FD}=3 \mathrm{CH}-\frac{3}{4} \mathrm{HD}$, and therefore, if $\frac{3}{4} \mathrm{HD}$ be inconfiderable, $\mathrm{FD}={ }_{3} \mathrm{CH}$, or if $\frac{1}{4} \mathrm{HD}$ be inconfiderable, $\mathrm{FH}=3 \mathrm{CH}$. Parallel, and near rays, therefore, are united at the diftance of a diameter and a half, if the refraction be in water, even when the convex furface is oppofed to the luminous body.
3. Hence, alfo, arilies a method of determining the focus of parallel rays ftriking on a lens convex on both fides, the two femidiameters, and the thicknefs of the lens, being given.

For if the ray H I, (Plate VI. Optrics, fis. 10.) near the axis D G and parallel to it, fall on a lens convex on both fides, after a double refraction, it will meet the axis in $F$, provided that GE:GC and DK:D O have the ratio of refraction. And GD will be to GK as GO to GF. Since EG: GC in the ratio of refraction, the ray HI will tend to the point G ; and if DK be to DO in the ratio of refraction, after the fecond refraction at its egrefs, it will meet the axis in $F$, and GD:GK :: GO:GF. See Refraction.
And therefore, GD: DK :: GO:FO. Let the ratio of refraction be that of $n: m$, then $\mathrm{GE}: \mathrm{GC}:: n: m$, and D K: DO:: $n: m$; and, therefore, $n-m: n:: \mathrm{CE}:$ GE , and $n-m: n:: \mathrm{KO}: \mathrm{D} \mathrm{K}$; wherefore if the ratio of refraction and the femidiameters CE and KO are given, GE and DK may be found: and fince $\mathrm{GD}=\mathrm{DK}+\mathrm{EG}$ -EK , and $\mathrm{GK}=\mathrm{GE}-\mathrm{EK}$, and $\mathrm{GO}=\mathrm{GE}+$ KO-EK, and GD:GK::GO:GF; GF may be found: moreover $\mathrm{GE}-\mathrm{GF}=\mathrm{EF}$. If EK be rejected as very fmall, $\mathrm{GD}=\mathrm{DK}+E \mathrm{G}, \mathrm{GK}=\mathrm{GE}$, and $\mathrm{GO}=\mathrm{GE}+\mathrm{KO}$; and therefore, $\mathrm{DK}+\mathrm{EG:GE}$ $:: G E+K O: G F$.

## L E N S.

Hence, if the lens be ghafs, fince $G E=3 C E$, and $\mathrm{DK}=3 \mathrm{KO}, 3 \mathrm{KO}+3 \mathrm{CE}: 3 \mathrm{CE}:: 3 \mathrm{CE}+\mathrm{KO}:$ GF ; confequently $\mathrm{KO}+\mathrm{CE}: \mathrm{CE}::{ }_{3} \mathrm{CE}+\mathrm{KO}$ : G F. And fubltituting for $\mathrm{K} \mathrm{O}, a, \mathrm{CE}, b$, and $\mathrm{GF}, x$, $x=\frac{3 b b+a b}{a+b}$, and FE or FK, (rejecting E K) $=3 b$ $-\frac{3 b b+a b}{a+b}=\frac{3 a b+3 b b-3 b b-a b}{a+b}=\frac{2 a b}{a+b}:$
therefore the fum of the femidiameters $\mathrm{KO}+\mathrm{CE}$ is to the double of one of them, or 2 CE , as the other KO is to F IK the ditance of the focus from the lens.

If the glafs lens were equally convex on both fides, then $\mathrm{KO}=\mathrm{CE}$, and $2 \mathrm{CE}: C \mathrm{E}: \downarrow^{4 C E}: G \mathrm{~F}$, and there-
fore, $\mathrm{GF}=2 \mathrm{CE}$; and $\mathrm{FK}=\frac{2 a^{2}}{2 a}=a=\mathrm{EC}$; i.e. the diftance of the focus from the lens is equal to the radius of convexity.

If the lens were full of water, fince $G E=4 C E$, and $\mathrm{DK}=4 \mathrm{KO}, 4 \mathrm{KO}+4 \mathrm{CE}: 4 \mathrm{CE}:: 4 \mathrm{CE}+\mathrm{KO}$ : GF; confequently $\mathrm{KO}+\mathrm{CE}: \mathrm{CE}: \mathrm{I}_{4} \mathrm{CE}+\mathrm{KO}$ : G F. Wherefore fubftituting as before $x=\frac{4 b b+a b}{a+b}$, and FE or FK $=4 b-\frac{\overline{4 b b+a b}}{a+b}=\frac{3 a b}{a+b}$ : confequently the fum of the femidiameters $\mathrm{KO}+\mathrm{CE}$ is to the triple of either, 3 C E, as the other KO is to FK , the diftance of the focus from the lens.

If this lens were equally convex on both fides, we fhould have $2 C E: C E::{ }_{5} C E: G F$; therefore $G F=\frac{5}{2}$ CE; and FK $=\frac{3 a a}{2 a}=\frac{3}{2} a$ : i.e. the diflance of the focus from the lens is $\frac{3}{2}$ of the radius.

In order to find the principal focus of a plano-convex, or double convex lens experimentally, various methods have been devifed and recommended. One is as follows: Meafure exactly the thicknefs of the lens in the middle and at the edge, and alfo its breadth; then it will be, as the difference of the above thickneffes is to half the breadth, fo is half the breadth to the focal length required. The following mathod will ferve, according as the centres of the fides are on different fides or on the fame fide of the lens; as the fum or difference of the radii of the fides is to one of them, fo is double the other to the focal diftance from the lens. If the curvity of each fide is the fame, the radius of that curvity may be deemed the focal length; and if one fide of the lens. is plane, the focal length may be reckoned equal to twice the radius of the fpherical fide. The focal length of a convex lens may be alfo found by the following methods : darken a room, fo that no light fhall enter into it except through a tube in one of the window-fhutters; then, placing the lens againt and clofe to this hole, move a white paper behind it, till the picture of a particular object, directly facing the lens, appears moft diftinct, and there fix the paper; then meafuring the diftances betwixt the paper and the object from the lens refpectively, there wiil be fufficient data for finding the focal length required. Let $Q P$ (ffor. in.) be the object without doors, A the lers in the window-hhutter, $q p$ the place of the paper where the image of $Q P$ is moft diftinct, and $\mathrm{Q} \mathrm{A}_{q}$ the axis of the lens. Having meafured the diftances $Q A, q A$, it will be, $Q q$ : $Q A: Q A:$ $Q F ;$ and $Q A-Q F=A F$ the focal length required.

The focal length of any lens, it is ohferved, is in ftrictnefs the diftance from its principal focus to the refpective focal centre: and in the example above given, the diftances brtwixt the focal centres of the lens fhould have been fubtracted from $Q q$, and for $Q A$ we foould have taken the diftance from $Q$ to the nearelt focal centre. But in experiments of this kind, thefe niceties would be fuperhous. Moreover, in the above experinent, there will be a certain part of the axis, extending on each fide of the geometrical focus $q$, within which, wherever the paper is placed, the picture as to fenfe will be equally diftinct. Having found nearly the place of $q$, move the paper from thence both ways along the axis, till an indiftinctenefs begins to be per. ceptible in a particular fimall part of the picture; and having noted thefe two places, the middle point between them may be taken for the focus $q$. Again, if the focal length of the lens does not exceed two or three feet, it may be found without darkening the room, by holding the lens at fuch a diltance off, that the image of the window-fafh may be dif. tinct upon the oppofite wainfcot : then computing as above, the window-fafh being now the object. And for common purpofes, when the focal length of a lens is but fhort, this length may be reckoned the diftance from the lens to the place where the image of a remote object appears moft dif. tinct. For if the object be diftant from the lens 100 or 1000 times the focal length, the image will be beyond the principal focus only the ioodth or 1000dth part of that focal length. The focal length of a lens may be found, without computation, by making the flame of a candle the object, thus: Move the lens or the candle, and the paper for receiving its image, fo that, when the image is molt diflinct, the lens be exactly in the middle betwixt the other two; then half the dittance betwixt the object or its image and the lens is the focal length required. Or if either the lens, or the candle, or the paper for receiving its image, be moved, while the other two are fixed; having meafured the refpective diftances, the focal length may be found in the manner already ftated. Or, if a fmall hole, of about one-fourth or one-eighth of an inch broad, be made in the window-fhutter of a darkened room, and a lens and a paper be held behind this hole at proper diftances ; the place where the image of the hole is moft diltinct may be determined very accurately, and fo the focal length of the lens may be found as above. Again, place the lens fo that its axis may point as nearly as polfible towards the fun; then holding a paper behind it, the burning point, or that in which the fun's image is fmalleft, and when its limb appears moft diltinct, is the focus of the lens. See thefe various methods illuftrated more at large in Harris's Optics, book ii. $\$ 4$.

On the principles above illuftrated is founded the fructure of refracting burning-glaf ${ }_{e s}$, the fun's light and heat being exccedingly augmented in the focus of the lens, whether convex or plano-convex; fince the rays, falling parallel to the axis of the lens, are reduced into a much narrower compafs; fo that it is no wonder they burn fome bodies, melt others, and produce other extraordinary phenomena. See Burning Glafs.
4. If a luminous body be placed in a focus behind a lens, whether plano-convex, or convex on both fides; or whether equally or unequally; the rays, after refraction, become parallel. In this cafe the refracted rays become the incident rays, and vice verfâ; and confequently the refracted are parallel. Hence, by means of a convex lens, or a little glás bubble full of water, a very intenfe light may be projected to a valt diftance.

And this furnifhes us with the ftructure of a lamp, ois lantern, to project an intenfe light to an immenfe diftance;
for a lens, convex on both fides, being placed oppofite to a concave mirror, if in the common focus of both be placed a lighted candle, or wick, the rays reflected back from the mirror to the lens will be parallel to cach other; and after refraction will converge, till they concur at the ditance of the fern-diameter, after which they will again diverge. But the candle being likewife in the focus of the lens, the rays it throws on the lens will be parallel: and therefore a very intenfe light mecting with another cumally intenfe, at the diltance of the diameter from the lens, the light will be furprifing; and though it aftervards decreafe, yet the parallel and diverging rays guing a lons way together, it will be very great at a very great diflance. Lamterns of this kind are of confiderab'e fervice in the night-time to difcover remote objects, and are ufed with luccefs, by fowlers and fifhermen, to gather their prey together, in order to take them.

If it be required to have the light, at the fame time, tranfmitted to feveral places, as through feveral ftreets, \&c. the number of lenfes and mirrors is to be increaled.

If the luminous body placed in the focus be of a larger extent, the rays, flowing from points fenfibly diltant from each other, cannot be parallel; but they will conftitute feveral trains, or parcels of rays, parallel to each other.
5. The images of objects, oppofed in any manner to a convex lens, are exhibited, invertedly, in its focus.

Hence, if a paper be applied to a convex lens (efpecially in a dark room) at the diftance of its focus, the images of oobjects fhining upon it will be reprefented dittinctly, and in their natural colours, upon it: nor is the focus of the fun's rays any thing elfe, in effect, but the image of the fun. Hence in folar eclipfes, the fun's image, eclipfed as it is, may be burnt by a large lens on a board, \&c., and exhibit a very entertaining phenomenon.

Hence, alfo, if a conrex lens, of any kind, be expofed both to nearer and remoter objects, and a paper at the fame time be applied, fo as to receive the images of objects diltinetly, the diftance of the focus from the lens, and thence the diameter of the convesity, may be determined, See the above.
6. If a concave mirror be fo placed, as that an inverted image, formed by refraction through a lens, be found between the centre of the focus, or even beyond the centre, it will again be inverted by reflection, and to appear erect in the firit cafe beyond the centre; and in the latter, between the centre and the focus. On thefe principles is conitructed the camera obfoura, which fee.
7. The diameter of the image of an object delineated beyond a convex lens, is to the object itfelf in the ratio of the diftance of the image to that of the object.

Since then the image of a remoter object is lefs diftant from the lens than that of the nearer, the image of the more remote will be lefs than that of the warer. And becaufe the diftance of the image from the lens is greater, if the lens be a fegment of a greater fphere than of a lefs; hence the image will be greater in the former cafe than in the latter. The image therefore will be of fuch a magnitude, as it would be of, were the object to Shine into a dark room through a bittle hole upon a wall, at the fame diflance from the hole at which the focus is from the lens. When an object is lefs diltant from a lens than the focus of parallel rays, the diftance of the image is greater than that of the wbject; otherwife the diftance of the image is lefs than that of the object ; in the former cafe, therefore, the image is greater than the object ; in the latter leifs.

If the images be made greater than the objects, they will not appear ditinctly; becaure in that cafe there are fewer
rays which meet after refraction in the fame point; whence it happens, that rays proceeding from different points of an object terminate in the fame point of an imare, which is the caufe of confufion. Hence it appears, that the fame aperture of a lens may be admitted in every cafe, if we would keep off the rays which produce confufion. However, though the image is then more dittinct when no rays are admittel but thofe near the axis, yet for want of rays the image is apt to be dim.
8. If the eye be placed in the focus of a convex lens, an object viewed through it appears erect, and enlarged in the ratio of the diftance of the object from the eyc, to that of the eye from the lens, if it be near; but infinitely, if remore.

The theory of real images may be thus illuftrated by at experiment. Upon a long table draw the line BDD (Plate VIII. Optics, fis. 1.) and over fome point there as A, place the consex lens $O$, whofe principal focules are $F, f$, fo that the axis $\mathrm{F} f$ of the lens be parallel to BD. In the line $B D$, take AF, Af, each equal to OF or Of in the axis $Q q$. On one lide of $A$ divide the line $A B$ into the parts $1,2,3,4,8 \mathrm{cc}$, each equal to $\mathrm{A} F$; and on the other fide take $f$ a cqual to $A f$ or A F , and divide it into $f_{\frac{1}{2}, f \frac{z}{3} \text {, }}^{\text {, }}$ $f \frac{1}{3}$, sic. fo that thefe parts be refpectively equal to $\frac{1}{2}, \frac{1}{3}, \frac{1}{3}$, $\mathbb{S} c$. of $f 1$ or A $f$. Then if the room be darkened, and a lighted candle be placed over any one of the divifions in the line $A$ ID, as at 2 ; the image of the candle will be feen diftinct but inverted, upon a paper held over the correfponding fiaction on the other fide, as at $\frac{\mathrm{J}}{2}$. If the candle be placed at the point 3 or 4, sc. the paper for receiving the image mult be held over $\frac{1}{3}$ or $\frac{2}{4}$, Sic. So that if the candle be moved from 2 to an infinite diftance, the whole motion of the image will be from $\frac{x}{2}$ to $f$. If the candle be placed at 1 , the image will be at $I$, at the fame ditance from the lens on the other fide. If the candle be brought nearer to $F$, the motions of the image and candle will now be reciprocal, to what they were before. But if the candle be placed any where between F and the lens, there will be no image formed.

Since an object placed at any diftance, and its image, fubtend equal angles at the focal centres $s, v$, of any lens; the angle under which any remote object appears being given, it will be cafy to find the diameter of its image : let $q$ (ffr.2.) be the principal focus of the convex lens O , and let the angle Ps R $(=p \not v r)$ be that under which the fun (or any other very remote object) appears to the naked eye : bifect the angle $p v r$ with the line ov $q$; then in the rightangled triangle $v q p$ or $v q r$, we fhall lave the fide $v q$ and all the angles; whence it will be eafy to find $q p$ or $q r$, the femi-diameter of the image. See Image and Refracrios.
Lesaes, for concave, their laws are as fellow.-1. If parallel rays ftrike on a plano-convex lens $K L$, and $F C$ be to FB in the ratio of refraction, the rays will diverge from the axis; and the point of divergency, or difperfion, called the virtual focus, will be F. See Plate VII. Optics, fig. 3. See Tocus.

For the ray H I, parallel to the axis, is perpendicular to K L , and will therefore pafs unrefracted to E . Wherefore FC being to FB in the ratio of refraction, F will be the virtual focus.
If then the lens be glafs, $\mathrm{FB}=2 \mathrm{BC}$; i. $e$. the virtual focus F will be diftant from the lens $\mathrm{K} L$ by the fpace of the diameter $=\mathrm{BC}$.

If the refraction be in water, $\mathrm{FB}=3 \mathrm{BC}$; ;. e e the virtual focus $F$ will be diftant from the lens $K L$ a diameter and a half 3 BC .
3. If

## L E N S.

2. If the ray $A \mathrm{E}$, parallel to the axis TP , frike on a lens concave on both likes: and both FC be to F B, and II to PH in the ratio of refraction; and FP: P $\mathrm{H}:$ : I: $B: B C$; $G$ will b: the point of difperfion, or the virtual foens. See Plate VII. Opties, fig - 4.

If, therefore, the ratio of the refraction be $=n: m, \mathrm{CB}$ $=a$, and $\mathrm{I} \mathrm{I}=b ; \mathrm{FB}=\frac{n a}{n-m}$, and $\mathrm{PI}=\frac{n b}{n-m} ;$ confequently, diffegarding the thicknefs of the lens, FI $=\mathrm{FB}+\mathrm{IP}-\frac{n!+n b}{n-m}$, and PII $=\mathrm{PI}-\mathrm{IH}=\frac{n b}{n-m}-b$
 $a+b: \frac{m b}{n-m}:: a: \mathrm{B} \mathrm{G}$, or $\overline{n-m} \times \overline{a+b}: m b:: a: \mathrm{B} \mathrm{G}$; i.e. $\overline{n-m} \times \overline{\mathrm{CB}+1} \bar{H}: m \mathrm{IH}: \mathrm{CB}: B \mathrm{G}$.

If, therefore, the refraction be in a glafe lens, fo that $m=2, n=3$, and $\overline{a+b}: 2 b:: a: \bar{B}$; the fum of the femidiameters C B and H I will be to the diameter of the concavity of either, 2 HI, as the femidiameter of the other CB , to the diftance of the virtual focus from the lens, B G.

But if the femidiameters H I and C B are equal, or $a=b$, $\mathrm{BG}=\frac{2 a^{2}}{2 a}=a$; or BG , the diftance of the virtual focus from the lens, is equal to the femidiametcr CB or H I . If the refraction be made in water, $n=3$ and $n=4$, and, therefore, $a+b: 3 b:: a: \mathrm{B} \mathrm{G} ; i, e$. the fum of the femidiameters CB and HI will be to a diameter and a half of either concavity, 3 HI , as the femidiameter of the other $C B$ to $B G$, the diffance of the virtual focus from the lens : in this cafe, if $a=b$, or $\mathrm{HI}=\mathrm{CB}, \mathrm{BG}=\frac{3 a^{2}}{2 a}=\frac{3}{2} a$ $=\frac{3}{2} \mathrm{CB}$, i.e. the ditance of the virtwal focus from the lens BG , is to the femidiameter BC in a fefquilateral ratio.

Hence, the fun's rays ftriking on a concave lens, their light, after refraction, will be confiderably weakened; fo that the effect of concave lenfes is oppolite to that of the convex ones.

To find the focal length of a concave lens experimentally. Let the lens be covered with paper, having in it two fmall circular holes, as at $\mathrm{O}, v$ (Plate VII. Optics, fig. 5.) ; and on the paper for recciving the light, defcribe two fimall circles as $a, b$, whofe centres are placed at twice the diftance apart of the centres of $\mathrm{O}, v$, and it will be beft if their diameters are alfo double thofe of $O, v$. Thus, moving the paper to or fro, till the middle of the fun's light coming through the holes $\mathrm{O}, v$, falls exactly on the middle of the circles $a, b$; that diftance of the paper from the lens will be the focal length required. For it is evident, that $a b: \mathrm{O} v:: a \mathrm{~F}: \mathrm{OF}$; or, whatever is the diftance of $a, b$, it will be, $a b-0 v$ : a $\mathrm{O}:: \mathrm{Ov}: \mathrm{OF}$, the focal length of the lens. Inftead of the paper with the holes, fmall patches may be ftuck on the lens.

The focus may be alfo found by candle-light, thus: let $Q$ be the place of the flame; $c, d$, the bright fpots upon the paper, and the point where the lines $v d, \mathrm{O} c$, produced, backwards, would interfect. To find the point $q$, it will becd-Ov:Ov:: $\mathrm{O} c: \mathrm{O} q$. Then $Q q: Q \mathrm{O}::$ QO:Q $a$, and $\mathrm{O} a$ is the focal length required.

The focal length of a concave lens may be readily found by joining it to a convex one, having a fhotter focus. Let $q$ (fig. 6.) be the image of any object formed by the convex Lens $A$, fixed at $A$; and let $Q$ be the image of the fame object, when the convave lens $O$ is joined to $\Lambda$. Having meafured the diltances $Q q, q O$, for finding the focal lenith of the concave lens, it will be (as before) $Q$ 生: $Q O:$ $Q O: Q F$; then $Q F-Q O=O E$.
3. An object viewed through a concarc lens appears erect, and diminifled in a ratio compounded of the ratios of the fpace in the axis between the point of incidence, and the point to which an oblique ray would pafs without refraction"; to the fpace of the axis between the eye, and middle of the object; and the fpace in the fame axis between the eye and the point of incidence, to the fpace between the midele of the object, and the point the obligue ray would pafs to without refraction.
Though the properties of lenfes have been here confidered principally with regard to rays falling near the axis, and parallel to it ; yet the reafoning will be calily transferred to rays remoter from the axis, and falling in any direction.Thus we may fay univerfally, that in a convex lens, all parallel rays become converging, and concur in a focus : that diverging rays either become lefs diverging, or run parallel, or converge; and that converging rays converge the more: a'l which alterations are more fenfible in oblique rays than in perpendicular ones, becaufe the angles of incidence in that cafe are greater.

In concave lenfes all parallel rays become diverging, and all diverging rays diverge more; converging rays either converge lefs, or become parallel, or go out diverging; all which things hold of oblique as well as direct rays, but more fenfibly in the firt.

For the further illuftration of this part of the fubject of the article before us, we fhall here fubjoin two or three propofitions; firt premifing, that all pencils of rays (fee Pexcil), refrected by a lens, excepting that whofe axis is perpendicular to both the furfaces, are faid to be oblique, and are called "oblique pencils."

If "In every oblique pencil of rays, refracted by any lens, there is one ray whofe incident and emergent parts are parallel ; anc this ray is the axis of that pencil, or that ray of it which undergoes the leait refraction." In Plate VII. Optics, fir. 7 to $:=$, let R, $r$, be the centres of the fpherical fides $\mathrm{A}, a$; and in fris. 7,8 , let $r$ be the centre of the fpherical fide $a$. In the flatteft fide of any lens whatfoever affume any point $B$, at which let a ray of light be refracted, either at its entrance into the lens, or at its emerfion out of it; draw R B perpendicular to that fide, and parall. 1 to it draw alfo $r \cdot b$ perpendicular to the other fide $a$; join $\mathrm{B} b$, then will $\mathrm{B} b$ be a ray, whofe parts $\mathrm{P} \mathrm{B}, p b$, without the lens, will be parallel. For the ray B $b$, drawn between the two parallels $\mathrm{R} \cdot \mathrm{B}, r^{b}$, is equally incined to them both, and confequently PB, $l_{p}$ are alfo equally inclined to $R \mathrm{~B}$, $r b$, (by the law of refraction,) and therefore parallel to one another. After the fame manner, whercver the phint $B$ is affumed, we can find a ray $\mathrm{B} b$, that fhall be equally inclined to both the furfacés; and therefore in cvery oblique pencil of rays there is one ray whofe incident and emergent rays are parallel. It is evident alfo, that every other ray pafting through B will be more refracted than the ray $\mathrm{B} b$; for a plane touching the lens in any other point befides 6 will be inclined to a plane touching it in 13 ; and, therefore, a ray paffing through B , and any other point belides $b$, will be bent out of its courfe, more or lefs, according as thefe pianes are more or lefs inclined. Whence the propofition is exident.
$Q q$ is the axis of an oblique pencil on the contrary fide

## LENS.

of the axis of the lens. Hence it appears, that the axis of any oblique pencil whatfoever is equally inclined to each fide of the lens, and the lefs oblique is the pencil, the nearer the point $B$ will be to the vertex $A$; and the lefs will be the dittance between the parallel rays P $\mathrm{B}, b$ o
2. In every oblique pencil of rays (figs. 7 to 12 ), the part $\mathrm{B} b$ of the axis within the lens, produced, if need be, will interfect the axis of the lens in the very fame point $O$; and the point $O$ divides the axis of the lens in fuch a manner, that $\mathrm{AO}: a \mathrm{O}:: \mathrm{R}: r$; that is, I . The point O is in the vertex: of a plano-convex and plano-concave lens (figs. 7 and 8.) 2. In the double convex and double concave (figs. 9 and 10), the point O divides that part of the axis, which is within the lens, in the ratio of the radii of the fides, the fhorteft part being next that fide which has the greatelt curvity. 3. The line $\mathrm{B} b$ muft be produced without a concavo convex lens (figs. II and 12), before it will interfect the axis; and the point $O$ in the axis, where the faid line B $b$ produced interfects it, lies next to that fide which has the greateft curvity; and its diftance from the fides is as the radii of thefe fides refpectively."

Let the radius of the flatteft fide $A$ be called $R$, and the radius of the other fide, $r$; and becaufe the axis $B b$ of any oblique pencil is equally inclined to both the fides of the lens (as we have above fhewn), it neceflarily follows: Cafe 1. In a plano-convex and plano-concave lens (figs. 7 and 8), the axis $B b$ of any oblique pencil paffes through the vertex $a$, and therefore the point O is alfo in $a$. For no perpendicular to the fpherical fide can be parallel to a perpendicular to the plane fide, but that only which paffes through the vertex $a$. Again, becaufe $R$ in this cafe is infinite, and O coincides with $a$; it will be R:r:: AO: $a \mathrm{O}$. Cafes 2 and 3. Becaufe the radii R B, $r b$ are parallel (by hyp. ), the triangles R B O, rbo are fimilar; and, therefore, R B:rb: R R : rO. Alfo RB $\pm r b: R B$ or $r b:: \mathrm{RO} \pm r \mathrm{O}: \mathrm{RO}$ or $r \mathrm{O}$. But the three firtt terms being invariable quantities, the $4^{\text {th }}$ is fo likewife; that is, in the fame lens the point $O$ is invariable. And from the pofition of the parallel radii $\mathrm{RB}, r b$, it is plain that the point O muft be within the double convex and double concave lens, and without the concavo-convex. Again, becaufe R O:RA (R B) :: $r \mathrm{O}: r a(r b)$; we fhall have $\mathrm{AO}(\mathrm{RO} \sim \mathrm{R} A): \mathrm{RA}:: a \mathrm{O}(r \mathrm{O}$ on $r a): r a$; that is, AO:a $O:: \mathrm{R}: r$; whence another part of the propofition is manifelt.

Hence it follows; that the point $O$ is in the middle of a double convex and double concave, whofe fides are fegments of the fame fphere: and in every lens whatfoever, the greater proportion the greater radius bears to the leffer, the nearer will the point $O$ be to the vertex $a$ of that fide which has the greateft curvity.
3. "If the axis Bb (fig. 7 to 12.) of a pencil of rays is not very oblique to the axis of the lens; the points, $s, v$, where the parts without the lens, P B, $p b$, produced, of the axis of the oblique pencil, and the axis of the lens, divide that axis in fuch a manner, that $\mathrm{AO}: \mathrm{A} s:: m: n::$ $a \mathrm{O}$ : $a v$ nearly." The angles, $\mathrm{R} \mathrm{B}, \mathrm{s}, \mathrm{RBO}$, or their fupplements, are the angles of incidence and refraction at the firtt fide A; and therefore their fines are as $m$ to $n$. In figs. 7 and 8 , the angle $\mathrm{RB} s=\mathrm{AsB}$; and $\mathrm{RBO}=$ A O B. And in figs. 9 and 10 , the difference between the angles, $\mathrm{RB} s, \mathrm{RBO}$, or their fupplements, and the refpective angles $A s B, A O B$, is equal to the angle $A R B$, as will appear by drawing $d \mathrm{~B}$ parallel to the axis $\mathrm{R} A$. And therefore the fines of thefe refpective angles are pretty nearly in the fame ratio; that is, fine $<A$ s $B$ : fine $<$ A O B $: 5: s: a$ nearly. But the fines of the angles, As $B$,

A O B , are as the fides $B O, B s$; and when the point $B$ is not very remote from $\mathrm{A}, \mathrm{BO}$ and $\mathrm{B} s$ will be as $\mathrm{A} O$ and $A s$ nearly; and therefore when the point $B$ is the ncareft of all to A , it will be $\mathrm{AO}: \mathrm{A} s: m: n$. In figs 7 and 8, the points $u, v$, and $O$, coincide; and in figs. 9 and 10, it might be proved as above, that when the point $b$ is very near to $a$, it will be, $a \mathrm{O}: a v:: m: n$. Hence the further the point $B$ is from $A$, and $b$ from $a$, the greater will be $O s$ and $O v$. Let $s$ and $v$ be points belonging to pencils that have the leall obliquity to the axis of the lens; then will $\mathrm{A} s=\frac{n}{m} \mathrm{AO}$; and $a v=\frac{n}{m} a \mathrm{O} . \quad$ Let the thicknefs, $A$ a of any lens be called $t$; then in a plano. convex and plano-concave lens, $A s=\frac{n}{m} t$. And in a double convex and double concave, whofe fides are fegments of the fame fphere, $\mathrm{A} s=a v=\frac{n}{2 m} t$. Hence again, in a plano-conver and plano-concave glafs, $\mathrm{A}_{s}=\frac{2}{3} t$; and in a double convex glafs of equal convexities, and in a double concave glars of equal concavities, As=av引 $\frac{1}{3}$ t. It appears, moreover, that the focal length of any lens is to be reckoned from the point $v$, if the flattelt fide is expofed to parallel rays; and from the point $s$, if the parallel rays are incident upon the moft convex or concave fide; the point $v$, in all cafes, being the moft remote from the flattelt fide, A, of the lens. The points, $s$ and $v$, may occafionally be called the "focal centres" of the lens. Hence it follows, that the fccal length of a convex lens is, properly, the diftance between the principal focus and the next focal centre; and the focal length of a concave lens is to be reckoned from its principal focus to the fartheft focal centre. As the axes of the feveral pencils that are not very oblique, are refracted from the fame point $s$ or $v$ nearly; fo the refraction of thefe axes caufes no fenfible confufion in the image. Moreover, becaufe As=$\frac{n}{m_{2}} \mathrm{AO}$, and $a v=$ $\frac{n}{m} a \mathrm{O}$, and becaufe $\mathrm{R}: r: \mathrm{AO}: a \mathrm{O}$; it will be, $\mathrm{R} \pm r: \frac{\mathrm{R}}{r}:: t(\mathrm{AO} \pm a \mathrm{O}): \frac{\mathrm{AO}}{a \mathrm{O}}$; therefore AO $=\frac{\mathrm{R} t}{\mathrm{R} \pm r} ;$ and $a \mathrm{O}=\frac{r t}{\mathrm{R} \pm r} ;$ wherefore, $\mathrm{A} s=\frac{n}{m}$ $\times \frac{\mathrm{Rt}}{\mathrm{R} \pm r} ;$ and $a v=\frac{n}{m} \times \frac{r t}{\mathrm{R}_{\mathrm{t}}{ }^{\circ}} ;$ and multiplying one fide of each equation by $m \times \overline{\mathrm{R} \pm r}$, it will be $\mathrm{A}_{s}$ : $\pi v:=n \mathrm{R} t: n ヶ t$.
4. "The foci of both direct and oblique pencils of parallel rays are nearly at the fame diftance from the focal centre (sor $v$, as the cafe is) of any lens.". Let ArQ (Plate VIII. Optics, fig. 1 to 6.) be the axis of the lens, $r$ the centre of the firft furface $a b, Q$ the principal focus of that furface, and F the focus of the lens. Let $p b \mathrm{~B}$ P be the axis of any oblique pencil ; and let the emergent part, BP, produced backwards cut the axis of the lens in so Of all the rays parallel to the axis $p b \mathrm{BP}$, there fhall be one as $\mathrm{D} d$ which will fall perpendicular upon the firft furface $a d$; and therefore if the medium was continued, this ray (produced backwards from a concave lens, but continued through

## L. E N S.

through a convex lens) would pafs through the eentre $r$, and the geometrical focus of rays parallel to it would be at $q$, fo that $r q=r Q$. This is plain, becaufe $d r q$ is perpendicular to the furface $a$, as well as ar $Q$. Again, of all the rays parallel to the axis $p b$, there fhall be one as $\mathrm{E} e$ (if the lens is broad enough) which flall be refracted into eG, perpendicular to the fecond furface A. B; and therefore the focus of this ray fhall be in $s \mathrm{P}$ produced, and in $e \mathrm{G}$ produced; that is, in the point of interfection $f$. Neglecting the aberration of the firft furface $a b, e \mathrm{G}$ avould unite with the axis $d r q$ in $q$. Hence we are to thew that $s f=s \mathrm{~F}$ nearly.

Cafe 1. When one fide of the lens is plain. (Figs. 1, 2.) Becaufe $s r, f q$, and $s f, r q$ are parallel ; $s f=r q=r Q$ $=s \mathrm{~F}$.

Cafe 2. When both fides of the lens are fpherical. (Fig. 3-6.) Let R be the centre of the fecond furface A B , and becaufe e G is perpendicular to this furface, it will pals through the centre R. And becaufe rq is parallel to $s f$, it will be $\mathrm{Rr}: \mathrm{R} s:: r q: s f$. The two firlt terms, $\mathrm{R} r, \mathrm{R}_{s}$, being invariable quantities, and $r q$ being allowed to remain invariable, $s f$ will alfo be invariable; that is, $s \mathrm{~F}$ will defcribe the fector $s \mathrm{~F} f$, and $s f=$ $s$ F. But becaufe of the aberration by the firlt furface $d e$, no ray, as $\mathrm{E}_{e}$, parallel to and remote from the axis $\mathrm{D} r q$, can be refracted to the focus $q$; but it will cut the axis $r q$ in fome point $y$ between $q$ and $r$ ( $f$, I it 6. ); and therefore 3 ray parallel to $p b$, that fhall be refracted perpendicularly to the fecond furface $A \mathrm{~B}$, muft be fome ray $b k$ between $E \varepsilon$ and the axis $p b$, if the centres, $\mathrm{R}, r$, are on different fides (figs. 3 and 4.) ; otherwife $b k$ will be farther from the axis than $\mathrm{E} e$ (figs. 5 and 6.); and confequently this ray will cut the axis s $f$ in fome point $x$, between $f$ and s. But it has been already fhewn, that if the lens had no aberration, $f$ would be the focus of all the rays parallel to the axis $p b \mathrm{Bf}$; and as the aberrations at the different furfaces are contrary, it is fufficiently evident that the focus of thofe rays which are neareft to the axis $p b \mathrm{~B} f$, will not be remote from $f$.

In every lens whatfoever, the true focus $g$ of an oblique pencil of parallal rays will be between $f$ and $s$; that is, $s g$ will be lefs than $s f$ or $s$. Becaufe if there was no aberration at either furface of the lens, $s g$ would be equal to $s \mathrm{~F}$ or $s f$; and therefore it muft follow, that if the aberrations at each furface were equal, they would deftroy each other. (Figs. 3, 4.) Let rays of light be within the lens, on each fide of the axis $b \mathrm{~B}$, and let their inclination to that axis be fuch, as that they would emerge at the fide $b$, parallel to $b p$. It is plain, that a ray parallel to the oblique axis $p b B P$, and between the faid axis and the perpendicular $d r$, will be more oblique to the emergent fide $A$ than to the incident fide $a$; and therefore, in this cafe, the aberration at the fide A is the greatelt, and this excefs of the aberration contracts the focus nearer to $s$ than $f$, as to $g$. In like manner, if the parallel ray be on the other fide of the oblique axis, the greateft aberration will be on the incident fide $a$; and in the prefent cafe likewife, this excefs of aberration contracts the focus nearer to the lens, as to $g$; and it is plain, that the more oblique is the pencil, the greater will be $f g$ : whence the propolition is manifent.
5. "The focus of incident rays, either diverging or con. verging upon any lens, being given: to find the focus of the emergent rays." Let Ff (Plate VIII. Optics, fig. 7 to 12.) be the axis of any lens B $b$, whofe focal centres are $s, v$; and principal foci are $F, f$. Let any point $Q$ in the axis of the lens be the focus of incident rays, either diverging as $Q B$, or converging as $M B$; and let $f$ be the geoVol. XX.
metrical focus of thofe rays parallel to the axis of the lens, whofe incidence is on the fame fide with the ray QB, or M B. To find the focus of the emergent rays, fay QF : $\mathrm{F} s:: \nu f\left(\mathrm{~F}_{s}\right): f q$; and placing $q$ the fame way from $f$ that $F$ is from $Q$, the point $q$ thus found will be the focus required. Let the point of incidence $B$ be not remote from the vertex of the lens; from the centre $v$ defcribe the arc $f d$, and draw $v d$ parallel to the incident ray $Q B$, or $M B$; then will $d$ be the point where the emergent ray interfects the axis $v d$; and therefore the point $q$, where the emergent ray $b d$ (or $\mathrm{N} b$ ) produced, interfects the axis of the lens, is the focus required. Again, draw $s$ D parallel to $q$ B; then will the triangles, $\mathrm{Q} \mathrm{D} s, v d q$, be equiangular, and therefore QD: $\mathrm{D}_{s}::$ vd: $d q$. But D is a point where the incident ray $q b$, or $N b$, after refraction by the lens, will interfect the axis $s \mathrm{D}$, fo that $s \mathrm{D}=s \mathrm{~F}$ nearly; and when the triangles, QD D, vd $q$, are vanifhing, the point D will coincide with F , and $d$ with $f$; wherefore $Q \mathrm{~F}: \mathrm{F}_{s}::$ $v f: f q$. Hence it follows, I. Becaufe $\mathrm{F} s=v f, \mathrm{Fs}$ or $v f$ is a mean proportional between $Q F$ and $f q$; that is, QF:Fs: Fs:fq. 2. QF:Fs:: (vf:fq::) Qs $\left(Q F_{\sim}^{+} F s\right): v q\left(v f_{\sim}^{+} f q\right) \cdot 3 \cdot Q F: Q s::\left(F_{s}:\right.$ $v q$ ::) $\mathrm{Qs}(\mathrm{QF}+\mathrm{Fs}): Q s+v q$. Obf. When the lens is not very thick in proportion to its focal length, the focal diffances, $\mathrm{SF}, v f$, may, without fenfible error, be reckoned from the point $O$, which bifects vs; and then the preceding proportions will be convertible into the following: viz. $Q \mathrm{~F}: \mathrm{FO}:: \mathrm{FO}(=\mathrm{O} f): f q$; and $Q F: F O:: Q O: O q ;$ and $Q F: Q O: Q O: Q q$. 4. If $q$ be the focus of incident rays, $Q$ will be the focus of the emergent rays. 5. The focufes, $Q$, $q$, move both the fame way, and always lie contrary to $\bar{F}$ and $f_{0}$. And the diftances, $\mathrm{FQ}, f q$, vary reciprocally; that is, as one increafes, the other decreafes, but with a different velocity, according as they are differently fituated. When $Q$ coincides with $\mathrm{F}, q$ will be at an infinite diftance; that is, the refracted rays will emerge parallel to the axis. And in figs. 7,8 , when $Q O=20 \mathrm{~F}, \mathrm{O} q$ will be $=O Q:$ whence the difference of the focal diftances of the refracted rays, when $Q O=2 O F$, and when $O Q$ is infinite, is only equal to $O f$. When the focus $Q$ of rays diverging upon a convex lens (fig.9.) lies between $F$ and the lens, the refracted rays ( $b \mathrm{~N}$ inftead of croffing the axis) will diverge from the focus $q$. And if incident rays upon a concave lens converge towards the point that is neater to it than F (as in fig. 10.), the lens in this cafe will have a real focus; that is, the refracted rays will crofs the axis in $q$. And univerfally, 7. When the focufes, $Q, q$, lie both on the fame fide of the lens; if the incident rays diverge from Q (fg. 9-12.), the emergent rays will diverge from $q$. And if the incident rays emerge towards $Q$ (fig. 10, 11.), the emergent rays will converge towards $q$. And in ail thefe cafes, the nearer $Q$ is to $O$, the nearer alfo will $q$ be to O ; and if one of thefe focufes be in O , the other alfo will coincide with it. And the contrary happens, when $Q$ and $q$ are on different fides of the lens; that is, rays diverging from $Q$ (fg. 7.) will converge towards $q$; and rays converging towards $Q$ (fig. 8.) will diverge from $q$.

We have hitherto taken notice of the progrefs of a fingle pencil of rays, or fuch as come from a fingle point, through a lens; but it is eafy to apply the fame kind of reafoning to the various points of an object. Let DE (Plate VIII. Optics fig. 113 .) be an object, A B a double convex lens, whofe centre is $\mathbf{C}$; and let us examine the pencils of rays which come from three points only of the object, lince the

## L E N

fituation of the intermediate pencils, is evidently comprehended between thofe three. Of all the rays which proceed from each of thefe points, that which paffes through the centre C of the lens mult proceed, if the lens is not remarkably thick, in a ftraight line, fo that DCI, FCH, and ECG, are ftraight lines; fecondly, the focus of the rays D B A, after refraction, mult be fomewhere in the axis or Atraight line DCI; alfo that of the middle pencil, FBA, mult be fomewhere in FCH, and the focus of the third pencil muft be in E C G. Thirdly, the refractéd focus of each pencil muft be on the contrary fide of the asis of the lens, to what its incident or radiant focus is ; for inflance, the refracted focus $I$ is below the axis of the lens, whillt its incident or radiant focus D is above it; and the refracted focus G is above the axis, whilt its radiant point E is below it : the confequence of which is, that if the object D E be fufficiently luminous, and a piece of white paper, or other flat and opaque body, be fituated at G I, an image of the object D E will be formed upon it, but in an inverted pofition. If the opaque body be removed, then no image will be feen by a fpectator fituated on one fide; for the rays of light, though they meet at their refpective foci in I H G, yet they proceed divergingly beyond that place through the air or other tranfparent body, and none come to the lateral fpectator. If the paper be fituated nearer or farther from the lens than the place G I, then an imperfect image, or no image at all, will be formed upon it, becaufe the rays of the refpective pencils do not meet at any other place.

From what has been faid above with refpect to the conjugate foci of the fame peacil, it will be clearly deduced, that if the object DE be brought nearer to the lens, the refracted foci, or the image G H I, will be formed farther from the lens, and vice verfâ. And from this it follows, that (fince the angles DCE, GCI, formed at the centre of the lens by the axes of the two extreme pencils, are equal) when the ditance of the object from the lens is equal to that of the image from the lens, then the fize of the image is equal to that of the object; when the former diftance is lefs than that of the latter, then the image is larger than the object ; and when the former diftance is longer than the latter, then the image is fmaller than the object,

With refpect to the brightnefs of that image it mult be confidered, that of the innumerable rays which are inceffantly emitted in every direction from each point, for infance $D$, of the object, a confiderable number, viz. D A B, falls upon the lens, and are converged to a fingle point I; therefore that point mult be more or lefs bright in proportion as the furface of the lens is larger or fmaller. Hence alfo a very remarkable property of thofe lenfes is eafily comprehended, which is, that when an image G H I is thus formed, if you cover part of the lens, be it the middlemoft or fome lateral part of it, the image I $G$ will not thereby be rendered partly invifible,-the whole image will be feen as well as before, but it will appear lefs bright than before; for if we confider each indefinte part of the lens, we may eafily perceive that rays of light from every point of the object mult pafs through that part, and mult meet at the refpective foci in GHI.

The above explanation of the progrefs of various pencils through a convex lens, may, mutatis mutandis, without much difficulty beadapted to explain the action of concave lenfes. .Newton's Optics. . Smith's Optics. Harris's Optics. Cavallo's Philofophy, vol. iii.

Lens, or Lenticula, was the name of a kind of weight

## L E N

among the Romans; being the hundred and eighth part of a drachm; equal to a grain and a half.

Levs, in Anatomy, a tranfparent body, nearly fpherical in figure, placed in a depreffion in front of the vitreous humour of the eyc. It is generally mentioned with the epithet cryftalline. See Eye.

Levs, in Botany, the Lentil, Ervum Lens of Linnæus, but in reality a feecies of Cicer; fee Sm. Fl. Brit. 776, and our article Ervum. The Latin word lens is faid to have originated from lenis, mild, becaufe thofe who fed on this fort of pulfe were fuppofed to become mild and gentle in difpofition.

Lens, Palufiris. See Duck's Meat.
Lens, in Geography, a town of France, in the department of Jemmape, and chief place of a canton, in the diftrict of Mons. The place contains 1229, and the canton 13,784 inhabitants, on a territory of $237 \frac{1}{2}$ kiliometres, in 19 communes. - Alfo, a town of France, in the department of the Atraits of Calais, and chief place of a canton, in the diftriat of Bethune ; feven miles N.W. of Douay. The place contains 2325 , and the canton 13,246 inhabitants, on a territory of $152 \frac{x}{2}$ kiliometres, in 21 communes.

LENSWYCK, a town of Norway; 20 miles W.N.W. of Drontheim.

LENT, Quadragesma, a time of mortification, during the fpace of forty days, wherein Chriftians are enjoined to falt, in commemoration of our Saviour's miraculous falting fo long in the defert, and by way of preparation for the feaft of Eafter.

In the ancient Latin church, Lent only confifted of thirty-fix days. In the ninth century, to come fomewhat nearer to the miracle, feveral took upon them to add four days more; which in time became a general practice: though the church of Milan is faid till to take up with the ancient thirty-fix.

According to St. Jerom, St. Leo, St. Auguftine, and others, Lent muft have been inflituted by the apofles. Their way of reafoning is thus: whatever is generally received throughout the whole church, and whofe inftitution we do not find in any council, muft be efteemed to have been eftablifhed by the apoftles. Now fuch, they fay, is the faft of Lent. Its inftitution is not fpoken of in any council ; but many of the ancient councils, particularly that of Nice, that of Laodicea, \&cc. and fome of the oldelt fathers, particularly Tertullian, fpeak of it as a thing of fome itanding.

The refurmed, generally, hold Lent to be a fupertitious inflitution, fet on foot by fome vain enthufiafts, who durft undertake to ape the miracles of Jefus Chrift; as, in effect, it appears to have been from a paffage of Irenæus quoted by Eufebius.

Some will have it to have been firft inftituted by pope Telefphorus, in the fecond century : others, who own that there was a kind of abftinence obferved in the ancient church before Eafter, yet contend that it was entirely voluntary, and was never enjoined by any law till the third century. See Fast:

This religious feafon is faid to have been firft obferved in England by our Saxon anceltors in the year 640. Anderfon's Hift. of Commerce, vol. i. p. 25 :

Political Lents have been often enjoined by ftatute and royal proclamation. See Abstinence.

King James I. iflued a proclamation againft eating fefh in Lent in 1619, and another in 1625. A fimilar proclamation was alio iffued by Charles I. in 162.7, and another in 1631.

There was fome difference between the practice of the Greek

## L E N

Greek and Latin churches, as to the bufinefs of Lent ; the Greeks beginning it a week fooner, but at the fame time allowing more days of intermiffion than the Latins: thofe who held it feven weeks did not falt on Saturdays, as thofe who obferved but fix did.

The ancient Latin monks had three Lents: the grand Lent before Eafter, another before Chriftmas, called the Lent of St. Martin ; and a third after Whitfunday, called the Lent of St. John Baptift ; each of which confifted of forty days.

The Greeks, befides that before Eafter, obferved four others; that of the Apofles, of the Affumption, of Chriftmas, and of the Transfiguration; but they reduced each of them to the fpace of feven days. The Jacobites added a fifth, which they called the Repentance of Nineveh; and the Maronites a fixth, called the Exaltation of the Holy Crofs. By the ninth canon of the eighth council of Toledo, it is ordained, "That if any perfon, without evident neceflity, eat flefh in Lent, they fhall be deprived the ufe of it all the relt of the year."

By the fifth chapter of the fourteenth feffion of the council of Trent, confeffion is enjoined as peculiarly fit and acceptable at this feafon. Hard. Conc. tom. x. p. 93.

The forty days in Lent, fay fome, are obferved in remembrance of the forty days wherein the world was drowned; or, as others fay, of the forty years wherein the Jews wandered in the defart ; others of the forty days allowed Nineveh for repentance; others of the forty ftripes by which malefactors were to be corrected ; or, the forty days during which Mofes fafted at the receiving of the law; or the forty days falt of Elias; or finally, the forty days faft of our Saviour.

LENTAGO, in Botany, a name adopted by Cæfalpinus, (de Plantis, 76,) for the Lauruftinus, Viburnum Tinus of Linnæus, and faid to be of Tufcan origin. Linnæus has applied it to an American fpecies of Viburnum.

LENTELLA, in Geography, a town of Naples, in Abruzzo Citra; 18 miles N.E. of Civita Borella.

LENTEMENT, $F_{r}$. in Mufic. This word is equivalent to largo in Ital., and implies a flow movement. Its fuperlative, treflentement, very flow, is the floweft of all movements.

LENTEN, in Geography, a town of Norway; 20 miles N . of Berga.

LENTES Lapidere, foffile lentils, in Natural Hifory, the name given by many writers to a very remarkable foffile fubftance, ufually found immerfed in hard ftones, and of a roundifh but flattened fhape, refembling not unaptly a pea or lentil flattened by preffure. They generally lie in great quantities in the fame mafs of ftone; and are of very different appearance when their fides or ends are feen, from that which they exhibit when their flat furfaces come in view.

They are generally fuppofed to be lentils petrified and bedded in ftone, and as their fides come in view in fome parts of the maffes, they are not perceived to be a part of the fame fubftance, but are called the remains of feeds of other plants, and the whole fone is ufually nanaed lapis frumentarius.

We are not to fuppofe, that fo foft a body as the lentil feed, or a common pea, could be eafily petrified and preferved in its own form in flone; fince if thefe foft fubftances were readily capable of fuch a change, they are fo very common in their recent fate, that they muft be expected to be found in this foffile condition very frequently alfo, and in great variety. This, however, is not the cafe. But this improbability is not all the reafon we have to conjecture, that thefe are not what they are vulgarly fuppofed to be,
that is, foffile feeds; for a fricter examination of the things themfelves proves this to be, impoffiblc. Seeds, and other fuch things, are of fome determinate growth; the fize of which we know, and are well acquainted with their internal ftructure, which is only a farinaceous matter contained in a thick fuperficial ikin or covering.
On the contrary, thefe foffils, when examined, prove to be of various fizes, from the minuteft fpeck vifible to the eye, to near an inch in diameter, a fize that no lentil could be fuppofed to arrive at. They are of two kinds; the one convex on both fides, the other convex on one fide only, and plane on the other. The firft are thickeft in the middle, and gradually leffen in thicknefs all round, till they terminate in a thin edge; the others are jult like the halves of thefe when fplit horizontally. Thofe which are convex on both fides, have ufually feveral crooked lines, rifing from the umbilicus on each fide, and tending towards the circumference; and the flat ones have ufually on the flatted fide a number of concentric circles furrounding the umbilicus, and one another to the edge. When thefe are broken, they are found to confilt of a number of cafes, or coats, one within another, all of the fame frape with the outer one; and fome of them are ftriated, or made up of tranfverfe fibres. They are plainly of animal origin, though they differ from all the parts of animals hitherto known. Woodward's Cat. of Feffils. vol. ii.
Dr. Woodward, in onc place, fuppofes them to have been the loofe bones which are found in the heads of fome feafifhes, and are fuppofed to ferve for hearing; but that they belong to fome fifh at prefent unknown, or that has not been yet examined in this particular : there is, however, another much more probable opinion, which he mentions afterwards, that they may have been opercula of fhell-fifhes, of the nature of the umbilicus Veneris, of which the fifhes we know afford us a great variety; and the many others we are yet unacquainted with, may furnifh numbers of other kinds very different from all we do know.

Thefe bodies are found in a hard greyifh ftone, and fome of the large ones, which are flattened on one fide, give great reafon to judge that they are of this origin, as fome of the large ones have on the flat fide a reddifh line, beginning at the centre, and thence continuing in a firal form for eleven or twelve turns, till it reaches the edge of the ftone. This is exactly the formation and lineation of the common umbilicus Veneris, only that it has fewer fpires. The ftone, called by authors lapis numi/malis, is generally allowed to be of the nature of thefe opercula, and this differs very little from thefe large lentes lapidea, as they are called.

LENTHALL, William, in Biography, an Englifh lawyer, and famous as a fpeaker in the Long Parliament, was born at Henley on Thames, in Oxfordhire, in 1591, and educated at Alban-hall, Oxford, from whence he removed to Lincoln's Inn, where he was called to the bar. In 1639 he was elected into parliament for Wooditock, and in $164{ }^{\circ}$ was chofen fpeaker, in which capacity he was faid to have made a confiderable fortune by joining the ruling party. He was alfo mafter of the rolls, a commiffioner of the great feal, and chancellor of the duchy of Lancafter. He was turned out by Cromwell in 1653, but in the following year he became fpeaker of the parliament called by the protector. At the refloration he was exempted from the act of indemnity, but obtained a pardon from the king. He died, it has been afferted, exprefling great penitence for the part which he had borne in the rebellion, in 1662. Several of his fpeeches and letters have been printed.
lentibularia, in Botany. See Utricularia.
LENTICULA, fo called from the convex figure of its

## LEN

## L E N

little round leaves, which refembles that of the Lens, or Lentil feed. See Limna.

Lenticula. See Petechia.
LENTICULAR Scalpel, from lenticulaire, doubly convex, in Surgery, denotes an inftrument ufually placed among thofe which are confidered neceflary in the operation of the trepan. Its particular ufe is to cut off the irregularities which often prefent themfelves at the edge of the perforation made with the trephine, and which might, if unremoved, caufe irritation and injury of the dura mater. The fhape of the inftrument can hardly be conceived without ocular examination, or, at leaft, a reference to an engraving. (See the Plate of Trepanning. Infruments.) We can only ftate, that one fide of its blade is convex, the other concave, and one of its edges Aharp. On the end of the blade is fixed a little fallow cup, with its concavity towards the handle of the initrument: This fmall cup-like part ferves the purpofes of receiving the little pieces of bone when detached, keeping the end of the blade from hurting the dura mater, and when applied under the margin of the perforation in the cranium, enables the operator to guide the inArument all round with fteadinefs and fecurity. Dict. of Practical Surgery.

Lenticulare, Ganglion, in Anatomy, a fmall ganglion in the orbit, from which the nerves of the jris are produced. See Nerve.

Lenticulare Os, is a fmall round bone of the carpus, oftener defcribed under the term pifforme. See Extremities.

Lenticularia, in Botany. See Leman.
Lentigo. See Freckles.
Lentigo is alfo ufed by Dr. Quincy for a brown, fcaly, or fcurfy eruption upon the fkin; fuch, efpecially, as is common to women in the time of child-bearing.

LENTIL, Less, in Botany, a fpecies of Ervum; which fee.

Lentils are the beft as well as cheapelt food for pigeons.
The feeds of lentils are frequently the common food of the poor in fome of the illands of the Archipelago, and other warm countries, when they can meet with no better fare. Another fort of lentil has of late years been cultivated in England, under the name of French lentil. This is the lens major of Cafpar Bauhine; and being twice the fize of the common lentil, is by fo much the better worth cultivating. This is called tills in many parts of England. Miller's Gard. Dict.

The anclents affirm, that lentils, eaten with their kins on, bind the body, and ftop a loofenefs; and yet at the fame time, that the liquor they are boiled in loofens the belly. They are but rately ufed in phyfic, though the flour of them may be ufed outwardly in cataplafms, for the fame purpofes as bean-flour.

Leytil, in Agriculture, the name of a plant of the vetch or tare kind, which is cultivated in fome places as fodder for cattle. Lentils grow a foot and a half in height, with ftalks and leaves like thofe of tares, but fmaller ; and, like them, they bear their feeds generally three or four in little pods. Thefe feeds are round, hard, fmooth, and flat, but thicker at the fides. There are two forts of lentils, the white and the yellow; but the latter affords the greater quantity of fodder. The feeds of this plant are commonly fown in March, where the land is dry ; but in moilt ground, April is a better feafon. The ufual quantity of feed allowed to an acre of land is from one bufhel and a half to two bufhels. If thefe are fowu in drills in the fame manner as peafe; they are faid by fome to fucceed better than when they are fown broad-caft. The drills fhould be a foot and a
half afunder, to allow room for the hoe to clean the ground between; for if weeds are permitted to grow among them, they are apt to get above the lentils, and prevent them from being properly fupported.

This is a crop not uncommon about Chefterford, in Effex, where they fow a bufhel an acre on one ploughing in the beginning or middle of March. "It is there the cuftom," Mr. Young fays, "to make hay of them, or feed them, for cutting into chaff for trough-meat for theep and horfes, and they fow them on both heavy and dry foils." It is added, that the whole country is of a calcareous nature; and likewife that attention fhould be paid not to water horfes foon after eating this fort of food, as they are apt to hove them. They are likewife afferted to be cultivated for the fame purpofe in Oxfordfhire, and probably in other diftricts.

Lentilius. See Linsenbahrt.
LENTINI, in Geography, anciently Leontini or Leontium, which was a fpacious, rich, and celebrated city of $\mathrm{Si}-$ cily, and the rival of Syracufe, is now reduced to a population of 4000 perfons, who occupy a very inconfiderable portion of the ruins of ancient Leontium. It is fituated in Noto, on a river of the fame name, about five miles from the fea. The air of the adjacent ceuntry, which abounds in marfhes, is fo infalubrious, that it prevents the increafe of inhabitants, notwithltanding the fertility of the foil and the variety of its productions. Three miles from Lentini is a large lake, eftimated at about 20 miles in compafs, called "Bivieri," or the lake of Lentini, belonging to the prince de Butera, which produces $1500 \%$ a-year; for the leafe of the fifhery, confifting of eels, tench, and cefalu, or a fort of barbel, that feeds in either frefh or falt water. The sicinity alfo yields great plenty and variety of game ; 19 miles N.N.W. of Syracufe, N. lat. $37^{\circ} 18^{\prime}$ E. long. $15^{\circ}$.

LENTISCASA, a town of Naples, in Principato Citra; nine miles S.W. of Policaftro.

LENTISCUS, in Botany, the Maftic tree, fuppofed to have derived its name from lentus, and lentefio, alluding to the pliability and tenacity of its gum or refin. See Pistacia.

Lentisk. See Pistacia and Mastic.
Lentisk, African and Peruvian, or Indian Mastic. See Schinus.

LENTO, Ital., a mufical term for flow, or a movement between largo and grave:
Lento, in Geography, a town of the inland of Corfica; 11 miles S. of Oletta.
LENTON, John, in Biography, a mufician in the band of king Witliam and queen Mary, whofe inftrument was the common flute. He compofed and publifhed, in conjunction with Tollet, a work entitled "A Conforte of Mufick, in three parts," probably two flutes and a bale-viol or archlute. At the beginning of the laft century, the flute a bec, or common flute, was in much higher favour than the violin, or German flute, which was then hardly known in this country. There are catches of Lenton's compofition printed in "The Pleafant Mufical Companion."
LENTOR in Medicine, a term employed by Boerhaave and his followers, to denote a fuppofed glutinous or vifcid condition of the fluids of the living body, to which they afcribed the origin of many difeafes.
It is fcarcely neceffary to enter at any length into the detail or refutation of an hypothefis, which was founded at the beft upon a gratuitous and miftaken view of the operations of the animal economy, and which a better pathology has long ago exploded. Boerhaave, in his obfervations on difeafes arifing from a fpontaneous gluten, (fee his Aphorifms, §69, et feq. and the commentary upon them in his "Praxis Me-

## L E N

dica,") confiders the direct effect of it to be an obftruction to the free circulation of the blood, efpecially through the fmall ramifications of the veffels. "Hence all the concoctions, circulations, fecretions, excretions, all the vital, natural, and animal motions are difordered; whence arife fuffocation and death." (.? ph. § 73.) Under this head, then, he readily includes not only inflammations, tumours, and concretions, but almoft every fpecies of chronic difeafe, efpecially where there is any change either in the qualities of the fecretions, as the faliva, urine, \&c. in the colour and complexion, as in chlorofis, leucophlegmatia, jaundice, \&c. : or where any part, either external or internal, is altered in its form ; as in all eruptive or cutaneous complaints, in fcrofula, cancer, fchirrus, meliceris, or other fpecies of fwell. ing. But in all thefe inftances, the afferted prefence of a gluten or lentor is gratuitous; there is no evidence of any fuch change in the property of the circulating blood; and the morbid humour, where any fuch palpably exits, is found out of the courfe of the circulation, and is, in all probability, the refult of a deranged action of the veffels in the part where it is found. Thus, in an abfeefs, following a phlegmonous inflammation, (as in a common boil,) it is clear that there is no fuch thing as a purulent lentor in the mafs of the blood; the pus is generated in the inflamed part, by an operation of the veffels, analogous to the fecretion of bile or faliva, and is a new product, not a pre-exifting matter. The argument, deduced from the appearance of the buffy cruft on blood, drawn during the exiftence of inflammatory fever, is altogether fallacious; as this buff is but the ordinary coagulable lymph of the blood, fome what more feparated from the red globules. See Blood, and Humoral Pathology.

LENTZ, in Geography, a town of Pruffia, in the territory of Ermeland; tight miles N.E. of Elbing.

LENTZBURG, an extenfive bailiwick of Switzerland, in the canton of Berne, which was formerly a rich and powerful country. Its capital, of the fame name, is one of the four municipal towns of the Aryan, having a confiderable trade, and mar-ufactures of flowered linens and cotton, tobacco, \&cc.; 16 miles W. of Zurich.
LENTZEN, a town of Brandenburg, in the mark of Pregnitz, near the Elbe; 74 miles N.W. of Berlin. N. lat. $53^{\circ} 9^{\prime \prime}$. E. long. $11^{\circ} 36^{\prime}$.

LENZA, a fmall ifland in the Adriatic. N. lat. $44^{\circ} 5^{\prime}$. E. long. 15 3 $\mathbf{I}^{\prime}$.

LEO, LIox, in Afronomy, the fifth of the twelve figns of the zodiac.
The flars in the conttellation Leo in Ptolemy's Catalogue are 27, befides the informes, which are eight; in Tycho's 30, in the Britannic Catalogue 95. See Constellation.

Leo I., in Biography, emperor of the Eaft, fucceeded Mar: cian, in the year 457 , through the favour and interelt of the patrician Afpar, who, on account of his Arian principles, was excluded from the empire. Leo was a native of Thrace, who had gradually rifen in the Roman armies to the rank of military tribune, and was principal \{teward of Afpar's houfhold. He received the imperial crown from the hands of the patriarch of Conftantinople, which is the firft inftance of an ecclefaaltic being employed in that ceremonial. Under Genferic the Vandals planted thenfelves in Africa, and Afpar favoured their caufe. Leo became jealous of the influence and power of Afpar, and in the end caufed him and his fon to be put to death without the form of a trial, upon the mere charge of a confíracy. The remaining parts of his family and friends attempted to revenge this treachery, and the Goths, attached to them, committed great diforders in Conftantinople, which were fuppreffed by Zeno. The Arians, having loft their patron, were treated

## L E N

with great rigour by Leo. From the Goths he was obliged to purchafe a peace, which he did not long furvive. He died in January 474, after a reign of nearly feventeen ycars. His moderation and love of juttice have been praifed, and feveral of his laws remain in the code of Juft nian.

Leo III., furnamed the Ifaurian, from Ifauria, the place of his birth, was born of low and obfcure parents. He entered the army, and became a guard to Juftinian II. He attained the rank of general under Anaftafius II. who took him in 717 as a coadjutor in the empire. The Saracens having ravaged Thrace, laid fiege to Conftantinople, which was bravely defended by Leo, who compelled them to retire. His reign was marked with aets of atrocious tyranny ; he drove the patriarch Germanus from his place, and gave it to Anaftafius. In the fifth year of his reign, he caufed his fon Conftantine, furnamed Copronymus, to be folemnly crowned. In 726 he made his famous attack on image worfhip, which has rendered his reign memorable in ecclefiaitical hiftory. The deftruction of objects long fo much venerated, and efpecially of a ftatue of Jefus Chrift placed over one of the gates of the city, fruck the people with fo much horror, that a ferious infurrection was the confequence. Leo had authority fufficient to enforce his reform in the eaftern empire, but in the Weft it cncountered a more formidable oppofition. Pope Gregory II. declared with great warmth agdinit the imperial edict, and the people of Italy openly revolted. Leo fent a fleet to chaftife the revolters, which was wrecked in the Adriatic, a circumftance that was interpreted as a divine interpofition. The emperor, irritated by his want of fuccefs, inflicted great cruelties on the oppofite party; the Saracens took advantage of thefe diffentions to make incurfions into the bordering provinces. A dreadful earthquake added to the calamities of this reign. Leo died in 741, after a reign of twenty-four years.

Leo IV., the fon of Conftantine Copronymus, fucceeded his father in 775 , at the age of 25 . The firll object of his reign was to fecure the fucceffion of his fon Conftantine, whom he had by Irene, an Athenian lady of great accomplifhments. He caufed the youth to be folemnly crowned, and declared a partrer in the empire. Leo IV. inherited his predeceffor's enmity to images, and is on that account reckoned, by the Catholics, one of the impious "iconoclafts." He obtained fome advantages over the Saracens, and initiated into the Chriltian religion a king of the Bulgarians, who, in the preceding reign, had inficted great evils on the empire. He died in 780 , and his death was imputed to an eruption on his head, which was faid to have been excited by a crown that he wore, and which was fludded with jewels, that he had facrilegioufly taken from the great church of Conftantinople.
Leo V., the Armenian, fon of a patrician, commanded an army againtt the Saracens in the reign of Michael I. His fuccefs, contrafted with the difgrace incurred by the emperur himfelf, caufed a revolt of the army, and Michael himfelf quitted the throne, to which Leo fucceeded, without oppotition, in the year 813 . He had been educated in the camp, and was ignorant of laws and letters; his adminiftration, therefore, partook of feverity and military difcipline. In religion he followed the fteps of the iconoclafts, and drew upon himfelf an excommunisation from pope Pafchal I. He attempted a reformaticm in the abufes of government, by which he made himfelf many enemies. At the head of thefe was Michael, forr , erly his fellow commander in the army, and a principal intrument of his elevation. Though he had been ensiched and promoted by Leo, he was diflatisfied with his rr avard, and formed a con-

Spiracy againft him. This was deteeted, and Michael was arrefted, and condemned to die on Chritmas day, but the holinefs of the feafon caufed a refpite of the exccution. In the interval, the friends of Michael affembled, and mingling with thofe who came to perform divine fervice in the imperial chapel, concealed themfelves till the entrance of Leo. A fignal was given, and an attack was made, by miftake, on the prieft who led the devotions; perceiving their crror, they inftantly turned their fury upon the emperor, who had retired to the altar, and difregarding the crofs which he held, they cruelly affafinated him. This cvent took place in $\mathrm{S}_{2}$, after Leo had reigned with reputation feven years and a half.

Leo VI., the philofopher, was the fon and fucceffor of Bafil, the Macedonian, who had caufed him to be crowned as his partner in the empire in 870 . By the treachery of a monk he had nearly loft his eyes and his inheritance, but his friends zealoufly exerted themfelves to procure his releafe, and refloration to favour. On the death of Bafil in 886, Leo fucceeded to the imperial throne, having a nominal partner in his brother Alexander, but he himfelf poffeffed the fovereign power. The Bulgarians, in this reign, renewed their ufual hoftilities againit the eaftern empire; and the ill fuccefs of the generals of the emperor, obliged him to fubmit to fuch terms of peace as they were pleafed to impofe. With the Saracens likewife feveral actions were fought by fea and land with various fuccefs. But he was chiefly haraffed by confpiracies at home, and had more than once nearly loft his life. By his literary reputation he acquired the title of "philofopher," but his private conduct difplayed an indolent and voluptuous character. He had in his theological zeal prohibited third marriages, whereas having himfelf loft three wives, he entered into the holy flate a fourth time, which led to his excommunication. It has been urged, in excufe of his conduct, that he had no remaining iffue by the firlt three marriages. He was, during his whole reign, much under the dominion of favourites; he was fuperfitious, and made pretenfions to the art of foretelling future events by divination. A defeat of his fleet by the Saracens preceded his death, which happened in 9ri, after he had been on the throne twenty-five years. He bequeathed the empire to his brother Alexander, as a trult for his fon. Leo had been educated under the learned Photius, from whom he derived an attachment to various kinds of erudition. He was fuppofed by fome to have been the author of a collection of fermons or homilies; of a letter to the caliph Omar on the truth of the Chriftian religion; of a paftoral letter to his fubjects; of a treatife on military difcipline, and a collection of laws begun by his father. For farther partioulars relating to the foregoing emperors, fee Gibbon's Hift. and Univer. Hift.

Leo I. pope, furnamed "The Great," was a native either of Tufcany or Rome; at the latter place he was educated. Nothing certain is known of him till he was raifed to the dignity of archdeacon of the Roman church under the pontificate of pope Celeftine. He occupied the fame poft under Sixtus III. and acquired a very high reputation for piety, orthodoxy, eloquence, and prudence, in the management of bufinefs. He was employed to negotiate certain differences which had arifen in Gaul, between Aetius and Albinus, and fucceeded in the object of his miffion. While he was in Gaul, Sixtus III. died in $44^{\circ}$, upon which the univerfal voice of the Romans proclaimed Leo his fucceffor, and upon his return he was received with the greatelt demonftrations of joy. He commenced his pontificate with the moft zealous exertions of a Chriftian bifhop, and he was particularly anxious for the advancement and grandeur of
the papal fec. In the year 442, he extended the law of celibacy to the archdeacons, who neverthelefs were not to abandon the wives whom they had married, while in inferior ftations, but were in future to live with them as fifters. In the year 445, he quarrelled with Hilary, bifhop of Arles, for oppofing the power of the papal fee, and obtained an edict from the emperor Valentinian, which put an end to the ancient liberties of the Gallican churches, and enforced thofe appeals to Rome which gradually fubjeeted all the weftern churches to the jurifdiction of the pretended fuc: ceffors of St. Peter. About this time many of the Manichæeans flying from Africa, after the conqueft of Carthage by Genferic, king of the Vandals, had repaired to Rome as a place of fafety. The zeal of Leo would not fuffer them long to enjoy tranquillity, but caufed great numbers of them to be feized and imprifoned. Thofe who abjured their diftinguifhing tenets were admitted into communion, but thofe who fteadily adhered to their principles were condemned to perpetual banifhment. The pope found that many of the Manichæans had made their efcape from Rome; he accordingly fent a circular letter to all bihops, exhorting them to be upon their guard againft the faid heretics, and when difcovered, to profecute them without mercy. His holinefs was not contented with what he could do by the power with which he himfelf was armed, but he applied to the emperor Valentinian, for a law to exclude fuch perfons from all civil and military employments, and to declare them incapable of giving or receiving any property by will or teftament, or of making any contract. Leo was equally violent againt the Priccillians, who pretended to high degrees of purity of life and manners, who practifed great mortifications, and whofe opinions were a compound of Gnoflicifm and Unitarianifm. For propagating them, their leader, Prifcillian, had been put to death, and was accordingly regarded as a faint and martyr. Leo now condemned the doctrines and practice of his followers as impious and deteftable, and declared all thofe who tolerated heretics, no lefs guilty than thofe who embraced their opinions. The doctrine of Eutyches, which maintained that there was but one nature in Chrift, roufed the zeal of Leo, and after much difcuffion, concerning which our limits do not allow us to enlarge, he caufed the heretic to be condemned, fent into banifhment, and deprived of his facerdotal dignity; and a decree was paffed, that " in Chrift there were two diftinet natures united in one perfon, and that without any change, mixture, or confufion." During the pontificate of Leo the fourth general council was held, in which the famous canoa was enacted, which rendered the fee of Conftantinople equal to the fee of Rome in all refpects, except precedency. This canon was evidently intended to check the growing power, and to oppofe the daily encroachments of the bifhop of Rome. When Leo was made acquainted with the determination of the council, he was filled with the utmof rage, and refolved to oppofe it with all his might. He faw his rival but one ftep behind him, and was apprehenfive he might foon get before him; he was, therefore, determined to difpute his power in every flage. Wihing, however, that he might be thought to be acting upon Chriftian motives, he pretended to be influenced only by a zeal for the decrees of the council of Nice, for the practice of antiquity, and for the rights and privileges of the patriarchal fees of Alexandria and Antioch. During the year 452, Attila, king of the Hunns, made an irruption into Italy, foon became mafter of feveral important cities, and then bent his march towards Rome, hoping to enrich bimfelf with the fpoils of the metropolis. At this time the city was not in a condition to bear a fiege, and the emperor fent a folemn embafly

## LEO.

embaffy to Attila, with fuch propofals as might be acceptable to him and his army. Leo himfelf went at the head of the embaffy, in which he was joined by two men of the firft rank, and of long experience in negociations. On their arrival with a grand and numerous retinue, at the enemy's camp, in the neighbourhood of Mantua, they were received by the king of the Hunns in a very favourable manner, which the ecclefialtical writers afcribe to the fame of Leo's extraordinary fanctity. The terms which they propofed were readily agreed to by Attila, and a treaty of peace was foon concluded between him and Valentinian, in confequence of which he repaffed the Alps, and retired beyond the Danube. In the year 453, Leo's zeal was directed towards the converfion of the monks of Paleftine and Egypt, who denounced war againft all the abettors of the council of Chalcedon, and maffacred, without mercy, fuch of the clergy and laity, as had the courage to profefs a belief in the two natures in Chrif. In 455, Leo's attention was drawn off from the affairs of the Ealt, by the calamities produced in Italy, in confequence of the daath of Valentinian. That prince was murdered by Maximus, who not only ufurped his throne, but obliged Eudoxia, the emperor's widow, to marry him. Determined to revenge the death of one whom the had loved with the greateft tendernefs, and to deliver herfelf from the tyrant, fhe applied to Genferic, king of the Vandals, in Africa, who fhe well knew would be glad of any favourable opportunity of invading and plundering Italy. To him fhe difpatched a confidential meffenger, conjuring him to come without delay and refcue her out of the hands of Maximus, afluring him that he wonld meet with no oppofition, and promifing to affilt him to the utmoft of her power. Genferic gladly feized the opportunity, and appeared in a fhort time with a very powerful army in the neighbourhood of Rome. His appearance ftruck the.Romans with difmay, and inftead of preparing for defence, they threw open their gates, and furrendered at difcretion. In this extremity of diftrefs, Leo went out to meet the enemy, and endeavoured by prayers and tears to mediate for the fafety of the city. The pope could not prevail, and the army of Genferic plundered the city, and carried away the inhabitants into captivity. After fpending fourteen days in ranfacking the houfes, churches, and public buildings, and ftripping them of all their wealth, and valuable monuments, the Vandals re-embarked, and returned to Africa with an immenfe booty, and as many captives as they could carry on board the fleet. Thefe troubles, and the mifchiefs which they occafioned, engroffed much of Leo's care and attention to mitigate them, till, on the death of the emperor Marcian in 457 , the Eutychians once more obtained the afcendency in Egypt. The chief of this revolution was Timothy, furnamed Ælurus; who affembled his council, confifting of a fmall number of Eutychian bifhops, in which he openly anathematized the council of Chalcedon, pope Lco, and the Catholic bifhops. In virtue of this fentence, he excommunicated, depofed, and drove from their fees, all the bifhops of the patriarchate of Alexandria, who refufed to abjure the faith of Chalcedon, and in their room took care to place fuch as had diftinguifhed themfelves by their zeal for the Eutychian doetrine. In the year $45^{8}$, the emperor invited Leo to Conftantinople, that he might converfe with him, in perfon, on the fubjects of the decree of Chalcedon, and the intrufion of 在lurus. To this invitation his holinefs replied in two letters; one containing his excufes for not undertaking fuch a journey, and the other intended to explain and confirm, with the teltimony of the fathers, the doctrine of the two natures. The lalt named letter became very famous with the orthodox, and was often
quoted by the writcrs of that and fuceceding ages. After this Elurus gave the pope a public challenge to debate the points in difcuffion. But Leo refufed to comply with the propofal, alleging that it was dangerous and unnecelfary to examine anew, or to queftion what had already been examined and defined by an occumenical council. From this time Leo continued his efforts, with unabated zeal, in defence of the Catholic caufe, and omitted no opportunity of endeavouring to imprefs the emperor's mind with a fenfe of the heinoufnefs and enormity of 不lurus' crime. In 460 , the bifhops of the Eaft united in the fame caufe with fo much ardour, that an order was obtained from the emperor to expel and banish the heretic, which was carried into execution without delay. This event was followed by the election of a Catholic bifhop to the fee of Alexandria, and the refloration of thofe prelates who had been difplaced for their adherence to the council of Chalcedon. The news of this important change afforded the highef fatisfaction to Leo, but the pleafure was of fhort duration only, as he died in the year 461, having prefided over the Roman church twenty-one years. Leo was a man of great learning, and of eminent abilities; but his ambition was unbounded, and with him every object, every confideration was made to yield to his predominant paffion for aggrandizing his fee, or, in other words, for extending his own power and authority. His works confift of 141 letters, and 96 fermons. The beft edition of them was publifhed at Paris in 1675, in two vols. 4 to. which was reprinted in folio at Lyons, in the year 1700. The ftyle of Leo's writings is energetic and elegant, though fometimes, in the purfuit of elegance, he renders his difcourfes too highly polifhed.

Leo II. pope, a Sicilian by birth, was raifed to the papal dignity in the year 682. With the decree confirming his election, he received an account of the proceedings of the fixth general council, held at Conftantinople, by which pope Honorius I. was anathematized as a monothelite. In reply to this letter, he fays, that he had received this council as he received the five preceding general councils, and anathematized all whom the council anathematized. He alfo fent letters to the metropolitans of the different provinces of the Weft, acquainting them with the proceedings of this council, and requiring them to receive it, as well as to caufe it to be received by the bifhops in their refpective jurifdictions. By this conduct he acquired fo much intereft at court, that he found the opportunity favourable for extending the power of the papal fee, and procured an edict, fubjecting for ever the fee of Ravenna to that of Rome. He died in 683, after a pontificate of only ten months. Five of his letters may be feen in the fixth vol. of the Collect. Concil.

Leo 1II., pope, born at Rome, was in due time appointed to the office of prefoyter in the church; and upon the death of Adrian, in 795, he was unanimoully elected to the papal fee. Upon his ordination, he wrote to Charlemagne, acquainting him with his promotion, and, at the fame time, fending him the keys of the tomb of St. Peter, and the ftandard of the city of Rome, with other prefents, and requefting him to fend fome fit perfon to receive the oath of allegiance from the Roman people. The anfwer of the king was conceived in equally civil and complimentary terms, and it was accompanied with immenfe treafures to be employed by Leo in repairing and adorning the churches of Rome, efpecially that of St. Peter. In the year 796, he reftored the fee of Canterbury to that jurifdiction over all the churches of England, which had been taken away by Offa. Towards the beginning of the year 799, Leo affembled a council at Rome, in which Felix, bifhop of Urgella, and Eliphand, archbifhop of Toledo, were condemned. During

## LE O.

the fame year, a confiriacy was formed againft Leo, by two nephews of pope Adrian, who had been raifed by him to high employnents in the church, and governed all things at Rome, during his pontificate, with an abfolute fway. To them, indeces, Leo had been greatly indebted for his election, and they fuppofed that gratitude would have led lim to furrender all power into their hands. Leo, willing to fhew his own authority, checked them in their defigns, and in turn they refolved to puthim to death. The attempt was made on the feltival of St. Mark, when the pope was proceeding from the Lateran palace to join in an annual proceflion. The delign did not fucceed, though he was expofed to the moft imminent danger, and was in fact thrown into a dungeon covered with wounds. From his prifon he was refcued by the duke of Spoleto, who conveyed him fafely into his own territory: From Spoleto the pope wrote to Charlemagne, to acquaint him with the cruel treatment he lad met with, and foon after fet out on a vifit to that prince, to folicit protection againft his enemies. Charlemagne received him with the greateft marks of refpect and friendfhip, and after affuring him of his protection, fent him back to Rome, attended with feveral bifhops, and a force fufficient to protect him againft any farther attempt of his enemies. He entered the city amidft the loud acclamations of the people, and took poffeffion once more of the Lateran palace, where the nobles and bifhops who had accompanied him affembled, and to which all were fummoned who had any caufe of complaint againft Leo, thefe being commiffioned by the king to hear them and do them juftice, if in any refpect they had been injured by the pope or his minifters. Some did appear, and among thefe the nephews of Adrian, who accufed him of feveral crimes; but not being able to fubitantiate the charge, they were fent to prifon, tried, and fentenced to death for the confpiracy, in which they had been the principal actors. At the earnelt folicitation of Leo their lives were fpared, and their fentence exchanged to banifhment. About this period, the title of emperor of the Romans was revived in the perfon of Charlemagne, who, on the propofition of the pope, was faluted Auguftus by all claffes of the Roman people, and on the day of his coronation received their homage, as well as that of Leo. In So3, the pope having expreffed his wifh to celebrate the nativity of Chrilt, with the emperor Charlemagne, the latter fent his fon as far as St. Maurice, in the Valais, to meet his holinefs, and went himfelf to Rheims, where he received Leo with extraordinary marks of elteem and friendfhip. From Rheims they proceeded to Quiercy, where they kept their Chriftmas, and then repaired to Aix-la-Chapelle. Here, after entertaining him for eight days, Charlemagne difmiffed the pope with rich prefents, and an efcort, who were ordered to attend him as far as Ravenna. In 809, the difpute was revived in' France on the queftion concerning the proceffion of the-Holy Ghoft : by the firft council of Conftantinople, an addition was made to the fymbol of Nice, declaring that "The Holy Ghoft proceeded from the Father." In the fifth and fixth centuries, the churches of Spain added to the fymbol of Nice and Conftantinople the word filioque, "and from the fon," and their example was followed by moft of the Gallican churches. The queftion now under difcuffion was, whether the expreffion " filioque" ought to be added or omitted. Leo was for the omiffion, though he adhered to the doctrine attached to it ; becaufe he faid if it were received by the churches, it would be a fair plea for the addition of many other articles of equal importance. To thew more decidedly that he did not approve it, he caufed two tables of filver to be fet up at the tomb of St. Peter, and the fymbol to be engraved in Greek
onone, and on the other in Latin, without the words "and from the fon," which, however, were afferwards added to the creed by his fucceffors. Leo paffed the remainder of his pontificate in tranquillity, till the death of Charlemagne, his great friend and protector, in 814 : when the relations of pope Adrian and their partifans formed another confpiracy agamit him, with the defign of depofing and murdering him. The plot he difcovered in 815, fome time before it was ripe for execution, and caufed all who were concerned in it to be apprehended, and put to death without mercy. It has been faid that he glutted his, revenge by executing fome of the confpirators with his own hands. His feverity excited the difpleafure of the new emperor Lewis, who commanded his nephew Bernard, king of Italy, to proceed immediately. to Rome, and to take cognizance of the whole affair on the fpot. The emperor was faid to be perfectly fatisfied with the pope's juftification of his conduct, but the people, who felt for themfelves and for their friends, who had been the victims of his cruelty, were not fo eafily appeafed : they defroyed every thing belonging to his holinefs that they could get at, and would have excited an infurrection, had they not been fuppreffed and difperfed by a body of troops under the duke of Spoleto. The pope died in June 816, after he had prefided over the Roman church more than twenty years. He left behind him thirteen letters, which are to be found in the feventh vol. of the Collect. Concil. He has been celebrated for having enriched the churches of Rome with the molt coftly and valuable ornaments, for which he was chiefly indebted to the liberality of Charlemagne.

Leo IV., pope. was born at Rome, and educated in the monaftery of St. Martin, ordained fub-deacon by Gregory IV., and preflyter of the Roman church by Sergius II. Upon the death of the latter, he was unanimounly elected to the pontifical throne. The firft object of his care was to rellore to their former fplendour, at an immenfe expence, the churches of St. Peter and St. Paul, which had been defpoiled of their ornaments by the Saracens, and likewife to fecure them againft the future attempts of fuch plunderers. With this view he refolved to build a new city upon the Vatican, and to enclofe it, as well as the church of St. Peter, by a ftrong wall. This refolution met with the approbation of the emperor, who not only contributed himfelf to the work, but engaged contributions from his brothers in fupport of the fame caufe. With this encouragement Leo fet about the undertaking with the utmoft diligence and ardour, performing in his own perfon the daily office of overfeer, in all kinds of weather. In 849, he was interrupted in the work by a threatened attack upon the city by the Saracens. The attempt was made, but a ftorm arifing, the enemy's fleet was driven on fhore, and almoft all the fhips dafhed in pieces, and thofe on board perifted. Of the veffels that efcaped the fury of the waves, fome fell into the hands of the Romans, of which the greater part of the crews were hanged, and left on gibbets to ftrike terror into the minds of their countrymen, and the reft were put into irons, and forced to labour in the pope's new works. While the Romans were celebrating the victory obtained over their enemies, Lewis king of Italy arrived to be crowned emperor, in order that he might fhare the empire with his father. This was in 850 , and in 852 Leo faw his new city completed, which was called, after the founder, the Leonine city. In the following year Leo affembled a council at Rome, for the purpofe of reltoring difcipline, and banifhing abufes that had crept into the church: among other things which they did, was the depofition of Anallafius, cardinal prefbyter of the church, for abfenting himfelf from his fee five years. In the fame year, the illuftrious Alfred was fent
by his father to Rome, to be educated under the care and direction of the pope. The Saracens continued ftill to infelt the court, notwithflanding their late defeat and confequent difafters: he accordingly fortified the cities on the coalt to guard his people from there depredations, and he built a new city which he called Leopolis. Scarcely had he finifhed this city, when he was furprifed with the intelligence that the emperor Lewis was arrived in the neighbourhood of Rome, at the head of a large army. Leo was fcon informed of the defign of his coming, which was to bring to trial Gratian, commander of the Roman militia, one of the pope's counfellors, who was accufed of having folicited another commander to join him in driving out the French, and calling in the Greeks in their room. On the day of trial, the innocence of Gratian appeared perfectly clear, and the accufer was delivered up to be difpofed of at pleafure. His life was, however, fpared at the folicitation of the emperor. Leo died in 855 , after a pontificate of cight years and upwards. He was, according to Anaftafius, poffeffed of aH the moral and Chriftian virtues, without the alloy of a fingle vice. He left behind him two letters, and a difcourfe, defigned for the inftruction of the clergy in the duties of their office, which are to be found in the eighth vol. of the Collect. Concil.
Leo V., pope, a native of Ardea, afcended the pontifical throne in the year 903 , but fcarcely had he attained to this diftinguifhed honour, before he was depofed by one of his own priefts, and thrown into prifon, where he fhortly died of grief.

Leo VI., pope, a Roman, was elected to the papal dignity on the death of pope Jobn X., in the year 928. He held the high office but about fix months, when he was depofed and imprifoned.

Leo VII., pope, a Roman, was raifed to the pontifical throne by the unanimous vote of the clergy and people, on the death of John XI., in the year 936. He is highly commended for his zealous efforts to reltore ecclefialtical difcipline, to reform the monaltic orders, and to correct the abufes which prevailed in the Roman and other churches. He died in 939, after having fat on the pontifical throne three years and a half. He has left three letters, inferted in the Collect. Concil.

Leo VIII., pope, though by others Ayled antipope, was born at Reme, and was chief fecretary of the Roman church, an office in which he fucceeded his father. Upon the depofition of John XII., in 963 , Leo, on account of his excellent character, was elected to the pontifical dignnty, with the approbation, if not by the influence, of the emperor Otho. He enjoyed his fituation but a fhort time; the people, inftigated by John, drove him from his elevated flation, and Benedict-was placed there in his itead, the partizans of whom bound themfelves by the fanction of an oath, never to fubmit to Leo, whom they called the emperor's pope. Leo was, however, in a fhort time reftoreci to his holy office, and died after a pontificate of fifteen months.

Leo IX., pope, was born at Toul, in Lorrain, in the year 1002, and being educated for the church, he was ordained deacon in 1025, and promoted to the bifhopric of his native place in the following year. By his conduct in that fee he acquired fo high a reputation for learning, prudence, and piety, that on the death of pope Damafus II. in 1048, he was chofen as the moft fit perfon to be his fucceffor. He went from Toul in the habit of a pilgrim, and was received by the people at Rome with fongs of joy and loud acclamations. An affembly of the clergy and people was convened, at which he informed them of his having been

Vor. XX.
nominated to the apoftolic fee by the emperor, but that he did not confuder his election valid unlefs made by them, and that, therefore, they were at full liberty to choofe or reject hira; and that, if he were not unanimoufly chofen by them, he would return to his bifhopric as willingly as he had unwillingly left it. This addrefs was received with every demoniltration of refpect and fatsfaction, and he was proclaimed fovereign pontiff under the title of Leo IX. In the year 1049 he affembled a council at Rome, which was attended by the Italian and Gallican bifhops. By this council all fimoniacal bargains were prohibited on pain of excommunication, and fo:ne bifhops convieted of crimes were depofed from their high rank. When the council was broken up, Leo took a journey into Saxony to vifit the emperor, with whom he celebrated the feftival of St. Peter and St. Paul at Cologne, and having fummoned the Gallican bihops and abbots to meet him at Rheims, he opened a council. At this council, among other excellent decrees, was reftored to the people the right of choofing their own paftors. From Rheims Leo proceeded to Mentz, where he held another council of German prelates, at which the emperor, the chief lords and princes of Germany, affifted. Leo returned to Rome towards the clofe of the year 1049; and in the following fpring he vifited feveral Italian cities, reftoring every where the decayed difcipline of the church. Soon after this he held a council at Rome, which is chiefly memorable for the unjuft fentence of condemnation which it pafted upon the celebrated Berenger, without hearing him in his own defence, or fo much as fummoning him to attend. In 1053 he held another council at Rome, in which he condemned the practice of the Greeks, in adminittering the eucharit with leavened bread, which was one of the principal fubjects of a letter addreffed by him at this time to Michael Cerularius, patriarch of Conftantinople. In the mean time Leo had conceived a jealoufy of the Normans, who had made a conquelt of Apulia, which they divided into twelve counties. He was Atrongly prejudiced again!t them by the Apulians, who reprefented that their government was cruel and tyrannical, and painted them as barbarians without either laws or religion: he was therefore determined to expel them from Italy, which was one grand object of his latt journey into Germany, but the emperor was too much engaged in his own affairs to afford any material affiftance in his project. Upon Leo's return he refolved to undertake the tafk himfelf. Having therefore affembled a numerous army, he marched with all poffible expedition to the borders of A pulia, but before he could gain any decifive advantages, the Normans had put themfelves into a pofture of defence, and in the end they prepared for offenfive meafures; and put themfelves under the command of Umfred, count of Apulia, Richard, count of Averfa, and the brave Robert Guifcard: Thefe experienced warriors fell upon the pope's army with incredible fury, and after a bloody action entirely routed it with immenfe flaughter. The pope was now glad to fly, but was obliged in a fhort time to furrender at difcretion. Leo now anticipated the moft cruel treatment from thofe whom he had been accuftomed to think, and to treat as barbarous enemies. His apprehenfions were foon relieved: Umfred accofted him with all the refpect due to his character, and conducted him, attended by the chief officers of the army, to his camp. There he entertained him with great magnificence, and fet him at liberty, providing him with an efcort. With this behaviour of the Normans, Leo was fo greatly pleafed, that he abfolved them from all the cenfures which they had incurred, and even approved of the conquefts which they had made, and likewife encouraged them to add the reduction of Ca -
labria

## L E O.

labria to that of Apulia. The pope now received a letter from the emperor, in which he expreffed a great delire to fee the ancient union rettored between the fees of Conitantinople and Rone, and offered to contribute whatever lay in his power towards fo grod a work. Before any thing could be done to effect this, the pope was feized with a fevere and fatal illnefs, which put an end to his life in the year 10j", at the age of fifty-two, after having governed the Roman church live ycars and two months. He was zealous in reforming abufes, and is highly commended for his prudence, his gencrolity, and lris peety. For his attempts to aggrandize the holy fee he has been honoured with a place amorg the faints in the Roman calendar. He was the firt pope who made ufe of the Chriltian era in the date of his bulls, his predeceflors having followed that of the Indictions. Nineteen of his letters are preferved in the ninth vol. of the Collect. Concil: and feveral of his humilies or fermons were publifhed at Louvain in $156 \%$.

Lro X., pope, born at Florence in December 1475, the fecond fon of Lorenzo de Medici the Magnificent, bore the baptifmal name of Giopanni, or John, was originally dettined by his father for the church, and received the tonfure at the age of feven years. Being then declared capable of receiving ecelefraltical preferment, Lorenzo obtained two rich abbacics; and the lift given of the preferments accumulated upon him at an early age, amounts to the number of twentynine, a proof of the great interelt of his family, and of the fcandalous corruption of the church. It was the great object of his father's ambition to decorate his houfe with the popedom, and upon the acceffion of Innocent VIII. to the pontificate, Giovanni, then thirteen years of age only, was nominated to the dignity of cardinal. Lorenzo was not wanting in exertions to make his fon worthy of his premature advancement, and the difpolition of the youth, which was grave and folid beyond his years, contributed to the fuccefs of his initructors. When he was nominated to the cardinalate, it was made a condition that he fhould fpend three years at the univerfity of Pifa in profeffional ftudies, before he was invefted formally with the purple. In 1492 this folemn act took place, and he immediately went to refide at Rome as one of the facred college. His father foon after died, and was fucceeded in his honours in the Florentine republic by his eldeft fon Piero. The young cardinal's oppofition to the election of pope Alexander V I. rendered it expedient for him to withdraw to Florence, from whence, at the invafion of Italy by Charles VIII. he and the whote family were expelled, and obliged to take refuge in Bologna. About the year 1500 he again fixed his refidence at Rome, where he refided during the renainder of Alexander's ponzificate, and likewifs in the early part of that of Julius II. cultivating polite literaturc, and the pleafures of elegant fociety, and indulging his tafte for the fine arts, for mufic, and the chafe, to which latter amufement he was much addicted. The deprefiion of his houfe occafioned frequent embarraffments in his finances, but his cheerful temper fupported him under difficulties, and he extricated himfelf without lofs of honour. In 1505 he began to take an active part in public affairs, and was appointed by Julius to the government of Perugia. By his firm adherence to the intereft of the pope, the cardinal acquired the molt unlimited conlidenec of his hulinefs, and was entrufted with the fupreme direction of the papal army in the Holy League againit the French in 1511, with the title of legate of Bologna. At the bloody battle of Raveuna, in 1512, he was made prifoner, and was conveyed to Milan, where the facrednefs of his function caufed him to be treated with great refpect. The French in their retreat carricd the cardinal with them,
but on his arrival at the banks of the Po he effected his efcape. About this time the family of the Medici was reftored to its fcrmer condition at Fiorence, and the popular conltitution of that republic was overthrown. The cardinal contributed to this event, and remained at Florence, till the death of Julius II. called bin fuduenly to Rone. At the fcrutiny for a new pontiff in 1513 , the election was declared to have fallen on the cardinal de Medici, who was then only in the thirty-eighth year of his age. He affumed the name of Leo X . and afcended the throne with greater manifeltations of good-will, both from Italiaus and forcigners, than moft of his predeceflors had enjoyed. One of his firtt aets was to interpofe in favour of forne confpirators againft the houfe of Medici, at Florence, and he treated wath great kindnefs the family of Sodoreni, which had long been at the head of the oppolite party in that republic. He exhibited his talte for literature by the appointment of two of the molt elegant fcholars of the age, Bembo and Sadoleti, to the office of papal fecretaries. With regard to foreign politics, he purfued the fyitem of his predeceffor, in attempting to free Italy from the domision of foreign powers : and in order to counteract the antipapal council of Pifa, which was aflembled at Lyons, he renewed the meetings of the council of Lateran, which Julius II. had begun, and be had the good fortune to terminate a divifion which threatened a fchifm in the church. Lewis XII. who had incurred ecclefiattical cenfure, made a formal fubmiffion, and received abfolution. Having fecured external tranquillity, Leo did not delay to confult the interelts of Jiterature by an ample patronage of learned đudies. He reftored to its former fplendour the Roman gymnafium or univerfity, which he effected by new grants of its revenues and privileges, and by filling its profeflorfhips with eminent men invited from all quarters. The ftudy of the Greek language was a very particular object of his encouragement. Under the direction of Lafcaris a college of noble Grecian youths was founded at Rome for the purpofe of editing Greek authors; and a Greek prefs was eftablifhed in that city. Public notice was circulated throughout Europe, that all perfons who poffefled MSS. of ancient authors would be liberally rewarded on bringing or fending them to the pope. Leo founded the firt profefforfhip in Italy of the Syriac and Chaldaic languages: this was in the univerfity of Bologna. With regard to the politics of the times, the pope had two leading objects in view, viz. the maintenance of that balance of power which might protect Italy fron the cver-bearing influence of any foreign potentate; and the aggrandizement of the houfe of Medici. When Francis I. fucceeded to the throne of France, it was foon apparent that there would neceflarily be a new war in the north of Italy. Leo attempted to remain neuter, which being found to beimpracticable, he joined the emperor, the Swifs, and other fovereigns againit the French king and the ftate of Venice. The rapid fucceffes of the Freach arms foon brought him to befitate, and even to ftand aloof, and after the Swifs army had been defeated, the pope thought it expedient to detach his caufe from that of his allies, and to form an union with the king of France. Thefe two fovereigns, in the clofe of the year 1515 , had an interview at Bologna, when the famous Pragratic Sandion (which fee), was abolithed, and a concordat eftablifhed in its ftead. The death of Leo's brother left his nephew Lorenzo the principal object of that paffion for aggrandizing his family, which this pontiff felt full as ftrongly as any one of his predeceffors. Under the influence of this paffion, he found a pretext, in 1516 , for iffuing a monitory againit the duke of Urbino, and upon his non-appearance, Leo iffued an excommunication againgt him, and feized

## LEO.

his whole territory, with which, together with the ducal title, he invelted his nephew. In the fame year a general pacification took place, though all the efforts of the pope were made 20 prevent it. In 1517 , the expelled duke of Urbino collected an army, and, by rapid movements, completely regained his capital and dominions. Leo, exceffively chayrrined at this event, would gladly have engaged a crufade of all Chrillian princes againit him. By an application, which nothing could juntify, of the treafures of the church, he raifed a conriderable army, under the command of his nephew, and compelled the duke to refign bis domirion, upon what were ealied honourable terms. The violation of the fafe conduct, granted by Lorenzo to the duke's fecretary, who was feized at Rome, and put to torture, in order to oblige hin to reseal his malter's fecrets, imprints on the memory of Leo X. an indelible ftain. In the fame year his life was endangered by a confpiracy formed againlt him, ini which the chief actor was cardinal letrucci. The plan failed, and the cardinal, being decoyed to Roine, from whence he had efcaped, was put to death; and his agents, as many as were difcovered, were executed with horrid tortures. The conduct of Leo on this occafion was little honourable to his fortitude or clemency, and it was believed that feveral perfons fuffered as guilty who were wholly innocent of the crimes laid to their charge. To fecure himfelf for the future, the pope, by a great fretch of his high authority, created in one day thirty-one new cardinals, many of them his relations and friends, who had not even rifen in the church to the dignity of the epifcopal office; but many perfons alfo who, from their talents and virtues, were well worthy of his choice. He beftowed upon them rich benefices and preferments, as well in the remote parts of Chritendom, as in Italy, and thus formed a numerous and fplendid court attached to his perfon, and adding to the pomp and grandeur of the capital. During the pontificate of Leo X. arofe the daring Luther, whofe life will be given farther on; neverthelefs, in this place, we muft notice certain facts with which Leo and the reformation are clofely connected. The unbounded profution of this pope, in every object of expence attached to a talte for luxurious magnificence, had rendered it neceffary to devife means for replenifhing his exhaufted treafury ; and one of thofe which occurred was the fale of thofe indulgences which the church claimed a right of difpenfing from the itore of her fpiritual wealth. The commiffaries appointed for this traffic in Germany, exaggerated the efficacy of their wares in fnch very extravagant terms, as gave great offence to the pious and thoughtful. Luther, a public preacher at Wittemberg, warmly protelted againtt this abufe in his difcourfes, and in a Lotter addreffed to the eleator of Mentz. He likewife publifhed a fet of propofitions, in which he called in queltion the authority of the pope to remit ins, and made fome very warm ftrictures on this method of railing money. His remonftrances produced corfiderable effect, and feveral of his cloth undertook to refnte him. Leo probably regarded theological quarrels with contempt, and from his pontifical throne looked down upon the efforts of a German doctor with fcorn : even when his interference was deemed neceffary, he was inclined to lenient meafures. At length, at the exprefs defire of the emperor Maximilian, he fummoned Luther to appear before the court of Rome. Permifion was, however, granted for the cardinal of Gxta to hear his deferce at Augßourg. Nothing fatisfactory was determined, and the pope, in 1518 , publifhed a bull, afferting his authority to grant indulgences, which would avail both the living, and the dead in purgatory. Upon this, the Reformer appealed to a general council, and thus open war was declared, in which the
abettors of Luther appeared wih a Aremgth little calculated upon by the court of Rome. The fentiments of the Chiriftian world were not at all favourable to that court. "The fcandal," fays the biographer, " incurred by the infatny of Alexander VI., and the violence of Julius II., was not much alleviated in the reign of a pontiff who was characterized by an inordinate love of pomp and pleafure, and whofe claffical tafte even cauferd him to be regarded by many as more of a heathen than a Chriltian."
The warlike difpolition of Selim, the reigning Turkifh emperor, excited great alarms in Europe, and gave occafion to Leo to attempt a revival of the ancient crufades, by means of an alliance between all Chriftian princes; be probably hoped, by this thow of zeal for the Chriftian caufe, that he fhould recover fome of his loft credit as head of the church. He had, likewife, another object in view, viz, that of recruiting his finances, by the contributions which his emiffarics levied upon the devotees in different countries. By the death of Maximilian ia 1519 , a competition for the imperial crown between Charles V. and Francis 1. took place. Leo was decidedly againft the claims of both the rival candidates, and attempted to raife a competitor in one of the German princes, but he was unable to refitt the fortune of Charles. At this period he incurred a very fevere domettic misfortune in the death of his nephew Lorenzo, who left an infant daughter, afterwards the celebrated Catherine de Medicis, the queen and regent of France. The death of Lorenzo led to the immediate annexation of the duchy of Urbino, wihl its dependencies, to the Roman fee, and to the appointrment of Giulio, Leo s coufin, to the fupreme direction of the ftate of Florence. (See Clement VII.) The rapid progrefs of the Reformation forcibly recalled the attention of the papal court, and Leo, anxious for an amicable negotiation, employed a Saxon nobleman to treat in perfon with Luther, but the matter was, at this period, carried too far to admit of reconciliation. Luther appealed to the fcriptures for his authority; and the pope infilted upon unqualified fubmifion to the decrees of the Catholic church. The Reformer was perfuaded to addrefs a letter to his holinefs ; but, inftead of expreffions of humiliation, it contained much bitter invective againft the court of Rome. It was, therefore, determined to condemn him and his doctrines; and a bull to that purpofe was iffued, June 15 th, 1520, which occafioned a total feparation between the papal fee and the reformers. The writings of Luther were publicly burnt, an infult which he boldly retaliated by an equally folemn and public conflagration of the papal decrees and conftitutions, and the bull itfelf. Leo was not fatisfied with his own exertions, but was defirous of gaining on his fide the Imperial court. Before, however, the emperor would condemn, he determined to hear, in perfon, what Luther had to fay in his own juftification, and a mandate was iffued for his appearance at Worms. (See Luther.) We may obferve here, that Leo conferred on Henty VIII. of England the title of "Defender of the Faith," for his appearance on the fide of the church as a controverfial writer. The tranquil ftate of Italy, at this period, allowed the pope to indulge his tafte for magniticence in hows and fpectacles, and in the employment of thofe great artilts who have reflected fo much luitre on his pontificate. His private hours were chiefly devoted to indolence, or to amufenents, frequently of a kind little fuited to the dignity of his high ftation. He was not, however, fo much abforbed in them as to neglect the aggrandizement of his family and fee. Several cities and diltricts in the vicinity of the papal territories, and to which the church had claims, had been feized by powerful citizens, or military adventurers; fome of thefe
the pope fummoned to his court to anfwer for their conduct ; and in default of an exculpation of their crimes, he caufed them to be put to death. His holinefs next laid a plan to get into his poffeffion the city aud territory of Ferrara. He had fet his heart upon this object, and being unable to attain it by open means, he had recourfe to treachery, and it has been afferted that his plan included the affaffination of the duke. The commander of a body of German troops was bribed to deliver up one of the gates to the papal forces, which were to be in readinefs; but bic took the pope's money, and apprized the duke of the plot, which was thus happily defeated Another project, which entered deeply into the views of the pope, was the expulfion of the French from Italy. In 1521 , he formed a treaty with the emperor for the re-eftablifhment of the family of Sforza, in the duchy of Milan. He engaged a large body of Swifs in his fervice, who, under the pretence of different meafures, made much progrefs againtt the French, and drove their troops before them; but in the midift of thefe fucceffes, and while public rejoicings, were making in Rome on account of them, the pope was feized with an illnefs, which at firlt was confidered as a flight cold only, but which put an end to his life in a few days. This event happened on the ift of Dec. 1521 ; when Leo was in the 46 th year of his age, and the ninth of his pontificate. The people at large expreffed much concern at his death, but the honours rendered to his memory were not fuch as might have been expected. An exhaulted treafury was the pretext for an economical funeral, and amidt all the eminent fcholars of his court, an illiterate chamberlain was appointed to pronounce his funeral oration. Leo was himfelf but moderately furnifhed with folit erudition: he afforded liberal encouragement to ufeful and reputable fudies, but he alfo lavihed his patronage upon productions and perfons of an oppofite character. The merit of a fovereign in promoting thofe ornamental arts by which alone he can difplay a magnificence fuperior to that of a private citizen, can rank no higher than an exertion of good tafte; and this quality may be undoubtedly conceded to Leo. He was, however, rather the unfortunate inheritor, than the creator of great talents. Michael Angelo and Raphael had both rifen to fame under his predeceflor, Julius II., who had planned and made a commencement of the ftupendous edifice of St. Peter's : the Vatican palace had likewife received fome of its nobleft ornaments in his and the former pontificates. But the reader who wifhes to obtain an accurate view of the thate of literature and the arts in Italy prior to, and during the reign of Leo, will have recourfe to Mr. Rofcoe's "Life and Pontificate of Leo X.," from which the foregoing facts are principally drawn. The character of this pontiff has been finely celebrated by Pope in the following lines:
But fee! each mufe, in Leo's golden days, Starts from her trance; and trims her wither'd bays;
Rome's ancient Genius, o'er its ruins fpread,
Shakes off the dut, and rears his rev'rend head.
Then fculpture and her fifter arts revive:
Stones leap to form, and rocks begin to live ;
With fweeter notes each rifing temple rung,
A Raphael painted, and a Vida fung.
Leo XI., pope, the fon of Octavian de Medici, coufin of Cofmo, duke of Tufcany, was born in the year 1535. He was made archdeacion of. Florence, and filled the poft of ambaffador from Francis, the great duke, at the court of Rome. He was created cardinal by Gregory XIII., and by Clement VIII. he was fent legate to Henry IV. of France, and he was fuccefsfully employed in adjufting the
terms of peace between Philip 11., king of Spain, and the French monarch, and for his good offices he received from the latter a noble prefent. On the death of pope Clement VIII., in the year 1605, he was elected pope by the unanimous fuffrages of the conclave when he took the name of Leo XI. The Romans and Florentines were highly delighted with his elevation on account of his dilfinguifhed talents and virtues, and becaufe they knew that to his zeal for the interefts of the church, he united a liberal fpirit, a love of learning and learned men, and, as it were, an hereditary tafte for the polite arts. On the day of the proceffion, when the pope commences his office with great pomp and form, the feveral orders of the city endeavoured to furpafs each other in their demonitrations of joy on the occation. Their fatisfaction, however, was of very fhort continuance, and was fpeedily changed into grief and mourning, on account of his death, which happened on the 25 th day after his election, in the joth year of his age. Bower's Lives of the Popes. Bayle. Moreri. Lardner.

Leo Allatius. See Allatius.
Leo, the Grammarian, of whofe perfonal hiftory nothing is come down to us, was author of a continuation of the Chronicle of Theophanes, in the Greek language, comprifing the lives of the feven emperors of the Eaft, from the year 813 to 1013. It is annexed to Combefis's edition of the chronicle, printed at Paris in 1655. Moreri.

Leo, Јонл, named Africanus, a traveller and geographer, was a native of Granada of Moorih extraction. When that city was taken by Ferdinand and Ifabella, in 1492, he retired into Africa, and on that account obtained his furname. He ftudied the Arabic at Fez, was employed by the king as ambaffador, and took feveral journeys into Europe, Leffer Afia, and Africa, of which he wrote a narrative in the Arabic language. He once fell into the hands of fome pirates, and was fold as a flave to a mafter, who prefented him to Leo X. The pontiff highly efteemed him on account of his learning and knowledge, and having perfuaded him to renounce Mahometanifm, gave him his own names of John and Leo at the time of his baptifm. He now applied hinvelf to the attainment of the Italian language, and tranflated into it his defcription of Africa. This work is reckoned one of the moft curious of the early. voyages and travels. The author defcribes what he had himfelf feen, chiefly on the northern and weftern coafts of that peninfula, and it fupplies deficiencies from the relation of others; but as a geographical work it has various imperfections and defects. It has been tranflated into Latin and French. Leo probably died foon after he had rendered his work into the Italian language in 1526. He was author likewife of a treatife " De vitis Philofophorum;" printed at Zurich in 1664 . Moreri.

Leo of Orvieto, born in the territory of Orvieto, in Tufcany, became a monk of the Dominican or Francifcan order, who flourifhed towards the commencement of the fourteenth century. He was author of tyo "Chronicles," one of the popes, down to the year 1314 ; and the other of the emperors, terminating at the year 1308 . They were brought into notice by John Lamy, who publifhed them in his "Deliciz Eruditorum, feu Veterum Anecdoton Opufculorum Cillectanea," printed at Florence. Both the chronicles were publifhed in 1737 , in two volumes 8 vo., with notes and illuftrations. The fecond volume contains a Nketch of the hiftory of France, written by John de l'Ife, fuppofed to have been a monk of the abbey of St. Dennis, in the $15^{\text {th }}$ century, entitled "de Geftis et Faetis memorabilibus Francorum." Moreri.

Leo ne Modens, a learned rabbi, whofe Jewifh name

## LEO

was R. Jehudah Arie, was born at Modena, and fourifhed in the feventeenth century. He was for a confiderable time chief of the fynagogue, and efteemed a good poet both in Hebrew and Italian. He was author of a valuable work on the ceremonies and cultoms of the Jews, which is held in eflimation by the learned of all nations. It is entitled " Ittoria de Riti Hebraïci, vita et Offervanze de gli Hebreï di quefti Tempi;" the beft edition of this work was printed at Venice in 1638 . It was tranflated into the French language in 1674 , by Richard Simon, with fupplements relating to the fects of the Karaites and Samaritans. Leo meant to have given an Italian tranflation of the Old Teftament, but he wis prohibited from purfuing it by the Inquifition. He compiled a Hebrew and Italian dictionar ${ }_{j}$, entitled "The Mouth of the Lion." This work was publifhed at Venice in 1612 , and was afterwards reprinted in an enlarged form at Padua, in 1640 . Leo died at Venice in 1654, in about the eightieth year of his age.
Leo de St. John, a Freüh monk, born at Rennes in the year 1600 . Before he entered into the religious profeffion, his name was John Macè. He was nominated to all the honourable and confidential pofts of his order, and acquired the efteem of popes Leo XI., and Alexander VIII. and of feveral cardinals. He was an eloquent preacher, and had the honour of performing the duties of his office before Lewis XIII. and Lewis XIV. . He was the friend of car. dinal Richelieu, by whom he was patronized. He died in 1671, leaving behind him numerous works, the principal of which is entitled "Studium Sapientix Univerfalis"" in three volumes folio. His "Hitory of the Carmelites;" "Lives of different Romifh Saints;" and "Journal of what took place during the laft Sicknefs, and at the Death of Car. dinal Richelieu,' are well known and frequently referred to.

Leo, in Botany, a name ufed by fome authors for the columbine, or aquilegia. Columella, befides others, calls it by this name. See Aquilegia.
Leo, the Lion, in Zoology. See Felis Leo.
Leo, Formica. See Formica Leo.
Leo Pulex, a name given by M. Reaumur to a fpecies of infects which feeds on the pulex arboreus, or common tree-puceron, in the fame manner that the creature called the formica leo does on the ants: this being alfo, like that, an animal, yet in an imperfect ftate, and finally to be changed into a different creature. This author has kept up the remembrance of this analogy between them, by giving this a fimilar name.

The leo pulex is ufually bred among the herds of the pulices, which he devours moft unmercifully. He is a worm of the hexapode, or fix-legged kind, and very foon arrives at the time of his change; after which be becomes a green fly with four wings. Another animal of this kind, and not lefs deftructive of this fmall race of animals, is a fix-legged worm of a whitifh colour, and fmaller than the former, which finally becomes a round-bodied beetle. Another fpecies of thefe devourers this author calls wermis byffrix, the porcupineworm, from the valt number of ficulx, or tender prickles, with which he is armed. This alfo finally becomes a round and fmall beetle. Reaumur, Hift. Inlect. tom. i. See Lion puicron.

LEOBEN, or Leuben, in Geography, a town of the duchy of Stiria, on the Muehr; 68 miles S.W. of Vienna. At this town the preliminaries of peace between the emperor and the French republic, were fettled on the zoth of April 1797. N. lat $47^{\prime \prime} 22^{\prime}$. E. long. $14^{\circ} 55^{\prime}$.

LEOBSCHUTZ, or Lubschutz, a town of Siléfia, and capital of a circle, in the principality of Ingerndorf; 16 miles N. of Ratibor. N. lat. $50^{\circ} 5^{\prime}$. E. long. $17^{\circ} 44^{\prime}$.

## L. E O

LEOCROCO'TTA, in Natural Hifory, a name given by the ancients to an animal faid to be the fwifteft of all creatures in the world. It is defcribed as a mongrel or baftard animal, unable to propagate its own fpecies, being begotten upon the lionefs by the male hyzna of fome of the larger kinds: but is one of thofe animals, the exiftence of which is much to be doubted. The Latin authors have made fome confufion between this creature and the mantichora, attributing the things that have been faid of one to the other.

LEOGANE, in Geography, a fea-port sown of the ifland of Hifpaniola, or St. Domirgo, on the N. coaft. It was once the feat of the French government. Although its fituation is not good, the air is Calubrious, and the foil of the adjacent territory is fertile. In 1796, it was taken by the Britifh. It is a place of confiderable trade, N. lat. $18^{\circ}$ $30^{\prime}$. W. long. $73^{\circ} 25^{\prime \prime}$. See St. Domingo.

Leogane, Bay or Bight of, called alfo Cul de Sac of Leogane, lics at the W. end of the ifland of St. Domingo, and is formed by two peninfulas. It opens between Cape St. Nicolas at the W. end of the N. peninfula, and Cape Dame Marie, the N.W. point of the S. peninfula, 45 leagues apart. At the bottom of the bay, which embofoms a valt number of other fine bays, are the iflands Gonave, and on the $N$. fide of the $S$. peninfula the ifles Reffif and Caymite. The town of Lengane is fituated on the N . fide of the neck of the S. peninfula, in the bay of Leogane, at the head of a finall bay which fets up E. from the bay of Grand Goave, four leagues N.E. of the town of that name. See Sr. Domingo.

LEOMINSTER, or LEMSTER, a borough and markettown in the hundred of Wolphy, and county of Hereford, Ensland, is fituated in a very rich and fertile vale abounding with orchards, hop-yards, fine meadows, and arable lands. Its immediate fcite is, as Leland defcribes, "fumwhat lowe, and all the ground very neere about it is farre lower." The river Lugg flows on its north and eaft fides; two fmaller ftreams run through the town, and three other confiderable rivulets pafs it within half a mile. Its extent from nort $\mathrm{H}_{1}$ to fouth is nearly a mile ; and from eaft to weft about half a mile. "The towne of Leonmintter," Leland fays, "is metely large, and hath good buildinges of tymbre. The towne, by reafon of their principall wool, ufe great drapinge of clothe, and thereby it flourihhed. Syns of latter days it chanced that the cittyes of Hereford and Worcelter complained of the frequency of people that came to Lemfter, in prejudice of bothe their marketts; whereupon the Saturday markett was removed from Lemilter, and a :narkett on Friday newly affigned to it; fyns that time the towne of Lemiter hath decayed. The antiquity of the towne is moft famous by a monaftery of nunnes, that Merwaldus, kinge of the Marches, built and endowed."-" There is but one paroche church in Leonminfter; but it is large, fomewhat dark, and of ancient building, infomuch that yt is a greate likelihood that yt is the church that was afore the conqueft. The common fame of the people about Lemfter is, that king Merewald, and fome of his fucceffors, had a caftle, or palace, on an hill fide by the towne of Leonminfter, half a mile off by eaft." In the year 1055, Leominfter was feized upon by the Wellh chieftains, who Itrengthened it by fortifications, the remains of which may be traced even at the prefent period. The town appears to have been a place of fome confequence at the time of the Domefday furvey: as that regifter records that the manor, with its appurtenances, confifting of fixteen dependent eftates, had been affigned by Edward the Confeffor to his queen Editha; and that it was governed by eight bailiffs, eight

## LE O

## LEO

eight beadles, and eight free temants. When the furvey was made, the manor belonged to the king; great part of the cullomary rent was paid as compofition for falt, fifh, and eels. Here was alfo a wood fix miles in length, and three broad; but part of it was even then begun to be "a aflarted," and cleared for tillage; "an aerie of hawks" is alfo mentioned in the fame record. About the time of William Rufus, the fortifications of Leominfter were Atrengthened and enlarged, the better to fecure it againtt the incurfions of the Welfh. In the reign of king John, William de Braofe, lord of Brecknack, a turbutent and high-fpirited baron, plundered this cuwn, and burned great part of it, together with the priory and church. In Henry IV.'s reign, Leomintter was for fome time in the poffeffion of Owen Glendour, after he bad defeated the earl of March. In the next century, the inhabitants of this town took a deciive part towards the eltablifmenent of queen Mary on the throne; for which fervice fle granted them the firit regular charter of incorporation, with many vaiuable' privileges. An annual fair had been granted ia 1170 , by Henry II.; two additional fairs, cach of fix days continuance, were granted by Edwaré I.

The church of Leominfter, having been partly deftroyed by live March 18, 1700, was re-edified at the expence of nearly 17:0001.; the whole of that part ufed for divine fervice being entirely new. The church in its-prefent fate is itregular, both in its form and architecture. The mont ancient parts are the eaft wall, the north fide, the tower which itands at the north-welt angle, the weft end, and the wall and windows of the fouth fide. In the interior the chief part is modera, excepting what is called the back aifle, which, as well as the lower part of the tower, is principally of Saxon workmanhip. The exterior of the ealt end has three large buttreffes, a high pointed window with interfecting mullions, and two fmaller windows. On the north fide is a very ftrong femi-circular arched door-way, with a finaller one within it. The upper part of the tower is in the pointed ityle and embattled; the lower part: is Saxon; it difplays a fingularly rich entrance door-way on the welt, having a receffed arch, with three pillars on each fide, the capitals of which are ornamented with fculptures of foliage, a couchant man, a tyger, fnakes entwined round branches, and birds. The mouldings fupported by thefe pillars are flightly pointed, but are embelliihed with lozenges and zigzag work. On the north fide of the church is the nave and north fide of the ancient Aructure, which are feparated from each other by a range of maffive circular columns, with round arches, over which are Saxon arcades; the arch of the tower which opens into this part is pointed, and reaches nearly to the roof. Befides the church, there are four places of religious worfhip in the town, for the refpective denominations of Baptifts, Prefbyterians, Moravians, and Quakers. During the time of rebuilding the church, divine dervice was performed in a contiguous buildug, anciently called the Chapelle in the Forbury, erected by Peckham, archbifhop of Canterbury, about the end of the thirteenth century. It was afterisards appropriated to the purpofe of tuition, and theace called the fchool-houfe; but has lately been converted into a regular theatre ; it is a plain building, with pointed windows. The priory was fituated to the north-eait of the church, on the little river Pinfley; fome of the buildingo are yet ftanding, among which is the prioryhoufe, which has undergone various alterations fince the diliflution. The town-hall, or butter-clofe, as it is communly termed, is a fingular bulding, conitructed of timber and platter about the year 1633. The archutect was the selebrated John Abel, who built the Shire-hall at Hereford,
in the year 1645. This fabric flands on twelve oak pillars, fuftained on ftone pedeftals; the brackets and fpandrils above the arches, and the upper parts of the building, difo play much carving. A new gaol was crected in the year 1750 ; and a market-houfe in 1803 . Several improvements have been recently made in the town; the trade is flourihhing, and many of the fhops are refpectable. The clothing and hat trade provide employment for a great number of the inhabitants. The wool grown in the vicinity is proverbially excellent ; the cyder alfo, and the hops, are held in high eltimation.

The corporation confifts of a bailiff, chief fteward, recorder, twenty four capital burgeffes, a chamberlain, and two ferjeants at mace. Two reprefentatives in parliament are chofen by the corporation and inhabitants paying fcot and lot ; the number of voters being about 500 ; the earlict return was in the twenty-third of Edward I.

Leominfter is 137 miles diftant from London ; the population, as returned under the act of 1800 , amounted to 3019 ; the number of houfes to 736. The fcite of the caltle or palace mentioned by Leland as belonging to Merwald, is fuppofed to be the mount to the ealtward which overlooks the Hay lane.

Berringion, about four miles to the north-eaft, was the feat of the late Right Hon. Thomas Harley, About a mile to the fouth-ealt from the town is Eaton, formerly the feat of the Hackluyts, a family of great antiquity and refpectability. On the Brierley hills, about two miles fouth-weftward from Leominfter, is Ivinton camp, a ftrong fortification divided into two parts by an entrenchment more modern than the outer works. This is fuppofed, with great probability, to be the camp occupied by Owen Glendour. Price's Hiftory of Leominfter, 8vo. Beauties of England and $W$ ales, vol. vi.

Leominster, a pofl-town of America, in Worcefter county and ftate of Maffachufetts; 46 miles W. of Bofton. It has a printing office and fevaral neat buildings. This townfhip was taken from Lancalter, incorporated in 1740, and contains 1486 inhabitants. On the ftreams that pafs through this town are feveral mills of different kinds. About 200,000 bricks are annually made here. The manufacture of combs is alfo carried on in great perfection and with confiderable profit.

LEON, in Ancicnt Geograthby, a promontory of Greece, in the inle of Eubca.-Alfo, a promontory of the ille of Crete.-Alfo, a river of Pheenicia. Ptolemy.

Leon, in Geography, a province of Spain, called a kingdom, fituated towards the N.W., and inclofed between Ef. tramadura, Old Caltile, Galicia, and Portugal. Its form is a kiad of irregular long rectangular figure. Its mean length from N. to S . is elfimated at about $5^{2}$ leagues, and its mean breadth from E. to W. about 30 leagues. This is the country which was furmerly inhabited by the Vettones, mentioned by Strabo. It is bounded on the E. by Old Cafile; on the S.E and S. by Eltramadura; on the W. by the provinces of Beira, Tra-los-Montes in Portugal, and Galicia; and on the N . by the Afturias. Its capital has given name to the country, which was for a long time a feparate menarchy ; but its crown was united with that of Cattile in 1069; but without lofing the title of kingdom. Its territory is mountainous; neverthelefs it contains many beautiful fields, good pattures, and large fertile vallies, which produce a great quantity of grain, as wheat, barley, \&c. wine, and excellent flax, both in fmall quantities, vegetables, and good fruits. Its mountains are covered with different kinds of trees, and they afford iron and copper mines, mineral waters, \& c. The mules bred in this country are of a fupe-

## LEON.

rior kind, and it furnithes a good number of fheep. The river Ducro almolt bifeets the country. The kingdom of Leon contains fix bifhoprics, viz. thofe of Leon, Salamanca, Palencia, Zamora, Altorga, and Ciudad Rodrigo; fix cathedral chapters, nine collegiate chapters, 2460 parifhes, as well rectories as vicarages; 396 convents, 23 hofpitals, five afylums, two military governments, four intendencies of provinces, a celebrated univerfity, four fuperior colleges, 25 colleges of all claffes, fix cities, 539 towns or boroughs, 3005 villages or fettlements, of which 76 , formerly inhabited, are now deferted. Its mountains that are particularly diftinguifhed are thofe that form part of the Sierras of Pico and Occa, formerly mount Idubeda; the former extends from the E . of the fouthern point of the kingdom of Leon to the W. of the fouthern point of Old Caltile: the latter comes from the N. by E. point of Old Caftile, and extends a little way into the kingdom of Leon, at the S. point of the E. Amonglt its rivers, which are numerous, we may reckon the Sil, the Buroia, the Sabor, the Baeza, the Arago, the Xero, the Pifuerga, the Alagon, the Agueda, the Cea, the Exla, the Tuerta, the Obrega, and the Bernefga, almolt all of which rife in Leon or near its confines ; the Duero, the Carrion, the Erefma, Rio de Salamanca or Torme, \&c. The principal towns of Leon are, on the N. of the Duero, Leon, Altorga, Zamora, Toro, Palencia, Medina-del-Rio-Seco, Tor-de-Sillas, Villa Pando, Duenas, Marfilla, Villa Franca, and Benevente; and on the S. of the Duero, Salamanca, Ciudad Rodrigo, Alva-da-Tormes, Pena-Arande, Pena-de-Frania, Carpio, Medina-del-Campo, and Ledefma near Los Banos.

When the Gothic king Roderic was defeated by the Moors in the battle of Xeres de la Frontera, the fugitives difperfed to Galicia, Afturias, Lower Bifcay, and the country at the foot of the Pyrenees; but their courage revived and they rallied their forces under prince Pelagius, who, in 717 , obtained a fignal victory over the Moors, and took poffeffion of Oviedo, of which he was acknowledged king. Having regulated this little ftate, and gained new fubjects, he again attacked the Moors, and retook from them the town of Leon, and fome others. Thus was raid the foundation of this new kingdom, although Pelagius and his fucceffors only took the title of kings of Oviedo or the Alturias, till Ordagno II. who in 915 affumed the title of king of Leon. The kingdom of Leon paffed, in the year 1030, to Ferdinand, furnamed the Great, then king of Caltile, by his wife. In the kingdom of Leon there are 5598 fecular priets, 2064 monks, 1570 nulis, 196 convents, 2460 parifh churches, 2695 villages, 31,540 nobles, 25,218 fervants, and near 600,000 other inhabitants of all profefions; which gives a total of about 665,000 perfons. The agriculture of this country might be much improved, if the inhabitants availed themfelves of the water which their rivers fupply in the irrigation of the land. They are alfo negligent in the culture of fruit trees, and though they have fine rich paftures, their flocks are, removed from one part of the country to another. The commerce of this province confilts chiefly of importation, and it fcarcely furnilhes any thing to the neighbouring provinces. It Cends to Galicia part of the ferges and baize manufactured at Rio Seco; but this is very trifling compared with the goods which it is obliged to import. It traffics in fome wines, fome of which, of an excellent kind, are found in the country towards the S.E. Palencia had formerly confiderable manufactories for cloth. At Zamora there is flill a manufactory for hats: and they make fome houfhold cloths in the country. The Englinh, by way of Portugal, carry away the madder of the environs of Ciudad Rodrigo, and of Medina-del-Campo, In the province of

Leon there are four fprings of cold mineral waters. niz. at Amufco, about $3 \frac{\pi}{2}$ leagues from Palencia, at Buron, at Bavila-Fuente, four leagues E. of Salamanca, and Afludillo, nine leagues from Palencia. There are alfo four thermal fprings, viz. near Almeyda, at Ledefma, at Bonar or Bonah, fix leagues from Leon, and at Barnos, near the fronticrs of E . tramadura and Caftile. The inhabitants of this province are very grave, and addicted to taciturnity ; thofe who retain remains of the national manners of Span, and who live in the mountains in the Mauregatos, near Aftorga, wear pyramidal hats, a kind of ruff round the neck, a jacket or flirt, and clofe coat, wide breeches and fpatterdafhes. The women of Mauregatos wear large ear-tings, a kind of white turban, flat and widened like a hat, and their hair parted on the forelead. They have a chemife clofed over the chell, and a brown corfet buttoned, with large fleeves opening behind. Their petticoats and veils are alfo brown. Over all they wear immenfe coral necklaces, defcending from the neck to the knee; twifting them feveral times round the neck, paffing them over the fhoulders, where a row is faltened that forms a kind of bandage over the bofom; another row is fufpended lower than this ; and alfo a third and even a fourth row at fome diflance from each other. The lalt falls over the knec, with a large crofs on the right fide. Thefe necklaces or chaplets are ornamented with many filver medals, fhaped with the figures of faints. Thefe ornaments are chiefly worn on feftivals. On the dajys of religious folemnities, particularly the Affumption, the fronts of the churches are illuminated, bonfires are made before them, mulicians attend, and the people dance all night; the women play the caltanets, and are accompanied by an inftrument called "Pandero," which is a kind of tambour de bafque. De Laborde's View of Spain, vol. ii.

Leos, Legno, the capital of "the above province, or kingdom, is a very ancient town, founded before the reign of Galba; it was called by the Romans " Legio Septima Germanica," from the legion that bore that name being Atationed there. This city is fituated between the two fources of the Exla, which are called the rivers of Torio and Bernesja. This is one of the molt famous and molt ancient epifcopal fees in Spain, and poffeffed, in the time of the Gothic kings, the privilege of appealing immediately to Rome. The bifhop is fuffragan to the archbithop of Compoftella, without being in any refrect dependent on its jurifdiction; this bihopric poffefles a revenue of 22,000 ducats. Its diocefe contains 823 villages, 883 parifhes, 26 convents of monks, 11 of nuns, collegiates, and hofpitals. When the kings refided here, till the $3^{\text {th }}$ century, its population was confiderable; but it is now much reduced. According to the flatement of 1788 , there were within the juridiction of the intendant of Leon $250,13+$ inhabitants. A great part of its walls confilts of green marble. It contains 13 parih churches, one collegiate church, four convents of monks, five of nuns, and a number of hofpitals and hermitages. Here are the royal ho: fes of San-Ifidoro and San-Marios of the order of St. James; and a chapter of noble canoneffes, not cloiltered, but who take the vows. This town was the firl of any importance which the Cluiftians retook from the Mcors. Pelagius made himfelf matter of it in 722 , fortified it, and built a good caftle, to defend the approaches to it.

It had the honour of being the capital of the firlt Catholic kingdom of Spain, and of being, for three centuries after the invafion of the Arabs, the relidence of the kings. The palace which the duke of Alphonfo built here at the end of the 12 th century is fill to be feen. Among its moit iplendid edifices we may reckon the cathedral church, which in beauty furpalies the molt admired in Spain, and is one of the mott attractive
attractive monuments of Gothic architecture. The hotel of the counts of Luna is alfo large and handfome. The town-houfe has a good appearance, with a tolerably regular front. The palace of the Guzmam is magnificent, ornamented with a fuperb portal, and fecured by very ftrong walls. Among the gates of the town one was formerly a famous prifon; and at the bottom is the ftatuc of king Don Pelagius, with an infcription. The Place Mayor has a beautiful appearance. There is a number of other fquares and handfome fountains. Notwithtanding the antiquity and importance of this city it is very deficient in cleanlinefs. It is furrounded by trees, and the country about it is every where embellifhed; it has beautiful promenades. as well as broad and noble avenues of handfome trees. In the environs of the town the corn harvelfs are not abundant ; but this deficiency is fupplied by many excellent vegetables, fruits, flax, and verdant meadows, which furnith good paltures. At Leon there are feveral manufactories for different woollen articles; ftockings, hofiery, leather, gloves, \&c. are alfo made here. Leon is 159 miles N.W. of Madrid. N. lat. $42^{\circ} 3^{6}$. W.long. $5^{\circ} 37^{\prime}$.

Leon, a town of Spain, jn Catalonia; 43 miles N.W of Urgel.

Leon, a town of France, in the department of Stura; 4 miles N . of Savigliano.
Leon, Ifle of, a kind of ifland four leagues from Xerez, in Andalufia, formed by a canal which furrcunds it, ten miles long, and 24 feet deep in high water, and capable of admitting the larget fhips. This illand was entirely deferted in the feventeenth century, and there was fcarcely a houfe upon it. At prefent the principal freet of the town is two miles long, with rows of fhops on each fide, and containing upwards of 2000 inhabitants. . Provifions are here abundant, and the place exhibits a moving fcene. The ifland has an alcade-mayor for the adminittration of juftice ; a municipality compofed of a number of regidors, and a manufacture of ftained linen, refembling printed calico.

Leon, a river which falls into the gulf of Mexico, from the N.W., at the bay of St. Bernard.

Leon, a town of Mexico, in the province of Guadalajara; 40 miles E. of Guadalajara.

Leon, a town of Mexico, and capital of the extenfive province of Nicaragua, fituated on a large lake of frefh water, abounding with fifh. It is a bifhopric, but a town of little importance. It has about 1200 houfes, four churches, and feveral convents. Its fituation near a mountain, in which is a volcano, renders it fubject to earthquakes. The lake is faid to ebb and flow like the fea. Realjo is a fmall entrenched town, with an excellent port, and ferves Leon the capital.

## Leon de Caraccas. See Caraccas. <br> Leon de Guanuco. See Guanuco.

Leon, New, one of the feven domains, called kingdoms, into which the Spanif dominions in North America are diftributed. This name is reftricted by the maps to a fmall province round the town of Monterey, which muft not be confounded with another of the fame name, to the N. of California, It is bounded on the N. by the Savage nations, on the E. by New Mexico Proper, on the S. by a part of Mexico, and on the W. by New Bifcay. New Leon proper, a diftrict ridiculoufly called a kingdom, is divided from Guadalcazar on the S. by the defert of Jaumave, and mountains of Tamalipa. It is very mountainous, produces little except lead, and is very thinly peopled. The other provinces of the domain of New Leon, befides New Leon proper, are Sootander and Coaguila, or New Eftramadura.

LEONAN, a fmall illand in the Eaft Indian fea, near
the N.E. coait or Borneo. N. lat. $6^{\circ} 39^{\circ}$. E. long. $117^{*}$ 48'.

LEONARD of Pifa, in Biography, an Italian mathematician, who flourifhed at the commencement of the thirteenth century, was the firft perfon who brought into Europe the knowledge of the Arabic cyphers and algebra. He gives an account of the fact himfelf, and fays, that being at Bugia, a town in Africa, he was inftructed in the Arabic method of keeping accounts, and that, finding it more corvenient, and preferable to the European method, he had draws up a treatife for the purpofe of introducing it into Italy. From Italy the knowledge of the Arabic cyphers and algebra was afterwards communicated to the other countries of Europe. He was author of a treatife on furveying, preferved in the Magliabecchi library at Florence.
LEONARDO LEo, principal organilt of the chapel royal at Naples, was not only admired and refpected by his contemporaries, but his memory ftill continues to be held in reverence by every profeffor that is acquainted with his works. The firft opera of his compofition that we were able to find, is "Sofonifba," which was performed in Naples in 1718 , and the laft," Siface," in Bologna, 1737. Between thefe he produced three operas for Venice, and four for Rome. Leo likewife fet the "Olimpiade", of Metaftafio, in which the duo, "Ne i giorni tuoi felice," and the air, "Non fo donde viene," are admirahle; as is "Per quel paterno ampleffo," in Artaferfe, the only air in that opera that we have feen. "Dirti ben mio vovice," was in extreme high favour, as fet by Leo, about the middle of the laft century, in England, where it was fure to be heard at every mufical performance, both public and private. Leo likewife fet Metaftafio"s oratorio of "St. Elena al Calvario," of which we have feen fome very fine airs. His celebrated "Miferere," in eight real parts, though imperfecly performed in London at the Pantheon, for Anfani's benefit, $17^{81}$, convinced real judges that it was of the higheft clafs of choral compofitions.

The purity of his harmony, and elegant fimplicity of his melody, are no lefs remarkable in fuch of thefe dramas as we have been able to examine, than the judicious arrangement of the parts. But the maffes and motets, which are carefully preferved by the curious, and ftill performed in the churches at Naples, have all the choral learning of the fixteenth century. There are likewife extant, trios, for two violins and a bafe, fuperior in correctnefs of counterpoint and elegance of defign to any fimilar productions of the fame period. This complete mufician is equally celebrated as an inftructor and compofer ; and the "Solfeggi," which he compofed for the ufe of the vocal fludents, in the confervatorio over which he prefided at Naples, are ftill eagerly fought and ftudied, not only in Italy, but in every part of Europe, where finging is regularly taight.

This great mufician died about the year 1742, at the age of fifty-three. His death was unhappily precipitated by an accident which at firft was thought trivial ; for having a tumour, commonly called a bur, on his right cheek, which growing, in procefs of time, to a confiderable magnitude, he was advifed to have it taken off; but whether from the unfkilfulnefs of the operator, or a bad habit of body, a mortification enfued, which colt him his life. After expreffing the reverence which we have always had from our earlieft youth, for the productions of this admirable compofer, we thall tranfcribe a character of him from "L'Effai fur la Mufique," drawn up with elegance, force, and feeling, which does not feem to flow from an exclufive admirer of Rameau, under the guidance of the intolerant preacher of the triple progreffion.
" Leonardo

## LE O

"Leonardo Leo, a Neapolitan, the firft mafter, and mott fublime genius for mufic of his time; who is never mentioned but with refpect and admiration by every intelligent pro. feffor. They all aver that no compofer has given to mufic that interefting elevation, that impreffive dignity, which are the principal characteriltiss of the Ayle of Leo. A noble pathos always reigns in his compolitions; his ferious and feeling character has inttinctively guided his pen. This has made him partial to the chromatic, which he has fo ahly treated. In Spite of the difficulty of compofing in this genus, he joins all the grace and fweetnefs which are fo delightful, even in the moit natural mulic. His tafte and expreflion will be always celebrated; as all thefe natural gifts were under the guidance of the moft profound knowledge of his art. In hort, this wonderful man cannot be too highly praifed. His mame and works are known to all Enrope. He moit delighted in dramatic mufic, which, however, did not prevent him from enriching the church and chamber with innumerable productions of the mott finifhed kind. The following are fome of his operas ; in 1720 , Cajo Gracco; in 1722, Tamerlane and B3jazet; in 1723. Timocrate; 1728, Argene; in 1729, Catone and Utica; in 1735, La Clemenza di Tito ; and in ${ }_{1737}$, Siface. This truly great mufician died about the year 1742 , at the age of $53^{\circ}$
LEONARDSTOWN, in Gcography, a poft-town of America, in the ttate of Maryland, and capital of St. Mary's counts, fituated on the E.fide of Brition's brook, where it falis into Britton's bay, five miles from its mouth in the Patownac ; and containing about 50 houfes, a courthoufe and gaol; 217 miles S. WW. of Philadelphia. N. lat. $3^{82} 18^{\prime}$.
LEONBERG, or Leonsberg, a town of Wurtemberg, on the Glems; 6 miles W. of Stuttgart. N. lat. $4851^{\prime}$. E. long. $9^{\circ} 7^{\prime}$.

LEONE, one of the Navigator's inles, about five miles in circumference, E. of Fanfoué, from which it is feparated by a channel.

LEONES, a fmall inand in the Atlantic, near the coaft of Patagonia. S. lat. $50^{\circ} 2^{\prime}$.

LEONESSA, a town of Naples, in Abruzzo Ultra: 19 miles N.IV. of Aquila.

LEONFORTE, one of the largett and handfomeft towns in Sicily, 10 miles from Argiro: fituated on an eminence. The number of inhabitants amounts to 12,000 . The convent of Capuchins is as populous as the town.

LEONI, a town of Naples, in Priucipato Ultra; 12 miles W. of Conza.

LEONICENUS, Nicholas, in Biograpby, an eminent Italian phyfician, was born in one of the Venetian ftates in the year 1428. He was profeffor of medicine at Ferraraduring upwards of fixty years, and was the firlt perfon who undertook to tranflate the works of Galen into Latin. In $f_{a}$ ct he was fo ftrongly attached to literary purfuits, and to the duties of his profefforhip, that he gave up little time to the practice of lis profefiion : and when his negligence in this refpect was condemned, he faid, "I do more fervice to the public, than if I vifited the fick, by inftructing thofe who are to cure them." He extended bis attention allo to the belles lettres, which he confidered as clofely connected with the proper fludy of philofophy and medicine; he wrote fome refpectable poetry, and tranflated into Italian the hitory of Dion Caflius, and the dialogues of Lucian. Until the age of thirty, Leonicenus was tormented with fre$q^{n}$ nent attacks of epilepfy, which reduced him at times to melancholy and defpair. This difeafe, however, afterwards left him, and, by means of great reçularity and temperance, Vol. XX.

## L E O

he attained the age of ninety-fix years, and died in 1524 . poffefled of all his farulties. To one who inquired, with aftonihment, by what fecret he had preferved this entire pollefion of his faculties, together with an erect body, and vigorous health, at fo great an age, he replied, that it was the effect of innocence of manners, tranquillity of mind, and frugality in diet. The duke and fenate of Ferrara erected a monmment to his memory. He left feveral works, moft of which have been feveral times reprinted. "De Plinii et aliorum Medicorum in Medicina crroritus, \&c." Ferrari, 1492. In a poilhumous edition, printed at Bane, in 1532, fome other opufcula were added, particularly "De Herbis, Fructicibus, $\Lambda$ nimalibus, Metallis, Serpentibus, Tiro fou Viperâ,"-" Liber de Epidemia quam Itali Morbum Galli. cum vocant, Galli verò Neapolitanum," Venice, 1497. It feveral fubfequent editions, the title "De Morbo Gallico" was adoptel.- "f Prefationes in Libros Galeni a fe tranflatos,", ibid. 1508, folio, with fome other treatifes. "Opus de tribus doctrinis ordinatis fecundum Galeni fen. tentiam," ibid. 1508, fol. "Libri c̊uo Galeni de curandi ratione ad Glauconem Latinè verfi," Paris, 1514, 4to. " Hippocratis Aphorifinorum Libri VIl., Grrece et Latine,", ibid. 1526, 8.0. "Converfio et explanatio primi Libri A riftotelis de partibus Animalium," Bafle, 1541 , Svo. "Galeni Ars Medica," Venice, 1606. Eloy Diez. Hitt. de Med.
LEONICO, Tomeo, Nicholas, was born in Venice, of an Albanian family, in the year 1456 . He ftudied Greek at Florence, and made fuch progrefs, that he became able to explain Ariftotle in the original language. For this purpofe he was invited to Padua in 1497. He was brought up to the church, and taught the learned languages at V enice, but in 1520 he returned to Padua, where he gave inftructions to cardinal Pole. Pe was much attached to the Platonic philofophy, and paffed his time remote from worldy purfuits, and folely intent upon his ftudies. Bembo, Giovio, and others, fpeak of him with great efteem, and Erafmus mentions him with honour, as a man equally refpectable for the purity of his morals and the profundity of his erudition. He died in 1531, and was buried in the church of St. Francis, at Padua. He tranfated feveral of the works of Arittotle, Proclus's Commentary on the Timxus of Plato, and other treatifes of the ancient philofophers. He wrote ten dialogues on fubjects philofophical and moral, a work, "De Varia Hiftoria," and fome Italian poems.
L.EONIDAS I., king of Sparta, fucceeded to the throne in the year 491, B.C. When Xerxes, king of Pcrfia, invaded Greece, Leonidas was appointed by the Lacedxmonians to the chief cormand of their forces to oppofe him. He marched at the head of 4000 men, to take poffeffion of the itraits of Thermopyle. Aware of the great danger of the enterprize, he confidered himfelf as one devoted to the fafety of the country. He pofted his fmall army fo inilfully, that the Perfians, on arriving at the ftraits, found that it would be difficult to force them, and Xerxes endeavoured to bribe the commander to his interelt, hy the offer of making him mafter of Greece. The propofal was rejected with indignation, and the monarch immediately fent a herald to order the Grecians to lay down their arms. "Let him come and take them," was the reply of Leonidas. Thrice the Perlians were repulfed with great lofs; and when a treacherous Greek had led a chofen body of 10,000 Perfians by a fecret paffage to the rear of Leonidas, he was determined to afford a memorable example of what the Greeks could do when called upon to die for their country. Xerxes marched his whole army to the entrance of the ftraits, where Leonidas advanced to meet him. The efforts of valour, heighten. 32

## LEO

ed by defpair, were terrible, and the Spartan king fell amidit a heap of naughtered enemies. His friends defended his body, till the appearance of the foe in the rear caufed the furvivors to collect into one clofe band, facing every way. All thefe, overpowered by numbers, were left on the field of battle, having amply revenged their fall. The Perlian tyrant, enraged at his lofs, caufed the body of the hero to be nailed to a crofs; but the memory of his valour and patriotifin could not be obliterated, and the defence of Thermopylx is confecrated among the noblef actions of antiquity. The gratitude of his country raifed a fplendid monument upon the fpot to the fallen, and a funeral oration was for a long time annually pronounced amidit the celebration of martial games, over their tombs.

LEONINE, in Poetry, is applied to a kind of verfes which rhyme at every hemiltich, the middle always chiming to the end.

In this kind of verfe we find feveral ancient hymns, epigrams, prophecies, \&c. For inttance; Muretus, fpeaking of the poetry of Lorenzo Gambara of Brefle, fays,
"Brixia veftrates, qux condunt carmina vates Non funt noltrates tergere digna nates."
The following one is from the fchool of Salernum:
"Ut vites panam, de potibus incipe canam."
The origin of the word is fomewhat obfcure: Pafquier derives it from one Leoninus, or Leonius, who excelled in this way, and dedicated feveral pieces to pope Alexander III. ; others derive it from pope Leo; and others, from the beaft called lion, becaufe it is the loftielt of all verfes.
M. Fauchet makes the leonine rhyme the fame with what the French call the rich, and we the double rhyme, i. e. where two fyllables have the fame orthography, accentuation, and pronunciation, with two others.

LEONOTIS, in Botany, fo called from $\lambda$ say, a lion, and ous, woos, the ear. Lion's-ear. Brown Prodr. Nov. Holl. v. 1. 504, Ait. Hort. Kew. ed. 2. v. 3.409. (Leonurus; Tourn. t. 87.) - Clafs and order, Diclynamia Gymanopermia. Nat. Ord. Verticillate, Lirn. Labiata, Julf. Brown.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, oblong, with ten flight ribs, permanent; its orifice unequally toothed, with from fix to ten teeth. Cor. of one petal, ringent; tube cylindrical, longer thian the calyx; upper lip elongated, flightly concave, bearded, undivided; tower much fmailer, in three neariy equal fegments. Stam. Filaments four, concealed by the upper lip, two of them longer than the relt; anthers of two oblong divaricated lobes. Pijf. Germen fuperior, four-lobed; ityle the length and pofition of the ftamens; Itigma cloven, acute, its upper fegment fhorteft. Peric, none, except the permanert calyx. Secds four, oblong, triangular.

Eff. Ch. Calyx with ten ribs; unequally toothed. Upper lip of the corolla elongated, bearded, undivided; lower much fmaller, in three nearly equal fegments. Lobes of the anthers divaricated. Upper fegment of the ftigma fhorteft.

1. L. nepetifolia. Catmint-leaved Lion's-ear. (Phlomis nepetifolia; Linn. Sp. Pl. 820. Cardiaca americana annua, nepetz folio, floribus brevibus phoniceis villofis; Herm. Lugd. Bat. 115. t. 117.)-Leaves heart-fhaped, pointed. Calyx with eight fpinous teeth; the upper ore largeit. Stem herbaccous.-Native of the Eaft Indies, from whence fir Jofeph Banks procured it for Kew garden in 17.78. It is a tender annual, kept in the flove, and flowering in September and October. Hermann received the feeds from Suri-

## LEO

nam; Linnzus from the Eaft Indies, and it flowered in the Upfal garden. The whole plant is hoary, with extremely foft minute pubefcence. Stem four or five feet high, quadrangular, with oppofite £preading branches. Leaves oppofite, two or three inches long, and one or two broad, heartfhaped, veiny, deeply crenate or ferrated, pointed, on falks of their own length. Flowers in denfe whorls, with linear fpinous brateas, and ftrongly fpinous calyx-tecth. Corolla aboat an inch long, moft elegantly clothed with denfe fcarlet hairs, paler at the edges.
2. L. Leonurus. Narrow-leaved Lion'sear, Lion's-tail. (Phlomis Leonurus; Linn. Sp. Pl. 820 . Curt. Mag. t. 478. Leonurus capitis bonæ fpei ; Breyn. Cent. t. 86.)-Leaves lanceolate. Calyx with ten regular teeth, five fmaller than the reft. - Native of the Cape of Good Hope, from whence it was brought into the European gardens, for the fake of its beauty, carly in the lalt century, and is ftill kept in greenhoufes, being propagated by cuttings, and flowering abundantly in autumn. The fem is fhrubby, feven or eight feet high. Leaves lanceolate, rather narrow, bluntly ferrated, about two inches long, of a dull green, roughifh, tapering down into fhort foottalks. Flowers large, in denfe bracteated whorls. Calyx downy, its teeth regular, very fmall, and fcarcely fpinous; the five alternate ones fmaller than the reft. Corolla two inches long, flender, incurved, downy, of a fine tawny orange, or fomewhat fcarlet colour, the lower lip fmall and brown.
3. L. Leonitis. Round-leaved Lion's-ear. (Phlomis Leonitis; Willd. Sp. Pl. v. 3. 128. Ph. Leonotis; Linn. Mant. 83. Leonurus' minor, capitis bonx fpei; Mill. Ic. t. 162. f. 1.)-Leaves ovate, blunt, crenate. Calyx with eight awned teeth; the upper one largeft. Stem fliubby. -Native of the Cape of Good Hope, from whence it was brought early in the laft century, but is lefs frequent in our greenlouves than the foregoing; from which it differs in its fmaller fize, roundifh long-ftalked fmall leaves, and rather fhorter more obtufe corolla, befides the effential ditinctions of the caly.x.

LEONTARI, in Geography, a town of the Morea; 20 miles N.W. of Mifitra.

LEONTESERES, in the Natural Hifory of the Ancients, the name of a Ipecies of agate, famous in early times for its imaginary virtues in taming the rage of wild beafts, and not a little efteemed among us for its beauty. It is the molt variegated of all the agates. Its ground colour is yellow, and its variegations are flame-coloured, white, black, and green.
Sometimes it is one irregular congeries of all thefe colours, but more frequently it is very beautifully variegated with them in form of clouds and veins; the black and green particularly are ufually difpofed in concentric circles round one or more points. It is found only in the Eaft Indies, and is very fcarce.
LEONTEVKA, in Geography, a town of Ruffia, in the government of Novgorod; 40 miles S.E. of Valdai.

LEONTIASIS, in Medicine, a name given by the ancients to the elephantiafis, improperly called the Arabian leprofy, from a fuppofed refemblance of the tuberculated countenance of the patient, in fome inftances, to the vifage of the lion (leo). See Elephantiasis.
LEONTICA, feafts, or facrifices celebrated among the ancients, in honour of the fun.
They were called leontica, and the priefts who officiated at them leones, becaufe they reprefented the fun under the figure of a lion radiant, bearing a tiara, and griping in his two fore-paws the horns of a bull, who Atruggled with him, in vain, to difengage himfelf.

## LEO

The critics are extremely divided about this fealt : fome will have it anniverfary, and to have made its return not in a folar, but in a lunar year; but others hold its return more frequent, and give inftances where the period was not above 220 days.

The ceremony was fometimes alfo called Mithrisica; Mithras being the name of the fun among the ancient Perfians.

There was always a man facrificed at thefe fealts, till the time of Hadrian, who prohibited it by a law. Commodus introduced the cuftom afrefh, after whofe time it was again exploded.

LEONTICE, in Botany, a name adopted by Linnæus from Pliny, as a fublitute for Lcontopetalon of T'ournefort. (See Leontopetalon.) Lion's-leaf. Linn. Gen. 168. Schreb. 223. Willd. Sp. Pl. v. 2. 148. Mart. Mill. Dict. v. 3. Ait. Hort. Kow, ed. 2. v. 2. 272. Sm. Prodr. Fl. Grec. Sibth. v. I. 234. Juff. 287. Lamarck. Ylluftr. t. 254. -Clafs and order, Hexandria Monogynia. Nat. Ord. Corydales, Linn. Berberides, Juft.

Gen. Ch. Cal. Perianth inferior, of fix linear, fpreading deciduous leaves, the intermediate ones fmaller. Cor. Petals fix, ovate, acute, twice as long as the calyx. Nectary of fix half-ovate, fpreading, equal, ftalked fcales, inferted into the bafe of the petals. Starn. Filaments fix, thread-flaped, very fhort, oppolite to the petals; anthers erect, of two cells, and two valves, burfting from the bafe upwards. $P_{j} /$ t. Germen fuperior, oblong-ovate; ityle fhort, nearly cylindrical, inferted obliquely upon the germen; ftigma fimple. Peric. Berry hollow, inflated, globofe with a point, of one cell, but flightly fucculent. Seeds few, globofe.

Eff. Ch. Corolla of fix petals. Nectary of fix fpreading italked leaves, attached to the bafe of the petals. Calyx of fix leaves, deciduous. Berry inflated, of one cell. Seeds few, globofe.

1. L. Chryfogonum. Pinnated Lion's-leaf. Linn. Sp. Pl. 447. (Leontopetalo affinis, foliis quernis ; Moris. v. 2. 285. fect. 3.t. 15. f. 7. Chryfogonum Diofcoridis; Rauw. It. t. 119. Chrifogono di Diofcoride; Pon. Bald. 14I.)Leares radical, pinnated, deeply cut--Native of corn-fields in Greece. Dr. Sibthorp gathered this \{pecies near Abydos. It is much to be regretted that fo curious a plant, though cultivated by Miller, is now a ftranger to our gardens, and that even dried fpecimens are fo very rare. Whether it be really the $\chi_{i}$ visorisoy of Diofcorides, his flort defcription muft ever leave doubtful. The leaves are not much like an oak, nor the flower like a Mullein, though the tuberous root may be compared to a turnip. He delcribes his as very red within. 'Authors reprefent our's as having a perennial, flefhy, fomewhat conical root, producing feveral upright italked leaves; thefe are about a fpan long, imooth, rather glaucous, limply pinnate; the leaflets not quite oppofite, about nine or ten pair, feffile, oblong or roundifh, either wedge-fhaped or in fome degree heart-fhaped at the bafe, entire at the fides, but more or lefs deeply cut towards the top. In our fpecimens they are by no means fo deeply divided as in the figures above quoted, which have led profeffor Willdenow to fuppofe them whorled. Flosver-ftalks one or two, radical, a little taller than the leaves, manyflowered, branched, corymbofe, round, imootb, leafleis. Brateas elliptical, coloured, folitary at the bafe of each branch. Flowers yellow, fomewhat like thofe of Celandine. Anthers ovate before they burft.
2. L. Leontopetalum. Common Lion's-leaf. Linn. Sp. Pl. 448. (Leontopetalon; Camer. Epit. 565. Ger. am. 236. Barrel. Ic. t. 1029, 1030. Moris. v. 2, fect. 3. t. 15.

## L E O

f. 6.)-Radical leaves twice or thrice ternate ; flem-leaves ternate.-A bundant in corn-fields in the Levant, flowering early in the fpring, and ripening fruit in May. Gerarde fays, lord Zoach in his time brought a plant from Italy, but, as far as he knew, it perifhed. Miller, however, appears to have raifed both this and the preceding from feed, but could not preferve them, on account of the unfayourable fpring fo ufual herc. Root tuberous, perennial. Stems folitary, ereet, 12 or 18 inches high, branched, fmonth, leafy. Radical leaves fomewhat like thofe of a Columbine, on long ftalks, twice or thrice ternate, the leaflets rounded or obovate, entire, confluent or decurrent, veiny; thofe of the ftem much finaller, and fearcely mure than fimply ternate. Flower-flalks corymbofe, foon racemefe, with ovate concave bractuas. Flowers ycllow, copious, much like the laft. Fruit an inch long, more of lefs ovate, foon beecming a dry, membranous, curioufy reticulated bag, in the bottom of which are three or four large round feds. The Leantice incerta of P.llas, in his Travels, v. 3. 726.t. V.f. 3 , which Willdenow has allopted by the name of $L$. veficaria, feems a mere variety, differing a little, as is perhaps ufual, in the fhape of the fruit, but otherwife agreeing exactly with the Leontopetalum. Pallas was in doubt refpecting it, as having feen nothing of the flowers.
3. L. altaica. Fingered Lion's-leaf. Willd. n. 4. Pallas. Act. Petrop. for 1779.257. t. S. f. I-3. Willd. Lamarck. f. 2. - Radical leaves twice compound ; them-leaves fingrered, oblong.-Difcovered by Pallas on expofed parts of the Altay mountains. We have never feen this fpecies, but Willdenow, who examined a dry โpecimen, fays, "the radical leaves have their ftalk firit three-cleft, and that each divifion bears five elliptic-lanceolate, entire leaflets at its fummit; the ftem-leaves are in like manner quinate, generally three together in a whorl. Brataas eliiptical, obtufe." This latter part of the defcription accords with Lamarck's figure, copied, we prefume, from Pallas.
4. L. thaliitroides. Columbine-leaved Lion's-leaf. Linn. Sp. P1. 44. (Canlophyllum thalictroides; Michaux Bo-reali-Amer. v. 1. 205. t. 21.) -Stem-leaves twice or thrice ternate ; terminal leaflets three-lobed, acute- Native of North America. It was procured from thence by Peter Collinfon before $175 \%$, and is till preferved in fome curious gardens, flowering in May. Root perennial. Stm a foot, high or more, erect, fimple, bearing one thrice compoud leaf, and another, clofe to the flowers, twice compound, both feffile, but with long partial italks; leafiets dark green above, glaucous beneath, rounded at the bafe, with two or three deep acute fegments at their fore part ; as the fruit advances they become more rounded and much enlarged, refembling fome large kind of Meadow-rue, or Columbine. Flowers green, in a fmall, fightly compound, flender, ftalked clufter, with little ovate acute brakeas. The whole plant is fmooth. Michaux detcribes the fruit as more pulpy than in the above fpecies, and fingle-feeded, like the drupa of the floe, but this is hardly fufficient perhaps to eitablif, as he does, a new genus. We find the berry hollow, and apparently fomewhat inflated, though far lefs than in the fecond fpecies. American botanitts mutt folve this difficulty.
5. L. tri, byilla. Three-leaved Lion's leaf.-Leares radical, ternate, bluntly toothed. Stalk radical, fimple. Flowers fpiked. - Gathered by Mr. Archibald Menzies, on the weft coaft of North America. The root is perennial, fomewhat creeping. Leaves folitary, on a dender, fimple, upright, fmooth foot Ralk, about ten or twelve inches high, with a few imbricated, elliptical, concave, ribbed fcales at its bafe; leaflets three, feffile, two inches wide, fmooth, pale green, beautifully reticulated with innumerable veins; ra-

## LEO

ther sedge-flaped at their bafe, the fide-ones dilated laterally; the outer margin of all wavy or bluntly toothed. Flows:-Ralk folitary, from the fame bud with the leaf, but a little taller, fimple, nender, naked. Spike terminal, about an inch long, of numerous, feffile, white flozvers, of whofe caly:x or corolla we can find no traces, but the famens agree fo well with thofe of $L$. Leontopetalum, in their very peculiar flructure, that we venture to refer our plant to this genus. The filunents are extremely fiender at their bafe; the germen is ovate, with a thick, nearly feflile, oblique figma.

Leostice is alfo a plant mentioned by the ancient Greeks, and called by them catalia.
Dinfcorides tells us it had thefe names in common, and that it was of great virtue in curing difeafes of the a/pera arteria, or wind-pipe.

This medicinal plant of the Greeks was very different from that we now call cacalia. Some have defcribed it to have flowers like the oak, others like the olive-tree, but the old manufcripts of Diofcorides all fay, the flowers were like thofe of bryony. Hence it could by no means be the cacalia of the moderns; nor is it eafy to fay, from fuch thort and uncertain accounts, what it was. See the preeeding article.
LEONTINI, or Leontium, in Ancient Geogratby, a town of Sicily, called alfo, as Diodorus informs us, Xuthia, a name given probably to the fmall diftrict in which it is fituated. It was fituated, according to Herodotus's account of it, between two rivers, which, after their junction, ran into the fouthern part of the gulf of Catana. One to the S. was called "Lifus," now Liffo, and the other to the N. "Terias," called St. Leonard's ftream. The town was built, at the fame time with Catania, by the Chalcidians, under the conduct of Theocles, the Athenian, in the it year of the $13^{\text {th }}$ Olympiad, as we are informed by Thucydides; in whofe time it was defended by two ftrong citadels, one called the citadel of Phocea, the other the citadel of Bricinnia. The adjacent territory was fo fruitful, that it yielded, according to Pliny, crops of corn an hundred fold, and Cicero calls . it the grand magazine of Sicily. Its wines were the molt delicious of the whole ifland, but the inhabitants perverted the benefit into an occafion of intemperance, fo that it became a proverbial faying, "the people of Leontini are always at their cups." Leortium had its tyrants as well as Syracufe, and between thefe two cities there fubfifted a conftant rivalhip and enmity. This was the birthplace of the celebrated rhetorician Gorgias, whofe eloquence aftonified even the Athenians, and who perfuaded them to zundertake the unfortunate expeditoon under Nicias. Leontium at length fell under the power of Syracufe, Dionyfus the tyrant having removed the inhabitants thither. The fituation of the caltle, and the fertility of the country, rendered Leontium at all times a place of importance to the different nations which poffeffed Sicily. The earthquake of 1693 completed its deftruction, and reduced it to its prefent itate of wretchednefs. The ancient city, built on four hills, prefents to the obferver nothing but a fpot of ground torn by focr ravines, which lay open a few wretched grottos, the fole remains of its former greatnefs. The caftle ftood on a dstached rock, oppolite to the city, which was originally hewn out of it, and has been fucceflively built and rebuilt according to the Ityle of different ages, and the prevailing modes of behieging and defending places. The rich connery of Leontium, fo luxuriant in corn, is now called the plain of Catania; it is 12 miles wide by 20 in length, and was formerly the country of the Lestrigons, divided and bathed by the "Simacthus," the largett river in Sicily, which rolls along in ist Aream a quautity of bleck
and ycllow amber, which is fought for where it difgorges itfelf into the fea, and is wafhed up at Catania.

LEONTIUM, in Biograplyy, an Athenian courtezan, at one time noted for the licentioufnefs of her life, and afterwards diftinguifhed by her application to the ftudy of the Epicurean philofophy. It has been afferted, that the did not defilt from her intrigues after the was an attendant on Epicurus, but proltituted herfelf to the difciples of his fchool, and ever to the philofopher himfelf. She became the wife of Metrodorus, one of the principal difciples of Epicurus, and had a fon by him, whom Epicurus commended to the notice and regapd of his executors. Leoutium applied with great diligence to the ftudy of philofophy, and wrote, in defence of the Epicurean doctrines, againlt Theophraltus, one of the principal of the Peripatetic fect. The book is acknowledged by Cicero to have been written in a polite and ekegant tyll: Bayle. Moreri.

LEONTIUS, furnamed the Scholafic, who flourihed in the fixth century, was a native of Conftantinople, was educated an advocate and afterwards became a mouk. He lived till about the clofe of the century. The principal work of Leontius is "A Treatife on the Sects of Heretics," divided into ten difcourfes. It was publified in Greek and Latin at Bafil, in ${ }_{157} 7$. He was alio author of various. treatifes againft the Eutychians, Neftorians, and Appollinarilts; a difcourfe on the fettival celebrated between Eafter and Whitfunday; and there are "Orations" and "Homilies" afcribed to him in the Bodeeian and Vienna libraries. Moreri.

LEONTODERON, in Natural Hifory, a name given by feveral authors to a fpecies of agate, of a plain yellowifh colour, without variegations.

LEONTODON, in Botany, derived from $\lambda_{\text {ev }} \lambda_{\text {, }}$ scrios, a lion, and bov:, a tooth, and io called from a fimilarity in the thape of its jagged leaves to the teeth of a lion. Linnxus beltowed this name upon the genus in juft preference to the compound one of Dens Leonis given by Tournefort. The Englifh name Dandelion, which is a corruption of Dent de Lion, is expreffive of the fame idea, and might poffibly have given rife to its botanical appellation. Dr. Smith has deferibed the leaves of Leontodon Taraaacm, in his Introduction to Botany, P. 157, as runcinate or lion-toothed, cut into feveral taanverfe, acute fegments, pointing backwards. A flriking character of this fort, which, at firft fight, fuggefts a name, borrowed from fome familiar or popular refemblance, is always defirable, and is fufficiently apparent in this genus.- Linn. Gen. 402. Schreb. 529. Willd. Sp. Pl. v. 3.15 4. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. vo 2. 822. Ait. Hort. Kew. v. 3. 120. Gærtn. t. 158. (Dens Leonis; Tournef. t. 366. Taraxacum; Jufi. 169. Lamarck. Illuitr. t. 653.)-Clafs and order, Syngenefa Polygannia Risualis. Nat. Ord. Compofita Semiflofculofis, Linn.' Cichoracee, Julf.

Gen. Ch. Common caly, imbricated, oblong; its interior fcales lirear, parallel, equal; outer fcales fewer in number, often reflexed at the bafe. Cor. compound, imbricated, uniform ; the florets hermaphrodite, numerous, equal, eachy of one petal, ligulate, linear, abrupt, with five teeth. Stam. Filaments five, capillary, very thort, anthers united into a cylindrical tube. Pif. Germen nearly ovate; ftyle thireadflaped, as long as the florets; Itigmas two, revolute. Periz. none, except the oblong, ftraight, at length refiexed, calyx. Seeds folitary, oblong, rough; down capillary, titpitate. Recept. naked, dutted.

Eif. Ch. Receptecle naked. Calyx double, imbricated with rather lax fcales. Down thalked, hairy.

1. L. Zarasacum. Common Dandelion. Linn. Sp. Pls

## L E O

2122. Engl. Bot. t. 510 . Curt. Lond, fafc. 1. t. 58. -Outer fcales of the calyx reflexed. Leaves lion-toothed, fmooth. Perhaps the molt common of all plants, in meadows, paftures, on rubbih and on all cultivated land, flowering from April to July. This troublefome though handfome sweed, has a deep and branching perennial root. Leaves radical, runcinate, toothod, of a bright green cclour, fmooth. Flower-flalks fimple, longer than the leaves, hollow, brittle, milky and fingle-flowered. Flower terminal, large, golden-coloured, cloling in the evening. Styles hairy. Seeds obovate, furrowed, bearing on a long footitalk a tuft of fimple, radiated down. The diuretic qualities of this plant, which caufed it to be called Pifinlit in French, procured it a fimilarly expreflive name in this country, by which it is well known to the vulgar. The whole herb is milky and bitter, but like Lettuce or Celery becomes fweet by culture or blanching. Curtis remarks that the French are very partial to this fpecies in their falads. It is efpecially ufed by the poorer fort of people, becaufe it is fo common and to eafily prepared.
2123. L. palufris. Marfh Dandelion. Sm. Fl. Brit. 823. Lyons Fafc. 48. Engl. Bot. t. 553. (L. lividus; Willd. n. 3.) -Outer fcales of the calyx fhorter, upright, ovate. Leaves finuated and toothed, nearly fmooth. Founid generally on moors and marhes. At Hinton Moor, in Cambridgefhire, by the Rev. Mr. Relhan, and at Heydon, Norfolk, by the Rev. Mr. Bryant. It flowers in June and July. Root perennial, fpindle-fhaped. Leaves not quite fo diltinctly lion-toothed as in Tarazacum, fometimes inclined to be hairy. Flower-falks about as long as the leaves, fometimes decumbent. Caly.x imbricated on all fides; its fcales graduall5- fmaller outwards, ovate, acute, all erect. Florcts golden-coloured, the outer ones purplifh at their back. Seeds and Dozun very fimilar to the former fepecies. Indeed this was confidered merely as a variety of that, till Dr. Smith eftablifhed the prefent plant in his Englifh Botany. The whole herbage is more delicate and flender than that of the commen Dandelion.
2124. L. ferotinus. Late-flowering Dandelion. Waldit. and Kitaib. Pl. Rar. Hung. v. 2. 119. t. I14. Willd Outer calyx fpreading. Stalk tingle-flowered. Leaves runcinate rough, their teeth rounded and notched. A native of hills in Hungary.-Flower-falk generally fmooth, fometimes downy. The fpecies is fufficiently marked as being diftinet from L.Taraxacum, to which it is nearly allied in habit, from having the fcales of its caly.x ${ }^{\text {. }}$ preading and fticking out in all directions; its leaves are allo rough, their lobes rounded and toothed.
2125. L. lavigatus. Smooth Dandelion. Willd. n. 4.-Outer calyx erect, clofe-preffed; fcales ovate. Stalk fingle-flowered. Leaves deeply runcinate, toothed, fmooth. A native of Spain. Radical leaves deeply runcinate, almoft pinnatifid, very fmonth and thin; teeth triangular, notched. Flower-ftalks fmooth, afcending. Scales of the outer calyx: ovate, clofely-preffed. It differs abundantly from L. paluftris in having its leaves more flender, and deeply cut, with triangular notches.
2126. L. oboratus. Obovate Dandelion. Willd. n. 5.Outer calyx fpreading ; fcales ovate. Stalks fingle-flowered. Leaves obovate, rather obtufe, toothed. Found, like the laft, in Spain. Leaves obovate, generally very obtufe, fometimies rather acute, toothed at the margin, fmoth; their foottalks and mid-rib fometimes fringed. Calyx furnihed with external; acute, fpreading fcales. This is decidedly diltinguiked from all the other fpecies by the shape of its leaves.

## 1. E O

This genus is much more ample as it ftands in Linnaus. We have adopted all the Species retained by Willdenow, who has removed the reft to different genera, as follows. Leontodon bulbofus, and aurcus, are referred to Hieracium: L. bafilits, tuberofus, autumndis, alpinus and bificilus to Apargia of Schreber: L. Lirtus to Thrincia of Roth., and he has followed Swartz in calling L. tomentofits, Tupfilizo albicans. We do not feruple following Willdenew in reforming the genus of Leontodon, efpecially as we have the authority of Jacquin and Sinith for having done to in Trasopozon.

Leontodon Taraxacum, or Common Dandelion, in the Materia Medica, \&c. The young leaves of this plant in a blanched fate have the talle of endive, and make an excellent addition to thofe plants caten early in the fpring as falads. At Gottingen the roots are roalted and fubttituted for coffee by the pourer inhabitants; who find that an infulion prepared in this way can hardiy be diltinguifhed from that of the coffee-berry. Dandelion is generally confidered by medical writers as the moft active and efficacious of the lactefcent plants; the expreffed juice is fomewhat acrid, the root ftill more bitter, and poffeffing more medicinal power than any other part of the plant. Taraxacum has been long in repute as a mild detergent and aperient, and its diuretic effects may be inferred from the vulgar name it bears in moft of the European languages, "quafi lectiminga et urinaria herba dicitur." Bergius recommends its ufe in obltructions of the liver, hypochondriatis, and jaundice. We have various proofs of the gocd effects of the Taraxacum related by different authors, in jaundice, dropfy, pulmonic tubercles, and fome cuianeous diforders. The leaves, roots, flower-ltalks, and juice of dandelion have all been feparately employed for medical purpofes, and feem to differ rather m degree of ftrength than in any effential property ; therefore the expreffed juice, or a ftrong decoction of the roots, has been moft commonly prefcribed, from one ounce to four, two or three times a day. The plant fhould be always ufed frefh; for even extracts prepared from it appear to lofe much of their power by keeping. Woodv. Med. Bot.

LEONTODONTOIDES, in Botany. See Hyoseris.
Leontopetalo Affinis. See Leontice.
LEONTOPETALOIDES, the name of a genus of plants defcribed by Dr. Amman, being a fpecies of the leontice of Linneus; which fee. See alfo Tacca.

LEONTOPETALON, from $\lambda_{\text {E } 2 \%,} \lambda_{\text {eroins, }}$ a lion, and Tifla $\lambda 0$, a leaf. Lion's-leaf. Tourn. Cor, 49. t. 484. See Leontice.

LEONTOPODIUM, from $\lambda_{\xi \omega y}$, a lion, and $\pi \because \varsigma$, moso;, the foot, has been applied as a name to feveral plants, whofe thick and fuft hairinefs, enveloping their flowers or ftalks, as the claws of a lion are enveloped, feems to have given rife to the idea. Among thefe are Myofotis fcorpioides; feveral fpecies of Gnaphalium, efpecially the elegant Filago Leontopodium of Linnxus, now reftored by Willdenow, very juttly, to Gnapbalium, where Linnæus at firlt placed it; Alchemilla vulgaris, called Leontopodium by Brunfelfus, v. 2. 53; and Plantago cretich, the Leontopodium of Cluffus. What Diofcorides, the father of the name, intended by his Atovionodor, is very difficult to be gueffed. Dr. Sibthorp thought it might be Micropus eretus, which is very common in Cyprus and feveral of the Greek iflands; but it hardly anfwers to the defcription.

LEONTOPOLIS, or Leoston, in Ancient Gcagraphy, a town of Egypt, and capital of a nome, which took the name of. "Leontopolites nomos." Ptolemy.

LEONURUS,

## L E O

## LEO

LEONURUS, from $\lambda_{\text {ewv, }}$ a lion, and spx, a tail; a name given by Tournefort to fome Linnæan (pecies of Phlomis, (fee Leovoris, but applied by Linneus to the Cardiaca of Tournefort, for which it is now retained. Mo:herwort. Liun. Gen. 295. Schreb. 391. Willd. Sp. P1.v 3. 114. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 3. 405 Sin. Fl. Brit. 637. Brown. Prod. Nov. Holl, v. 1. 50. Juff. IIf. Lamarck. Illuftr, t. 509. (Cardiaca; 'Tourn. t. 87.) - Clafs and order, Didynamiua Gymnofpermia. Nat. Ord. Verricillate, Linn. Labiate, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, with five angles, and five awl-haped, finous teeth, permanent Cor. of one petal, ringent; tube narrow; limb gaving; throat long; upper lip longet, femicylindrical, concave, giblous, haggy, rounded and obtufe at the top, undivided; lower reflexed, in three deep fegments, not quite equal. Stam. Filaments four, concealed under the upper lip, two of them fhorter than the others; anthers oblong, incumbent, their lobes parallel, and near to each other, befprinkled with minute, globular, fhining, elevated granulations. Pijf. Germen fuperior, four-cleft ; ftyle threadfhaped, the length and fituation of the flamens; ftigma in two equal acute fegments. Peric, none, the permanent calyx containing the feeds in its cavity. Seeds four, oblong, convex on one fide, angular at the other.

Eff. Ch. Calyx with five teeth, pentagonal. Upper lip of the coroila concave, hairy, undivided; lower in three deep, rather unequal, fegments. Anthers with parallel lobes. Stigma equally divided.

1. L. crijpus. Cut-leaved Motherwort. Murray in Linn. Sylt, Veg. ed. 14.538. Nov. Comm. Goett. v. 8. 44. t. 4 -Leaves with three or five lobes, deeply toothed, rugged and wavy. Corolla longer than the calyx. - Native of Siberia. Said to have been cultivated in the Oxford garden in 1658. It has all the appearance of being a luxuriant or monftrous variety of the following.
2. L. Cardiaca. Common Motherwort. Linn. Sp. Pl 817. Engl. Bot. t. 286. Fl. Dan. t. 727. (Cardiaca; Ger em. 705. Camer. Epit. 864. Rivin. Monop. Irr. t. 20. £ 1.)-Upper leaves lanceolate; three-lobed or undivided. Corolla longer than the calyx; the middle lobe of its under lip acute - Native of walte ground in the more northern parts of Europe, not frequent in England. It loves a gravelly or calcareous foil, and is perennial, flowering in July and Augult. The berb is bitter, with a pungent unpleafant fmell. Stem a yard high, purplifh, fq̣uare, regularly befet with numerous, oppofite, ftalked, roughiih, darkgreen leaves; of which the lower are broadeft, three-lobed, and more or lefs deeply cut ; the upper gradually narrower and lefs divided, till they become lanceolate, acute, and quite entire. Flowers numerous, in denfe whorls. Bralleas awl-naped, pungent. Calyx-tectb fpreading, rigid, nearly equal, broad at the bafe. Corolla purple, variegated; its upper lip elegantly villous with white hairs. The anthers are marked with fhining points, but that is not peculiar to the genus.
3. L. Marrubiaffrum. Small-flowered Motherwort. Linn. Sp. Pl. 817. Ehrh. Pl. Exfice. n. 157. Jacq. Auftr. t. 405 -Leaves ovato-lanceolate, ftrongly ferrated. Cosolla fcarcely longer than the calyx ; the middle lobe of its under lip rounded, obtufe.-Native of Bohemia, Germany, Tartary and Siberia. The leaves vary in breadth, and are either flrongly ferrated or entire, but never cut or jagged like the preceding. The calyz-teeth alfo are narrower and longer; and the corolla totally different, fearcely exseeding the length of the calyx, but dightly downy, and the midule lobe of its under lip almoll heart-haped, or at leaft dilated
and very blunt. The root moreover is faid to be only annual, or biennial. The plant has little to excite notice, and is only kept in curious gardens.
4. L. Jupinus. Decumbent Motherwort. Willd, n, 5, -"Leaves moltly five-lobed; the lobes obtufe, toothed at the fummit. Calyx feffile. Stems afcending."-Native of Siberia, communicated to profeffor Willdenow by his friend Stephan. "Root perennial. Stons feveral, half a foot high, afceiding, branched, fquare, downy. Leaves oppofite, half an inch long, with three or five lobes, which are oblong, fomewhat wedgc--fhaped and obtufe, furnilhed at the extremity with three or five obtufe teeth; downy on both fides, efpecially the under. Fooffalks the length of the leaves. $l$ horls of four to fix flowers, feffile. Brateas briftleThaped, pointed, downy, Thorter than the calyx. Calyw downy, its fegments ovate, fpisous. Corolla white, rather longer than the calyx, its lip three-lobed, obtufe." Such is Willdenow's defcription. made from the dried plant, which in almoft every minute particular accords fo well with our Lamium palmatum, (fee Lamiuns) that we fhould conclude them to be the fame, were it not for the brafteas, of which our plant is certainly dellitute.
5. L. tataricus. Tartarian Motherwort. Linn. Sp. PI. 8IS. (Cardiaca foliis tenuiùs et profundiùs incifis glabra; Mill Ic. v. 1. 53. t. So.)-Leaves in three deep divifions; their lobes jagged. Upper lip of the corolla flattened, upright, reflesed.-Native of Tartary. It differs from the following merely in the forver being fmaller, with a more rounded upper lip, whofe extremity is reflexed. Gmelin, who gathered both, thought them varieties, and we find no difference to be depended on.
6. L. fibiricus. Siberian Motherwort. Linn. Sp. PI. 81S. Sm. Exot. Bot. t. 94. (Ballote inodora, foliis coronopi; Amm. Ruth. 48. t. 8.)-Leaves in three deep divifions ; their lobes jagged, bluntifh. Upper lip of the corolla ftraight.-Native of Siberia, China, and the Eaft Indies, a hardy annual in our gardens. Stem two or three feet high, branched. Leares deeply cut in a three-fold manner, into various deep divilions, mofly narrow and bluntifh, more or lefs downy. Flowers crimfon, in denfe whorls, with awl-fhaped bra\&eas. Calyx bilky. Corolla twice as long as the calyx ; its upper lip concave, but fraight; lower in three lobes, the middle one dilated, heart-fhaped. Mr. Sowerby found a double row of crimfon glands in the mouth of the tube. The calys is often fpinous, but not always fo.

Leopard's Bane, in Botany. See Doronicum.
LEOPOLD I., in Biography, emperor of Germany, fon of Ferdinand III. was born in 1640 . He was elected king of Bohemia in 1654, and of Hungary in 1655 , and he fucceeded to the imperial crown in July 1658 . His reign was fruitful of important events. A war with the Turks, which broke out in 1661, was brought to a conclufion in 1664, in confequence of a victory obtained over the grand vifier, at St. Gothard, in Hungary. This was fucceeded by a revolt of the Hungarians, excited by thofe infringements of their privileges which have been continually renewed under the princes of the houfe of Auftria. The execution of the leaders in 1671 , for a time, quelled the diforders, without removing the caufes of difcontent. In 1672 Leopold joined in a league with other powers to protect the Dutch againft Lewis XIV.; at this crifis the Hungarian malecontents took the opportunity of thaking off the Auftrian yoke and afferting

## LEO

aferting their original independence. Headed by count T'ekeli, and fupported by the Turks, they again role in arms, and obtained various fucceffes againft the Imperialifts. In 1682 a new war broke out between the empire and France; and about the fame time the breach of a truce by the Hungarian revolters, and the irruption of a valt Turkifh arny;, reduced Lcopold to the greatelt danger. His general, the duke of Lorraine, was obliged to retire under the walls of Vienna, and the grand vizier laid fiege to that.capital, while the emperor with his court withdrew to Lintz. A feries of fucceffes afterwards attended the imperial arms in Hungary, and all that had been loft was gradually recovered. The rebels were tried, the nobleit blood was fhed without mercy or remorfe, and the Hungarians were fo far humiliated, that an affembly of the ftates, in 1687, declared the kingdom hereditary in the houfe of Auftria, and elected for their king the archduke Jofeph, then only nine years of age. Three years afterwards, Lespold procured the election of his fon Jofeph to the fucceffion of the empire, as king of the Romans. The war with France was carried on with various fuccefs, till the general peace, concluded at Ryfwick, in 1697. In 1699 a long truce was agreed on between the German and Turkifh empires, on terms favourable to Leopold, whofe arms had obtained great glory under the illuftrious prince Eugene. The war, on account of the Spanifh fucceffion, o plunged Europe again in blood. Leopold gained over the elector of Brandenburgh to the party of the allies, by confenting to recognize him as king of Pruffia. The events of the war were at firit unfavourable to the emperor, but the decifive battle of Blenheim or Hochitet, in 1704 , changed the face of affairs. Leopold did not long enjoy the brighter profpect which was opening upon him : he died in the following May, at the age of fixty-five, after a reign of forty-fix years, leaving the power of his houfe much augmented in his hands. "His original education," fays the hiftorian, "which was that of an ecclefiaftic, had coincided with his natural difpofition, in producing a cold formality of character; and the narrownefs of his ideas threw him into the power of favourites, whom his jealoufy of authority led him frequently to change. The great objects of his policy were, however, purfued with a fleadinefs which enfured their final fuccefs." Modern Univer. Hift.

Leopold IL., emperor of Germany, born in 1747, fon of the emperor Francis I. and the emprefs-queen Maria 'Therefa, was created grand duke of Tufcany about the year 1765 , and during a reign of twenty-five years, difplayed a conltant regard and attention to the happinefs and profperity of his people. He carried into effect a number of improvements relative to all the branches of adminiftration, which rendered that portion of Italy peculiarly flourifling. He diminifhed the taxes, and yer augmented the revenue; introduced an exact police; encouraged the arts, manufactures, and agriculture; freed indultry from the fetters of numerous feltivals, meliorated the condition of the public hofpitals and prifons, and promulgated an entire new code of laws, characterized as well by their humanity as their fimplicity. In the preface to this"code he fays, "We have confidered the examination and referm of the criminal laws as one of cur principal duties;"; and after much experience he fays with true patriotic exultation; "With the utmoft fatisfaction to our paternal feelings we have at length perceived, that the mitigation of punifhments, joined to a moft fcrupulous attention to prevent crimes, and alfo a great difpatch in the trials, together with the fuddennefs of punifhment to real delinquents, has, inftead of increafing the number of crimes, confiderably diminifhed that of the fmaller ones, and rendesed thofe of an atrocious nature very rare ;" fo rare, ino
deed, that during ten years not a fingle execution took place in his dominions. Leopold protetted the lower ranks from the oppreffion of the higher, and his palace was ever acceffible to the meaneft fupplicant. Though the father of his people, lie was alfo their mafter, and would admit of no oppofition to his will; though fincerely detirous of doing good, he was cold and faturnine. In 1790 the imperiat crown, and the fucceffion to the Auprian dominions, devolved to him on the death of his brother Jufeph. The refuit of that unfortunate prince's fchemes had been an abfulute revolt of the Low Countries, the difaffection of Huncary, and the jealoufy of all the furrounding ftates. leoopold, by employing the arte of conciliation, in conjunction with firmnefs and pradence, was able in a fhort time to recover the Low Countries, to quell the oppolition of the Hungaria, malecontents, to Itrengthen his houfe by fplendid alliances, and to eftabiifh. peace with the Ottoman Porte. He reflored a good under. Itanding between the courts of Vien:a and Berlin, and concurred with England in checking the ambitious projects of Ruffia. Soon after the commencement of the French revolution, Leopold formed, at the congreis of Pilnitz, a coalition with Pruffia, for the avowed purpofe of giving a goo vernment to Frasce, and the fubfequent invalion of that country by the united forces of the two powers is to be regarded as a confequence of this alliance. Leopold did not live long enough to witnefs the commencement of hoftilities. He died in the month of March 1792, at the age of fortyfour, leaving behind him a numerous progeny, of whom his eidelt fon Francis II. fucceeded to the racant throne. Univer. Hit. New Ann. Regit. Ediat of the grand duke of Tufcany, printed by the celebrated $\mathrm{Mr}^{\text {. John }}$ Howard.

Leopold was paffionately fond of Italian poetry and mufic, and is faid by Quadrio (Storia d'Ogni Poefia, vol. i.) not only to have been the conftant patron of both, but to have compofed maffes and motets for his own chapel, and to hase written, and fet to mufic, himelf, many beautiful canzonets and madrigals. This prince, early in his reign, retained in his fervice the Italian lyric poet Minato, and Antonio Draghi, to write and fet operas for the imperial court at Vienna.

LEOPOLDSTADT, in Geography, one of the fuburbs of Vienna, large and populous; lituated on the N. fide of the Danube, and communicating with the city by a bridge. -Alfo, a fortified town of Hungary, on the river Waar ; 56 miles E. of Vienna. N. Lit. $\ddagger^{\circ} 23^{\prime}$. E. long. $1754^{\prime}$

LEOSTENIUS Snuus, in Ancient Geography, a gulf of Thrace, upon the Thracian Bofphorus, towards the northera part of the Hermæan promontory.

Leotaud, Vincent, in Biography, a French jefuit, and able mathematician, was born ai Laval-Louyfe, in the diocefe of Embrun, and died in the year 1672. He publifhed a work on the quadrature of the circle; "Arithmetical Inftitutions, in four books;" a treatife "On Cyclometry ;" a work "On Magnetology," and a work. "On the Primum Mobile."

LEOTIA, in Bctany, perhaps fo called from $\lambda_{\text {eas }}$, or $\lambda x a$; the people, or vulazar; yet it does not appear to be either a common genus of fungi, nor vulgarly ufed as food, like many others. Its afpect indeed is ordinary enough, being that of a fmall Agaric without gills. Perfoon. Syn. Fung. 611. Obf. Mycolog. v. 2. 21. t. 5. f. 1. t. 6. f. I, 2.Clafs and order, Cryptogamia Fungi. Nat. Ord. Furgit.

Eff. Ch. Head roundifh, reflexed at the margin and clofely embracing the ttalk, bearing feeds in its expofed: furface.

The fpecies enumerated by Perfoon are nine, four of

## L E P

which have a fmooth conical or ovate head, three an orbicular one, and the other two are efteemed doubtful.
Among the firt is L. Mitrula, the Elvela cucullata of Batich, f. 132, and probably Clavaria ferruginea of Sowerby's Fungi, $t .8+$; found in autumn growing copioufly on decayed leaves of Scotch fir. The flatk is near an inch high. Head conical or ovate, of a pale cimamon colour ; white and fpougy within.

In the fecond fection is $L$. lubrica, (Helvella gelatinofa; Bulliard 296. t. 473 . f. 2.) ; not unfrequent, after much rain, in beech woods. It is of a light greenilh buff colour, and tender fubftance. Stalk two or three inches high, hollow, tumid in the lower part; and the cavity is continued into the bend, which is rounded, depreffed, unchiated, and obfcurely lobed, about an inch in diameter, compofed as it were of two coats, with a hollow fpace between.

Helvella Relbani, Sowerby t. II, is one of the doubtful fpecies.
I.EOVILLE, in Geography, a town of France, in the department of the Lower Charente; eight miles N. of Montlieu.

LEOWITZ, Cyprian, in Biography, a celebrated aftronomer in the fixteenth century, was born in Bohemia, and was appointed mathematician to Otho Henry, elector palatine. He acquired a high reputation by his altrononical productions, of which the principal were " $\mathrm{E}_{\mathrm{p}}$ hemerides ab anno 1556, ad Ann. 1606;" "Expedita Ratio conftituendi Thematis cocleftis;" "Loca fellarum fixarum ab anno Dom; 1549, ufque in Ann. 2029;" and "De Eclipfibus Liber." His celelrity occalioned Tycho Brahe to pay him a vifit in the year 1;69, when they had feveral converfations on their favourite lubjects. Notwithitanding the great learning of Leowitz, he was wcak enough to become the dupe of judicial aftrology. He died in Swatia in 1574. He had predicted that the world would come to an end in 1584, and of this prophecy many priefts and preachers took advantage as the important period approached, and enriched themfelves at the expence of the fears of their people. Bayle. Moreri.

LEPA, in our Old Writers, a meafure which contained the third part of two buthels. Whence we derive a feed leap.

LEPANTO, in Gcograpby, a fea-port town of European Turkey, in the province of Livadia, fituated in a bay formerly called the "gulf of Corinth," now the "gulf of Lepanto." This town is fortilied and defended by a caftle on an eminence. N. lat. $38^{8} \quad 37^{\prime}$. E. long. $22^{\prime \prime} 0^{\prime}$.

LEPAS, in Conchology, a genus of the multivalve order, the animal of which, according to the Linnæan fyltem, is a triton, the fhell affixed at the bafe, and conlifting of many unequal erect valves. This genus, as defined by Linnaus and Gmelin, comprehends two very dittinct genera, the union of which, under one titie, is liable to much objection; though, for the fake of uniformity, we are not inclined in this article to feparate them. One of thefe natural tribes, for example, has the fhell of a conic form more or lefs tubular, the bafe firmly affixed upon rocks or other extraneous fubftances, without any tendinous tube; the fhell is compofed -of fix valves; and the truncated cpening above is clofed by a four-valved operculum. In the other genus the fhell, inthead of being conic, is broad, flattifh and wedge-formed, and in many fpecies refembling, in fome degree, the fpear or head of an arrow ; it is befides compofed, in general, of a much greater number of plates or valves, the aperture of which is lateral initead of being at the fummit, and has no operculum ; and lattly, the fhell is not affixed by its teflaceous bafe, but is placed at the extremity of a tendinous tube, the bate of which unites it to the rocks or other lubfances to shech, for convenience and fecurity, the animal connects it-

## L E P

felf. The very obvious diflimilarity that prevails between thefe two genera attracted the particular attention of early writers, even before the time of our own countrymen Lifler and Petiver, the term Balanus being adopted for the former, and Concha anatifera for the latter, and by thefe names the two tribes of fhells are recognized in the writings of Gefner, Aldrovandus, and others. Linnexus, notwithftanding thefe authorities, however, confolidated them together. Da Cofta was the firtt among the Englifh authors who again feparated them; he affigned to the firt the original name of balanus, or acorn fhell, at the fame time that he retained the former under the name of lepas, or in Englifh bernacle, a term preferable, no doubt, to that of Concha anatifera, which applied to a fingle fpecies rather than the whole genus. The obfervations of Da Cofta, as they militate in various refpects againt the conchologioal writings of Linnæus, have never perhaps been regarded in this country with fufficient attention, nor with ordinary liberality; he is not, we admit, on every occafion lucid, neither as a fyltematilt does he deferve mention; yet, upon the whole, his remarks are often judicious, and almolt conftantly correct, and his ftrictures on the genus lepas, as propofed by Linnzus, are in particular fatisfactory: he has reftored both genera to their proper ftation. Among the collectors of \{hells in Britain, from the time of Da Colta to the prefent, the namies of balanus and lepas have been almoft conflantly adopted, but the feparation of them is afcribed to Dr. Solander, and the difcrimination of earlier writers ceafes to be remembered. In England, as before obferved, the Linnæan term of lepas has been retained for one of the two gencra; the continental writers, on the contrary, though they adopt this genus in the fame form, reject the word lepas, and fubflitute that of anatifa in its place; the French call it anatife, and under the latter term it is diftinguilhed by their belt writers. Having pointed out the leading character of the two genera into which the lepas of Linnzus and Gmelin is divided, it only remains to enumerate the fecies defcribed by thole and fucceeding writers to the prefent time.

## Species.

Balanus. Shell conic, grooved; operculum, or lid acuminated. Linn. Fn. Suec. O. Fabr. Balanus majufculus valvis porcatis (porcatus), Da Cofta. Ridged acorn fbeell, Donov. Brit. Shells.

Frequent on the Britifh and other European fhores, adhering in vaft numbers to rocks, fhells and flones; the colour generally whitifh or greyifh, and the form rather variable.

Balanordes. Shell conic, truncated, and fmooth; operculum obtufe. Linn. Balanus parvus vulgaris, Petiv. Balanus cinercus, \&c. Lift. Common acorn 乃s:ll, Donov. Brit. Shells.

Found, like the former, in great abuindance on the fhores of Europe, and alfo thofe of the Amerizan and Indian feas. When afixed on an uneven furface, the bafe of this fhell fometimes extends down into a pretty long rugged tubular ftalk or root. This variety is noted by Pennant, and an extraordinary, but mutilated fpecimen, is fhewn in one of the plates of Brit. Zool. Another occurs in Brit. Shells. Donov. The colour is commonly greyifl ; the tips of the valves, as in the laft-mentioned variety, greenifh.

Intertexta. Somewhat deprefled; and ribbed obliquely. Donov. Brit. Shells. Leşas friata, Penn.
"This rare fpecies is the lepas intertexta of the Portland mufeum, and was fifhed up at Weymouth, adhering to a valve of the oftrea fubrufus, \&c." Brit. Shells.

Costara. Somewhat conic and fulcated, the ridges
equidiftant and divergent from the aperture ; operculum flarp-pointed. Donov, Brit. Shells.

A new fpecies found adhering to pieces of broken rocks on the coalt of Pembrokehhire.

Cosordes. Shell conic, fmooth, valves pointed at the tip, aperture very fimall. Donov. Brit. Shellis.
A new fpecies defcribed as above, the fpecimen was found by Mr. Bryer, of Weymouth, affixed to a fhell of the lepas anatifera.
Tinfinnabulum. Shell conic, or bell-fhaped, oftufe, rugofe, and fixed. Lepas tintimnabulum, Linn. Balanus major, Lifter. Balanus major, the conic centre kell, Grew. Belanus maximus, Petiver. Balanus ore hiante magnus, Borlafe. Gland de mer clochecte, Davila. B. tintinnabulttm, bell acorn Jeell, Donov. Brit. Shells.

Found adhering in large cluiters to the bottoms of thips in moth feas. A fuppofed variety of a dirty whitifh colour is mentioned by Chemnitz as a northern kind.
Tulipa. Shell fubcubic, and fmooth; operculum acute and tranfverfely ftriated. Müll. Zool. Dan.

Inhabits the North feas.
Borealis. Shell erect, fubconic, aperture quadrangular, operculum acute and tranfverfely ftriated. Donov. Brit. Shells.

A new fpecies, recorded as above flated. "A few fnall clufters, with fome detached fpecimens of this curious fpecies of balanus, were difcovered about the year i SOO , attached to the bottom of the Warfight thip of war, when taken into dock to be repaired, after lying in the harbour of Portfmouth for a great length of time. Mr. J. Hay of Portfmouth foon after found two or three fhells of the fame kind, by dredging in Portfmouth harbour: The fpecies appears to be very rare; we have one feecimen attached to the valre of an oftrea rufus brought from Newfoundland." Vide Brit. Shells.

Diadema. Shell fubrotund, fix-lobed and furrowed, Gmel. Balanus polythalamius, Walch. Diadem acorn /kell, Donov. Brit. Shells.

A curious and rare fecies, about the fize of a walnut, or fometimes larger; colour whitifh. Inhabits the European and Indian feas.

Bal.f.yaris. Shell fomewhat conic; lobes fix elevated wrinkled and four-parted; the operculum membranaceous and bidentated. Müll. Chemnitz,-\&c. Whale acorn Joell, Danov.

Found adhering to the fins and pectoral wrinkles of the whale (Balena boops); its fize refembies the latt, but its form is sery much depreffed, colour the fame as in B. diadema, as are alfo the furrows of the lobes. This is erroneoufly defcribed by fome authors as the B. diadema of Da Colta; we po太efs the example defcribed by Da Cofta under this name, and can in confidence affirm it to be the former fpecies. See Brit. Shells.

Palmipes. Shell erect, conic; operculum acute and tranfverfely ftriated. Olaff.

Size of a pea, and fmooth. Inhabits the ocean.
Galeata. Shell helmet-form, with a lateral aperture.

## Schroet.

Difcovered adhering to the gorgonia verrucofa, and ventilabrum ; fhell boat-fhaped and fmooth; aperture rhombic.

Mitella. Shell compreffed, erect, and irregularly ftriated. Liin. Balanus Rondeletii, Gefn. Balanus chinenfis friatus, Petiv.

Native of the Indian feas.
Testudinaria. Shell plano-convex; rays fix excavated and IIriated. Linn.

Inhabits the depths of the ocean, and is ufually found adVol. XX.
hering to other fhelle; the form refemLles a globe cut off in the middle.
Scalifellum. Shell compreffed, thirteen-valved, rather fmooth, and feated on a fcaly peduncle. Linn. Ellis. Scaly lepas, Donov. Brit. Shells.
A. molt curious and very elegant fpecies, refembling in fome meafure the following kind, but rather fmaller. Gmelin defcribes it as a native of the Norway feas, on the authority of a fpecimen met with by Dr. l'ontoppidan, the bifhop of North Bergen, and which is defcribed by Mr. J. Ellis in the Philofophical Tranfactions, A.D. 1\%58. He found it flicking on the Norway fea-fan, and, from the peculianty of its flructure, was induced to call it the Norway fes-fan penknife. "This very rare fhell is introduced into the Britifh Fauna, on the authority of an example found attached to fome fea-weeds, dredged up on the coalt of Weymouth, which, after paffing through the collections of the late duchefs of Portland and Dr. Fordyce, is at prefent in our poffeflion." Vide Brit. Shells.

Anatifera. Shell corppreffed, five-valved, fmooth, and feated on a pedicle. Lion. Concho anatifera, Merret. Balanus compreffus, flat centre Jkell, Grew. Barnacle, Gerard. Letpas analifera, anaiferous acurn Jhell, Donov. Brit. Shells.

Found in mont feas, and is ufually found affixed in cluftera to the bottoms of thips, and pieces of decayed timbers floating in the water. The colour whitiifh, with a fine polith beneath the thin epidermis, and tinged with reddifh or blueifh-violet; the ftems of the finell red.

The tentacula of thefe animals are long and pectinated like a feather, for which they were in fact miftaken in the fixteenth century ; and hence arofe the whimfical belief that the barnacle fhell was the farent of the barnacle goofe! Nor was this the vulgar opinion only: it was fanctioned by the grave details of leamed naturalifts of that time, and particularly by Gerard, whofe obfervations are generally noticed by authors, in defcribing this fingular marine production. See Barvacle Goofe. Sea alfo Gerard's Herbal, P. 158.

There are feveral fuppofed varieties of lepas anatifera, in one of which the peduncle is black.
Anserifera. Shell compreffed, five-valved, flriated, and feated on a peduncle. Gmel. Donov. Brit. Shells.
"A native of the American and Atlatitic feas, and is chiefly diftinguihed from lepas anatifera by having the valves ftriated with elevated lines; the valves in the former being perfectly frooth. Lepas anferifera has been heretofore confidered as a native of the American and Atlantic. feas; but that it inhabits likewife the Englifh coalt is certain, the fhell with the living animal having been dredged up at Weymouth." Brit. Shells.
Dilata. Shell compreffed, five-valved, and thin; dorfal valve dilated at the bafe with an acute angle, and feated on a peduncle. Donov. Brit. Shells. Lepas fafcicularis, Ellis Zoophytes. Lefas figillatum, Muf. Portl.?
The firft and only account we have of this kind of lepas, except that inferted in "Britifh Shells," is that given by the late Mr. Ellis, from whom we merely learn that it is from St. George's Channel. The fpecimen appears to have been fent by Mr. Ellis to the late duchefs of Portland, from whence it paffed through the hands of the late Dr. Fordyce, and at his death came into our poffeffion, under the title of lepas figillatum of Solander. Unlike lepas anatifera, or anferifera, (though it is larger than either,) the valves of this fhell are uncommonly thin and brittle, in a certain degree corneous, with the largef lateral valve rather crumpled in the ufuad courfe of the ftrix, and marked tranfverfely with 4 A
obsolcte
obfolete rays. The fhell is likewife covered with a fine pale brown fkin, or epidermis. 'The acute prominent dilation at the bafe of the valve on the back is very dingular. We muft be excufed for having expatiated with more than ufual minutdnefs on local particulars, in deferibing the laft-mentioned fpecies; as it is principally, and in fome inftances entirely, on the authority of the individual examples mentioned, that the fuecies are recorued, and their exiftence afcertained.

Avrita. Shell membranaceous, ventricofe, feated on a tube, eared; mouth cight-valved, and dentated. Seba, Qic. Lepas nuda comofa aurita, Ellis.

Inhabits the North feas. Tube long.
lsittacess Sholl falcated behind, fix-valved, and wrimkled. Molina.

Native of Chili. Length an inch; the larger valves refembling the bill of a parrot.

Minor. Shell reddifh, fix-valved, unequal; operculum pointed. Chemn.

An Indian fpecies. Shell marked with tranfverfe curved lines, dotted with white.

Verruca. Shell hemifpherical, ferrated, fix-valved; the four outer valves and the operculum plaited. Spengler. Native of the North feas.
Axgustata. Shell elongated, fmooth, fix-valved; the aperture narrow; operculum very minute. Chemn. Country unknown.
Poros. Shell granulated, ftriated, conic, and tubular ; the operculum obtufe. Schroet.

Inhabits India. When living, the thell is green, becoming black after death. A fuppofed variety of a larger fize, and broader in proportion, is defcribed by Klein under the name of balanus major latus.

Elongara. Shell cylindrical, fnowy, pellucid, fixvalved, and cleft above; lid obtufe, grooved, and tranfverfely ftriated. Chemn.

A fmall and very rare fpecies, found in the Iceland Seas.

Patellaris. Shell fix-valved; externally violet varie. gated with white, and marked with fine longitudinal Atrix; within falcated; valves denticulated at the margin. Spengler.

Native of Coromandel. A rare fpecies; tecth of the valves inferted in each other alternately.

Spinosa. Shell conic, with twelve triangular valves, fix of them more depreffed, lefs, and whitifh, with tranfverfe ftrix; fix purple, and longitudinally ftriated, and all armed with tubular recurved fpines. Gmel.

Inhabits India.
Violacea. Shell thick, glabrous, fix-valved, and white, with rays of violet. Chemn.

Native of India. The fhell flightly grooved within.
Pollicipes. Shell comprelfed, erect, many-valved, fmooth, and feated on a hort, hard, fcaly, coriaceous pe. duncle. Gmel.

Found in the Mediterranean. The four larger valves turned towards each other like the beak of a bird; leffer ones more than twenty.

Cylindrica. Cylindrical, Aightly curved, with a very larce oblique orifice; operculum homed. Gmel. Balanus naxillaris, Gronow. L.epas fefficis capenfis, E'c., Ellis.

Native of Africa under the torrid zone.
Crispata. Shell oval-truncated and conic, with fix blueifh valves thaded with white, and fix elevated reddifl ones fpinous and perpendicularly foriated. Schroet.

Country unknown.
Cariosa. Shell folid, white, depreffed with carious srooves; withim unequally fmooth. Pillas.

## L E P

Native of the feas about the Kurile ines.
Stramis. Conic-convex, with four ferrated ftriatect valves; operculum two-valved. Míll.

Inhabits the Danifl fea.
LEPASTRUM, cerived from the Greck $\lambda$ ertis, a fate Or plate, and asue, aflar, in Natural Hiflory, the name of a gensis of foffils, of the clafs of the felenite, compofed of filaments arranged into broad plates, and thofe difpofed in the form of a radiated flar.

Of this genus there are two known fpecies: the one a bright brownifhowhite lind, with thinner flakes; the other a white dull-looking kind, with thick flakes. They are both found on the fhores of Sheppey Ifland in Kent, and form themfelves in the cavities of the feptarix, called by authors ludus Helmontii ; and the feptarix, with thefe affixed to them, have been accounted a feparate fpecies of that body, and called the flarred waxed wein, or ludus Helmontii ftellatus.

LEPE, in Geograpby, a town of Spain, in the previace of Seville, celebrated for its grapes, figs, and wine; 10 miles E. of Ayamonte.

LEPECHINIA, in Botany, was named by Profeflor Willdenow, in his Hortus Berolinenfis, as a tribute of refpect to the labours of John Lepechin, Fellow of the A cademy of Sciences at St. Peterfburg, who publifhed various*tracts upon natural hiftory in the Tranfactions of that Society. Many of thefe were botanical monographs; fuch as, I. A defcription of Iris Güldenfledtiana. 2. Nowa fpecies Montha deforipla. 3. Quatuor Frucorum fpecies defcripta. 4. Refections on the ineceffity of ttudying the virtues of indigenous plants. He appears to have been an able chemift as well as naturalift, and to have travelled through various provinces of the Ruffian empire in the years 1768 and 1769 . We are unable to difcover either the time of his birth or of his death, though from the date of his Travels he muit have lived about the middle of the laft century, Willd. Hort. Be: rol. 21. Ait. Hort. Kew. ed. 2. v. 3. 390.-Clafs and order, 'Didynamia Gymnofpermia. Nat. Ord. Verticillate, Linn. Labiatr, Juff.

Eff. Ch. Calyx two-lipped. Upper lip of the corolla cloven, lower one deeply divided into three nearly equal: fegments. Stamens fpreading.
I. L. Spicata. Ait. Hort. Kew. ed, 2. v. 3. 390."Spikes of flowers on bracteated footitalks. Leaves ovate, crenate, truncated at the bafe." - The native country: of this hardy, peremial plant is manown. The fpecies in queftion was introduced into the Royal Gardens at Kew in; the year ISoo, by Mr. John Hunneman, who received it: from his friend Willdenow in Germany. By the above frecific character we prefume there are other fpecies.

LEPEIGA, in Geograply, a town of Hindouftan, in: the circar of Gangfour; 30 miles S.S.W. of Gangpour.

LEPEL, a town of Rufian Lithuania; 55 nilies S.E. of Polotfk.

LEPERS. See Elepifanthasis and Lephosy.
Lepers, I/le of, in Geography, one of the New Hebrides, fituated between Efpirito Santo and Aurora illand, eight leagues from the former, and three from the latter, in S. Jat. $15^{\circ} 22^{\prime}$, and netarly under the fame meridian as the fouth-eaft end of Mallicollo. It is of an egg.like figure, very high, and is or 20 leagues in circuit. In the north-ealt part there is anchorage half a mile from the land. It derived its namefrom Bougainville, who vifited it in 3768 , and found the inhabitants in general devoured with the leprofy. He deferibes the inhabitants as being of two colours, black and mulato. Their lips are thick, their hair frizzleds and that of lome is a kind of yellow wool: they are fmall, ugly, and

## L E P

ill made. Few women were feen, but they were no lefs difgufting than the men. They were naked, hardly covering their wailts with a mat. They carry their children on their backs in a kind of fearf; they wear ornaments in their noftrils; and have no beads.

LEPIDIUN, in Botaty, is the $A$ Eseson of Theophraftus and other ancient writers, and is faid by Profeffor Martyn to be derived from $\lambda$ atrb; a fcale, no doubt from the fealy appearance of its pods after their feed is difcharged, but that is fo ufual a circumflance with plants of this tribe, that we are rather inclined with Ambrofinus to conlider the word Lepidium as derived from $\lambda s=i \delta^{2}=4$, to be bot, or punzent, becaufe other plants which have agreed with this genus in its quality of pungency, but in no other way whatever, have been ditinsuifhed by the fame appellation, and hence its Englifh name, Pepper-wort. Linn. Gen. 333. Schreb. $43 \%$ Wild. Sp. Pl. \&. 3. 43 I . Mart. Mill. Dict. v. 3. Sm. Fj. Brit. 68 It Ait. Hort. Kew. v. 2. 373. Juff. 241. Lamarck. Illuttr. t. j56. Gærtn. t. 141. Cournef. t. 103. (Natturtium; Tournef. t. IO2.)-Clafs and order, Tetradynamia Siliculofa. Nat. Ord. Siliquofi, Limn. Crucifcra; Juff.

Gen. Ch. Cal. Perianth of four, ovate, concave, deciduous leaves. Cor. cruciform, of four equal obovate petals, twice as long as the calyx, with narrow claws. Stam. Filaments moltly fix, awl-fhaped, the length of the calyx, the two thorter ones oppofite; anthers fimple. Pij2. Germen fuperior, cordate; ftyle fimple, as long as the ftamens; Itigma obtufe. Peric. Pouch heart-fhaped, emarginate, compreffed, acute at the margin, two-celled; valves boatfhaped, keeled; partition contrary, lanceolate. Seeds few, ovate, pointed, narrower at the bafe, pendulons

Eff. Ch. Pouch notched, elliptical, with few feeds; valves keeled, contrary to the partition.

Obf. It is in fome cafes difficult to draw the line between the pouch of this and Thlafpi, even Gærtner confiders them as of the fame figure. He would retain in Lepidium, which he wifhes to call Nafurtium, thofe which have folitary feeds, ceferring the others to Thlafpi. The regular corolla diftinguifhes this genus from Iberis, with which it is otherwife molt clofely allied. The number of ftamens is few, in fome Epecies is fewer than fix.

The fpecies of Lepidium, in the fourteenth edition of Linnæus's Syltema Vegetabilium, are twenty; Willdenow has twenty-nine. Of thefe $\mathcal{L}$. didymum belongs to the genus Coronopus, Fl. Brit. Three of the remainder are natives of England.
L. petreum. Mountain Pepper-wort. Linn. Sp. Pl. 899. Engl. Bot. t. III. Jacq. Auftr.t. I3I.-Leaves pinnated, entire. Petals not longer than the calyx, flightly notched. Th'tis rare Linglith plant is found on St. Vincent's rocks near Irriltol Hot-wells, which has been its habitat ever fince the time of Ray. It is occafionally found in other places that are open and expofed, in the fouth of England, flowering in the carly fpring. Root biennial, fibrous. Stems two or three inches ligh, fpreading, leafy, fomewhat downy. Leaves alternate, unequally pinnatifid, of many pairs of finooth oppofite fegments, which are elliptical or fpatulate, entire. Ciorgmbs of many fmall, white, hexandrous flowers. Poucb elliptic-oblong, compreffed, linooth. Sceds roundifh, two in each cell.
L. latifolium. Broad-leaved Pepper-wort. Linn. Sp. Pl. 8 g9. Engl. Bot. t. IS2,-Leaves ovato-lanceolate, undivided, ferrated.-This is alfo a fcarce plant, found in moift faltith marfhes, and on maritime cliffs, as at Sheringham, by Cromer, in Norfolk, fowering in July.-Roo perennial,

## L E P

branched, very long. Stents three feet ligh, ereet, leafys round, fmooth, paniched, many-flowered. Leares alternate, lanceolate or fomewhat ovate, attenuated at the bafe, ferrated more particularly in the middle. Flowers hexandrous, fmall, white. Potch elliptical, with a reliile figma. The whole plant is biting and difagrecable. An infulion of it is faid by Dr. Withering to be emetic.
L. ruderale, Narrow-leaved Pepper-wort. Linn. Sp. P1. goo. Engl. Bot. t. 1595.-Flower, with two flamen:, without petals. Lower leaves pinnatiid, toothed; upper ones linear, cutire. - A native of muddy and calcarcous foils, which it prefers to fand, in the neighbourhood of the fea. It keeps flowering from June to Augult. Root biennial, branched. Stem a foot high, erect, branched, leafy, wavy, round, hoary. Leaves flefhy, fmonth. IFluzurs fmall, apetalous, diandrous; the clulters when in fruit becoming very long. Pouch elliptic or roundifh, emarginate, finooth. Sceds generally folitary, pendulous, obovate. Dr. Smith mentions in his Flora that he never found any petals to this fpecies, nor more than two ftamens, though Withering defcribes the petals as "fometimes wanting," and that the ftamens are either two or four.

As to the foreign fpecies, we flall fay a few words upon fuch as are more efpecially interelting.
L. perfoliatum. Various-leaved Pepper-wort. Linn. Sp. Pl. 897. Jacq. Auftr. t. 346-Lower leaves mech divided in a pinnate manner; upper ones heart-haped, embracing the ftem, entire.-A native of Auttria and the Levant. It flowers in July. Root annual. Stem a foot high, fmooth, tinged with purple, dividing into various flender branches, at the end of which are corymbs of fmall and compreffed flowers in long loofe fpikes. Ca!yx-lcaves yellowifh-greer. Pouches orbicular, fmooth, having a lingle, bay-coloured feed in each cell.
L. vffriarium. Bladdery Pepper-wort. Linn. Sp. Pl. 898. (L. orientale; Tourn. Cor. 15. Buxb. cent. v. 1. 17. t. 26.) -Leaves pinnate; fegments linear. Stems inflated at their joints. - A native of Iberia, and the dry plains of Media, where, according to Buxbaum, it flowers in July and Augult. Dr. Smith has perhaps the only fpecimen of this fpecies to be feen in this country, which was given bim by the celebrated M. Le Monnier from his garden at Vers failles in the year 1786. Stem two or three feet high, remarkably inflated at the joints. Leaves pinnate, with long, narrow leaflets. Flowers fmall, white. Poucls very fimilar to that of $L$. ruderale.
L. alpinum. Alpine Pepper-wort. Linn. Sp. Pl. ŞS. Jacq. Fl. Auftr. t. 137.-Leaves pinnate, entire, fmooth. Flower-ftalk naked, afcending. Petals larger than the calyx. Pouches lanccolate, pointed.-A native of the German, Swifs, and Italian Alps, where it may be feen in flower from May to Augult. This pretty little perennial has a Alender root. Stems very fhort, clothed with alternate leaves. Flower-fialks an inch or two in length, bearing a corymbofe clufter. Leaves thick, dark.green. Florvers milk-white; their petals roundifh and entire. Poucb ovate or lanceolate, compreffed, with the ityle at the end. The whole plant is fmooth, and has the flavour of Crefs
L. Julivum. Garden or Common Crels. Linn. Sp. Pl. 899. (Nalturtium hortenfe; Dod. Pempt. 7II.) Flowers tetradynamous. Leaves oblong, much cut and jagged.-The habitat of this plant fo commonly cultivated was unknown, till. Dr. Sibthorp difcovered it in Greece. Root annual, white, fpindle-fhaped. Sten upright, fmonth, from one to two feet in height, branched at the top. Stems and branches terminated by a fpike of flowers. Louzr
$4 \mathrm{~A}_{2}$ leafirt

## LEP

Aaffels mich refembling thofe of Parfley; uppor ones linear, or lanceqate. Flowers fmall, white. Calyx very fmall, greenilh. Pouch roundifh; valves wiaged. Seeds brown, folitary, tafting like Muftard. This is undoubtedly the K $c_{i} \delta \times \mu 0 ;$ of Diofcorides, and is in univerfal requett for falads in the winter and fpring. There are two varicties frequently to be met with, one of them having broad, the other curled leaves. It is faid to act as a diuretic and antifcorbutic when taken largely.
L. olvaccum. Notch-leaved Pepper-wort. Willd. n. 16. Forlt. Efcul. 69. (L. bidentatum; Montin in Nov, Act. Nat. Cur. 6. 324. t. 5. a.) -Leaves elliptic-oblong, acute, ferrated. Flowers tetrandrous. A native of the fandy thores of New Zealand. Root perennial. Stem herbaceous, from one to three feet in height. Leaves fcattered, alternate; the upper ones finaller, ferrated only at the tip. Flowers white. Poucles ovate, or heart-fhaped, compreffed, containing an ovate, acute, reddifh-gellow feed in each cell. Forlter fays that this plant, together with Apium or Smallage, and Tetragonia balimifolia, was of confiderable fervice to the fhip's crews under Captain Cook, when they lay in Charlotte Sound.
L. virginicum, a native of the Caribbee Iflands, is eaten by the natives in falads, like our Garden Crefs.
L. pifcidium, found in the South Sea iflands, is made ufe of by the inhabitants for catching fill by incbriating them. It refembles $L$. oleraceum, and is efculent like that fpecies.

Lepidiust, in Gurdening, comprifes a plant of the herbaceous annual kind, of which the fpecies cultivated is the garden or common crefs (L. fativum). But there are other fpecies which may be cultivated for variety.

It has feveral varieties, as with broad leaves, with' curled leaves, and the common fort with the leaves multifid.

Methood of Culture. - Thefe herbaceous plants are raifed by fowing the feed as wanted for ufe, at different times of the year, as once a week or fortuight, where a conitant fucceffion of fmall herbs in their young growth is wanted for falads, when only a fees days or a week or two old; or, where a conflant fupply of thofe fmall herbs is required in their young feedling growth, fome feed, as jult noticed, fhould be fown in fucceffion every week or fortnight at furthelt, all fpring, fummer, and autumn; and once a fortnight in the winter feafon.

The order of fowing them in the different feafons is, in a warm fouth border, or other fimilar lituation, or under a frame, \&cc. in the early fpring months; and as the warm feafon advances, in any open compartment, all in as light earth as the garden affords; but in fummer, or hot dry weather, in fomewhat fhady borders, or in a free fituation, fhaded with mats from the feorching fun, and daily watered; and in winter, in the warmeft lituation, or in fhallow frames defended with lights, and under hand-glaffes; but in frofly or other very cold weather, in that feafon, on moderate hot-beds; and hot-bed fowings are alfo requifite during the colder part of the fpring, or at any time in cold feafons, where a fupply of thefe and other fmall falad herbs are required to be raifed as quickly as pofible. The method of fowing the feed, in all the cafes, is very thick, as the plants are moftly ufed in finall young growth, and generally in frnall, flat, fhallow drills, about three inches afunder, fo thick as almolt to cover the earth, being lightly earthed over a quarter of an inch thick, or lefs; or on the plain furface, firft raking it fmooth, then fowing the feed thick as above, fmoothing it down with the back of the fpade, and either with the fpade fpreading fome fine earth lightly over it as thinly as polible, or covering it by fifting carth over it
evenly a fmall depth, juft to cover all the feed properly. This fort of falad herb thould always be cultivated fo as to grow as rapidly as poffible, being cut while perfectly young, and in a crifp ftate. See Small Salad Herps.

LEPIDOCARPODENDRON, in Botany, from $\lambda \varepsilon \pi t \%$,
 given by Boerhaave in his Hort. Lugd. Bat. ed. 2. v. 2. 183, to the Protec with hemilpherical heads of flowers, confricuous for the ample and beautiful fcales of their calyx, of which Linnæns compofed his genus Leucadendron, in Gen. $\mathrm{Pl},+6$, but which he fubfequently united to Protea. See Levcadendron.
 Eivos, form, figure, or Lepidoeides, in Anatomy, a name of the fquamous or fcaly future of the cranium.

LEPIDOLITE, Wern., Jam. Lepidolihh, Haiiy. Lilalite of fome other mineralogitts.

The colour of this mineral is generally pale peach-bloffom red, or rofe red, with an admixture of grey; but it alfo occurs of a pale violet and light cochineal red; fometimes the greyifh-red variety paffes into blueifh and greenifh; and a variety has been oblerved, in which the green approaches fikin green.

Occurs only maffive; but its fragments are faid fometimes to thew a tendency to adopting a prifmatic form.

Its internal luftre is gliftening, paffing into fhining : it appears fometimes between refmous and vitreous.

Fracture unceven, prefenting fine-grained and fcaly diftinct concretions; fragments generally indeterminately angular, with pretty fharp edges, which are faintly tranflucent.

It is moderately hard, paffing into foft; brittle; though not eafily frangible.
Specific gravity, 2,8jヶ, Haüy ; 2,816, Klapzoth; 2,35c, Gerhard.

Before the blowpipe the lepidolite, after a flight degree of intumefcence, melts. into a milk-white femi-tranfparent pearl. With borax it fufes more readily into a tranfparent colourlefs pearl.

Klaproth was the firt who analy fed this mineral. Among the refults of his analyfis was a deficiency of $6 \frac{\pi}{2}$ per cent., which a fubfequent chemical examination, (made by the fame chemift, with a view to afcertain the prefence of potafh, which he had a fhort time before difcovered in the leucite) proved to be occafioned by the lofs of the fame alkali, till then unfufpected to enter the compofition of mineral fubftances. Vauquelin afterwards found the fame alkali, but in far greater proportion.

| Silica | 54.50 | 54.0 |

|  | 100 | 100 |

Klaproth Beitr. ij. Vauquelin J. d. M. N ${ }^{\circ}$ sI.
The fluate of lime, in Vauquelin's analyfis, is probably owing to particles of fluor fpar that were adhering to the fpecimen examined by that chemift.
Lepidolite is found (exclufively, as it is fuppofed) on mount Radifco, near Rozena in Moravia, in a kind of gneifs, which is faid to pals into granite on one fide, and into mica flate on the other. The accompanying minerals,

## 1.E P

with which it is alfo mixed, are quartz, feldfpar, fluor fpar, fhorl-beryl, apatite, and common florl.

Fichtel makes mention of a mafs mixed of brownifh-violet grains of quartz, whitifh fhining feldfpar, and light and dark coloured lepidolite, which, (if the laft-mentioned fubftance be confidered as a fubltitute for mica, with which it is indeed nearly allied, conflitutes a particular kind of granite hitherto uanoticed.
Beyer has defcribed a variety of Iepidolite from Sudermanland, in Sweden ; but fome writers have doubted this to be real lepidolite.
The lepidulite was, by its difcoverers and other mineralogits, referred to zeolite: it had alfo been miltaken for a variety of foliated gypfum. Klaproth, who determined its real nature, fubitituted for the tatelefs name of Filalite, that of lepitlolite, derived from its fcaly ftructure.

What has been defcribed as cryftallized lepidolite, is the red variety of horl-beryl, or picnite, which is likewife found at Rozena in Moravia, in a quartzy matrix.

LEPIDOPTERA, from $\lambda_{\text {Eat }}$, $a$ facale, and wifpov, wing, in the Linnaan Syfem, an order of infects, with four wings, imbricated with Icales: in the mouth is contained a fpiral toague, and the body is hairy. This order comprehends three genera, viz the papilio or butterfly, the fphinx, and the phalzen or moth; and each genus includes a number of Species.

LEPIDOSARCOMA, from $\lambda_{\varepsilon \pi!}!$, a foale, and $\sigma x_{p} \xi$, $f_{e} / \sqrt{6}$. Severinus, a furgical author, implies by this term a farcomatous and fcaly tumour in the mouth.

LEPIDOSPERMA, in Botany, fo called by Labillardiere, from $\lambda \in \pi t s, \lambda: \pi \Delta b o s$, a fcale, and $\sigma \pi \varepsilon q \mu \alpha$, the feet, becaufe of the fix permanent fcales which inveft the bafe of that part. Labillard. Nov. Holl. v. I. 14. t. II-17. Brown. Prodr. Nov. Holl. v. I. 233.-Clafs and order, Triandria Monogynia. Nat. Ord. Calamaria, Limn. Cyperoidea, Juff. Cyperacee, Brown.

Gen. Ch. Cal. Spikelet imbricated every way, of one or two flowers, and one feed; fcales feveral, ovate, concave, acute, for the moit part empty. Cor. none, except we fo call the fix flat, membranous, thickifh fcales, united at their bafe, which inveft the bottom of the germen. Stam. Filaments three, capillary, projecting; anthers terminal, oblong, acute, pendulous. Pif. Germen fuperior, very fmall; ftyle cylindrical, erect, as long as the ttamens, deciduous; ttigmas three, equal, recurved, Ilender, downy, acute. Peric. none. Nut roundifh, obtufe, hard, not burting, accompanied by the above-mentioned fix fcales, of one cell, with a fingle roundifh kernel.

Eff. Ch. Spikelet of one or two flowers, and one feed. Gtumes chaffy, imbricated every way, molt of them barren. Six* flat combined permanent fcales at the bafe of the germen. Style deciduous. Nut folitary, bald, obtufe.

This genus is allied to the Cladium of Browne's Jamaica, (confounded with Schoenus by Linnæus), but is diftinguifhed by the fix fcales that accompany the germen. From the Scleria of Bergius it differs in the number of its glumes, and in having always androgynous fpikelets, of which the upper flower is oaly male. Labillardiere defcribes and figures feven fecies; Mr. Brown defines 19, all from the colder parts of New Holland, or from Van Diemen's land. 'They are harfh rigid rufhy plants, one or two feet high, with ftrong perennial roots, fimple leaflefs fems, encompaffed at the bottom with feveral long, narrow, moftly equitant, leaves, which are more or lefs compreffed and acute, their edges either fmooth or minutely ferrated. The panicle or frike is terminal, mofly branched or divided.

Examples of this genus are

## L E P

L. gladiuta. Labill. Nov. Holl. v. 1. 15. 1. 12.-P. ${ }_{2}=$ nicle denfe, repeatedly compound. Stem comprefied with an clevated rib at each fide; its edges fmooth, like thofe of the leaves. Glumes rather fharp.-Gathered by Mr. Brown at Port Jackfon, as well as in Van Diemen's land, and the fouth part of New Holland. The flem is fout and rigid, from eighteen to twenty-four inches high. Leaves half an inch broad, fmooth. Panicle upright, large, of numerous acute, oblong, fcaly fpikelets.
L. tetragona. Labill. Nov. Holl. v. 1. 1\%. t. 17. Panicle denfe, fomewhat compound. Leaves quadrangular. Stem bluntly angular--Gathered by the author cited, in Van Diemen's land. The fquare leaves are very remarkable. It is a much fmaller plant than the foregoing. The feales of each sipikelet are from four to fix only. The nut is clevated on a more confpicuous fpongy bafe than in moft of the other fpecies.

Nothing can give a more unfavourable idea of the fertility, comfort, or beauty of a country, than the prevalence of fuch plants as thefe; fight examples of which may be feen in our Schoenus nigricans, Nardus frifa, and a few others, found on the molt dreary and barren inland fands. Such of them as inhabit the fea-fhore, anfwer the moit valuable purpofe poffible, in forming a natural barricr againtt the encroachments of the ocean. See Elyancs.

LEPIDOTES, in Natural Hijfory, the name of a fone bearing a refemblance to the fcales of fifhes. The word has been ufed by fome, as the name of thofe ftones which are compofed of fmall flakes, or fcales of talc, and by others to exprefs the flones containing fifh, or the impreflions of fifh, found in many parts of Germany.

LEPIDUS, M. Emilius, in Biograpby, a Roman triumvir, was defcended from one of the molt illuftrious families in Rome, and rofe to the higheft employments of the ftate. On the death of Cxfar, Lepidus, who was zealoully attached to his interefts, thought it prudent to conceal himfelf. He afterwards joined Antony in driving away the confpirators, and obtained the dignity of chief pontiff, through the influence of that leader. Afterwards, when Antony was treated as a public enemy, Lepidus commanded an army of feven legions in Tranfalpine Gaul. Here Antony arrived in a very diftreffed fituation, and conjured his friend to join his forces to thofe which he commanded. Lepidus refufed, but affured him he would not act with hoftility againft him. Antony knowing in what eftimation he was held by the army, rufhed into the camp of Lepidus, where he was faluted with the loudeft acclamations. Lepidus was now, in his turn, glad to fupplicate the aid of his competitor. Antony treated him with apparent refpect, left him the nominal command, while he himfelf exercifed all the real authority. By this conduct, Lepidus loft the confidence of the fenate; and in a fhozt time he was declared a public enemy, and Octavianus and Decimus Brutus were fent out'againit him and Antony. In dividing the Roman world between three mafters, Lepidus was allowed a place, principally by way of a connecting medium between the other two. He poffeffed a confiderable family-interelt, and was not dellitute of military abilities; but he had neither capacity nor temper to take a leading part in political concerns. In the formation of the triumvirate, it was agreed, that while Antony and Otavianus fhould carry on war againtt Brutus and Caffius, Lepidus fhould remain at Rome with four legions, and maintain their authority in the capital. At the bloody profcription, and while the butchery was ftile raging, Lepidus had the unfeeling vanity to infult the public diitrefs by a triumph, on account of fome inconfiderable victories formerly-obtained by him over the revolted Spaniardsa

## I. E P

Spaniardo. He was conful a fecond time, B. C. $4^{2}$, with Manutius Plancus. The part of the empire which was allotted to Lepidus, after the Triumvibate (which fee) was fully eltablifhed, was Africa. In the war with Sextus Pompey, Lepidus brought a large force to Sicily, with which he joined Octavianus; and he fhared in the victory obtained againft that great gencral. The conlidence he felt at being at the head of a large army, induced him to treat his colleague with haughtinefs and neglect; but he had foon the mortification to fee himfelf deferted by all his troops, who joined Octavianus. He now fupplicated his life of his rival, which being granted him, he retired into a kind of exile at Circeii, a fmall town in Latium, where he paffed the remainder of his days in obfcurity. Plutarch. Univer. Hitt.

## Lepine, Francesca Margarita di. See Mar-

 garita.LEPIOTA, in Botany, from $\lambda$ 2mts, a thin membranous lajer, or cuticle, the, firlf fection of the great genus Agaricus in Perioun's Synopfis Methodica Fungorum; the characker of which is to have the gills dry and membranous, as the name expreftes, not clouded nor footy, and the ftalk encompaffed with a ring. It includes twenty-nine fpecies, of which Agraricus procerus is the firft and molt remarkable.

LEPISMA, in Entomology, a genus of aptera. Gmelin, after the Linnæan manner, defines it as having four feelers, two of which are fetaceous, and two capitated; the lip membranaceous, roundifh, and emarginated; antennæ fetaceous; body imbricated with fcales; tail ending in fetaceous brittles; legs fix, and formed for rumning. The character of lepifmx, as thus expreffed, combines the more effential character of Fabricius with that of Lineæus. Lamarck and others propofe fome further alteration; and, laftly, Latreille, in whofe arrangement they form the firtt family (lepifmenx) of the order thyfanoura, divides them into two diftinct genera: lepifma and machilis. The true lepifma, according to the nesv definition, has the antennx inferted between the eyes, the body flat, and the tail ending in three equal brittles. This genus walks and runs. In the genus machilis, (which moves by fkipping,) the antennx are feated under the eyes, the body convex, and the middle brifte of the tail larger than thole at the fides. The three firlt fpecies are defcribed by Linnaus; the other by Fabricius, and by Müller the author of Zool. Dan. All the fpecies, except the firlt, are natives of Europe. In their various flates of growth they prey on decayed wood, and moit or sotten fubbtances; and are moft commonly found in damp cellars, neglected water-courfes, lead gutters, and fimilar fituations. The larvæ, like the pupa and perfect ftate, are furnifhed with fix feet, and are remarkable for their activity and fwiitnefs.

## Species.

Saccrarincus. Scaly, filvery; tail triplc. Fabr. Leo pijma vulgaris, Scop. Forbicina, Aldrov. Forbicina plana, Geoffr. Lepisina faccharinum, Donov, Brit. Inf.

Originally a native of America, from whence it has been introduced and naturalized in Europe. The body is oblong and tapering; autennæ as long as the body ; tail terminating in three britles, and two pair of fmaller ones beneath. It fecretes itfelf among old furniture, and runs, when difturbed, with great agility: is often found among fugar.

Polyroda. Skipping; tail triple; fegments of the abdomen villous each fide beneath. Fabr. Lepifina foutata, - auda triplici, Linn. Donov. Brit. Inf.

Inhabits among ftones and rubbith on fandy fea-fhores, and poffefes the faculty of leaping to a prodigious height,
by means of the fprings under the tail ; antennx as long as the body.
Ternestris. Naked: tail triple. Linn. Fn. Suec. Gmelin mentions the clofe affinity this indiftinet fpecies bears to the podura tribe, to which it may perhaps belong. It is entirely white and cylindrical, with obtufe anterne half the length of the antenne.
Lineata. 'Tail triple; body brown, with two white fillets. Fabr.
Inhabits nld walls in Helvetia. Antenne as long as the body, which latter is brown above, wihh cinereous fpecks; legs fluort ; thighs corapreffed.
$V_{1 L L o s a ̀ ~ B r o w n, ~ w i t h ~ a ~ t r i p l e ~ v i l l o u s ~ t a i l . ~ F a b r . ~}^{\text {Br }}$
Native of China. The head villous-whitifh; body beneath whitifh; middle fpine of the tail longer; legs flart and white.

Collaris. Black, with a fnowy band on the neck and end of the abdomen; tail triple and villous. Fabr.

An inhabitant of the South American illands. Antennre as long as the body, and brown, with the bafe pale; head whitifh; beneath the tail two fhort briftles; legs pale.
Porypus. Scutate; tail triple. Müll.
Native of Denmark.
Minutus. Yellow; tail of three briftles. Müll.
Inhabits fame country as the latter. Appendages of the tail fometimes wanting.

LEPITA, in Hindoo Mythology, a name of Sarafwati, fpoufe of Brahma, and goddefs of literature, harmony, rhetoric, and the fine arts. See Saraswati.

LEPIUM, one of Hill's names for a variety of gypfum.

LEPOIS, Nicholas, in Biography, a phyfician of celebrity in the fixteenth century, was born at Nancy, in 1527. He fludied medicine at Paris under Sylvius, together with his elder brother, Anthony Lepois, who was afterwards firtt phylician to Charles III. duke of Lorraine. In this office Nicholas fucceeded his brother in 1578 . He fpent his whole time in fick-chambers, or in his clofet, perufing the ancient authors from Hippocrates downwards. He drew. up the refult of his reading, corrected and corroborated by his perfonal obfervation, in an aphoriftic form, chiefly withthe view of being ferviceable to his fons, Chrittian and Charles, whom he deltined for the medical profeffion; but his friend the celebrated Foelius, and feveral other perfons, having feen his MS. prevailed upon him to publifh it. It was firit printed at Franckfort, in 15 SO , in folio, under the title of "De cognofcendis et curandis pæcipuć internis humani corporis morbis, Libri tres, ex clariffimorum medicorum, tum veterum, tum recentiorum, monumentis non ita pridem collecti." Boerhaave had fo high an opinion of this author, that he edited this work, adding a preface to iot, at Leyden, 1736, in two volumes 4 to. Eloy Diet.

Lepois, Charles, more generally known by his Latin name, Carolus Pifo, was fon of the preceding, and born at Nancy in 1563. He was fent at the age of thirteen to the college of Navarre, at Paris, where he remained five years, and diltinguifhed himfelf by his rapid advancement in the knowledge of the languages, belles lettres, and philofophy. He received the degree of Matter of Arts in the univerlity of Paris in 15 Sx , and immediately commenced his career in the fchools of medicine. After four years, fpent in the faculty at Paris, he went to Padua in 1585 , and vifited the other fchools and the learned men of Italy before he quitted that country. He returned to Paris in the beginning of 1588 , and took his bachelor's degree in medicine, and two years afterwards became a licentiate; but he left Paris without having taken the degree of doctor, from ina-
bility to defray the expences of that ceremony, in confequence of the finall income left him by his father. He therefore returned to his native city, where duke Charles III. of Lorraine appointed him his confulting phyfician, and retained him near his perfon both at home and in his travels. Duke Henry II. likewife held him in the fame ellimation ; and, among many other marks of his efteem for Lepois, he inflituted a faculty of medicine at Pont-i-Mouffon, and nominated him dean and firtt profeffor. In order to undertake thefe offices, he repaired to Paris, where he received the degree of M.D., which gave him the power of conferring the fame degree upon others, and commenced the duties of his profefforthip in November 1598. He had now an opportunity of difplaying the itores of knowledge, which his acquaintance with the Greek and Latin, Arabic, Hebrew, Italian, and Spanifh languages had enabled him to obtain; he was indefatigable in his obfervation of difeafes, and omitited no opportuinty of examining by diffection the bodies of thofe who died; from which he juflly anticipated the moft important improvements would accrue to medicine. His repatation was clevated to the higheft degree, fo that he was the plyfician of all the honourable perfons in Lorraine. His zcal in the pratice of his profeffion continued unabated, and ultimately occafioned his death at the age of Seventy; for he died of the plague at Nancy, whither he had gone to adminifter relief to thofe afflited by the peltilence, in the year 1633. He left the following works, which have tranfmitted his reputation to pofterity ; particularly the firt, entitled "Selectiorrm Obfervationum et Confliorum de preteritis hactenus morbis, effectibufque proter naturam ab aquâ, feu fcrofâ colluvie et deluvie ortis, Liber fingularis," Pont-a.Mouflon, 1618, in 4 to. This work paffed through feveral fubfequent editions, one of which, (that of Leyden I 733 , was publifhed, with a preface, by the celebrated Boerhaave. A felection from, or an abridgment of it was alfo printed in 1639 , with the title of "Pifo esucleatus," in 12 mo . His other works were, "Phyficum Cometr Speculum," Ponte at Moationem, 1619, in 8 vo.; and "Difcours de la Nature, Caufes, et Remiedes, tant curatifs que prefervatifs, des Maladies populaires, accompagnées de Dyfenterie et autres Flux de Ventre," ibid. 1623 , in 12 mo . He tranflated from the Spanifh into Latin, "Ludovici Mrercati Inltitutiones ad ufum et examen corum qui artem luxatoriam exerceat," Franckfort, 1625 , in folio. He likewife publifhed the following eulogy of his firft patron, "Caroli III., Serenifimi, Potentiffimique Ducis Lotharingiz, \&c., Macarifmos, feu felicitatis et virtutum egregio Principe dignarum coronæ,'" 1690. Eloy Dict. Hitt. de la Med.

LEPOMERO, in Geography, a town of New Mexico, in the province of Hiagui; 130 miles E.N.E. of Riochico.

LEPORARIA AQuila, a name given by fome authors to the melanaëtos, or black eagle, from his deftroying great numbers of hares. See Falco melaronotus.

Leporinum Labium, in Surgery. See Harlelip.
Leporinca Rofrum, a term fometimes applied to the portion of flefh frequently obfervable between the margins of the fiffure in cafes of hare-lip. See Hare-ile.

Leponnuma Genus, in Zoology, the name of a genus of animals, fo called from their general refemblance to the hare in fhape, and other particulars: the charagters by which they are diftinguifhed from other quadrupeds are the fe; they have feet divided into claws; they feed on vegetables; and they have two very long teeth in the fure-part of their mouths.. Ray's Syn. Quad. P. 204.

LEPORINUS Oculus, ia Surgery. See LagomiTHALMAA.

## L E P

LEPOTI, in Geography, a town of the principality of Georgia, in the province of Kaket; 22 miles S.E. of Kaket.
LEPPOWIRTA, a town of Sweden, in the government of Kuopio; 24 miles S. of Kuopin。

LEPRA, $\lambda$ : facte; whence our Enslinh term J.cpurfy ; which fee.

Lepri Lankeng, in Gcografls, a town of Thibet; 68 miles S.E. of Toudfong.

LEPRAS, in Ichelsyology, the name of a fea-filh of the turdus, or wraffe kind, remarkable for the great variety and beauty of its colouring. It is feldom caught of more than five or fix inches in length, and is confiderably broad and flat. It fometimes grows to a foot lung, but that only in the ocean, never in the Mediterrancan fea, where it is ufually caught; and even there very rarely. It is fpotted all over like the body of a leopard. It is one of the moot beautiful fifh of the Mediterranean, but is not much ettecmed at table, being of an infipid and watery talle.

Leprevin, Leprlos, or Iepriam, in Ancient Gcorra*phy, a town of Triphylia, near the confluence of the rivers Jardanus and Alcidon, N.W. of Chaa. It is faid to have been founded by a perfon of the name of Leproos, a famous wreitler, who contended with Hercules, by whom hee was vanquifhed and killed. In the time of Paufanias, the inhabitants of Lepreum affumed the appellation of Arcadians. In this town was a temple of Ceres, conftructed of bricks, and near it was the fountain called Aréné.
LEPRIA, an ifland on the coalt of Ionia, mentioned by Pliny.

Leproso Amovendo, in Lawy, an ancient writ that lay to remove a leper, or lazar, who thrult himfelf into the company of his neighbours in any parifh, either in the church or at other public meetings, to their annoyance. The writ lies againft thofe lepers that appear outwardly to be fuch, by fores on their bodies, fmell, \&cc. and not againlt others : and if a man be a leper, and keep within his houfe, fo as not to converfe with his neighbours, he fhall not be removed.

LEPROSY, in MIedicine, a denomination which has been given to a variety of chronic difeafes, chiefly affecting the kin; but which has not been exclulively appropriated to thofe that are characterized by the formation of fcales, as the origin of the term imports. Even the Greek. writers. themfelves, and more efpecially the later ones, have not adhered uniformly to the proper import of the appellation; but the confufion which has prevailed in fubfequent periods of medical hiltory, in regard to the application of this term, almolt bids defiance to the induffry and difcrimination of the inquircr. This is partly to be afcribed to the difficulty of conveying accurate notions of cutaneous appearances by verbal defcriptions, partly to the extreme varie! y in which thofe appearances prefent themfelves, and partly to the neglect of minute obfervation, where diftinctions can only be detected by a careful and practifed eyc.. Thus the latter Greek phyficians applied the term lepra in a more extended fenfe than their predeceffors, and rendered future difcrimination more difficult. But this difficulty was exceedingly multiplied by the tranflators of the works of the Arabian phyficians into Latin, after the revival of learning. The Ara-1 bians appear to have diflinguifhed the lepra and elephantiafis of the Greeks, by appropriate terms in their own language : but the tranflators rendered the word which denoted the latter (viz. juxam, and baras or albaras) by the Greek term lepra; and the Arabic words (albohak and alkouba) which feem to have fignified the fame with the lepra, a!phos, and pfora of the Greeks, they tranated by the terms impetigo and

## LEPROSY.

morphaer refpectively. (See Willan on Cutan. Difeafes, 2 dedit. p. 112.117. and 126.) This produced the double confufion of applying the fame appellation to a variety of difeafes, and of denoting each difeale by a variety of names; infomuch that almoft every fevere chronic affection of the flin at length acquired the denomination of leprofy, which became rather the name of a clafs of difeafes, than a fpecitic term. This confufion was flill farther increafed, during the middle ages ; when innumerable hofpitals and places of refort, together with the means of fubfiftence, were provided for thofe who were afflikted by this prevalent malady; and when the epithet of leprous was a fufficient claim upon the charity of the Chrittian world. For every Ipccies of difeafe affecting the fkin was reprefented as leprofy; and multitudes of idle and filthy perfons obtained a fubfiftence by ranking themfelves in that clafs.

The fame term, leprofy, has, moreover, been applied by the tranflators of the facred writings, to a variety of cutaneous difeafes, refpecting the nature of which there has been fome difference of opinion; fome referring it to the fcaly lepra of the Greeks, and others confidering it as a variety of the elephantiatis of the fame people; we mean the leuce, vitiligo, or albaras alba.

In order to arrive at a tolerably clear-notion of the feveral varieties of lignification, which have been given to the term, we mult, therefore, confider it under four different heads; namely, the leprofy of the Arabians, of the Greeks, and of the Jews, and the leprofy of the middle ages.

Leprosy of the Arabians, or Lepra Arabum, is the fame with the Elephantiafis of the Greeks. See Elephantiasis.

Under that head, we have defcribed at length the fymptoms of this formidable difeafe, as detailed by Aretæus and the other Greek phyficians; as well as the appearances, which it has been faid to affume in the Weft Indies, in Arabia, and in other fouthern climates, in modern times. We mult here, however, obferve, that the appellation of Arabian leprofy has originated in error; and that the imputation of having mifapplied the Greek term (lepra), which has been generally caft upon the Arabian phyficians, appears to be altogether incorrect. This imputation arofe from the mifinterpretation of their tranllators, as above ftated: and as the works of the Arabians were known only to European phyficians, through the medium of thefe tranflations, into Latin, it was naturally inferred that the original writers had committed the error. Avicenna defcribes the elephantiafis under the title of juzam, or ajiuzam, (the appellation which is ftill given to the difeafe in Arabia, according to Niebuhr,) and likewife diftinctly treats of the albers or albaras, and the albehtk or allokel (morphra of the tranflators). He carefully diftinguifhes, however, the albaras from the albohek, the former of which has feveral fymptoms in common with the confirmed elephantiafis (aljuzam), and is faid often to terminate in it. Thefe fymptoms are, a lofs of fenfibility in the parts affected; a change of colour in the hairs, which become white; and ultimately a lofs of the hair; and a change in the colour and texture of. the 1 kin , and of the mufcular fefly under it, which becomes white and bloodlefs, like that of oyiters, and finally perifhes and falls off. Thefe fymptoms have, in confequence of the miltakes of the tranflators of the Arabians, been transferred to the proper fcaly lepra, and are conjoined, in the ordinary defcriptions of the latter, with the fymptoms properly belonging to it alone. But it feems obvious that the Arabian terms albohek and albaras are of nearly the fame import as the Greek terms alphos and leuce, which both Hippocrates and Celfus have carefully diftinguifhed; confidering the former as a mere bleminh of the fim, but the latter as a formidable and almoft
incurable difeafe. See Leuce. See alfo Hippoc. lib. $\pi \xi_{6} \pi \alpha \sum_{\omega v}$ Celfus, lib. v. cap. 28, and Willan on Cutaneous Difeafes, ord. ii. genus 1.

Leprosy of the Greeks, or Lepra Gracorum, is principally characterized, as the term imports, by the formation of feales on the furface of the fkin, which confift of morbid lamine of the cuticle, hard, thickened, opaque, and of a whitifh colour, and appear in patches of different fizes, having always nearly a circular figure.

Such is the defcription of the difeafe which has been left us by the Greek writers, and which is given as the character of the lepra by the beft writer on the fubject in our own time; we mean Dr. Willan. Hippocrates has not left any circumftantial detail of the fymptoms of lepra, but fpeaks of it, together with the alfoos, pora, lichenes, \&c. as an external blemin, rather than a difeafe. The later Greek writers, however, although brief in their defeription of lepra, have pointed out the diftinctions between it and thofe fimilar affections, with which it was conjoined by their predeceffors. Aëtius flates, that it differs from the lence (vitiligo, or white elephantiafis) in not penetrating deeper than the fkin, and leaving the fubjacent flefl found; from the alphos, which, though fcaly, is more fuperficial; and from the pfora, in having large fcales, like thofe of fifh; whereas, in the latter, only fcurf, or branny exfoliations, appear. (Aët. Tetrabib. iv. fermo i. cap. I 34 .) It mult be here obferved that the pfora, fimply, fignifies a flight, fcaly difeafe; and not the fcabies; or itch, which is defignated, together with the moift-tetter, by the epithet ulecrating pfora, $\psi_{\text {upp }}{ }^{\text {in }}$ スwoins. (Aët. loc. cit. cap. 126, 127, and 130. Galen, Introd. Paul. lib. iv. cap.2.) Paulus Ægineta, in a chapter "On Lepra and Pfora," obferves, that "both thefe difeafes are characterized by roughnefs and itching, and a feparation of a melancholic humour; but lepra affects the fkin deeply, in circular patches, at the fame time throwing off fcales like thofe of large fifhes; whereas pfora is more fuperficial, varioufly figured, and throws off little bran-like fubfances." (Lib. iii. cap. 2.) Actuarius has given the fame account of thefe difeafes. (De Meth. Med. lib. ii. cap. Ir.) This fcaly P fora will be afterwards confidered, under the appellation of Psoriasss, which Dr. Willan has appropriated to it, in order to avoid the confufion which would enfue in retaining the term $\oint$ fora, which has been applied by many of the moderns exclufively to fcabies, or itch.

Three varieties of the fcaly lepra are obferved in this country, according to Dr. Wiilan, which he has denominated Lepra vulgaris, L. alphoides, and L. nigricans.
r. The lepra vulgaris firl thews itfelf in fmall, reddihh, and fhining elevations of the cuticie, on the tops of which thin white fcales are feen within twenty-four hours from their appearance. After three or four days, the fmall elevations are flattened, and at the fame time dilated, by an extenfion of their bafes, to the fize of a filver penny. Thefe patches continue to enlarge gradually, until they become nearly of the fize of a crown piece; they always retain a circular or oval form, are covered with dry fcales, and furrounded by a red border. The fcales often accumulate on them, fo as to form a thick prominent cruft, which is quickly reproduced, whether it fall off fpontaneoully, or have been forcibly detached. On its removal, the furface appears, through a magnifier, to be perous and irregular, or wrinkled; but the furrows do not coincide with the lines of the contiguous found cuticle. The eruption is not attended with any pain or uneafinefs, excepting a flight degree of itching, felt when the patient becomes warm in bed, and a fenfation of tingling

## LEPROSY.

upon any fudden change in the temperature of the atmofphere.

This fpecies of lepra often appears firf at the elbow, or on the foresarm, but more generally about the knee; in the Iatter cale, the primary patch forms immediately below the patella. Within a few weeks, feveral other fealy circles appear along the fore parts of the leg and thigh, increafirs by degrees until they come nearly into contact. The difcafe is then often Itationary for a confiderable length of time: if it does advance farther, its progrefs is towards the hips and loins, afterwards to the fides, back, and floulders, and about the fame time to the arms and hands. In a great number of cales, the hairy fcalp is the part laft affected: although the circles formed on it remain for fome time diltinct, yet they finally unite, and cover the whole furface on which the hair grows with a fcaly incruftation, producing, efpecially in hot weather, a troublefome itching. In fome inftances, the nails, both of the fingers and toes, are thickened, and deeply indented longitudinally; either the whole, or fome part of each nail is harder, and more prominent than ufual.

When the lepra extends to all the parts above-mentioned, it becomes highly difgulting in its appearance, and not only inconvenient, from the ftiffnefs and torpor which it oceafions in the limbs, but paipful where the fikin is red and tender, as it fometimes becomes, in the flexures of the joints. The difeafe, however, is feldom difpofed to terminate fpontaneoufly: it continues nearly in the fame fate for many weeks, or months, fometimes for feveral years, or even during the remainder of life, yet without being apparently connected with any diforder of the conftitution. An appropriate courfe of medicine, with a regular diet, acts very flowly on the lepra, but will at length accomplifh its cure ; and it then proceeds to a termination in the following manner. Firft, the incruftation feparates from about the centres of the patches, and is no longer reproduced. The fcales being farther and farther removed, a circle of red Thining cuticle, deeply indented, appears within the original patch, which fill retains a broad hard fcaly ring, or border: this border continues till the cuticle within it affumes the ufual colour and texture. It then gradually foftens, and the cuticular lines being extended over it, every veftige of the difeafe is erafed.

It may be obferved, with refpect to the fcaly Rpra, that the patches are generally fituated where the bone is neareft to the furface, as along the fkin, about the elbow, and upon the $u l_{n}$ in the fore-arn; along the fine, os ilium, and fhoulder-blade; and on the fcalp. They rarely appear on the calf of the leg, on the flefhy part of the arm and thigh, or within the flexures of the joints. The difeafe almolt conftantly affects both fides, appearing at each elbow, or at each knee about the fame time, and extending from thence along the limbs in a fimilar manser. But although frefh patches arife, from time to time, in different fituations, there is no ceffation of the complaint in the parts firt affected, as happens in fome cutaneous difeafes; but when it is about to terminate, all the patches aflume a favourable appearance at the fame time, thofe neareft the extremities going off fomewhat later than the reft. When the extremities, back, loins, and head, are all at the fame time covered with dry crults, it might be expected that the obftruction of the perfpiration on fo large a furface would produce difagreeable confequences; which, however, is not found to be the cafe.

The caufes of the common lepra are not fatisfactorily afcertained. Some writers maintain that the difeafe is both contagious and hereditary; but its contagious nature has probably been affumed from the erroneous notion of the

Vot. XX.
affinity between the lipra vulgaris, and the cleplantiafis. Dr. Willan (to whofe accurate obfervations we are indebted for the defcription of lepra), alfirms, jully, thit it is not a contagious difeafe. Ife admits, however, that an hereditary predifpofition to it is orcafionally tranfinitted from the parent to the offspring. A flow pulfe, or a lanyruid circulation of the blood, and, what mult generally be connected with it, a harfh, dry, impermeable flate of the frin and cuticle, appear to contitute a fundamental part of the pre-difpofition: The morbid efiects of fuch a ftate of the integuments are moft likely to be felt in the declive of life: accordingly, the difeafe is of more frequent occurrence, and proves more inyeterate after the age of forty, than at any earlier period ; an obfervation made long ago by Hippocrates and Galcu. Willan. loc. cit.

Among the exciting caufes of this form of the lepra, particular kinds of dict, as dried meats, finh, oatmeal, and fome incongruous tnixtures of food, are ufually mentioned, but not on fufficient authority: at leait the diforder is very frequent in this metropolis and its environs, where the articles of diet juit mentioned are little ufed. Nor does it appear that the general opinion, that lepra is more prevalent in fifhing-towns on the rea-coaft, than in other fituations, refts upon any better foundation. Expofure to cold and moitture, and the accumulation of fordes on the fkin, are the only exciting caufcs of this variety of lepra which Dr. Willan has been able to point out. From the laft-mentioned caufe, he fays, it frequently arifes in bakers, bricklayers, labourers, coal-heavers, duft-men, labo-ratory-men, and others who work among dry powdery fubftances; for thefe perfons are not able to attend very carefully to perfonal cleanlinefs, from the want of public baths, and an imperfect fupply of water in their own houfes. For our own parts, however, we have feen the difeafe molt frequently in females, where the laft-mentioned circumflances had not operated.
